VIII. The Places. The two first grow in *Marsh* grounds near the Sea in many parts of England. The second grows plentifully upon the Walls of the town against *Graveend*, as also on the Banks of the River below the lame Town, and below the Kings Stone-house at *Chatham* also by the Kings Ferry going into the Isle of *Shepey* and in the Salt Marshes by *Lee* in *Effex* in the *Marsh* by *Harwich*, and many other places. The second grows in the fields near the Sea, by *Colchester*, as *Lobel* says and *Clufius* saith, may be found about *Valencia* in Spain. The third has been found growing in *Virginia* and myself found it in *South Carolina* in a Marshy piece of Land at *Canoe* up *Wando* River, about nine Miles from *Charles Town* it was also lent to *Clufius* from *Paris*, by one that received it in the lame manner from *Lisbon* in *Portugal*.

IX. The Times. The two first flower in June and July, and their Seed ripens not long after: The last I saw in Flower in *Carolina*, in the Month of *July*, but played not in the place, to see its Seed.

X. The Qualities. They are temperate as to heat or cold, drying in the third Degree, Astringent, Styptic, Stomachic and Alterative.

XI. The Specification. They are peculiar against Catarrhs and Spitting of Blood.

XII. The Preparations. You may make therefrom, I. A liquid Juice, t. An Effence. 3. A Powder of the Seed. 4. A Decoction of the Roots, y. An Oil or half an of the Leaves.

The Virtues.

XIII. The liquid Juice. It stops Catarrhs or Disruptions of Rheum upon the Breast and Lungs, and prevails much against Fluxes of the Bowels, as also all sorts of Bleedings, whether by the Mouth, as Spitting and Vomiting Blood, Pissing Blood, the Bloody Flux, or overflowing of the Terms. Dose three or four Spoonfuls in a Glass of Red Florence or Red Port Wine, Morning, Noon and Night.

XIV. The Effence. It has all the Virtues of the Juice, but more Stomachic, and therefore better for such as have weak Stomachs. Dose two or three Spoonfuls in Red Wine, as aforesaid, and at the same times.

XV. The Powder of the Seed. Gerard says that being drunk in Wine, it helps the Collick, Strangury, and Dyfentery, or Bloody Flux: Dose one dram. It also stops the overflowing of the *Uterus* in Women, and all other Fluxes of Blood.

XVI. The Decoction of the Roots. Being made in Red Wine, it is very Astringent and Stypack, good against Catarrhs, and Fluxes of Blood, and has all the Virtues of the Juice and Effence, but not altogether so powerful: It has been found to be a specific against Agues, whether Quotidian, Tertian, or Quartan.

XVII. The Oil. It is made by boiling the Leaves in Oil Olive till they are Crisp, OV. Applied to Contusions, weakened Joints, weak Backs, and Burnings it cures them.

CHAp - XCVIII.

Of BURDOCK Great,

I.*-T^{6c}HE Names. It is called in Greek, ἄρνυον, JL Trycto-mov, J9 m & <n*xis: In Latin, Arcium, Profopium, Profopis, Perfonata, Lappa and Bardana, in Shops: In Englijh[^] Burdock, and Clot Bur.

II. The Kinds. There are several Kinds hereof, as, I.^o AfK⁶ov petty, Lappa major, Bardana major vulgaris, The Common Burdock. 2. Lappa Virginia ma, The Virginian Burdock. 3. Lappa feu Bar dana languinosi capitulis[^] The woolly headed Bur. 4. Bardana major Rofea, The Rofe Bur: Of all which we fhall treat in this Chapter. 6. Lappa minor five Xanthium, The finall Burdock, #5, Petafites, The Butter Bur, of which two laft, in the two following Chapters.

III The Defcription. The Common Greater Burdock, has a Root great and thick, - black on the outside, and whitijh within, fmeet and pleafant in tajie at firft, but fomething bitter afterwards: from whence fpring forth many large, hard, green Leaves, fomewhat tike to the Butter-Bur, or Wild Dock, but mre crumpled, and of a barker green color on the tipper fide, but greyijh underneath: amortg which rjjē up hard and rough green Stalks, two or three feet high, with many Branches from them, having many the like, but leffer Leaves on them, bearing at their Tops feveral rough heads or burs, with crooked pointed Prickles, apt to flick on Cloths, or other things which they touch *, out of the tops of each of which come forth many hard purplijh threads, which are the Flowers^h which being faded and paf, turn'to Dotvn in the Heads[^] and opening themfelves, Jhed their Seed, which is grayijh, fonfththng like to We Knap-weeds, which together with the Wind, 2s open

carried away, and, manp times falls down to the ground, in the place where it grows, by which it multiplies it Jelf[^]

IV. The Virginian Kind, is a kikk of the former, having like Roots *, but its Leaves a/e rounder and [mailer: the Burrs are alfomaller and harder, and furnifhed with very Jharp, crooked points, which ftick very faft to every thing they lay hold on.

V. The woolly headed Bur, it differs little from the firft, but only that the Leaves grow not altogether fo great; and the heads being J mailer[^] are woolly all over, and the ttrickles not Jo Jharp or flicking. Gem&fays, that the Leaves and whole %lant are fomewhat lefs than the jirfl or common kind[^] ami, that the Heads are hairy or downy, but othcnmfe like to it. Lobel calls this Ar&ion Montanum, and Lappa minor Galeni^h but it is indeed the Lappa minor altera Matthioli.

VI. The Rofe Bur, differs little or nothing from the firft kind, but in the head, which injhad of the prickly Burs, has many fmall green Leaves, Jet to* gether like a fmall Roje Plantane, and not much prickly at their ends.

VII. The Places. The/r/? of thefe grows plentifully with us every where, by Ditch fides, Water fides, Wafl places, and High ways. The Virginian is found in Virginia, Maryland*, New England, and in other Provinces upon that Coaft. The third is not fo frequent with us, as is the firft, yet I have found it in feveral places of England *, Label found it growing in Somerfet-Jhire, about three Miles from Bath, near the then Houfe of Mr. John Colt: alfo in the High way leading from Draiton to Iver, two Miles from Colebrook. The laji grows not with us, but near Lipfwick in Germany.

VIII. The Times. They Head, Flower, and Seed in June, July and Auguft -, the Seed being ripe in a few Weeks after the Flowers are gone.

IX. The Qualities. They are all cooling and drying in the firft Degree^h yet Gerard fays, that the Roots are moderately hot: They are Mnngenty Difcuflive, Digeftive, and Trauma tick^h Cephaick, Neurotick, Nepbritick, and Hyfterick 5 Alterative, and Alexipharmick.

X. The Specification. The Burdock is peculiar againft the Poifon of Serpents *, and Obfruffions of the Reins, Bladder and Womb.

XL The Preparations. You may have hereof, I. The Leaves. 2. The Juice. 3* The Ejjencei 4. The Saline Tinfure. 5. The Oily Tinture* 6. The Decodwn. 7. A Pouderofthe Root. 8. A Pouderofthe Seed. 9. A Conferve of the Roots. io. 4 mixture. - II. A Qataplajm. 12. A Salt.

The Virtues.

XII. the Leaves. Bieing applied either dry & green, they cool, moderately dry, and difcufts withaL, as Galen fays^h whereby they are good to heal old Sores and Ulcers, and help the Cramp, or thringing of the Sinews*

XIII. The Juice. The Juice of the Leaves mixt with Honey, provokes Urine, and takes away the Pains of the Bladder: and mixt with Wine* it is wonderfully good againft the tags of Serpents* Mad Dogs, and other Venomous Beasts. The Juice of the Root taken to the quantity of three or four ounces, and drank with a good draught of Ale, is an excellent thing againft W[^]d, and coldnefs of the Stomach.

XIV. The Effence. It has[^]11 the Virtues of the Juice, befides which it is excellent againft Poifon inwardly taken-, and is good, l'ing given Dietetically, againft Vehereal Diacafes, as the Pox, Gonorrhoea,

rhcca, £V. Ic heals inward Ulcers of the Lun;', is eool to cure {piecing of Blood. It is good ugainit Gravel, Sand, Sume and TartanAIS Matter, Oltliru- iYmg the Reins, Ureters and Bladder, and prevail- againlr. Vapors -in Women, Obitructtins of rift Womb, and Hjrfterick Fits. Dole from one ijsfo ful to tour, or fix, mixc with any propat Vehi

XV. *The Saline Titifurc of S<r/s. >r leaver.* _ It powerfully opens-OMlruffions or tie Womb, and Bladder, bringing away the Matter cauBag' die Obfrutiion: Outwardly, it is good to wafh the part bitten by a Mud Dog, tot ic draws out rite maligni- ty and Feafon. Hole inwardly j. OT ij 'drams in *AJ- mttn* or *P,irf?y* Water, or any other proper Vehicle.

XVI. *The Oily TinSure.* It is an excellent thing againft Punctures, and othet Wounds or' the Nerves, prevails againft ("ramps and Convulfions, imv.itdly given from twenty to thirty Drops, and outwardly applied.

XVII. *The DeeeSmn ef the Rent.* Drank liberally for fbme time, ic has been round very good to exterminate die R cliques of the *t/cneb D* iieale : The Deception of the Hoot, as alfo ot' the Seed, is com- mended by *Dwfcoridri* agamft the Tooth-ach, being held in the Mouth. It is alfo good to foment withal againft Burnings anJ Kibetl heels : and made with Wine, and drank, ic prevails again!?' the Strangury.

XVIII. *The inkier cf tbeRoat.* It is good againft fpining Blood, helpful hi Con fumpt tons, and expels Sand, Gravel, and Tartarous Matter out of the Reins, Ureters and Bladder. Dofe one OE two drams in White or Red Wine, 6V.

XIX. *The Fonder of the Seel* Taken to one dram, in a proper Vehicle, it is an excellent thing ^aS^{an}]« Sand, Gravel, or Tartaious Matter in Reins or Bladder, and gives eafe in the Strangury, and other like Difeafes of thofe parts : and drank with Wuie for forty days together, tr wonderfully helps the *Sciatica*.

XX. *The Confervt- of the Roots.* It is helpful in Confumptions, and «S»M for fuch as are troubled with the Stone,"ot any Flux of theBowels.

XXI. *The Mixture.* Take Juice of the R<w/, which make with Alicant two pounds : Old T««, •> jpin and half; mix them. Four punces of this being drank Morning, Noon and Night, (after due purging) is good againtt the Running of the Reins in Men, and the whites in Women. Or thus: *Take Juice ef the Rmtf, made at afore/aid^ tzoelve cujtet: old Tent eight ounces : lolks of new laid Eggs, u" ii'j i powder cfAcorns, an ounce and half: Rutmegs in powder half an ounce ; mix them.* It has the Virtues of the former, befidcs which, it eafes pain in the Reins, and wonderfully lengthens a weak Back.

XXII. *The Cataplasm.* Made of the Leaves bruifed^ Kith the While of an Egg, arid laid on any place burnt with fire, it takes the fire out, gives fudden eafe, and afterwards heals it. *The Roots made into 'a Calaplafm by being beaten will Salt,* and applied (as *Apuleim* lays) to the biting of a Mad Dog, cures it, and fo ipeedily ftees the Patient from all danger. *Columbia* lays, *the Cata- plijrn made of the heaves beaten up with Salt,* being laid upon the biting of a *Viper* (the pare being firfl fcarified with a Lancec) draws out the Poifon. The former Cataplafm of the *Rwts with StUt,* is more available than die former againft die Poilbn of Serpents ^ and being applied, is alfo good againlf. the KingVEvil.

XXIfl. *The Salt jrm the AJhes.* Taken in White Wine, Arfmair, or Pulley Water, from a fcruple to half a dram, it is ptx>d to provoke Urine, cleanie the Urinary PaffgeSi and to carry off the Watry Humor in DropCes.

CHAP. ACIX.

O/BURDOCK Small.

THE Name. It is called in Greek, *Leuca- pharyngos*; in Latin, *Scorzonera*; in the Shops, *Leuca scorzonera*, *Leuca scorzonera*, and by some, *Scorzonera*, and *Barbani minor*; in English, the Lesser or Small Burdock.

II. *The Kinds.* It is the leffer fort of *xhe Burdock*s, and fingular of the Kind.

III. *The Description.* It bar a *small Root* somewhat long and fibrous, and perijhing every year : from which *Root* rises up a rough crested *Stalk* about two feet high, breaking out into several *Branches*, with many blue kishpots upon them, with two much *fmaler* and whiter *Leaves* at every *Joint*, fianding upon long *Footstalks*, which *Leaves* are usually divided into three parts, something like unto a *Marsh Mallow* leaf, unevenly notch'd or dented about the edges : at the *Joints* of the *Stalk* and *Branches* with the *Leaves*, towards the tops of them, come forth *small Flowers*, which abide not long, and after them, two or three *small*, clofe *Burs*, a little pointed at the top, wherein lye two or three *small tank Seeds*, fomewhat like unto an *Oat*, which fall not out, nor do the heads open.

IV. *The Vlaces.* It grows in many places of this *Kingdom*, as particularly in two or three places between *Tidenham* and *Chepstow*, in the foot way -, in the *Highway* between *Stanes* and *Egham*, and between *Dray ton* and *Iver*, two Miles from *Colebrook*; and at *Southwick-fheet* in *Hampjhire*.

V. *The Times.* It *Flowers* and *Seeds* when the great *Burdock* does •, viz. in the *Summer Months*, *June*, *July* and *Auguf*.

VI. *The Qualities.* It is temperate as to heat and cold, dryness and moifture, yet *Galen* will have the *Seeds* to be hot and dry, digeftive, also difcuffive, *Neurotick*, *Splenetic*, and *Hyfterick* * *Alterative*, and *Alexipharmick*.

VII. *The Specification.* It is fingular againft the pain and hardness of the *Spleen*.

VIII. *The Preparations.* You may keep hereof
1. *The Juice.* 2. *The Effence.* 3. *The Saline Tin-Sure.* 4. *The Oily TinUure.* <;: A *Pouder* of the *Root.* 6. A *Pouder* of the *Seed.* 7. A *Conferve* of the *Roots.* 8. A *Salt.* 9. A *Decolion* of the *Roots.* to. A *Lotion*, or *Waf*t). n. A *Cataplafm* of the *Roots* or *Seeds.*

the *Virtues.*

IX- *All these Preparations* have the fame *Virtues*, *Ufes*, and *Dofes*, with thofe of the fame name in the *Chapter* of the *Great Burdock*, to which you are referfd; but there are fome peculiar *Virtues* in this *Plant*, not obferv'd to be inherent in the former, for which reafon we fhall fay fomewhat more of its *Effence*, *DeceUion*, *Lotion*, and *Cataplafm*, in the *Seftions* following.

X. *The Effence.* It ftrikes at the *Root* of the *Leprofie*, prevails againft *Faintings* and *Swoonings*, opens *Obftru&ions* of *Liver* and *Spleen*, but more especially of the laft, and gives eafe in pains of the *typpochonders* and *Bowels*. Dofe three or four fpoonfuls *Morning* and *Evening* in a *Glafe* of *Sherry Wine*.

XI. *The Decoftion.* It is to be made with *Wine*: and has the *Virtues* of tho* *Effence* ; it confumes the hardness of the *Spleen*, being taken inwardly *Morning*, *Noon*, and *Night*, to fix ounces, and as often bathed warm upon the part affected.

XII. *The Lotion.* It is made of the *Burs*, before they are ripe^ being bruifed and laid tofteepin *Ivater*^ or *Wine*, in which a little *Nitre* is diffolved, for twenty four hours. It difcuffes *Tumors*, and gives eafe in *Pains*, being bathed warm upon the parts affected. If the *Hair* is fometimes wafhed therewith, it makes it become yellow. It is an excellent *Gargle* for a fore *Mouth* and *Throat*, taking away the *Inflammation*, and healing of it in a very fhort time.

XIII. *The Cataplafm.* It is made of the *Roots* or

Green Burs, being beaten to a *Pap* in a *Mortar*^ and mixed zoith a third part of *Mihr'uLite*. Being applied upon hard *Kernels*, or *Swellings* in the *Flefh* (as thofe proceeding from the *Kings-Evil*) k is laid to foften and difolve them :- but more especially, if in the mean fealbn, the *Juice*, *Effence* or *Decoftion* in *Wine* aforementioned be daily given inwardly two, three or four ounces at a time, and that *Morning*, *Noon*, and *Night* \ for thefe *Preparations* very much fweeren the *Blood* and *Juices*; and correct the *Difcratie* of the *Humors*.

C H A P. C.

Of BUTTE R-BUR,

I-¹ Tp *HE Names.* It is called in *Greek* n\$7*.oiin < •.

JL In *Latin*, *Petafoes* -, (from the largeness of the *Leaf**, it being large like *ni-m<ny*, a *Hat* :) fome take it to be *i\$yov *Thephrafti*, and fome to be *Perfolata* *Plinij* : In *Englijlo* it is called also *Petafites*^ and *Butter-Bur* : The *Germans* call it *Peftitehee*^ *wort*, or *Plague-wort*.

II. *The Kinds.* It is of two forts, a *Greater*; and a *Leffer*, and differing also in the *Flowers* \$ but fo very like one another, that one *Description* will lerve for both. *Camerarius* calls the more common *Mas*, the other *Yesmima* : but in his *Epitome* d⁶. *Mathiolus*, he calls the *Greater*, *Tuffilago* *major*, for that fome will have it to be a kind of *Coltsfoot*.

III. *The Description.* It hd», a long *Root* dnt thick, fpreading under ground, tyckifh on the out* fide, and vohitifh within, oftentimes *Worm* eaten, and of a bitter and difpleafant taftc : It fprings up very early in the *Tear*, with a thick *Stalk* about a foot high, on zvhich are fet a few *small Leaves*, or

rather pieces, and at the Tops a long spiked head of Havers, in the one (which is the lefts, and the more rare to Jind) wholly white, and of a better /cent than the other (though some say it has no scent) in the Greater, which is the more common with us, of a bluish, or deep red color, according to the Soil* in which it grows; a clay ground bringing forth a paler color *fomewhat weak*, and before the Stalk ha*flood %*nb the r lowers a Month above ground, it will be jelled away and gone, and blown away with the Wind: after which the Leaves will begin to spring, which when they are full grown, will be very broad and large, big enough to cover the whole Body, at least the Head, like an Umbrella, which hides from Sun and Rain-, they arefomewhat thin, and almoft round*, whose thick red Footstalks, being about afoot or more long, stand tender, or towards the middle of the heaves, the lower parts of which, are divided into two round parts, close almoft one to another, of a pale green color above, and hoary underneath That which brings white flowers, brings forth alfo mailer leaves than the other doth, having divers ribs and veins therein.

IV. Gerard has another kind of Description, which in some measure explicates the former, for which reason I think it necessary to insert it here: Butter-Bur (says he) does in a manner bring forth its flowers before the Leaves, as Colts-foot does (for which reason some have thought it to be one of the tin Is of Colts-foot-, and for which reason Matthioli and CameTarius in their Epitome, have called it Tuffilago major, as is before mentioned:) These flowers, says he, are Small and MoJJe, tending to a purple color, which are made up into a big Ear, as it were, and quickly after, together with its Stem, (which is thick, full of flame, and brittle) fade and fall away : then comes up the Leaves, which are very great, like a round Cap or Hat, called in Latin Petasus, offuch avvidenefs or largenefs, a* that of it self one leaf is big enough to keep a Man from a shower of Rain, or from the heat of the Sun, and therefore are much larger than the Leaves of the great Burdock y their color is some what white, but

whiter underneath ; every Stem bears his Leaf which is sometimes a Cubit long, thick and full of substance, which stands, a* it were, under the Leaf in the Center or Middle abnost of the Circumference, like to one of the great eft Mushrooms, setting aside the Cleft at the lower part of the Leaf near the Stem, especially when they are perishing or withering away : at first the upper superficial or outside of the Mushroomy/rftirfj out, and when they are in withering it stands more in, and the edges, as it were, turn up i Jo is it in the Butter Bur Leaf which has on the outside a certain shallow hollownefs.

V. The Places. They both grow in wet and moist Grounds by Rivers and Waterfides, and upon the Brinks and Banks of Lakes and Ponds, almost every where.

VI. The Times. The Flowers rise and decay in February and March, and then fade away * Gerard says, in March or April: when they are gone, then come up the Leaves, which remain all Summer, even till Winter, new ones still growing up, and being added to the former.

VII. The Qualities. The Roots, which are mostly used, are hot and dry in the third Degree, Digestive, Difcussive, and Sudorifick * Cephaicck, NeuroticL Stomack, Hyfterick, and Cordial, Alterative, and Alexipharmick.

VIII. The Specification. It has a peculiar power and force against Poison of all kinds, and the Infection of the Plague.

IX. The Preparations. You may prepare from the Root, 1. A Pouder. 2. A Juice. 3. An Effence* 4. A Spirituous Tinture. 5. A DecoUwn. 6. A Mixture.

The Virtues.

X. The Pouder. Being given to one dram, and drunk in Wine, it is a most excellent thing against the Plague, and all sorts of Pestilential Fevers, as Spotted Fever, Purples, Measles, Small Pox, &c. because it is Sudorifick or provoking Sweat, and drives from the Heart all sorts of Venom and Poison : it kills Worms, and is powerful against Hyfterick Fits, or Vapors and Suffocation of the Mother : If it is strewed on old and filthy running Ulcers, it cleanses, dries, and heals them. It also provokes Urine, and the Monthly Terms in Women.

XI. The Juice. It is expressed out of the Root by being beaten in a Mortar, and squeezed out with White Port Wine. It has all the Virtues of the Pouder, and may be given from one ounce, to two or three ounces, Morning and Evening, as a preventive against the Plague, and every fix hou^r after Infection.

XII. The Effence. It has all the Virtues of the Pouder and Juice, but more powerful to all the Intentions : It Provokes Urine, and the Courfes, and kills the flat, broad Worms in the Belly. Dose one* or two ounces mixed with Wine. It is a powerful medicine for the Yellow Jaundice, and the Bilious & Measles.

XIII. The Spirituous Tinture. It is good against Poison and the Bitings of Mad Dogs, prevails against Fainting and Swooning Fits, and is a famous thing to rectifie the Distemper of the Stomach Dole one or two drams in a Glass of Canary.

XIV. The DecoUion. It is good against Coughs, Colds, Asthma's, Wheezings, difficulty of Breathing, and other Distempers of the Liangs, causing Expectoration. It kills Worms, provokes the Terms, and has all the other Virtues of the Pouder and Effence foregoing, but not full out so powerful; Dose from two ounces to four or fix, as hot as it can

can well be taken, Morning and Evening, to prevent the Infection of the Plague *, and as much every six hours, for those who are already seized with it.

XV. *The Mixture.* It is thus made: *Take of Juice expressed with Vinegar, or the Effence, twelve ounces: Juice of Rue four ounces: Venice Treacle, or Mithridate two ounces: mix them well together by shaking.* It is an Antidote against the Plague of pestilence, Spotted Feyer, Purples, Small Pox, Measles, Poifon, biting of Vipers, or other Serpents, and the bitings of Mad-Dogs, or of any other Venomous Creature. Dose two ounces at a time, as often as need requires.

CHAP. CL

Of BURNET

1. * THE Names. It is called in Greek by *Ktcp-*

X lous Myrepfm, n/wxi, or as *Gefner* has it, *TLi/vN*. In Latin, *Pimpinella, Sanguiforba, B'h fmmula, Peponella, Sorbajirella* and *Sanguinaria, quod Sanguineos fluxus fificat*: In English, *Burner.*

II. *The Kinds.* It is fourfold, i. *Pimpinella vulgaris* we minor, The Common or Lesser Burnet. 2. *Pimpinella inodora,* Smellefs Burnet. 3. *Sanguiforba* feu *Pimpinella Major* five *Sylvestris,* Great or Wild Burnet. 4. *Pimpinella Maxima Americana,* The Greatest, or *American Burnet.* Where Note, that some Authors think our Garden or Field Burnet to be the *Sideritis fecunda Diofcoridis*; but I think them to be mistaken, because this latter answers in the form of the Flowers to our Burnet.

III. *The Description.* The Root of Vibeje hcv a Root which is small and long, and of a blackish brow on the outside, growing deep into the Earth, with some Fibres thereat, from thence comes forth many long winged Leaves, sprouting upon the Ground, which

confist of divers small roundish, or rather Wailaves, green on the upper-side, and grayish underneath, finely dented about the edges, set on each side of a middle rib: among which rise up several crested brown Stalks a foot high or better, and in rank ground sometimes a foot and half high, with some mailer Leaves set in some places thereon, divided into several Branches. At the Tops grow several round loose heads, upon long footstalks of a brownish color, from whence part forth small purple Flowers, and after them cornered Seed. The whole Plant has a pleasant quick Smell and Taste, much like to the favor of a Smelt, and put into a Glass of Wine, gives it a pleasant Relish.

IV. *The Inodorous Burnet* in Roots, Stalks, Leaves, and Heads, is altogether like the former, save that the Leaves are not so round, but sometimes longer, and have no manifest Smell or Taste in them.

V. *The Great or Field Burnet,* has a Root black and long like the first Kind but greater, from whence springs up such like winged Leaves, but nothing so many, and each of those Leaves on the Wings, are twice as large as the other and nicked about the edges in the same manner, of a grayish color on the under side: Stalks are greater, and rise higher, with many such-like Leaves set thereon, and greater round heads on the Tops, of a brownish green color, out of which come small dark, purple flowers, very much like the former, but greater: The Plant itself has very little of Swell: OK Taste in it, which can be perceived.

VI. *The American great Burner,* has a Root much greater than the former, and moody, longer also, and blacker than the last, but in all its other parts, it is like our Field Burnet, but much greater: often times all its Leaves are of a bluish green on the upper side, and folded half way together inward, so that the under sides of the Leaves, which are greyish, show themselves upwards and they are dented somewhat deeply about the edges, with greater dents, which makes them the more comely and pleasant: the tops of the Stalks bear several, and longer,

...r, wh^rtijh green fpiked heads, fet thick with Knaps, each of which when it flowers (beginning below, and fo rifing higher) Jhevos to be four whitifh green heaves, having many fmall white long threads in the midji •, after which come in their places cornered Seed like the other. The whole plant has not much Jmell, but in its Tajie, is much like the firfl.

VII. *The Places.* The firft grows wild in feveral Counties of our Land, in dry fandyp^laces, but is ufually kept in Gardens. The fecond, *Bauhin* faith is found in Spain, and I have found it in fome Meadows in Norfolk, not far from *Lyn Regis*. The third is found in feveral Counties of England, in the Meadows in Norfolk, Suffolk, Cambridge-shire, Uuntngdon-shire, and Northampton-shire \$ as alfo near London, by Pancras Church, in two or three Fields nigh Boobfs-Barn, and in the middle of a Field by Paddington : I have alfo found it in fome Fields between London and Newington, as alfo going towards the Boarded River. The lajl is found in the French Settlements in Canada, and in the North parts of Virginia, where it is Natural : from whence it has been tranfplanted to us, and is nourifhed up in Gardens.

VIII. *The Times.* They all flower in June, and beginning of July ^ and their Seed is ripe in AH-gujl

IX. *The Vitalities.* They are generally hot and dry •, the firft of them in the Second Degree -, the other three in the Firft Degree : They are Incarnative, Afringent, Styptick, Repercuffive, and Traumatick, or Vulnerary: Cephalick, Neurotick, Stomatick, Cardiack, and Alterative : Alexipharmick, and Analeptick.

X. *The Specification.* Burnet is a peculiar Plant for flopping all forts of Fluxes of Blood h whence came the names *Sanguiforba*, and *Sanguinaria*.

XL *The Preparations.* You may prepare therefrom, i. A liquid Juice. 2. A Decoſion. 3. A Syrup. 4. A Wine. 5. A Vinegar. 6. A Spirituous Tinſure. 7. An Acid Tinſure. 8. A Pouder. 9. An Oil. 10. An Ointment. 11. A Balfam. 12. A Spirit. • 13. The Seed.

The Virtues.

XII. *The liquid Juice.* Taking it inwardly from three to five ounces, either alone or mixed with Red Wine, it ftops all manner of inward bleeding, whatfoever, whether fpitting or vomiting Blood, piffing Blood, or Bloody-flux : It alfo Strengthens, the Stomach and Heart : and is fingular good for all forts of Wounds, whether inward or outward,

XIII. *The Decollion.* It has the Virtues of th^e liquid Juice, but is much weaker, yet very good to reprefs Vapors in Women. Dofe fix ounce. Morning and Evening.

XIV. *The Syrup.* It is excellent againft fpitting of Blood, and heals Bloody-fluxes of the Bowels. and it is fo much the more effe^lual with Steele^d Water or Wine ; If it is made of the Juice, it is good for healing all forts of Wounds of Head and Body, inward or outward, for all old Ulcers, U^lcerated Cancers, and Running Sores, which are hard to be cured. Dofe two or three ounces at a time.

XV. *The Wine.* It chears the Heart, revives the Spirits ^ and is good againft Melancholly, drooping of the Mind, and fainting of the Heart.

XVI. *The Vinegar.* It is a fpecial thing to preſerve from, and cure: the Plague or Peftilence, the Spotted Fever, or any other malign acute Difeafe, of that kind •, for It in a fpecial manner defends the Heart from Poifonous and Noifom Vapors, and all contagious Pifeafes^ being given mixed with

The Juice in equal quantities, and the Patient laid to Sweat thereupon. Dofe three ounces.

XVII. *The Spirituous Tinſure.* It comforts and Ivarms the Stomach and Bowels, Strengthens Nature, and takes away the weaknefs of the Stomach and Inteftines, thereby flopping Fluxes of the Belly of all kinds : It ftrengthens the Heart and Liver, and other principal Parts, and therefore is good againft Faintings and Swoon^s ngs. Dofe one ſpoon^{ful} at a time in a Glaſs of Wine.

XVIII. *The Acid Tinſure.* This has all the Virtues of the Vinegar aforegoing, but is much more powerful than it, to all the purpoſes and intentions there fpecified: befides this is an extraordinary Stomatick, and therefore powerful in flopping Vomiting, and alfo fpitting of Blood, being given in a Glaſs of Canary, or Red Port Wine. Dole thirty or forty drops, to fifty or fixty, two or three times a day.

XIX. *The Pouder.* Ufed outwardly to old Ulcers, moift and running Sores, it drys them up wonderfully, and prepares them for healing. It may be made of the whole Plant.

XX. *The Oil* It is ufed to abate Inflammations, eaſe Pains, ftrengthen weak Parts, cure Burnings and Scaldings, and to draw malignity out of Wounds made by the bitings of Venomous Beafles.

XXI. *The Ointment.* It has the Virtues of the Oil, but penetrates not fo much, yet is more effe^lual for the cure of Wounds, Ulcers, and other Running and Malignant Sores.

XXII. 17* *Balfam.* If it is made of the Juice, or green Herb, it is one of the beft Vulneraries in the World: it digefts, cleanſes, drys, ftrengthenes and heals all green Wounds, old Ulcers, running Sores, and other ill hatured Difeaſes of that kind. It is certainly a moft excellent Wound Balfam. •if it is mixed with Pouder of Scammony, it takes away rotten Flefh, and deſtroys Putridity or Rottennefs.

XXIII. *The Spirit.* It ftops inward Bleedings, comforts the Heart and Bowels, and is an excellent thing againft Fluxes of the Belly of all kinds, more eſpecially the Bloody-flux, and the overflowing of the Terms in Women : and this it does the more powerfully, if a little Catechu be difſolved in it. It prevails alfo againft the Contagion of the Plague* Dofe from one dram to half an ounce.

XXIV. *The Seed made into a Pouder.* This, ſays *Parkinſon*, is no lefs eſte^lual, both to flop Fluxes, and to dry up moift or running Sores, being given inwardly (to one dram) in ſteeled Water or Wine, that is, if Water in which hot Gadds of Steel have been quenched •, or if Wine, in which* old Nails have been infuſed for two or three Months beforehand : The pouder of the Seed may alfo be mixed with Ointments or Inje^lions,

XXV. *The American Burnet* has all the fame Preparations with our *Engl^h*, and the fame Virtues, Uſes, and Dofes.

CHAP. CL

BUTTER-WORT.

I. ¹TP RE, *Barnes.* It ſeems not to be known to the Greeks, and therefore we have no univerſally received Greek name for it, only *Gejner* thought it to be *Dodecatbeon Plinij* : *Lugdune[?]ifis* thinks it may be *Crias Apulei*, and calls it *Cuculh^{ta}*: but it is called in Latin, *Pinguicula* by *Ge^lner*^ and from him all others call it io : other* *LinguU*

Plinij, *Viola humida*, *Viola Paluftris* : Bauhin caills it, *Sanicula montana flore calcare donata* : with us it is called, *Sanicula Ehoracensis* (because it grows lb plentifully in *Tork-shire*.) In *Engliſh* it is called *Butter-ivort*, and *Butter-root*, because of the Unttuofity of the Leaves ^ or elie from *fattening*, as *Gerard* fays, who alfo faith, they call it *White Rot*, and not *White Root*, because the Countrey people think, that if their Sheep fhould eat it, that it would give them the Rot ^ and they give it the Epithite *White*, from the color of the Leaf : as they have another which they call *Red-Rot*, which is *Pedicularis*, *Red-Rattlé*.

• II. *The Kinds*. It is a fingular Species of the *Sanicles* j being Genus to none elfe.

III. *The Defcriptiott*. It *htu d Root compofed of divers white fibres, or fmall Strings, which die not in the Winter, but abide all the time with green Leaves upon them: from thk Root Spring forth divers fat and long Leaves lying upon the ground round about it, broad at the bottom, and pointed at the end, of a pale green color on the upper fide, but white underneath, folded together at their fir ft rifing, which then are more White, from among theje Leaves, rife up two or three, or more, flender naked Stalks, about five or fix Inches high, bearing but one only flower at top of each Stem, fet in a fmall green hufk, in form fomewhat like a Violet flower, or thofe of Larks Heels or Spurs, having a fmall Heel or Spur, behind, in feme of a purple, in others of a more blew color, and infome white. When the flowers are paf, there come in their places fmall pointed round heads, in which is contained fmall, long, black Seed.*

IV. *The Places*. It is chiefly found in the Common Field, and in feveral Bogs on the Hills in *Tork-shire* : and in many places alfo in the *West Country*, and *Wales* : as alfo in a Common, about a Mile from *Oxford*, near a Village called *Jlerington*. *Gerard* lays, it grows in *England* in fquafhy wet Grounds, and will not yield to any Transplanting or Cultivating of it h and that it grows eſpecially in a field called *Crag-Clofe*, and at *Crosby*, and *Ra-*

venfwAith in *Wejmorland* -, upon *Ingieborow Yels*-> twelve Miles from *Lancafler* *, and in *Haru-ood* in the fame County, near to *Blackburn* h ten Miles from *Prefton* in *Aundernefs* upon the Bogs, and *Marfh Grounds*: and in the Bogy Meadows about *Bijhops-tiatfield* : alfo in the *fenns* in the way from *London* to *Whitlefea Mere*. in *Huntingtpn-JI*ire : It grows alfo in *Hampflnre*, and in great abundance in many places in *Wales*.

V. *The Times*. It Flowers towards the latter end of *May*, and all the Month of *June*, even to *July*, (according as the Weather proves) and the *Seed* is ripe not long after..

VI. *The Qualities*. It is *Temperate* in refpeft to heat or cold, and *Drying* in the Second Degree. It is *Afringent*, and *Cathartick*, like *Rhubarb* s *Con**, *iblidative*, and *Traumatick*, or *Vulnerary*.

VII. *The Specification*. It is dedicated to the curing of *Green Wounds*, and healing of *Recent Rup-tures* in *Children*.

VIII. *The Preparations*. You may make there* from, I. *A liquid Juice of the Plant*. 2. *A Syrup** 3. *An Ointment*. 4. *A Balſanu*

The Virtues.

IX. *The liquid Juice*. *Conntry People*, who live where it grows do ufe to wafh their *Hands* with it, when they are *Chapt* by the *Wind* or *Weather*: and in *Torkſhire* they anoint the *Dugs* of their *Kine*, with the *Fat* and *Oily Juice*, when they are bitten with any *Poilibnous Worm* or *Fly*, or are *Chapt* or *Rift* by *Weather*, or any other means*

X. *The Syrup*. The *Poorer* fort of *People* in *Wales*, make a *Syrup* thereof; as of *Rofes*, and there^ with *Purge* themſelves, and their *Children* : they mix it with *Broth* for the fame purpole, and fo it purges *Flegm* effe&uajly* Dofe from two ro four *poonfiils**

XI. *The Ointment*. They alfo with the *Herb* make an *Ointment*, which is held to be fingularly good (and that by the Experience of fome *Phyfi-cians*) againft the *Obftruftions* of the *Liver*.

XII. *The Balſam*. It is laid to cure *Ruptures* in *Children*, being applied *Plaifter-wife*: It is a *fingular Vulnerary*, for it digefts, cleanfes, and heals *Green Wounds* in any part, being highly *Aiiringent** *Drying*, and *Conſolidating*, not much inferior to any of the *Wound Herbs*.

CHAP- CIII.
CABBAGE,

L nr^HE Names. It is called in *Greek*, fe . . . JL X*P<*A>T>: In *Latin*, *Braffica Capitata* • In *Engliſh*, *Cabbage*, or *Headed Colczceort*.

II. *The Kinds*. It is twofold^ I. *Kfin/Zi* *«0«<>T«> • *Braffica Capitata Alba*, *White Cabbage*, 2. *Kgifog*, K*«X«IH sj</8^, » r ^ « Qp/w/a i^^/-^ R^ *Cabbage*.

III. *The Defcription*, T^ *Common White Cabbage* jttx a *Root* going right down, bufnot deep, nor *Spreading* far, and uſually dies in *Winter* : from which *Root* fpnngs up one thick *Stalk*, having at top thereof a great thick *Heau*^f crumpled *Leaves*: this *Head* is clofed hard and roi^d, and has at *Jirji* great large thick *Leaves*, of a gr^ytjh green, color, with thick, great, and lying open mtſ part of the *Summer*, without cloſing ^ but towards the end of the *Summer* beim grown to have many *Leaves*, it then be' T 2 g*TM

gins to grow clofe and round in the middle, and as it closes, the heaves grow white inwards -, yet there are some kinds, which will never be Jo clofe as these, but will remain half open, which are not accounted to be so good as the other. In the middle of this Head, the next Tear after the Sowing (in other Countries especially, and sometimes in ours) if the Winter is wild, you may see in divers Gardens a great thick Stalk to shoot forth, which is divided in the top into many Ramifications, or Branches, bearing thereon divers small Flowers, sometimes white, but most commonly yellow, made of four heaves, which being pail, turn into long, round, and pointed Cods, containing therein small round Seed, like to Turnep Seed. NOW here is to be noted, that by reason of the hard Frosts, and Cold of our Countrey, some of our Xjardiners, for the preventing the danger of the said Winter Frosts, do use to take up such Cabbages (as they intend to reserve for Seed) with their Roots ; and tying a Cloth or some such thing about the Roots, do hang them up in their Houjes, that thereby they may be defended against the Cold; and then Jet them again after the Frosts are past.

IV. *The Red Cabbage* is in all things like unto the White, excepting in the color, this being deeply Red *, as \$ afo in the magnitude, the Red being for the most part less than the White, and though it is many times found large, yet it is scarcely ever found so large as the large ones of the white. In this also the color of the heaves is very variable, in some it is Green striped with Red *, in others it is more Red \$ and again in some, it is a very deep Red, and sometimes declining to purple.

V. *The Places.* They are found growing with us only in Gardens, being nourished, and brought to perfection chiefly by the care and industry of Gardiners.

VI. *The Times.* They Flower for the most part in June or July, and the seed is ripe in August.

VII. *The Qualities.* They are Temperate in respect of heat or coldness and moist in the first Degree : They are also Opening, Absterfive, Diuretick and Emollient: Also Pe&oral, Hepatick, Nephritick, and Hyfterick, Galactogenetick and Alterative.

VIII. *The Specification.* It is in vain to be particular, for the old Romans having expelled Physicians out of their Territories for Six Hundred Years, did maintain their Health by using and applying Cabbages and Coleworts as their only Medicine, or Remedy, in every Disease. And therefore as they thought them to be equal against all Diseases of the Body, whether inward or outward, fo Chryfipus wrote a Volume of their Virtues, applying them to every part of the Body.

IX. *The Preparations.* You may make therefrom, 1. A liquid Juice. 2. A Decoction. 3. A Syrup. 4. An Eleuary. 5. A Jhes. 6. The whole Subfiance. 7. A Collyrium. 8. The Seed.

The Virtues,

X. *The liquid Juice.* Drunk in Wine to three or four, ounces, it is good against the bitings of Vipers, or other Venomous Creatures : mixed with Honey, and taken, it is good against Hoariness, or loss of the Voice, and helps to restore such as are in Consumptions : mixed with Wine or Vinegar, and drank, it is good against the Venom of Mufhrooms: Galen applied it to the Temples of such as had the Head-ach, arising from Drunkenness \$ it cleanseth so strongly, that it is said to cure the Leprosie.

XI. *The Decoction* The first Decoction is said to open the Body, but the second does Afringe or Bind, for that the Nitrous quality is quite consumed or spent. If it is made in Water, with an old Cock beaten to peices boiled in it, it prevails against Consumptions, and helps such as are troubled with Gripings, and pains in their Stomachs and Bowels, it is also good for such as are troubled with Obstructions of Liver or Spleen, and the Stone or Gravel in Reins or Bladder. It restrains the Vapors arising from Wine, and suddenly makes them sober again. It takes away the Swelling and Pain of Gouty Knees, being bathed warm therewith dispersing the Humors. It also cleanses and heals old and filthy Ulcers or Sores, and Scabbiness, being often washed therewith, as also Pustules and Wheals which break out in the Skin.

XII. *The Syrup.* Made of the Juice, has the Virtues of the same, but in a more peculiar manner it is good against Coughs, Colds, Wheafings, shortness of Breath, Consumptions, and other Diseases of the Breast and Lungs : dropt into the Eyes, it consumes Films, Clouds, or other things which obfuscate the Sight, and heals Sores and Ulcers in the Eyes

XIII. *The Eleuary.* It is made of the Pulp of the great middle Ribs of the great Leaves hndri foft in Almond Milk, or Cows Milk, and committ ed with Honey. It is profitably used for K L are Hoarse or Wheeze, or are Purse or S

XIV. *The Ashes.* They are made of the Stalks, JJ, of a dry Quality, that as Parti*

Ji at id S of A Ch a S have had vehement and inverte fains there, as also it is good for Pains in any other place, caused by the access of Melancholick and Flatulent Humors, helping mightily to dissuade and scatter them; and therefore must be very profitable against the Gout.

XV. *The who b S*bfiance.* It is usually boiled in Water, or in Mutton or Beef Broth, till it is soft, and so with Butter, Vinegar, and Pepper, it is eaten as a Sallet, and for Food: and so eaten it nourishes, cleanses the Bowels, eatcs Seed, also Milk in Nuries,

... helps Coughs, and Hoarthefts, and in Confumptions, being very Stomack 5 (for Stomatts are indeed the greateft reitjurarives.)

XVI. *The Collyrium.* It is made of the juice mixed with Honey, and boiled to the thicknes of a thin Syrup, Drop'd into the Eye, it clears the sight, and clears it of Clouds or Films, or any other matter which hurts it. It prevails agaiost an Ophialmie, and heals Sores or Ulcers of the Eye, removing the weakne!;* and much ftrenghening the part affected.

XVII. *The Seed.* If it isbruifed, and mixed with a fixth part of Muftard Seed, and io drunk wit Wine, it kills Worms in the Stomach or Bowels it ilfo expels Wind in the Fknvds ; and eafes the pains of the Ventricle caufM from Acid, or Colt and Moift Humors. Dole one dram, Morning and Evening.

CHAP. CIV.

CALAMINT Common and Small.

THE Names. It is catted in Greek, *Καλαμίνθη* (*quaji bond vel utilis Mntba*) in Latin. *flamintha*: and in EngHh, *Calamint*^ or *Mountain Mint*.

IL *The Kinds.* It is chiefly twofold, 1. *Calamintha vulgaris* Common Gtlamint \ or which in this Chapter. 2. *Calamintha pulegioides* Hyvm, *Calamintha pulegioides* Field or Wild Calamint s, of which in the nsift Chapter.

THE *Lamnwn Calamint*^ of wlu'ch we heK treat, is three fold, vis. 1. *Calamintha vulgaris* The Great Common Calamint. 2. *Calamintha pulegioides* The Greateft Calamint, whicJ grows plentiulljr in om Exglth Plamarioiw in *Amrke* - *Calamintha minor*, The Lefler *Calamint*

CALAMINTHA Commimis.

Calamintha Americana.

Calamintha Small

IV. *The Decription.* Our ordinary CiUimint kn 1 Root/ml and woody, wtb divers Jmill l wigs, or fibres, ftsreaJi/ig witiin the ground, not dying An* nuafly, bus abiding many J^f-f ; frmit which Root •ije ttpfeveralhiwf homy tt>A woody St.ilAs, about foot high, Jeldom higher -• Tbt Sral&s and Brariehet Jdve sw> boary Leaves fet sis J Joint^ aboit the big* nets of Marjoram, or r.n mtieb bigger, a little drmt- 'I about the edges, and oj a very perang and quick Scent, as the whole Herb a : 'the f&otsert (fond <tt

Several places of the Stalks, from the middle almost upwards, which are small and gaping, much like to those of Mint, and of a pale bluish color. The flowers being gone, there follows small, round, blackish Seed.

V. Calamintha Pradlantior Americana, has a woody Root, which abideth, and sends forth new Branches every Year. It is a Sweet Herb, and rises up to be about a foot and half high, with /quire, hard, and hoary Stalks, which are many, and more /ender than those of the Wild Mint; on which are Jēt at every Joint, two small, and somevohat round Leaves, deeply dented about the edges, yet larger than those of the Wild Kind, being somevohat hairy, but not very hoary, rather of a fad green color, of a very sweet Scent, and not strong or heady as the other. The blowers are gaping, and like the former, but larger, and of a purple color; which being gone, then comes the Seed, which is black, small, round, and something like unto Purflane Seed.

VI. The Small Calamint, is another sort of the first, and like unto it in all things, except the magnitude, being something less, and differing chiefly in the Flowers, which are not so large by one half, and therefore denotes it to differ from the same.

VII. The Places. The first grows in many Gardens, and in Dry and Upland Grounds, and on Heathy in many places of England. The second grows in many places of English America, it having been found in several old Plantations, after they have been flung up for rest, as also in the Borders of several Woods. It has also been found on the Eugaxan Hills near Padua, on Hills near Vicenza in Italy; on rocky Cliffs of Severn in Provence, as also in Germany: Lobel also found it growing in England. The Small Sort is found for the most part in those places where the first is also found, or not far off from them.

VIII. The Times. They all Flower about the latter end of June, and in July, and their Seed is ripe in some short time afterwards.

IX. The Qualities. It is hot and dry in the third Degree: Afringent, Carminative, Digestive, Diffusive and Sudorific. It is also Cephalick, Neurotick, Stomack, Pe&oral, Cordial and Hyfterick: Alexipharmick and Alterative.

X. The Specification. It powerfully provokes the Terms in Women, and facilitates the Delivery of Women in Labor.

XL. The Preparations. You may make therefrom, 1. A Powder of the leaves. 2. A liquid Juice. 3. A BecoSion. 4. A Bifilled Water from the Herb gathered in June or July. 5. A simple Syrup of the Juice. 6. A Spirituous Tincture, 7. An Acid Tincture. 8. An Oily Tincture. 9. A Saline Tincture. 10. A Spirit. 11. A distilled Oil. 12. A half an. 13. An Ointment. 14. A Pejary. 15. A Cataplasm.

Tee Virtues.

XII. The Powder of the leaves. Made into an Ele&uary with Salt and Honey, it kills Worms in the Body, helps the Leprosie, and such as are troubled with shortness of Breath.

XIII. The liquid Juice. It provokes Urine and the Terms, eases shortness of Breathing, and Choleric Torments of the Stomach and Bowels: It also facilitates the Delivery of Women in Travel, and expels the Dead Child, and therefore Women with Child ought to forbear the use of it. Dropped into the Ears, it kills Worms in them; and opens Obstructions of Lungs, Liver, Spleen and Womb. And the Body being first well purged, if it is given from

two to four ounces, to such as are troubled with a Tertian Ague, it cures it.

XIV. A BecoBion in Wine. It has all the Virtues of the Liquid Juice, but not full out so powerful; but as it is less in power, so it is much more pleasant to be taken, and therefore may be given in the larger Dose. It brings down Worms Courses, and provokes Urine, and is good for those who are Buriten, or are troubled with Convulsions, Cramps, or shortness of Breath. It helps the Yellow Jaundice, and stays Vomiting, and is good against the birings of Vipers, or other Venomous Creatures: It provokes Sweat powerfully, and therefore is singular good against all malign Fevers, as Measles, Small Pox, Spotted Fever, and the Plague it less Dose from four to six or eight ounces.

XV. The Bifilled Water. It has all the Virtues of the Decoction, but much weaker, and therefore is chiefly used as a Vehicle to convey any of the other Preparations in.

XVI. The Syrup of the Juice. It is highly Pectoral, and therefore a most excellent thing to open all Obstructions of the Lungs, and heal their Distempers, prevailing against Colds, Coughs, Hoarseness, Wheezing, shortness of Breath, difficulty of Breathing, hardness of the Spleen, and other Distempers of the Bowels. Dose two spoonfuls Morning and Evening, for some considerable time.

XVII. The Spirituous Tincture. It is a singular thing against all manner of Malignity, Poison, and Infection whatsoever: It powerfully cures Convulsions in the Bowels, Stomach, or in any other part of the Body, it strengthens Nature, cheers the Heart, revives tired Spirits, and is an excellent thing against cold Sweats, Faintings, Swoonings, Fits, and all sorts of Beliquiums of the Spirits or Heart, and other Bowels, proceeding from Cold, or a cold and moist Cause. Dose half an ounce in a Glass of Wine, Morning fasting, and Evening, or in the time of the Paroxysm.

XVIII. The Bifilled Oil. It has all the Virtues of the Juice and Decoction, but much more efficacious than either of them: being dropped ten or fifteen drops into Sugar, and so drunk in a Glass of Wine, it gives immediate relief in the Cholick* and so given to a Woman in Labour, it presently forces away the Child, either alive or dead; outwardly anointed upon parts Paralytick, or affected with the Cramp, it presently gives relief in the latter, and in some few times using helps the former.

XIX. The Acid Tincture. It is most admirable against the Plague, Spotted Fever, and all other sorts of Malignant Fevers, as also against the Poison of Serpents, as Vipers, Rattle Snakes, &c. bitings of Mad Dogs, or other Venomous Creatures: the Acid destroying all sorts of malignity and Poison whatsoever: It may be given inwardly from half an ounce to two ounces every six hours in some proper Vehicle, and outwardly bathed upon the Region of the Heart, or upon the place bitten or hurt, and Cloths dypt therein may be laid on and this three, four, or five times a day.

XX. The Oily Tincture. Given inwardly to two drams, it gives ease in the Cholick presently, and opens Obstructions of the Reins and Womb provoking Urine, and forcing away Sand Gravel, and other Tartarous Matter obilruaine the parts; Anointed UD on Smfmc it cures them in a short time, upon any part troubled with the Stone, it restores them/comforting the Nerves warming and lengthening the Parts afflitts it

they b

XXI. *The Saline Tincture.* It is good to wash such parts as break out with any (harp or fait Humor, as the Leprosie of the *Greeks*^ Scurfy Morphew, Scald Heads, Dandriff, and the like: bathed upon parts troubled with the Gout or Sciatica, and continued for some time, Morning and Evening, it gives ease of the Pain, does much good, and in time removes the Disease.

XXII. *The Spirit.* It is Cephalick, Neurotick, Stomack, Cordial, and Alexipharmick: It stops Vomiting, strengthens a weak Stomach, cheers the Heart, revives the Spirits, and is good against Fainting and Swooning, Vapors, and Fits of the Mother, and preserves (being taken in a Morning falling) from the Infection of the Plague, or of the Spotted, or any other Malign Fever. You may take a spoonful or two of it at a time (if Dulcified) and that twice a day, or upon the spot, if any Paroxysm is present: It is also good to bathe with, if any thing like a Gangrene is feared.

XXIII. *The Balsam.* Being applied to a cold Gout, it gives ease to the Pain, and anointed upon the Hemorrhoids, or Piles, it heals and cures them.

XXIV. *The Ointment.* It is good to anoint Womens Breasts, which are swollen and painful, proceeding either from Cold, or Curdled Milk, or from external Violence.

XXV. *The Pejjary.* The green Herb made into a Peffary with Wooll, and put up the *Vagina Uteri*, it provokes the Terms, eases the pains of the Mother, relieves Vapors and Hyfterick Fits, and if it is near the time of Travel, hastens and facilitates the Birth.

XXVI. *The Cataplasm.* It is made of the green Herb; with Lard, Crumbs of Bread, or Pouder of Bay-berrfes: being applied to any part pained with the Gout, it eases the Pains, abates the Tumor or Swelling, and discharges or draws forth the Humors. It must be continued Morning and Evening for some considerable time, by which means it is laid to perfect those Cures. Being applied upon places black and blew, or yellow, or otherwise discolored, it takes away the ill color, and cleanses the skin.

CHAP. cv.

CALAMINT, Wild.

I. *THE Names. It is called in *Greek*^*
 . X *Eyelet* * In *Latin*, *Calamintha agrestis*: and in *English*, Wild Calamint.

II. *The Kinds.* We shall treat here of three several Kinds ofk: 1. *Calamint ha arvensis verticillata*, *Jive Aquatica Lobellij*, Field Calamint with wharled Coronets. 2. *Calamintha altera odore ?ulegiu joltismaculofis*; Calamint having the Pennyroyal smell, and with Spotted Leaves. 3. *Calamintha minor incana*. The lesser hoary Calamint.

III. *The Description.* The *ML of thefe has a small root, abiding long, and not perishing after Seed time: from which Root come forth several square bo*™ *Stalks full of Joints, and twomail, and almost round hoary Leaves Jet thereat, up to the tops, something like to Verinyroyal leaves, of a brisk, sharp, and quick Scent, yet Sweet withal, like unto Pennyroyal. Towards the Tops of the Stalks and Branches there stand, with the Leaves, many purple flowers, several being Jet together, in a kind of Whorle or Coronet -, after which comes small blackish Seed.*

IV. *The second or Spotted Calamint, differs riot much from the Common Calamint in the former Chap* er, but that it grows nothing near so great nor high, it hat Jottare, hard, hoary Stalks, and hoary leaves thereon like it; but spotted here and there, of a very jirong Scent like unto Vennyroyal. The lowers grow in the same manner at the Common Calamint*

Calamint in Cap. 104. Sect. 4. but fmaier, and of a pale purplish color; having much like small blackish seeds

V. The third, or Lesser hoary Calamint, hat a fibrous Root like the other Sy. and not perishing yearly, from which spring up mail, low, and slender hoary Stalks, not above a foot high, on which, at every Joint, are set two Leaves, as in the other Kinds, but mailer, and more hoary, yea fmaier than the leafy Bush Basil. The Flowers are very small, but like the last described, and of a less heady smell, with like Seed also, but something lesser.

VI. The Places. The first grows in many places or England noth. in plowed Grounds, and moist Meadows. The second, Pena lays he found on certain Hills in Lombardy; and in several places of our own Land, but not always spotted*: I have found it in several places of South Carolina. The third and last is not common with us, but only nourished up in Gardens: It grows in Candia, from whence the Seed came first to Camerarius.

VII. The Times. They Flower in June and July, and their Seed is ripe soon after.

VIII. As to their Qualities, Specification, preparations, Virtues and Uses, they are exactly the same with those in the former Chapter, and therefore to those I refer you.

CHAP. CVL

CALTROPS, Land

1. THE Names, they are called in Greek Telr... In Latin, Tribulus: In English, Calthrope. The Arabians call this Plant Hafach, and Haferk, the Spaniard, Abrolas and the French, Saligot.

XL The Kinds. It is twofold, first of the Land called in Greek, T... in Latin, Tribu-

III. The Description. Land Caltrop has a Root which is white, grows downwards, and has many Fibres or Strings. From this Root rise up several hard, small, long Branches, full of Joints, spread abroad upon the ground, which are furnished with

several small Leaves, on both sides the said Rib, after the manner of Orobus or Vwche. At the top of these Branches, there are several small flowers, consisting of five small Leaves, like the Flowers of Tormentil. These being past, there comes forth little, rough, prickly heads, full of Trickleles, and bovine...

England, he found it growing amongst Rubbish Building, and by Walls, and the Ruins of

of Inflammations and Apoplems.

and (tops the Flux of Humors-, and being Iran tram two ounces to four, it breaks or walks ill Srone in the Reins, expelling Sand, Gravel, an Tarrarous Humors ; and flops all forts of Fluxes o the Bowels.

X. *The Effenee*. Ir has all the Emie Virtues, an the more pieplant Medicine to take. It cures for Eyes, being dropr into them, and abating the In flimmarion, takes avwy the Blood-Jhot. If it i drank to rwo or rthree ounces in Wine, it prevail againft the poillbn of the Viper, and the bitings o other Venomous Bealts.

XI. *The Decotton*. It has the Virtuesef thejuic and Effence, but not all OUE fo powerful : It tmj ferve as a good Vehicle ro convey the Pouder of th Root in.

XII. *The Voider of the Root*. It; ftops Fluxes o the Befly, and binds it: given to rwo drams, it i good againft the biting of Vipers; confumes Nodes and Kernels in the Neck, or other Parts, and in good mcaiiire ftreghthens the Stomach.

XIII. *The Cvilyritim*. It is made of the Juice o Effence nude into a thin Syrup with Honey. Thi put into the Eye three or four rimes a day, {tops fluxions of Humors into the Part, cools and take away the Inflammation, and heals Sores or Ulcer therein.

XIV. *The Cataplafm of the heaves*- It is good againlt a hot Gout, rpercuities the Hux of Humors hinders Apolterm, and diiculles Swellings in the Legs, or other parts of the Body.

XV. *The Letion*- Ir is made of the Decoftion in Wine, in a quart of which, Honey three ounces and Roch Allum haif an ounce, is diflblved. It j made to heal corrupt Sores and Ulcers of rheMouth Throat, and Gums, and to cleanie Fiflula's, as alft Apoltens newly broke, or opened, by inje&ing i with a Syringe.

XVI. *The Seed or fruit*. Ir is Alexipharmick Galen and Pliny fay, that the Tbrddaxs, who dwell near the River Strmon, lived themfelvis of thi Fruit or Kernels, making them into a Tweet and tine kind of Bread, which fmerling bound up the Ikilly : And that with the Herb they fed their Hod b But this making Bread of theKernels is affirmed by iome, to be only meant of the Fruit of the *Water Caltrop*, following.

vibicb rifng jrcta the bottom of the Water, mount above the fame ; at the top of each of which^ there are broad^ ami wore than half round Leaves, in feme places Spotted on the under Jide^ and dented about the Edges. The FoatjialAi on which thefe Leaves fiand, arc [mailer at tfa loiter end next the Root, than they are at top of the Water next to the Leaves. Among **ibeft** leaves rife up fappy round Stalfo, no higher than the Leaver, bearing whitifh Flowers at the Teps. Aftarcyohkbeome ibicJL, hard, and Woody, ainwli roundheads, with three or four Jharp pricks or points flicking out, of the bignefs of Hajle Kuts; and blacki/h in fonie places : fome of them are as large ai great Walnuts, having a jx^eet white Kernel -mithin, which is not much unlike to a Chefnut. Tim Fruit, with its outward husk, or Shell, & hard, triangled^ Jbarp pointed and Prickly, in Jhape almojt like to thefe things called Gurrops, which in War they caff in the any of the Enemy, to annoy the bin of their Hmfes, and from whence this riant took its name. The Kernel h tajled almefl like a Chefnut, and are **ufuatljftlen** green : And bcin& dried, i are ground la poml^ ^ and fo ferve to make Bread of-

CHAP. CVII.

CAL TROP, Water.

TP *HE femes*. Ir is called in Greek *Trifolium* -L itu/f@-: in *Litm*, *Tributes aquaticus*, *Tri-f* • mart nut, and by *CWW* w, *Lacuflrij*. i in *Etj* *Water*, *aterCaltrop* ; *Saligot*, and *Water Nuts*.

11. 12^ iivrfr. There are two ibrts of *Water Ultrops*. i. The *GrentaeWater Caltrops*, i. The *Laffer Water Caltrop*: kx& of the *Laffer* there are alto rwo Kinds, *vie*. The former and the latter. The *Greater Water Caltrop*, is called in *Latin*, *Tribulus Aquatints major*: *Tribulus Aquatilis*, and *Ca&anet aquatiles*. The lefter forts are called by *Oufits*, *Tribulus aquatieu? minor*; and diftinguifhed by him, the former of which he calls, *tribului aquaticut minor prior*; and the latter, *Tribulus aqmti-tiets minor alter*.

HI. The Defcription. *Vie Greater Water Caltrop hat a Root which grows Jbmeuihat feffi *TM IIIII of Joints^ with a Tuft of H.iirs or V'bres at each of them, • from the W ej this Root tying undsr ti'ater, rife up feveral ktig /lender Yortjids,*

IV. *The former lefler Caltrop, the whole Plant, is commonly covered over with Water, having very long^ /tender, creeping Roots, from white jeverat Parts or Joints come forth divers Tufts <>f fmall fibres or Strings, which take hold of the Mud. From ibis Root, at the lower Jvtns thereof cot;/ forth thin, flat, knotty Stalks, of a reddijh color, hree^fiur, or five Feet long, or longer, according id Jx depth of the Water in which it grots -, which being dry, are pliant, ani /lex/tile, and fit j or many occafions. They are divided towards the Top, into many Parts or Branches, carrying fingle Leaves at he lower Joints, on both fides, being about two nclyes long, and half an Inch broai, thin, and ahiofl tranf-went, or as it were fhinin^ - fo waved, wrinkled, f crumpled on the Edges, that they feem to be torn, ndfor the mofi part of a redd'tjh green color. The hoot-alks are fometchat long and thick, and rife up front nong riwje Leaves, which always grmx> two, one op- ojtite again/I another, in a contrary manner t<. I*

or diffblves Gritty Stones in the Reins or Bladder. Dofe fixty or eighty drops, in Ale, Beer, or Wine.

XIX. *The Oily Tinture.* This is more excellent, if there is any Wound or Ulcer in the Reins or Bladder -, for many of thofe parts being Nervous \$ this Homogene and Oily Body wonderfully comforts the Parts, gently cleanfes them of all Foreign, Tartarous, Vifcous, Clammy or Sharp Humors, palliates the Pain, and in fome fhort time heals them. If there be no Wound or Ulcer, but only Obftructions, or a weaknefs in the Reins and Back, it effe&ually opens them, fmoothly cleanfes them, and makes the Patient Pifs free and eafie, and withal fo Itrengthens the Back, and eafes the Pains thereof, as if there had never been any fuch Weaknefs, or Difaffleation there. Dofe twenty drops in a Glafs of Wine.

XX. *The Saline Tinture.* Being bathed upon any parts affe&ed with Pimples, Scurf, Morpew, Dandriff, or other like Preternatural Eruptions of the Skin, it cleanfes it, and takes them away. I was informed by a Gentlewoman who had ufed it for fome time, that it had taken away Tawnefs, Sunburnings, and Freckles, and cleared the Skin to admiration. Inwardly it is given to one dram in White Wine againft Stone, Gravel, Sand, and other Obftructions of the Reins.

XXI It is reported, that in former times the young Shoots, and tender Stalks, before they become prickly, were pickled up, to be eaten as a Sawce for Meat : and that they were wonderfully commended againft a ltinking Breath, and to take away the fmell of Wine in fuch who had drunk too much-

CHAP. CX,

CAMPIONS, Garden.

I. *T* HE Names. They are called in Greek, by X *Diofcorides* *and *Thepphrajus*, AU^KK (from *Lucerna*,) and 'EAAJ^O^ *quafluacemifju** *niculum*, for that in former times they ufd the Leaves of *Campions* in their Lamps, to burn inftead of Weiks : they alfo called it 'A8aW@-, id eft, /'^-*mortalis, quod diutius Venuftatemjuam retinet* : In Latin, *Lychnis, Lychnis Coronaria, Lychnis Saliva & Rofa Graca* : In Enghfh, *Campions*, and *Rofe tampions*.

It *The Minds*. They are twofold, i. AV'XVK <n- *Lychnis Coronaria*^ *Lychnis Sativa vel Uonenjis*, Garden *Campions*, of which in this Chapter. 2. *Lychnis Syvejlris*, Wild *Campions*, of which in the next Chapter. The Garden Kind, are, L^T^8L^ , 2. Double The Sin le are, L, chms

Lychnis rubra Jimp/ex, The Tingle red Rofe Cam- *Lychnis coronaria abafimplex*, The fingle white Rofe *Campion*. 3. *Lychnis coronana albe*^ *maculata*, & non *maeulatafimp/ex*. The bluth Rofe *Campion*, spotted and not *Lychnis coronana rubra* *Campion*.

III. The Defcnptions. *The Single red Rofe Cam- pion*, has a Root *Imall, long, and woody, with many fibres annexed unto it, and oft times fhoots forth* *li^w^ an* *fometimes alfo dies and perifhes*. *On the lop of this Root, there are divers thick, hoary, or z^ooly, long, green Leaves, abiding green all the Winter* *from among which in the end of tlye Spring, or beginning of Summer, there fhoots forth two or three hard; round, woolly Stalks, withfome Joints there-*

on, and. at every Joint twofuch like hoary green Leaves, a* thofe below, but fmaller, diverfly branch- ed at the Top, having one flower upon eachfeveral long Footstalk, confifting of Jive Leaves, fome what broad and round pointed, of a perfeff Red, Crwifon color, ftanding out of a hard, long, round husk, ridged and crefted in four or jive places : After the blow- ers are fallen, there come up round hard heads, in which is containedfmall blackifh Seed.

IV. *The fecond.* Single white Campion, is in all things a* Roots, Leaves^ Stalks, and flowers, -like to the former, javing only the color oj the Flowers, that being of a Red Crimfon color, this of a pure White.

V. *The third fort of Single Campions are like unto the former alsh, these other forts having no other difference to diftinguifh them by, but the colors of the YloiKiers, which arc of a pale or bleak whitijh blufh color, chiefly about the brims or edges of the heaves, or as if a very little Red wo* mixed with a great deal of White, the middle of the Flower being more White ; the one being /potted all over the Flower, with fmall fpts and fireaks, the other not having any fpot at all.*

VI. *Double red Rofe Campion,* is in all refpels like unto the Single red Rofe Campion, excepting that this bears Double Flowers, con^ fiftg of two or three Rows or Courfes of Leaves at moft, not Jo large as the Single. The whole Plant is more tender, and therefore more apt to die or perifh than the Single is.

VII. *The Places.* They are only nurs'd up with us in Gardens: both Single and Double are only by Nature not Art : and the Double ones have been found fo Wild: for I could never obferve that any Art or Induftry of Man could ever fo alter the properties of Nature, tho' by nev'sr fo many repetitions of Tranfplantations, and Obfervation of the Phafes of the Moon -, as to make any Flower Single by Nature, to become Double, tho' many Men have affirmed the fame •, and of this Opinion was Parkinson, who fays, that whatfoever has been found Wild to be Double, Nature it felt, and not Art, fo produced it, and fo was brought into Gardens, where they are much encreafed by flipping, and parting the Root, becaufe they give no Seed.

VIII. *The Times.* They do all of them flower in the Summer Months, through May, June and July, to the end of Auguf.

IX. *The Qualities.* The Seed, which is chiefly ufed, is hot and dry in the fecond Degree. It is Vulnerary, Alterative, and Alexipharmick.

X. *The Specification.* It is peculiar againft the Poifon of Scorpions.

XI. *The Preparations.* There are but few Preparations of this Plant •, the chief things taken from it are the Xeaf; and the Seed : of which there are ufed, i. *The Green Leaf** 2. *The Pouder of the Seed.* 3. *The Spirituous TinSure.* 4. *The Actd Tinture.*

The Virtues.

XII. *The Green Leaves.* Being applied whole, or beaten in a Mortar into a Cataplafm, with a little Hogs Lard and Turpentine, and applied to any old or foul Ulcers in the Legs, Arms, or other parts -, it does cleanfe and heal them.

XIII. *The Pouder of the Seed.* Galen affirms it to be hot and dry in the fecond or third Degree. And Diofcorides fays, that being drunk in Wine, it helps thofe who arettungby a Scorpion, and is alfo thought to be good againft the malignity or the Plague or Pefiience. Dole one dram at a time, Morning and Evening.

XIV. *The Spirituous Tinture.* It has the former Virtues, but more powerful againft the Plague or Pefiience, the Spotted Fever, bitings of Serpents, Mad Dogs or other Venomous Creatures. Dole half a fpoonful, or a fpoonful, in a Glais of Wine, Morning and Evening.

XV. *The Acid Imtfure.* It has the Virtues or the former, is more Stomack, and more powerfully refifts the Malignity or Poifon of the Plague, it deftroys that, and the Fever together. Dole fixty or eighty drops, or more, in generous Canary.

CHAP. CXL

Of CAMPIONS Wild.

I. *The Names.* They are called in Greek *I*%?** of «* » ayeut : In Latin, *Lychnis Sylvejiris* • and in Englifh, Wild Campions.

II. *The Kinds.* They are manifold, as, I. Single. 2. Double. The Single are, i. *Lychnis Sylvejritii flore albo Jimp/ex,* Wild Campions with a white Flower. 2. *Lychnis Sylvefins flore rubro fimplex,* Wild Campions with a red Flower. 3. *lychnis Sylvejiris flore rubro minor fimplex,* The leffer red Campion with a red Flower. 4. *Lychnis Sylvefins vel Segetum Vaccariarubra Ma,* Corn dampion. i. *Lychnis Marma alba Vrubra, ?teSKO*m^non* " 6 " in " il feff " arve " f* TM nor Anglic*. The Englifh finall Wild Campion with a white Flower. 7. *Lychnis plumana SylveRris fimplex,* The feathered Wild Campion.

III. *The Double Wild Campions, are,* 1. *Lychnis plumana Sylvefins multipk^Armrana pritenfis flore plena,* The feathered Wild Campion Double. 2. *Lychnis agreffis multiflora,* of Label, *Ocymoides flore plena.* oi Camerarius. • *Lychnis Sylvefins purpurea multiplex,* of Gerard : *blare plene rubro,* of Parkinson, Red Batchelors Buttons. 3- *Lychnis Sylvefins multiflora,* by pem and Label; *Ocymufria,* or *labemontanus* • *Lychnis Sylvefins alba multiflora* • *Flore alba plena,* by Parkinson; White Batchelors Buttons. 4- *Lychnis agreffis abortivum multiplici flore viridi,* Batchelors Buttons with green Flowers.

IV. The Descriptions. The first of the Single Wild Campions has a Root white and long, bearing forth divers Branches in the ground, and perishing after Seed time: from whence come forth many long and Somewhat broad, dark, green Leaves, lying upon the ground, with Several Ribs therein, not much unlike to Rib-wort Plantane, but somewhat hairy, broader but not so long. The Stalks are hairy, and rise up in the middle of them, three or four feet high, and onetime's more, and bear forth large white Joints at Several places thereon, and two such like leaves thereat up to the Top. Yea these hairy Stalks come forth divers Branches also at their various Joints, all which bear on various stalks white Flowers at their Several Tops, consisting of broad pointed Leaves, every one cut in on the end unto the middle, making them to look like two apiece: they make something like the green firpe, hairy Husk or Case, large and round according to the foot of the stalk. The Seed is found and gathered in the bare beads which come up afterwards.

Campion Wild Single flower.

V. The second Single Wild Campion has a Root like the former which perishes also after the same manner in the former, but its Leaves are not so broad, and its Bed, are somewhat greater, rounder and more firm or moaty in banilni. The flowers are of the same form and bigness as the former, of a pale, in other: of a bright red color, which makes the jagged Leaves seem to be more in number than the other. The Seed is like the former and gathered in the same manner.

VI. The third Single Red Wild Campion, is the lesser, has a Root like the former, which perishes after Seedtime, the leaves are like the former, but smaller and yet very much branched, and replenished with darker green Leaves. The flowers are red, and are small, and not so much cut or dented in at the ends. The Husks, and Seeds are like the former, every way less.

Common Campion

English-Sea-Campion

VII. The fair or Common Campion of the Gardens, has a Root, long, white, and woody with several branches springing from it, (as the former) rises up for the most part but one round Stalk, spreads itself every way into several Branches, having two long leaves at the bottom, being broad at the bottom and narrow at the top, the Stalk and Branches not much upright through the middle, rising in a straight line, at the tops of the stems, find the leaves, consisting of four Leaves.

pieces of a pale red color >, which being paji away, come jorb Skinny Husks, containing finally rounds bard, black Seed. This Plant for the beauty of its Mowers, is brought into, and nurfed up in our Gardens.

VIII. The fifth, or Sea Campion White. It has a long slender Root, which abides many Tears, from whence springs up several weak, flexible Branches, lying all about upon the ground, (which Branches are much divided into many other jmaier ones) two or three feet long -, thick Jet with small, long, fat, tind whitijh green Leaves. At the top of every Branch stands one short, thick, whitijh green Husk, parted or cut in at top *, out of which springs forth a small long necked white flower, not much unlike to that of the spat ling Poppy, and as white, composed of Jive small, round pointed Leaves, with some black-ijh threads in the middle: which being paffed away,, there comes forth Husks like those of the other Wild Campions, containing within them small brown Seeds

IX. The Red flowerd Sea Campion differs not from the former, neither in its Root, Stalks, Branches, Leaves, Flowers, Husks, nor Seed, nor yet in the manner of growing, excepting only in the color of the flower, this being of a fine p leaf ant Red, whereas the former is White: fo that some have thought it to be one and the same Species, Nature only sporting it self in the variety or color of the Flozver: this Plant Herborijls call in Latin, Lychnis Marina iore rubello, Red flower*d Sea Campion.

X. The sixth, or English small white Field Campion, has a Root which is small and white, and perishes every Tear ^ from whence spring forth Leaves, which are small and hairy, not much unlike to the small Moufe Ear: and from among, which springs forth a slender small Stalk, some times but one, which is Jingle of it Jelf; and sometimes mwy, not exceeding a foot high * At every ^ joint two Leaves are Jet together, smallkr tbm theft below, and Jotted with vfoite spots >, sh?n the bosom whereof, viz. between them atnd the Stdk, come forth Awo other Leaves, much fmatter than they, without any fenfible Tajie. The flcifaers are Jmall and. whiur^hke unto the other Wild Campions. After which come small long Heads, with small greyfb Seed in them. '~. >

XL hffjev^ntb, or Single Feathered Wild 6am- pton ban a. Root very fibrous, or full of smattfirings, from whence springs forth a Stalk r, as alfdj Leaves, somewhat like the jordinars Whife-WUD Campion, but not Jo large, or rather rejemhling the Leaves of Sweet Williattis> but that they gfovi not Jo clofe, nor fo mmy together. b Tbt Stalks "Skioe finfiller heaves fit thq Joints, tban those below, and > branched at the Top * m which several Tpps grow mmy i ale, but bright red Flowers, jagged or cut * P on the edges, like the Fmttfered Fink, for which thing f&ke, feme have tafafa it to be a kind, and fame for a kind of Wild William^ but mtvmh^mA^ all this, it is but a Wild Campion, 'as may easily be observed from fever al other parts of the Plajpti At ha* a Husk which bears the Flower, like flc^QappjiQns, and also round greyish Seed.

Double Wild Campions/

XIII. The second, or Red Batchelors Buttons has a thick large Root, white and long, with many Branches and hres springing from it, from whence come up many rough broad Leaves, somewhat woolly and hoary, among which rise up long soft and hairy Stalks, branched into many Arms, two or three Feet high, or more, set with the like Leaves, but less: The Leaves grow at the Joints, two opposite one to another, up to the top *, and from these Joints other Branches spring forth, at top of every one of which Flowers grow compacted of a multitude of Leaves and of a red color. These Flowers are very double composed of a great many red Leaves, very thickly pack* or crowd together, and commonly set in a short or broken Husk, whereby the Flower's seem to stand on one side, but are not jagged, or cut in on the top, as the flowers of other Campions are but together in one - It is like in all its parts % the Single Wild Campion as to its manner of growing, excepting that it is every ways less, and its flowers are Red and very Double.

XIV. The third, or White Double Primrose... names which now they bear.

XV. The... names which now they bear.

XV. *The fourth, or Green Batchelors Buttons, have no difference from the two former in the Roots, Stalks, Branches^ Leaves nor Seed, faving only in the Flowers, which in this are of a Greenifh color - andfometimes through the midft of them they fend up Stalks, bearing alfo Tufts of the like Double Flowers.*

XVI. *The P/aces.* Of thefe, the three firft Single forts grow for the moft part in our Countrey Fields, by Hedge and Ditch fidfis in many parts of *England*. The fourth grows in many Corn Fields in *Germany*, but with us is nourifht up in *Gardens*. The fifth, or *White and Red Sea Campions* grow by *Uurft* Caftle near the Ifle of *Wight*, and in the faid Me in many places by the Sea fide : They grow alfo by the Sea fide in *Lancashire* at a place Called *Lytham*, five Miles from *Wigan*, in which place grows that with Red Flowers alfo. *Johnfon* found it alfo growing in great plenty in the Marfh Grounds in *Thanet*, which lye direftly oppofite to the Town of *Sandwich* : The Red has been found about a Mile from *Southampton*, and both of them chiefly in the Southern parts of *England*, on the moift Stony Banks by the Sea fide. The fixth grows in feveral grounds by *Colcheftër*, and in a Field called the^VA/fc^behind the Houfe of Sir *Thomas Luc/s* near *Colchefter*. The feventh is only nourifht up in *Gardens*.

XVII. Of the *Double Wild Campions*, the firft grows here only in *Gardens*. The fecond and third grow Wild in feveral places, but with us are chiefly nurfed up in *Gardens*, for the beauty of their Flowers fake. The fourth alfo grows in *Gardens*.

XVIII. *The Times.* They all Flower in the Summer Months of *June, July* and *Auguft*, fome earlier than others, fome later, and their Seed is ripe foon after.

XIX. *The Qualities.* They are all of them hot and dry in the fecond Degree : Afrtringent and Alterative x and much of the nature of the Garden Kinds.

XX. *The Specification.* They have been found good to flop the Fluxions of Blood and Humors.

XXI. *The Preparations.* The lame Preparations may be made of them which we have faid to be made of the Garden Kinds in the former Chapter.

The Virtues.

XXII. Authors have faid little of their Virtues, nor have we much to fay of them by Experience -, the general ufe is for the beauty of the Garden, the Flowers being very beautiful in their Seafons. *Parkinfon* fays, that being Drying and Afrtringent, the feveral Preparations of them may be profitably applied to ftay the Fluxes of Blood and Humors in any part, and thereby alfo conduce to the healing of old and moift Running Sores and Ulcers.

XXIII. *Gerard* fays, the *SeettofWild Campions* being given to two drams (in powder) and fo druiak, that it purges Choler by 'Stool, and is good for them that are Bitten or Stung by any Venomous Creature.

CHAR CXIL
Of CATCH-FLIE.

THE MOUNTAIN CATCH-FLIE grows by the
side of the Mountains, and is very common
in the Mountains of *Germany*, and in
the Mountains of *France*, and in the
Mountains of *Italy*, and in the
Mountains of *Spain*, and in the
Mountains of *Portugal*, and in the
Mountains of *England*, and in the
Mountains of *Wales*, and in the
Mountains of *Scotland*, and in the
Mountains of *Ireland*.

phralli, Ar menus fios Stuart us Dodonèi, hen rubrum Monfpelienfium : In *EngUfio, Catch-füe*, and *Lime-wort*: alfo by *Gerard, Wild Williams*.

II. *The Kinds.* *Parkinfon* will have this Plañt to be of the Kinds of *Wild Lychnis*, or *Wild Campion* -, but *Gerard* fays, they are of the Stock of *Wild Pinks* and *Gilliflowers*, and fo calls them alfo with the other names *Wild Williams*. Thofe which we fhall handle in this Work are fuch as are ufual in *England*, viz. 1. *Mufcipula Lobelij, Lychnis Sylveftris prima Clufij, Jive Ben-rubrum Monfpelienfium, The French Catch-füe.* 2. *Lychnis Sylveftris latifolia Clufij, Mufcipula Cretica Auricute Trififacie, Catch-füe of Ondia.* 3. *Mufcipula five Vifcaria Lobelij, Vifcago Cavierarij, Lychnis Sylvefins tertia Clufij, Gerard's firft Catch-füe, or Lrñe-wort.* 4. *Mufcipula anguftijoliã, Lychnis Sylveftris quartd Clufij, Narrow-leav'd, or German Catch-füe.*

III. *The Defcriptions.* *The firft has a fmall Rodij fome what Fibrous, which penshes after it has givcri Seed, and afterwards rifes again of its own Seed, if it is fuffered to fhed it felf; If it Jheds it felf, it fprings up in the latter end of the Year for the moft part, or elje in the Spring, with five or fixd^{all} Leaves, very like unto the Leaves of Pinks, and of the fame Willow, or whitifh green color, but a little broader and jhorier. When it begins tojhoot up jor Flower, it bears fmaller Leaves on the Clammy or Vifcous Stalks, which Vifcofity is ftrong enough to hold any fmall thing or füe which lights on it. I heje Leaves are broad at bottom, compffing the Stalks and Branches, being fet two at a Joint, one againjt another. The tops of the Stalks are diver fly branch- ed into feveral parts, every Branch having diver* fmall red Flowers, not notched^ but fsmooth, ftandwg out of fmall, long, round; friipt Husks, which after the Flozvers are paf, contain fmall, greyif? Seed. (TrifjParkinfoi) accounts of the Species of Campions; being a pretty thing to furniff) and deck out a Gar- den,*

fed with a white Pith, and not hollow, near a Man's height, with Joints and Leaves on them, from the lower part upwards a good way, but bare and naked from thence to the top, where they have small, long, and round heads, shewing forth at Jirji some yellowish Flowers, which being past, the Torch-head or Spike grows greater, and conijils wholly of a Downy substance, of a blackish brown, and sometimes of a reddish brown color on the outside, and whitish within somewhat solid of weighty, which yet is in time blown away with the Wind.

IV. The second differs nothing from the former, but in this, that it grows not so high, nor great, the heads being also less than them of the former*

V. The third differs not from the second, but in being smaller than it, in both Leaf and Stalk, which are more hard and rough; and in the head or top, which in some places bears a smaller spike above, the base being greater, with a small distance between them, and a small Leaf at bottom of it.

VI. The 1st laces. They grow in Pools and (landing Waters, and sometimes in running Streams, as also in the middle of watry Ditches or Ponds, and by their Banks and Sides in many places of this Kingdom. Gerard says, he found the smaller sort growing in Ditches and Marshy Grounds in the Me of Shepey, going from Sberland-House to feverham. I have also found them growing in many places in the Fens, and in moist and Standing Waters in fenny Grounds in Cambridge-Shire, and the Isle of Ely. And in the South part of Carolina, at the head of Stono River, in the Marshes near the New Cut leading into Wa&wadmalm River, which are overflowed with every Tide, I have found them growing plentifully.

VII. The Times. They flower in June and July, and their Heads, Torches or Maces, are ripe in August; but the Down hardly flies away till the end of August; or Month of September.

VIII. The Qualities. They are cold and dry in the first Degree: Astringent, and very Styptic, Alterative, and Analeptic.

IX^{*} The Specification. The Down is a Specifick to stop the bleeding of External Wounds.

X. The Preparations. You may have, 1. The Down* 2. A Powder of it. 3. A Cataplasim.

The Virtuef.

XI. The Down it self Applied dry to Weeding Wounds, it presently stops their bleeding: applied to running ulcerated Kibed Heels, it quickly cures them; so also used to moist Sores*, and running Ulcers, it dries almost to a Miracle, incarnates and heals. In the fen Countries it is sometimes used to make Beds of, for poor People to lye on. And mixed with Butter, as a Bait for Rats and Mice, it kills them by choaking them.

XII. The Powder of the Down. Matthiolus says, it is good to help the burstenness or Ruptures of Children, wherein the Intestines fall down into the Cods. This others contest against, as being dangerous to be taken inwardly, as being rather fit to strangle than help them, because it choaks Rats and Mice. But this latter opinion I think to be an Error, for as it is used to choak and kill Rats and Mice, it is used Whole, and not in the Powder, whereas, if it is reduced to a very subtil Powder, as Matthiolus orders it, it can no ways be able to effect any such thing. This Powder may be given, says Gerard, mixed with Powder of Be tony, Roots of Gladiol, and Leaves of Horsetongue. This is to be mixed with the Yolk of an Egg, and so eaten, it is (says he) a most perfect Remedy against Ruptures in Children, and must be Administered every Day falling, for thirty Days together, one dram at a time: it not only helps Children and Striplings, but grown Men also, if in time of their Cure they use convenient Ligatures or Truffings, and fit proper Emplasters upon the grieved place, according to Art, thm he. For my part I have had no Experience hereof, and therefore can say but little to it, having, I confess, not much Faith in the Prescription, yet think it not of such a dangerous consequence, as some would have it* nor have I any great opinion of any Internals, given for this kind of Rupture, for that those Medicaments passing through the Intestines, can never come actual to the part where the Wound is, and so do little in order to the Cure.

XIII. The

XIII. The Cmapldjm. Made into a Cataplaib withi Hogs Laid, li is laid to heal Burnings & Scoldings with Fire or Water.

XIV. The Leaves are unuww kept to make fine fort of Marts of, and other like punSofb.

Skin : and being taken inwardly to one dram, it provokes Urine, and prevails against the Dropfie.

XVI. The Spirit. It comforts the Head, Stomach, Heart and Womb, refills Poifon, and the Plague, expels Wind, and gives ease in Pains and Stitches of the Side. Dose one Spoonful.

XVII. The fixed Salt. It provokes Urine powerfully, and expels Sand, Gravel, and other Tartarous matter from the Reins, Ureters and Bladder : it powerfully opens and cleanses, and given from a scruple to half a dram, or more, in a Spoonful of Juice of Limons, it Hops Vomiting, and admirably strengchens the Stomach.

XVIII. The green Leaves. diofcorides and Galen both say, that the Leaves being applied with Honey (I suppose in form of a Cataplasme) to running Sores or Ulcers, do cleanse them.

CHAP- CXL

d/CARROfs^f Candy,

L 'T * HE Names. It is called in Greek, Aa*... JL In Arabick, Dauco, and Giezar : In Latin also Daucus, Daucum, and Daucium, and Daucus Creticus : In hngliffh, Daucus, and Dauke, and Candy Carrots..

II. The Kinds. Parkin/on makes sixteen kinds of Daucus's, many of which are nothing to our purpose : Those which we are chiefly to treat of in this Chapter, are the Candy or Cretick Kinds, which Diofcorides makes to be three, viz. i. Daucus Creticus verus Diofcoridk, The true Daucus of Candy, 2. Daucus Selinoides, The Parsley Leav'd Daucus. 3. Daucus Conandri foliis, Daucus tertius Diofcoridis Bella, Coriander Leav'd Daucus, or Bellus his third Daucus of Diofcorides. 4. To these we think good to add a second kind of the Daucus Selinoides, which is Daucus Selinoides maxima^ The greateft Pailley Leav'd Daucus.

III. The Descriptions. The True Daucus ha* c, Root fmall, long, and white (lefferfays Gerard, that the Root ofa Parsnip, which is of a fragrant smell and almost a* quick and, (harp in Tafie as the Seed but voill not abide our Winters here in England, with all the skill we tan use, fo that we are fond tofow

anew eveiy Tear. From this Root rife up severall Stalks of Winged Leaves, a* finely cut as Fennel, but fhorter, fet at di fiances one againft another, of whitifh or hoary color, fuelling a littlefwet. From among which rife up divers flender Branwes or Stalks a Foot high, bearing at their Tops fmall Urnbles of white Flowers, and after them fmall hoary rayifh Seed, fomewhat long and round, and of a Tbarp or quick Smell and Tafte.

IV. The fecond Daucus has a Root fomewhat great, thick, long and white, with a bufh of hairs at the Head, as many other Umbeliferous Plants have, and of a hot andsharp tafte, as the Seed alfo is -, from whence rife up large Stalks of fomewhat broad pale green Leaves, bigger than Parsley, and with divisions of the fame fafhion and manner, next the ground: And alfo large Stalks almost two feet high, with the like Leaves at the Joints, but fhorter ; and at the tops fpokie rundies of white Flowers, which turn into long crested Seed, bigger than ordinary Fennel Seed, and of a yellow brown color.

V. The third Daucus of Diofcorides, according to Honorius Belks his account, has a Root great, thick and fhort, ferifhing yearly. The whole Plant is Aromatical, and both Root and Leaf are eaten by the Cretians as a common Sallet Herb. From this Root spring severall Stalks of fine cut Leaves, not much unlike to the Leaves of Coriander, but leffer and thicker. The Stalks are near two Feet high, xvith great andfwollen Joints, (and therefore called by fome Sefeli nodofom, knotted Hartwort, but by Bauhinus, Daucus Criticus nodofus Umbella lutea) and fmaller heaves at them, at the tops wherof grow yellow Umbles of Flowers (but white with us in Giggland) which being paf away, there comes much Seed larger than that of Fennel.

VI. The fourth Daucus, which is the large or largeft kind of the Parsley Leav'd, has a Root fometimes as large as ones Arm, or being young, of the bignefs of ones Thumb, parted into severall branches at the bottom, and covered with a rugged black bark of a Vifcous tafte at the fir ft, but sharp afterwards, fo CM to caufe fplitting, having at the top many hairy Heads, from whence come severall very large, and great Winged Leaves, much divided and dented about the edges, muchwhat like the laft, but bigger and of a pale or faint green color, a little fhining on the up'r fide, and of a greyifh afh-color underneath. Among these Leaves rife up, a large, great, crested Stalk, of a Fingers thicknefs, with fome Joints and Leaves at the Joints, and with Branches rll be tween them : at the tops whereof ft and fmall Vmbles of whitifh Flowers, and fomewhat like Seed to the (econd kind, but larger.

VII The Places. Candia is the Natural place of then Growth, but with us in England they are only nounted up in Gardens. The firft hTM i»~ iL y* the Hills and Rocks of Jura whence it has been tranfportinn^ Tnev^ from more Northern Regions

and iy^fr, hii^he Seed ^ R^ are hot KeteV^rLln^ Herb tarody ex* lei Dow^fni^ ^egree Of heat and therefore r** Sw r V^ are Aperitive, Attiaftive, Di- ceptive^ Camanative, Diuretick, Cephalick, Stoma- ck^ N^ Phntick, Hyfterick, Lithonriptick^ Altm- ^ ^ P^ nfiick and Spermatogenetick. A. The Specification. It is chiefly dedicated to V^ r y p r y Stone and fito PPage of Urine.

M. ibt Preparations. YQU may make hereof, i. A

1. [^] *liquid Juice of the Herb and Root.* 2. *An Effence of the fame.* 3. *A Pouder of the Seed.* 4. *An Infufwn of the Seed.* 5. *A Decottion of Seed or Root, or both.* 6. *A Cataplafm of the Herb and Root.* 7. *A Difilled Water.* 8. *A Spintuous Tinture.* 9. *An Acid TinSure.* 10. *An Oily Tinture.* 11. *A Saline Tin ffure.* 12. *A Spirit.* 13. *A difilled Oil.* 14. *Poteftates or Powers.* 15. *Ar Elixir.* 16. *A Salt.*

Two Virtues.

XII. *The liquid Juice of the Herb and Root.* It [^] *expels the Strangury, provokes Urine, and the Terms,* ² *expels both Birth and After-birth, and is good for thofe who have been bitten by the Phalangium, or any other Venomous Beaft. Dofe four fpoonfuls in Wine.*

XIII. *The Effence.* It has all the Virtues of the liquid Juice, and is ftronger, finer, and a much more noble Medicine: It prevails againft Vapors and Myfterick Fits, as alfo the malignity of the Plague, or Peftilence. Dofe one or two ounces in generous Wine, Morning and Night, or three or four times a Day, as the necellity or extremity may require.

XIV. *The Pouder of the Seed.* This (according to Authors) has that powerful heat in it, that it becomes a principal Medicine to help the Strangury, to eafe the pain, and remove all ftoppages of Urine. It provokes the Terms, taciHiates the Delivery, and brings away the Dead Child, and Afterbirth[^] and helps V apors and Hyftei ick Fits. Dofe one dram, to, one dram and half, in a Glafe of White Port Wine, Morning and Night, and in time of a Paroxyfm.

XV. *The Infufwn of the Seed in Wine.* It [^] *has all the Virtues of the Pouder, but I tear not full out fo effe&uaL Dofe hall a Pint, Morning, Noon, and Night.*

XVI. *The Decottion of Seed, or Root, or both.* It ought to be made in White Port Wine, and fo [^] *given to drink, two, three or four times a day, half Pint at a time: It has the Virtues both of the EP fence[^] and Pouder of the Seed [^] and a moft famous thing againft the Plague, the Patient being put to Bed, well covered, and fo made to Sweat upon it.*

XVII. *The Cataplafm.* The Herb, but more epecially the Roots made into a Cataplafm, by beating in a Mortar, and fo mixed with Hogs Lard, and applied, does eafe, difcufs, or affwage Tumors or Swellings in any park Made into a Mixture 'or Cataplafm with Honey, and applied to the Throat, it eafes an Inveterate Cough.

XVIII. *The Difilled Water.* It prevails againft [^] *Gravel⁵ Sand, Strangury, and all ftoppages Ql Urine, but is weak, in refpect to the Juice, Effence, and other more noble Preparations of the Want, and therefore is only nfed as a Vehicle to convey other Preparations of the fame in,*

A[^] *A. The Spiniaous Tinture.* It is an excellent thing againft the Plague or Peftilence, and againft all other maligni Fevers, as Purples, Spotted Fever, Meafles, Small Pox, and Fevers derived from the biting[?] of Serpents, as Vipers, Rattle Snakes, and others of like kind: It provokes Sweat gently, and defends the Heart after an admirable manner. Dofe two, three, or four drams ih the Difilled Water, or rather in Wine, or fome other fit Vehicle.

XX. *The Acid TinSure.* It has all the Virtues of the Spirituous Tin&ure, and if the Fever is very high or int&Lfg, is much the better Medicament⁵ beides the Acid, deftroys the Malignity much more powerfully. Dofe to one dram, or more, in the Difilk-r Water.

XXI. *The Oily Tinture,* hi an extremity, ot the Strangury this is the moft powerful Preparation, being given to thirty drops, or more, in a Glafe of White Port Wine: It is powerful to difcufs Gripping Pains, and Torments of the Bowels, to facilitate the Birth, and bring away the Dead Child: It eafes Convulfions, and heals Wounds in the Body or Bowels.

XXII. *The Saline Tin ffure.* It cleanfes the Reins and Urinary Paffages, being taken to one dram, of more, in White Wine [^], but heals not like the Oily Tin&ure. It digefts humors, and pOVokeS Urine; and the Terms in Women.

XXIII. *The Difilled Oil of the Seed.* It has all the Virtues of the Juice, Effence, Pouder of the Seed, Decottion, Spirituous, Acid, and Oily Tin&ures: and therefore may be given from eight drops to fixteenj being firft dropt into Sugar, and then mixed with the Difilled Water, or fome other fit Vehicle; It helps the Strangury upon the fpot, cleanfes the Reins of all Tartarous Matters, and all other the Urinary Parts, provokes the Terms, refills Vapors, and Hyfterick Fits, eafes the Cholick, produces the Birth, expels watry Humors in Dropfies, and refills the Poifon of Mad Dogs, or any other Venomous Creature [^], and curcs intolerable Pains of the Stomach proceeding from Cold, Weaknefs, and other like difaffe&ions.

XXIV. *The Poteftates or Powers.* They have all the Virtues of the Oil, and are alfo more fubtil and penetrating, and more pleafant to be taken, being more eafily mixed with Wine, or any other potable Liquor. Dofe from two to four drams.

XXV. *The Elixir.* This is yet more excellent, and noble than the Powers, being the Tinture of the Seed or Root extracted by the fublimity of the Poteftates [^], by which you have all the noble parts of the Plant concentrated in one Medicament: and fo has all the Virtues of the Juice, Effence, Pouder, Tintures, Oil, and Poteftates, in the higheft exaltation. Dofe one dram to two drams in a Glafe of Wine, Morning and Evening.

XXVI. *The fixed Salt.* It is ftrongly Diuretick* ftrengthens the Stomach, being given in the Acid Tinttiire, mixed with the Difilled Water, or fome other fit *Vehiculum.* Being taken for fome time in White Port Wine, it deftroys all Preternatural Acids, in what part of the Body foever, and diffolves the Stone, if it is of a gritty, friable, or brittle fubftance. The Dofe is from a fcruple to half a dram, or two fcruples, Morning and Evening.

CHAP - CXVII

Of CARAWAY.

THE Names. It is called ih Arabick, *Kdrvidj Karavia[^] and Garvi*: In Greeks *Kdg@[^]*: In Latin, *Carumⁿ*, alfo *Carui*, as the Apothecaries call it: *Simon Sethi* calls it *Carnabadion*: It took its name from the Countrey of *Caria*, from whence it came: Some call it *Careutn*, fome *Carvutn*, as in the Shops: and in *Eriglifh*, *Cdraway*.

IL *The Kinds.* We (hall here enumerate but two Kinds, I; *Carum Vulgare*, our Ordinary or Common Caraway* % *Carum pratense*, Meadow Caraway*

III- The Defcriptions. *The firft has a Root whs tijhmall[^] and long, fomewhat like unto a Pafnep, but with a more wrinkled Bark, and much lejs, ha* a little hot, and quick tafte, ftronger than a Parnep**

i'arjuep, and abiding after Seed time. Gerard/^J. the Root is like that of Parjley^ zvbite, an.l in taffe //Ac u/rte (/Carrat, a/? </fayshe) may fo/&<./!/?/ S/A eaten as the Parfnep or Carrot l>. from this Root Jpri/ig up divers Stalks of fine cut Leaves, lying on the Ground, fomewhat like to the heaves of Carrots, but not bufhtng out fo thick, of a little quick tafte in them, from among which rifcs up afquan Stalk notfo high as the Carrot, at whofe Joints are fet the like Leaves, but fmailer, and finer cut h and at the tops there are fmall open Tufts, or Umbles of white Flowers, which turn into Jmall blackijh Brown Seedjmaller 'than the Annifced, and of a quicker and hotter Tap.

IV. *The fecond has a Rootfmall and/lender, of a Smell not much unlike to Daucus, but of a hot and (harp 'Tafte, yet notfo hot and Jharp as the Seed, from this Root grows Leaves like the former, but larger -, and from among thofe Leaves, come forth Stalks greater and higher than the Common Kind. The fpokie Vmbles of white Flowers are in like manner larger, and the Seed like unto Cummin Seed, but much bigger.*

V. *The Places.* Caraways grow naturally in Carria, as Diofcorides faith, whence came the name : now they are found to grow almoft every where in Germany, as Tragus fays, in many places in the Fields, and by the Way fides j as alfo in Meadows, and in the fit and fruitful Fields of Bohemia, and likewise in low grounds, which are now and then over run with Water •, but with us they are ufually fown in Gardens, where they profper admirably.

VI. *The Times.* They Flower and Seed from May, and continue fo till the end of Auguft.

VII. *The Qualities.* Caraways Seeds are hot and diy, as Galen lays, almoft in the third Degree. They are Aperitive, Carminative, Digeftive, Difcuffive, Diuretick, Cephalick, Neurotick, Stomatick, Nephiitick, Alterative, and Alexipharmick.

VIII. *The Specification.* They powerfully expel Wind, and eafe Pains of the Cholick,

IX. *The Preparations.* You may have, 1. 17;* Root. 2. The Herb. J. The Seed! 4. A Juice of Ax Effence of tfiefiwe- 6. A Deco&ion of the Seed. 7. A Pouder of the Seed. 8. A Gitaplafm of the Herb. p A DifUI/ed Water of the zwhole Plant. 10. A Spirituous Tinture. 11. An Acid Tinfure. 12. An Oily TinSure. 13. A Spirit. 14. ADiJlilledOil. 15. Potefates, or Powers. 16. An Elixir.

The Virtues.

X. *The Root.* Parkinson fays, that it is better Food than that of the Parfnep, and is pleafant, and comfortable to the Stomach, helping Digeftion.

XL *The Herb.* Being dried, and made into Pouder, and ftrewed upon moift and running Sores and Ulcers., it dries them up, and in (hort time after heals them h it alfo heals Kibes in Childrens Feet.

XLI. *The Seed.* It is ufed whole in Bread, Cakes, Apple Pyes and Pafties, to give a relifli to them, and to add a ftomatick and warming Quality, in room of Spice •, alfo to be made into Comfits to correft the Wind in the Stomach. Being bruifed, fryed, and laid hot in a Bag, or double Cloth, to the lower parts of the Belly, it difperfes the Wind, and eafes the pains of the Cholick.

XLII. *The Juice of the Herb and Root.* It is prevalent againft Wind, and all cold Difeafes of the Head, Nerves, Stomach, Bowels, Womb and Joints: gives eafe in the Cholick, and griping of the Guts-, represses Vapors, and Hyfterick Fits, and provokes Urine. Dofe two ounces in Wine.

XLIII. *The Effence.* It has tRe Virtues of the Juice, but more efficacious in opening Obftu&ions of the Reins, Ureters and Bladder, and expelling Tartarous matter from thofe parts. It prevails againft the Cholick, and all Diftempers of the Bowels proceeding from cold and moifture.

XLIV. *The Deco&ion of the Seed.* It has the Virtues of the Juice and Effence, and is very good fox fuch as have the yellow Jaundice, and Virgins troubled with the Green-ficknefs, and fuch as are daily affii&ed with Wind in the Stomach and Bowels. It ought to be made in Wine, and may be taken to half a pint at a time sweetned with White Sugar.

XLV. *The Pouder of the Seed.* Taken to one dram, daily Morning and Night, mixed with fine Loaf Sugar, it has been found to fharpen the fight, to expel Wind, and help a bloody Flux, and other fluxes of the Bowels, though they have been of< long [landing. And by the conftant ufe thereof, a periodical Cholick has been often cured.

XLVI. *The Cataplafm.* Made of the Pouder of the Seed with White Bread and Sherry Wine, it & *? cuffes flatulent Tumors or Swellings, eafes pains in any part proceeding from Cold, comforts &? ftrengthens weak Limbs, and takes away the J? and bkW fpoats of 31ows, Bruifes, and the 1? The fame laid as hot on as can be endured to the lower parts of the Belly, gives eafe in the Cholick.

XLVII. *The Difilled Water of the whole PlariU* It is only ufed as a Vehicle to convey Stomatick and Carminative Medicaments in, down into the Body.

XLVIII. *The Spirituous Tinfure.* It is good againft Lethargies, Carus, Vertigo, Apoplexy, Palfie, Fainting, and illnefs of the Stomach, ficknefs at Heart, swooning Fits, Convulfions, coldnefs and weaknefs of the Nerves, and all thofe other Difeafes for which the Eilence is proper. The Dofe is half a fpoonfui in

in a Glaſs of Wine, Morning, Noon and Night, in all cold and moiſt Conſtitutions.

XX. *The Add Tiſſure.*— Jr admirably helps Diſſipation, creates a good Stomach, repreſſes Vapors, and is good againſt Fits of the Mother. Dole thirty or forty drops in any Liquor the Patient drinks, or in a Glaſs of Wine two or three times a day.

XXI. *The Oily Tinſſure.* It is Diuretick, eaſes pains of the Back and Reins, being taken inwardly to twenty dr thirty drop in any proper Vehicle outwardly bathed upon the part, it gives eaſe in Pains of the Gout, proceeding from a cold Cauſe; and is eminently good againſt Cramps in any part, Conuulſions, and the Palfie, if it be well anointed on the Paraliſtick part before a good fire, and rubbed in for an hour together, and ſo continued daily for twelve, fifteen, or twenty days, till the Patient finds he comes to the feeling ſtrength, and uſe of his Limbs, &c.

XXII. *The Spirit drawn from the Seed.* It revives the Spirits, cheers the Heart, comforts Nature, it preſſes Melancholly, warms and ſtrengthens a cold Stomach, and is good againſt Fainting and Swooning Fits. Dole half an ounce, or more, at a time, being dulcified, upon occaſion.

XXIII. *The Diſtilled Oil from the Seed.* It has all the Virtues of the Juice, Effence, Decoction, Pouder, Tinſures and Spirit, but much more powerful to all the ſaid putpoſes and intentions. Dole from eight to fifteen drops, dropt into Sugar, and then diſſolved in any proper Vehicle the Patient likes beſt, and is alſo agreeable to the Medicament in relieving the Diſeaſe.

XXIV. *The lowers.* They have all the Virtues of the Oil, but much more ſubtil and penetrating, and more pleaſant and eaſie to be taken by delicate and weak Stomachs. Dole two or three draughts in a Glaſs of generous Wine, Morning and Night.

XXV. *The Elixir.* It provokes Urine, (having all the Virtues of the Spirit, Tinſure, Oil and Powers exalted) and breaks the Stone, if it is ſoft and gritty, expelling Gravel, Sand and Tartarous Matter from all the Urinary Veſſels. It oppoſes Obſtructions of the Liver and Spleen, cleaſes the Blood from corrupted Humors, and is commended againſt the *Cachexia*, or evil diſpoſition of the whole Body, ariſing from a cold, moiſt, and watry habit of the lame, and therefore, in the going off of a *Dropſie*, when the Bowels are much weakned, and the Tone of them extreemly hurt, it ſo comforts and ſtrengthens them, as to make the Body to withſtand the return of the Diſeaſe, into which if the Patient ſhould Relapſe, it is generally fatal. The Dole is half a ſpoonful in Sherry, Canary, or *Madera* Wine.

CHAP. CXVIII

CENTORY the Greater.

HP & E. Names. It is called in Greeks *Κένταυρον*. In Latin, *Centaurium magnum*: of *rheopbraſtrnKivnte*: and in Enriſh, *Centory the Greater*, or *Greater Centory*.

II. *The Kinds.* There are four Kinds of this Centory, 1. *Centaurium majus vulgare*, *Centaurium magnum*, The Common Great Centory. 2. *Centaurium majus alterum*, The other Great Centory, or *Whole leav'd Centory*. 3. *Centaurium majus Americanum*, or *Canadianum*, *Centaurium foliis Cynara*, *Centaurium Vyremum* The American Centory, with *Artichock Leaves* / 4. *Centaurium majus luteurn*, The great yellow Centory,

III. The Deſcriptions. The firſt of theſe has a Root which grows to be .worg. than two fut long, and, a* large as a reaſonable great *Parjnep-root* blackiſh on the outside and ſomewhat of a recUff) yellow in the m^m abiding m(iny years, and fending forth freſh Leaves every Springy thoſe dying for the moſt part which were green all the Summer which Leaves are many large, long, and ſoft, deeply cut in on the edges, of a pale green color on the upper ſide, and whitish underneath, without any thing of the great bitterneſs which is in the leſſer Centory which PS no Species of this Plant. The Stalk is long arid round, and three or four feet high, divided at the top into many Branches, on which ſtand large, round, Jcaly green heads, ſhooting forth at their tops, many mail Threads or Thrums, of a pale blewish AJh-color. In which, after they are fallen, do grow, larger whitish, ſhining Seeds, not much unlike *Thijlle Seeds* Hit larger, and lying amongſt a great deal of *D. Matter*.

IV. The ſecond Great Centory has a Root growing to be as great or greater than the former, and black on the out ſide, but yellowiſh within, yielding aye/lowiſh red Juice, which is a little bitter, but ??wre. Aromaticall than the former. From the bead of this Root comes forth many Leaves lying almoſt upon the ground, which are long, and a* large aim oft us the former, but without any jaggedneſs or d'tvifion at all in them, yet deeply dented about the edges, and of a deep green color. The Stalk is round and great, but riſes not up ſo high a* the other does, nor divides it ſelf at the top, into ſo many Branches, but bearing only two or three heads on a Stalk, which are ſcaly, in the ſame manner, and in ſuch like Thrums or Thready Flowers, of a pale whitish color which being paſt, there comes forth like Seed in the heads, lying in a tlocky or Downy Subſtance, and every one bearded in the ſame manner, but a little blacker.

V. The third, which is the American, or *Fft>ridia* Great Centory, has a Root great and black on the out ſide, but longer than the firſt, and of the bigneſſ of ones *Wrijj*: It has larger Leaves than the *Jirji*; and more jagged, or cut in deeply on the Edges \$

jomewbat rejemintng an Artichoak Leaf in the divisions, whence the name Foliis Cynaris, green above, and gray, or as it were hoary underneath. The Stalk rises about a yard high, cornered and hoary, having several smaller Leaves, and leafs jagged, set thereupon, and parted at the top into some Branches, each bearing a few small Leaves, under the Heads, which are much greater, and more scaly, with sharp pricks at their ends, like a little Wild Artichoak Head. The tuft of Threads, which are the Flowers, are more purple, than in the first and the Seeds are white, wrapped up in Down in like manner.

VI. The fourth, or Yellow Great Centory, has a Root which grows in time to be greater than any of the former, having many Heads which shoot forth new Leaves in the Spring, the old Leaves going away or dying upon the ground every Year, which is wrinkled, and black on the outside, and yellowish within, full of a viscous or slimy moisture, and striking deep into the ground, with some greater Branches, and a few small fibres. The new Leaves which this Root sends forth are both larger and longer from the Root than the others, some of the leaves having fewer divisions in them, than some others of them have but those which grow upon the stalk as well as some of the others below, are very much divided into many parts, making every winged leaf to consist of fourteen or sixteen Leaves, the great rib is the middle between the two being whitish, each for the most part set against another, with an odd one at the end, and every of them being narrow and long, without any dents on the edges, and of a whitish green color. The stalks are manifold, round and strong, a little set raked down length ways, each being divided into some other Branches, which bear scaly Heads greater than any of the others and larger spread thrums in the middle, of a delicate pale, but lively yellow color, which continue in their glory and beauty for a long time, without decaying; but they seldom yield any Seed here with us in England, because that the scaly Heads are so filled with moisture (as is supposed) which hinders the Seed to grow ripe therein; for if they are but a little pressed between the fingers, there will issue out on all sides small clear drops of Water, almost of a Honey like Sweetness, and that not only at Noon-time of the Day, as Bauhin is pleased to say, but also at all other times of the Day, and not for one only time and no more, but often times, and every Day, as long as the flowers are fresh, and not yet withered: but when it perfects its Seed, it is not much unlike to the Seed of the second kind, but a little leffer, blacker, and more joining.

VII. The Places. The first delights in a fat and fruitful Soil, and in Sunny Banks, full of Grapes and Herbs. The first and second grow upon the Alps, and Mount Baldus: Diofcorides faith, they grow plentifully in Lycia, Peloponnesus, Arcadia, &c. The third grows upon the Pyrenean Hills, and upon itony Hills near Lisbon in Portugal, near the River Tagus: It has also been found to grow in America, upon the floridian Continent, near Canada, New England, Virginia, and parts adjacent to them. The fourth not far from Lisbon, near the Tagus, and also on Mount Baldus, as Pena faith: With us, they are only nourished up in Gardens, where they thrive and flourish very well.

VIII. The Times. They all Flower about the end of June, and in July, and the Roots may be gathered in Autumn. The American seldom Flowers with us, because of the coldness of our Climate, nor does it live, unless with much care.

IX. The Qualities. It is hot and dry in the third Degree. It is Aperitive, Absterfive, Afringent, Digeftive, Difcuffive, Incarnative, Anodyn, and Traumatick, or Vulnerary. It is dedicated to the Sto-

mach, Lungs, Liver, Spleen, Reins and Womb: it is Alterative, Alexipharmick, and Hemopock.

X. The Specification. It is a noble Wound Herb: Pliny and Theophrastus set it down among the number of Panacea's, All-heals, or Wound Herbs, thist Great Centory, (as also the Leffer, of which in the next Chapter.) Pliny, lib. 25. cap. 4. reciting the words of Theophrastus, says, that they were found out by Chiron the Centaure; and that from thence they were called *Ceauria*: and in cap. 6. he repeats and affirms again the same thing, and thereupon, he faith, they were both named *Chiroma*, though in truth they, viz. the Greater and Smaller, are no Kin one to another, not being Species of the same Genus, and so have no relation but only in name. It is reported, that Chiron was cured herewith of a Wound in his Foot, which was made with an Arrow, which fell upon it, when he was entertaining Hercules in his House, upon which it was called *Chironium*: or else from the curing of the Wounds of his Soldiers, for the which Intention it is most excellent.*

XL The Preparations. The Roots and Herb are both used, but the Root chiefly; and from them you may prepare, 1. A liquid Juice. 2. An Effence. 3. An Infusion. 4. A Decoction. 5. A Powder. 6. A half an. 7. An Ointment. 8. A Cataplasm. 9. A Spirituous Tincture. 10. An Acid Tincture* 11. An Oily Tincture: all made from the Root.

¶ Virtues.

XII. The liquid Juice. Being taken to two or three ounces, or more, Morning and Evening, opens Obstructions of the Liver and Spleen, and prevails against the Dropick and Yellow Jaundice, stops friting of Blood, and is prevalent against Ruptures, Cramps, and Pleurifies, and for those who have an old and continued Cough, or are ftiort Winded, and can hardly draw their Breath.

XIII. The Efface. It has all the former Virtues, but more powerful: every Intention; besides which, this Preparation is profitable against Agues, eases the Cholick, and all sorts of Gripping Pains, both of Belly and Womb. It is also a singular Traumatick, for it heals all inward Wounds and Excoriations of the Bowels, and outwardly applied to Wounds, running Sores and Ulcers, it digests, cleanses, dries, and Disposes the same to a speedy healing. Dose two or three ounces in a Glass of generous Wine.

* *Wl Th l n n - It is a weak thing compared with the former Preparation; yet being mixed in Wine, it opens Onions of the Ventricle, is good against the Jaundice, pains of the Pleura or Stitches in the Side. Dose four or six ounce Morning and Evening.*

XV. The Vecomon. It is something more powerful than the Infusion, and is good for the first Dis-eases which that and the Essence « good Tincture. Sweetened with Honey, or Sugar Candy, it is good against Wheefings, Hoarseness, Obstruction of the Lungs, shortness of Breath, and an inveterate Cough. It is good against the Strangury, or pissing by drops: and used as a Lotion, it cleanses Wounds, old Sores, and running Ulcers, and as a Gargarism, it cleanses and heals Cankers and Ulcers in the Gurus, Mouth and Throat: being drank half a Pint at a time it expels the malignity of Wounds made by the bitings or flinging of Venomous Creatures. Dropt into the Eyes it clears them, and flarpens the Eye-sight.

XVI. The Vouder. It has all the Virtues of the Juice, Effence and Decoction, being taken one dram, or dram and half at a time Morning and Evening*.

^hn Wine : besides which, being frowed upon moift, running Sores, it cleanfes, dries, and heals them.

XVII. *The halfam.* It heals Wounds at once or twice dressing : if they be contused, it digests them, cleanfes and heals. Applied to foul, corrupted, rotten Sores, and old Ulcers, it digests them, cleanfes, dries, and heals almost to a Miracle. Applied to the Gout, it draws the humor out through thepores of the ski[^] and fo cures it.

XVIII. *The Oinrment.* It is vulnerary, drying, and healing, good againft burnings, scaldings, and iuxes of iharp Humors, which k represses by virtue of its Afringency, the Sore, Ulcer or Wound, being first wafht with the Juice or Efence : then the Pouder of the Root being frowed upon it, and afterwards pledgets being dipt in the Ointment, and laid over all, with a *De Minio Emplaster* upon that to hold it on : by this means desperate old and running Sores and Ulcers have been suddenly and effectually cured.

XIX. *The Cataplafm** It is an excellent Anodyn and Difcuffive, prevalent againft flatulent Tumors: If it is made up into a Peflary with the Pouder of the Root, and put up the Womb, it provokes the Terms in Women, and educeth the Dead Child and After-bfith.

XX. *The Spirituous TinBure.* It is good againft Convulfions, Lethargies, Palfies, Cramps, Pains and Aches in the Limbs, as also in the Stomach and Belly, Colick, and all Difeafes of thofe parts proceeding from Wind : Let it be taken inwardly three times a day, from two drams to four in any proper Vehicle : and outwardly, let it be bathed upon the part affe&ed Morning and Evening, till health is recovered.

XXI. *The Acid. Tintfure.* It is good againft Malignity, and the Poifon of Pestilential Fevers : is good againft the bitings or ftings of Venomous Creatures, h opens Obftru&ions of the Lungs, helps againft Coughs, Colds, Ihortnefs of Breath, Wheez* ing, Hoarfnefs, &c. being taken in all that the Patient drinks, whether Ale, Beer, or Wine, fo many drops at a time as may make the Liquor pleafingly fharp.

XXII. *The Oily Tintfure.* It opens Obftru&ions of the Reins, Ureters and Bladder, is prevalent againft the Strangury, pains and weaknefs in the Back, being taken from ten to twenty or thirty drops in White Port Wine twice a Day, viz. Morning and Night ^ and withal being bathed well in, upon the *Spina Dorfi*, or Back Bone.

X^AIII. *The whole Want, as well Herb as Root,* is available in all forts of Wounds, Sores and Ulcers, to digest, cleanfe, dry, conglutinate, and heal them -, and therefore are principal ingredients, and fhould be in all vulnerary Ointments, Balfams, Drinks, Lotions, andInje&ions, according to Tome of the aforegoing prefcribed Preparations, refest being had to the parts affliaed, and the way 2nd Method of Application or Exhibition, whether Inward or Outward.

C H A P , CXIX.

Of CENTORY the Lesser,

I-[^]p if E Names. It is called in Arabic*, *Kan-A tar ion Sages*, and *Canturion Sege*, or *Segir* : In Greek, K ^ W ? TJ tu*gj* : In Latin, *Centaurium minus*; iff *parvum* : Of fome, *Centattrea*, *febrijuga*,

from its Quality -, *he I TenV*, from its exceflive bit-tetnefs. *Dirfcorides* fays, it was called *Limnefw*, and *Pliny*, *Libadion*, becaufe it loves to grow in moift places. It is thought to be that Plant which *Theophrastus* called *Leptophyllum* : In *Engliffh*, *Centory the LeJJer*, and *LeJfer Centory*.

II. *The 'Kinds** It is no Species of the *Greater Centory*, nor claims any the teaft Kindred with it, having no Relation in any kind, but only in the name, and therefore is *Genus* or *General* it felf. It is fix fold, as growing with us, viz. 1. *Centaurium minus vulgare flore rubente*, The Common Red Small Centory. 2. *Centaur 111711 minus flore albo*, White flowered Centory. 3. *Centaurium minus hiteum*, Small yellow Centory. 4. *Centaurium minus luteum perfoliatum ramofum*, Branched through-leav'd Small yellow Centory. 5. *Centaurium minus luteum non ramofum*, Small yellow Centory, not Branched. 6. *Centaurium minimum luteum*^ The very fmall, or fmallest yellow Centory,

III. The Defcriptions. *The first of thefe, which is our Common final Centory, has a Root fmall and hard, periffing every year, from whence fprings up for the moji part, but one round and crefted Stalk, about a foot high, or fomething* more, branching out at the top into many Sprigs dr Branches, andfome alfo from the Joints of toe Stalks below. The heaves are fmall, and a little roundiff, very like unto St. JQNYLS Wort, but without any holes in them, as that has. The i lowers ft and at the tops, as it were in a Tuft or Vmble, and are of a pale red color, tending to a Carnation. They confift of five, andfometMes of fix, fmall Leaves, very like unto thofe of Hypericon, opening themfelves in the Day time, and dofing at flight, after which come Seed in little Jhori Husks, and in form like unto Wheat Corns. The whole Plant is of an exceeding bitter Tafte.*

IV. *The fecond, with the White Flower, differs nothing from the other, a* to the form, neither in Root, Stalk, Leaves, Height, flowers or Sced, faving only in the color of the Flowers, which zs White, as the other is Red; and the bitter tafte is the fame in its full Latitude;*

t. The third, which is the Small Yellow Centory, is a little like to the second, and a little greater than it ; the leaves are also larger and broader, and broad at the bottom, but yet not so broad as to encompass the Stalk, as the next does: the flowers are also a little greater, and yellow, which is the principal thing in which it differs from the last, and withal the whole Plant is not altogether so bitter.

VI. The fourth, which is the Through-leaved Centory, has a Root small and white, like the former, from whence comes some leaves next the ground

like unto the former Centories, but somewhat greater. from this Root comes forth a Stalk, which sometimes it self forth into many long Branches, from every one of the Joints, and sometimes it spreads it self only at top: At the Joints it and two somewhat broad and long pointed Leaves, so encompassing the Stalk about the bottom, and making it seem as if it run through them, that they will hold the Earth or any Water which falls upon them : The Flower which it and at the tops of the small Branches are a little larger than those of the Common Centory; composed of six or eight leaves, of a fine pale yellow color, and sometimes of a deeper yellow, after which comes larger Heads than those in the first, and Seed a little bigger. This Plant is not full out so bitter as the first.

VII. The fifth, which is a Small yellow Centory not Branched, and differs not in Leaf or flower from the fourth: The Stalk bears several foliated Leaves, but spread not themselves forth in Branches, as the former doth : It bears also but one only flower at the top, which thing, together with its not being branched, makes it to be different, and another Species of the perfoliated kind, the whole Plant is left bitter than the first.

VIII. The sixth, and smallest of the Yellow Centories differs very little from the fifth, or last described Through leaved Centory, excepting in this, that it is wholly leafless in every part of it, and whereas the former bears but one flower at the top of it, this bears two or three, and sometimes more, small Flowers at the top of every of its Branches.

IX. The Places. The first grows in great plenty throughout all England, in most Pastures and Grass Fields, and indeed they are all of them found in many places of this Kingdom, but the first or common sort almost every where, in Fields, Pasture and Woods, but that with the White blowers is more sparingly to be had than the first. The first I found growing in the South parts of Carolina, in many Plantations, but particularly in that, formerly Captain Abbot's, up Wando River, about five Miles from Charles Town : The third of these enumerated in this Chapter, grows in many places in Kent, as in a Field next unto that which was formerly Sir Francis Carew's House, at Bedington near Croydon and in a Field next beyond Southfleet Church towards Gravesend, and in many other places, where also the other kinds are sometimes found.

X. The Times. They all Flower in July and August, and their Seed is ripe in about a Month after. They ought to be gathered in their flowering time : but some people out of a meer Superstition, gather them between the two Lady-days.

XI. The Qualities. They are generally hot and dry in the second Degree : but Gerard says, that our third, which is the first yellow Centory, is hot and dry in the third Degree, and yet it is not so bitter as the first. They are all highly Stomachic, Pectoral, Hepatick, Splenetick, and Hyfterick : they are noble Aperitives, and Alteratives, Vulneraries, Alteratives, and Emmenagogicks.

XII. The Specification. It is Antifebricitick, and good against Distempers of the Stomach.

XIII. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion. 4. A Decoffin. 5. A Powder. 6. An Oil by Infusion or Boiling. 7. An Ointment. 8. A Balsam. 9. A Cataplasme. 10. A Distillate Water. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture. 14. A Saline Tincture. 15. A Spirit. 16. A Collyrium. 17. A Fixed Salt from the Ashes. 18. An Essential Salt.

The Virtues*

XIV. *The liquid Juice.* Being given four or five ounces two hours before the coming of the fit of aij Ague (as also given in the same quantity Morning and Evening for some days) it removes the Fit, and perfectly cures the Ague. It evacuates and carries off Choleric and Gross Humors, and prevails against the Sciatica: And yet with *Dodoti* I do not perceive that it has any sensible Purg- ing, or Cathartic quality, though in the mean time, many things which are not purely Catharticks or Purg- ing, are found to be very cleansing, and in passing off themselves, carry many other Humors along with them.

XV. *The Effence.* This has all the Virtues of the Juice } it opens Obstructions of the Gall, Liver, Spleen, Reins and Womb, prevails against Hypochondriack Melancholly, and the Yellow Jaundice ^ it eases Pains in the Sides, and hardneis of the Spleen, making thin both Blood and Humors. It is of good use for those that have the Dropie, or Green-sicknefs, because it strengthens the Stomach, and all the other *Vifcera*: I know some will not allow it to cure the Dropie ^ but this I know, that if the Hydropick Humors are carried off by other means, and the parts affected are once emptied of their Water, that if this Effence be duly given, it fo strengthens the Bowels, that that Disease returns no more. It kills Worms in the Belly, and dries up Rheums.

XVI. *The Infusion in Wine.* It cleanses gross Humors, and eases pains in the Hips, the Gout, and other like Diseases proceeding from Tartarous Humors: It is good in Agues, strengthens the Stomach, helps Digestion, and causes a good Appetite. It also prevails against Stitches, pains of the Sides, and other Diseases of the *Pleura*.

XVII. *The Decoffion.* It has the Virtues of the Infusion, is good against Agues, Catarrhs, and the vehement pains of the Colick: It provokes the Terms in Women-, and brings away the Birth, whether dead or alive, as also the After-birth, easing the pains of Mother, and causing an effectual Cleaning after Delivery. It is good against the Rickets in Children, evacuates Tartar out of the Urinary Passages, and brings away Sand and Gravel, stopping the passage of the Urine.

XVIII. *The powder.* Taken to one dram in Wine, it gives ease in the Colick, kills Worms in Children, and (as *Yarkinfontays*) is a wonderful good help against the biting and poison of a Viper or Adder. Strewed upon moist and running Sores and Ulcers, it cleanses, dries, and heals them.

XIX. *The Oil by Infolation or Boiling.* It is Anodyne, eases the Spleen, and pains of the Mother, and is very effectual in all old pains of the Joints, and Limbs, as Gouts, Sciatica, Convulsions, Cramps, &c. proceeding from a Cold Cause. It is also a very good thing to anoint Womens Breasts which are swollen, hard, or pained, through Cold, or Curdling ^h or any other accident, as of a blow, &c.

XX. *The Ointment.* It has the Virtues of the Oil, but is more strengthening and fanative: It cleanses, dries, and heals foul Ulcers, and other spreading Scabs of the Head ^h and to anoint the Back-bone and Joints of such Children as have gotten the Rickets: It strengthens and gives ease in pains of the Back, by anointing therewith.

XXI. *The Balsam.* It is an incomparable Vulnerary, and cures simple Green Wounds at the first intention. If they are composed by bruising, and dilaceration of the flesh, it first digests, then clean-

ses, dries, and heals them: It also cleanses foul sores, foetid Ulcers, fills them up with flesh, and obviates their lips, it heals old running Sores, cleaning, incarnating and drying, and perfectly curing them, the Hollow, or Filtulous.

XXII. *The Cataplasm, made of "the green. Herb,* It has the Virtues of the Balsam, but is an especial thing for cleansing and healing purrid Ulcers in what part soever, if duly applied thrice a day: washing the hollownefs or fiftulous part allb with an Expressed Juice of the Herb.

XXIII. *The Dililled Water.* It has the Virtues of the Infusion or Decoction, but is pleaster, as being less bitter ^ but by so much, it is the less efficacious: and is many times used as a Vehiculum ^ to convey other Preparations of the Herb. in: It is laid to take away Tanning of the Skin, Sun-burning, and other the like distaffitions.

XXIV. *The Spirituous Tincture.* It comforts all the *Vifcera* after a singular manner ^ and therefore if it is taken from One dram to four drams, Morning, Noon, and Night, it *ib* strengthens the Bowels, as that it prevents the return of a Dropie in those Persons where it has been lately cured. It also removes the Gout out of the Stomach, (which many times is fatal) is good against the Jaundice, and Hypochondriack Melancholly: It is indeed a good remedy against the bitings of Vipers, Rattle-Snakes, and other Serpents, as also the Poison of Mad Dogs.

XXV. *The Acid Tincture.* It is excellent against Vapors, Fits of the Mother, and other distaffitions of the Womb. It strengthens a weak Stomach, relieves Vomiting, causes a good Appetite and Digestion, removing faintness and sicknefs at heart. It is good against Poison, and the Plague, as also all Putrid; Malign, and Pestilential Diseases, being taken in all that the sick drinks from twenty to forty drops at a time, at least five or six times a day ^ it takes away the malignity of the Distemper, and wonderfully abates the putrid heat of the Fever*, whether Continual, Continual or Contermitting.

XXVI. *The Oily Tincture.* It carries off the yellow Jaundice, as also the Morbifick cause of Obstructions of the Reins and Ureters by Urine: being given from one dram to two drams, in a good draught of *Carduus* Poffet-drink, it has been known to cure Agues: more especially if the *Spin* Dorfi* be effectually anointed therewith, from the *Vertexbra* of the Neck almost to the *Anus*. Anointed on the sides, it eases their Pains: and given inwardly* gives ease in the Colick. Given to a Woman in Labor from fifteen to thirty or forty drops, in some convenient Vehicle, it facilitates the Delivery, whether alive or dead, and effectually brings away the After-birth.

XXVII. *The Saline Tincture.* It fits good against foul Ulcers, and spreading Scabs of the Head, or other parts ^h takes away Cutaneous Deformities, as Tannings, Sun-burnings, Spots, Marks, Scurf, Dandriff, Morpew, and other like diseases of the skin: And being long applied, it is said to remove freckles, tho' of great continuance.

XXVIII. *The Spirit.* It strengthens the Stomach wonderfully, cheers the Heart, revives the Spirits, and fortifies the Universal Oeconomy, of Nature: it is good against Vomiting, and Indigestion, and causes a good Appetite to *tood* ^h makes a fresh and lively Countenance, and restores the Pristine itate of the Bowels. It is a very good thing against *Diarrheas*, *Dysenterias*, *Lientens*, and the *hepatic flux*, and gives ease in an exquisite Colick, when sometimes many other things will do nothing, Dose from one spoonful to two, in some proper

XXIX. *The Colly num.* It is made of the *Liquid Juice, or Effence*^ mixt with an equal quantity of *vrified honey.* Being put into the Eyes, four, five or six times a day, it clears them from Dimness, Mills or Clouds, or any thing which obfuscates or hinders the sight : and if a little Spirit of Wine (about an eighth part) be added to it, it becomes profitable for fore, inflamed and running Eyes, it strengthens the weakned part, and powerfully itops the fluxion. It also cleanses Ulcers in the Eyes, drys, and heals them : And I was was informed by a very skilful Chirurgion, that he once cured a *R- fiula Lacrymalis* therewith, by inje&ing it in, with a proper Syringe. This I am fure of, that it fingularly cleanses, and drys hollow Ulcers in other parts of the Body, and difposes them to an effe&ual heating •, and drys up moist Scabs, and other breakings out like Scurf or Morpew, though of long Handing, if it is affiduoufly ufed and applied for some time. Taken inwardly, from half an ounce to two ounces at a time, it prevails againft Colds, Coughs, Hoarfness, Wheazings, fhortness of Breath, difficulty of Breathing, and other diffie&ions of the Lungs. Being thus continued for some considerable time, I have known it to cure Ulcers of the Lungs -5 the Patient drinking with it, new Milk warm, sweetned with double refined Suger, drinking no other Liquor, and wholly forbearing all Wines, and Maulted Drinks.

XXX. *The Fixed Salt.* It is highly Antifebricitick ^{lⁿ V¹ ^ 1 *} Diffblved to one dram in the Distilled Water, and fo drank, it carries off the Morbifick caufe of all Fevers by Urine, and cleanses all the Urinary parts of Gravel, Sand, and Tartar, lodged in them. It is also excellent good againft the yellow Jaundice, and all Obftruaions of the Liver, spleen, Reins, and Womb. It diffolves Choler in the Body, and casts it out by Urine : Take of this salt halt an ounce : of the distilled Water a pint: mix and diffolve. This cures Cutaneous Difeases, and takes off Freckles from the Face, if constantly ufed for some time * and also removes other deformities of the Skin.

XXXI. *The Ejjential Salt.* It has all the Virtues f* the Liquid juice and Eflence, and may be given in all those cafes from one dram to two or three drams at a time, in a glafs of generous Wine, Morning and Evening. It is a great Stomack, and Sweetner of the Blood * a noble Antifebricitick, and kills Worms in Young or Old, being taken for some time. It is highly Traumatick, and therefore good to be taken Dieteticaliy, by such as hare Wounds and Ulcers about them.

CHAP. CXX.

0/ CELANDINE.

Ἰακύνθου. *Names.* It is called in *Greek,* Ἰακύνθου, ^{S * In L i Cb} and *Qhãtdoriium majus, Uirundinana major* : In *Arab'ick, Kauroch,* feu *Memiram* : and in *English, Celandine,* and *Celandine the Greater.* This latter name is given to it, becaufe another Plant lesser than this, has the name of *Celandine* given to it, and is called the lesser -, and yet it has no Kin or Relation to it: and therefore for diftinction sake, this is called *Celandine the Greater.* It is also i'ometimes called *Swallow-wort,* in anfwer to the latter *Lit in* name. The name is said to arise from Swallo. vs curing the Eyes of their young ones when

they were hurt, therewith ^ but as it is a thing wholly tabulous, fo we leave it.

II. *The Kinds.* It is twofold, I. *Xi*JEvnp vip.*y** Κοίβοvy *Chelidoniwn majus vulgare,* Common Great Celandine. 2. *XSA/^W 10 ^ KOKTTCS^* *Chelidomum majus Laciniatum^* Jagged Celandine.

III. *The Description.* Common Celandine *hoi a Rootfomewhat great at the Head, fhooting forth fever a I other long Roots, with fmall reddijh fibres or Strings Springing-from them, the infide being yellow^ andjullof a yellow Juice : from this Root fpri'ng\$*

up fever al tender, round whitifh, green Stalks, with larger Joints than are ordinary in other Plants of like magnitude, like as it were knees, very brittle, and eafie to break, from whence faring forth branches of a dark blewifh green color on the upper fide, like unto Columbines, and of a more pale bwewifh green underneath, full of a yellow Juice or Milt, which iffues forth, when any part n broken, of bitter Tafie, and jlrong Smell. - At the tops of the Branches, which are mucf) divided, grow goldyyello blowers, having four Leaves a piece, after which come fmall long Cods, with blackifh Seed therein.

IV. *The Jagged Celandine*, grows in its Roots an, Stalks, and almoft in all things elfe like unto the former, fave that the Leaves are thinner, and the divifions /tenderer, and more cut in on the edges the blowers confiji alfo of four Leaves apiece, and are of the fame golden yellow color, but fomewhat larger than the other, and are each of them cut h on the edges, as the green Leaves are, for which reafon Clufius calls it, *Chelidonium majus ladniau-flore 1* this, as the other, by fhedding its Seed, rife again before Winter, and Jo continues flbinefing the next Spring, and feeding in Summer.

V. *The Places*. The firft is nourifhed up by many in Gardens ; but is alfo found growing Wild in many places by old Wall fides, and by the Hedge, and Way fides in unfilled ground in feveral parts of this Kingdom, delighting in fhady places. The fecond is only found growing in Gardens.

VI. *The Times*. They both flower all the Summer long, from the Month of April, and in the mean feafon the Cods come to perfeftion, and yield ripe Seed.

VII. *The Qualities*. They are both hot and dry in the third Degree, and of an Abfterfiv? or Cleaning Faulty, h Aperitive, Sudorifick, Hep^tick, Arthritick, Alterative and Alexipharmick.

VIII. *The Specification*. It is faid to be peculiar thing againft the yellow Jaundice.

IX. *The Preparations*. You may have therefrom, 1. *The liquid Juice*. 2. *The Ejjuice*. 3. *The Be-cottionin Wine*. 4. *The Pvderofthr Root*. 5. *The Infuffate Juice*. 6. *The Dijilled Water*. 7. *The Spirituous Tintture*. 8. *The Acid Tintture*. 9. *The Saline Tintture*. 10. *A £aiap!afm, A Mixture**

The Virtues.

X. *The liquid Juice*. Being taken failing from one ounce to two ounces mixed with a dram or two of Mithridate, and a Glafs of Wine, it is of fingular good ufe againft the Plague or Peftilence, die fauent being laid to Sweat thereupon. The juice dropped into the Eyes, cleanses them from Films, and Clouds which hinder the fight ; more efpeciall V if mixed with a little of the Diftilled Water, to alky it. It is alfo to good purpofe ufed in old runting Sores, and filthy and corroding Ulcers where- to hinder their malignity, and flop their J?« Tig and fretti" g, and to caufe them the more fpeedily to heal. The Juice often applied to Warts, Corns, Tettars, Ring-worms, or fuch other like fpreading Sores, deftroys their Acrid ferment, and alfo cures them.

^The Effence. It has all the Virtues of the liquid Juice, but much more powerful to the intentions, and may be given in the fame Dofe in Wine. It opens Obftruaions of the Gall, Bladder, liver, and Spleen, and prevails againft the Dropfie, and yellow Jaundice,

XII. *The De coltion of the Herbs and Roots in Wine*. You may boil with them a few Annifeeds alfa It has the Virtues of the Liquid Juice, and Effence, but not altogether fo poweffill. It, de&nfes much, and fo is helpful againft the Yellow Jaundice, and gargled in the Mouth eafes the Tooth Ach.

XIII. *The Ponder of the Root*. Put upon Aching Gums or Teeth, or upon a loofe or hollow Tooth, it will eafe the Pain prelently : and as Authors fay, quickly caufe them to fall out. *Vix Credo*. The over Credulous, may eafily make a Tryal

XIV. *The hipiffaiNtfice*. This is thought to be better for the Eyes than the liquid Juice, becauie many of the fharp Particles by the lulpilitionii are Evaporated. You may diffolve it with alictlcBreaf Milk, or Cows Milk, and fo drop it into the Eyes, it is good againft Clouds, Films, Blood-fhor, Inflammations^ Pearls,, and other Difeales of the Eyes.

XV. *The Biftilled Water*. It is laid to be a good thing to clear the Eye-fight, and taken with a little Mithridate or Venice Treacle, and JJweating ihereon, it is good againft Malign and Peitflennal Dif eafes, and may be ufed as a Vehicle ibor other Pieparations.

XVI. *The Spirituall Tinfure*. It has the Virtues of the Effence -, and is a fingular good thing againft cold and moiit Diitempers of the Head, Nerves^ Stomach, Liver and Womb. It prevails againft Vertigo's, Lethargies, Convulfions, Cramps, Palfie^ Lamenefs, Numbnefs, and Contortions of the Bowels. By the conftant ufe of this Tin^ure for about fix or feven Months, I knew a Man of about thirty fix or thirty eight Years of Age, perfe&ly cured of th& Palfie. Dole one, two or thiee drams at a time, Morning and Evening (and in very cold habits of Body, Morning, Noon, and Night) in a Glafs of Madera, or other generous Wine. In Cramps and Convulfions it would be good to bathe the parts affected therewith: and in Palfies, to bathe rhofe parts of the Back Bone, whofe *Verticbrx* fend Neives to the places affli&ed.

XVII. *The Acid Tintture*. It has all the Virtues of the liquid Juice, and EtTence, and is indeed a powerful thing againft all Malign and Peftitientia Fevers, for it aftually deftroys the malignity, and abates the Heat of the Fever., Outwardly applied, it is found of fingular good ufe to tjike away defecations, or defilements of the Skin.

XVIII. *The Saline Tintture*. It is good for thofe who are troubled with the Itch, or have old Sores in their Legs, or other parts of their Bodies : it alfo takes away Tanning, Sun-burning, Scurf, Morpew, black and blew Spots, and other difcolorings and deformities of the Skin.

XIX. *The Cataplafm*. the Green Herb, with the Roots, being bruifed, and made into a Cataplafm, with a little Oil of Camomil, and powder of Orice Roots and Zedoary, and applied hot to the Navel, it eafes the Griping pains of the Belly and Bowels, as alfo the pains of the Mother. And applied to the Left fide takes away Stitches, and eafes the pains of the Spleen. Applied alfo to Womens Breafes, who have their Courfes in too great meafure, it ftops them, and gives great relief to the affe&ions of the Mamillary parts.

XX. *The Mixture*. £ of the liquid Juice four ounces : Oil Olive one ounce : blowers of Sulphur an ounce and half: mix them. It cures the Itch, Morpew, Scurf or Dandyiffi fcald Heads, difcolorings of blows or Wounds, Tettars, King-worms, and other like difcompofures of the Skin, being anointed therewith, Morning and Evening, fox fome time.

C H A P. CXXL

Of CHARLOCK.

THE Names. I do not find that this Plant was known to the Greeks, and fo have no Greek name for it. It is called in Latin, *Rapiftrum*: and in English, *Charlock*, *Carlock*, and *Chadlock*.

II. The Kinds. Some would have it to be a Species of the *Wild Turnep*, others of *Sinapi*. Some of *Eryfimium*, others refer them to the *Lamp/ana* of *D'wfcorides*: but it took its name *Rapiftrum*, *afimilitudine Rapifoliorum*, for which reason it was that some have called it *Wild Turnep*. But taking it as *Genm*, There are several kinds of them to be found in *England*, viz. 1. *Rapiftrum Commune*, Common Charlock. 2. *Rapiftrum Syheftre*, five Arvorum, Wild, or Field Carlock: *Mdthwylus* calls it *Lamp/ana*, fo alfo *Anguilara*, *Lonicerus*, *latgdu-nenfis*, *Gerard* and *Gefner*, in *Hortis*: *Fuchflus* and *Turner* call it *Irion*: *Bauhini*, *Rapiftrum flore luteo*. 3. *Rapiftrum alter um Arvorum*, A fecond Field Charlock, which is alfo called by all the former names. 4. *Rapiftrum album Articulatum*, White Field Charlock, which is the *Lamp/ana* of *Turner* and *Cfalpinus*, who alfo calls it *Radix Sylveftris*: The third *Sinapi agrefte of Tragn*: *Rapiftrum flore albo Eruct fohis Lobeli*, *Armoracia Tabermontani*, *Rapiftrum flore albo fliqua articulata Bauhini* S. *Rapiftrum Mono/permon Bauhini*, One Grained Charlock. 6. *Rapiftrum Aquaticurn*, Water Charlock.

III. The Defcriptions. The firft of thefe has/ender Rvots with feveral fibres or ftrings hanging at

them, which perifkes when the Seed is ripe -, from this Root rifes Leaves alnoft like to the *Rapum Sylveftre*, but leffer, and fmaller at the bottom, not Jagged: among which rifes a rough, /ender, brittle, and fomewhat hairy Stalk, a foot and half, or two feet high, having larger Leaves than the former^ and fomewhat Jagged and Waved: The Stalk towards the top is divided into many Arms and Branches, on which do grow little yellowifh Flowers, which make a great fhew; but jometimes they are foit to be of a purplifh color -, which being pafte there follows hng Pods, fharp towards the end, containing feveral flattifh Seeds, of a whit ifh yellow color.

IV. The fecond, has a Root long and white, which grow? woody when it runs up to Stalk and Seed, and perifhes after Seed time. From which Root fprings forth many long and broad rough Leaves, hairy and green, lying upon the ground round about the Root fomewhat deeply gafhed in on the edges, and rounk pointed: from among which rifes up one flender hairy Stalk, feldom many, branched from the middle upwards into many Arms, with divers leffer Leaves on them to the tops, on which ft and many yellow Flowers, having four or five Leaves apiece, which in a Hemp Land, or Corn Field make a mighty and glorious fhew (but much to the Owners difprofit:) after thefe Flowers are pafte, there follows long rough Pods, not very flender, with divers round, finally reddifh brown Seed therein, like unto *MustardSeed*^ but larger, as quick and fharp in tafte, but wore bitter than it.

V. The third has a long Root, with many fibres at it, like the former, which dies every year, from whence fpring up many large Leaves waved in, a little rough or hairy, but not cut or jagged as the former, the upper Leaves being whole and fmaller: The Stalk rifes up rough and hairy like the others* of about eighteen Inches high, or more, fspread out into many Branches -> at the tops of which are a great number

icctco. aie likewiie to be bathed with the fame. Anointed upon a Nerve prickt or hurt, it eases the Pain and Anguifh, and abates the Tumor, if any be prelent.

XX. *The Saline TinSure.* If given inwardly, from half a dram to two drams, it opens Obftructions of the Urinary parts, and of the Womb; but *h* is of greateft ufe in outward Applications againft Tanning, Sun-burning, Scurf; Morphew, Dandriff, and other like Dcdedations of the Skin-, for it cleanles after a fingular manner, by reafon of its Volatile Particles.

XXI. *The Cataplafm.* Made of the Green Herb, but principally of the Seed, with the addition of a quarter part of Mithridate, and fo much Orrice powder as will bring it to a confidence, and applied to cold flatulent Tumors, it difcuffes them: if Nature defigns the Tumor for breaking, it brings it to maturation or ripenefs, and that in a litde time, becaufe of its heat. If it is applied to the Gout, it eases the Pain, and attra&s the Morbifick Humor through the Pores of the Skin, in manner of Sweat.

CHAR CXXII.

^/CHERRY Winter.

I. ***YHE Names.* It is called in *Greek*, ~~Κεκεν~~ *Κεκεν* *Jb^vyjiQ- CIMKAKIQ-*: In *Arabick*, *Keken* *Alketengi*: In *Latin*, *Alkakengi*, *Halicacabum*, *Solanum Halicacabum Theophrasii*, *Veficarium rlimj6 Saxifraga quart a rubra Brunfiffi* and *Solanum Veficanum*: In *Englifh*, *Winter Cherries*.

II. *The Kinds.* *Parkinon* fays, it is one of the kinds of *Solana*, or *Night-Jhades*, fet forth and fpoken of by *Diofcorides* and *Galen*, and one of the two of *Theophrastus*. We make two Kinds thereof, I. *Halicacabum five Alkakengi Vulgare*, Our Common *Winter Cherry*. 2. *Halicacabum five Alkakengi Virginienfe*, The *Virginian Winter Cherry*. There is another Plant, which fome Authors have joined with *Winter Cherries*, and called it, *Halicacabum Peregrinum*, *Veficana Peregrina*, and *Halicacabum Rcpens*, *Winter Cherries Creeping*, as *Tragm*, *Iuchfius*, *Gefner*, *Matthiolus*, *Dodonaeus*, and others *, but *Cordus* oppofes, and makes it another Plant: *Bauhinus* puts it among the *Peafe*, as a kind thereof, and calls it *Pifum Veficarium*: *Label* thinks it to be the *Ifopyum Diofcoridis*, and calls it, *Cor Indum*, *Pifum Indicum*, and *Pifum Cordatum* -, for all which Reafons, it being rather a *Grain* than a *Berry*, we have forbore to put it in this place: and fo much the more alfo, becaufe it is no *Native* or *Denijon* of our Ccuntry, nor does it grow naturally, as fome think, in any Part of *Europe*.

III. *The Defcription.* Our Common *Winter Cherry* has a running or creeping Root in the Ground, long, and not much unlike to the Roots of *Quitch-grafs*, running very far abroad under the upper cruft of the Earth, caufing it greatly to encreaje; it is fometimes of the thicknefs of ones little finger, fljoot- i//g forth at fever al Joints, and in fever al places, by which means it quickly fills a great piece of Ground, from, this Root rizes up a Stalk two or three Feet high, round, (lender, fsmooth, and fomething reddifh, reeling this way, and that way,

by reafon of its weaknefs: upon which come forth many broad and long green Leaves, not much unlike to thofe of Common *Nightfhade*, but larger: at the Joints whereof, and among which Leaves come forth wjpitih flowers, confifing of five fmall Leaves apiece: In the middle of which Flower comes forth a Berry, green at firft, and red when it is ripe, like almoft in color and bignefs to our Com* mon Red Cherries (whence the Englifh name >,) Thefe Berries are enclosed in Skins, or Bladders, of a pale reddifh color. In the Berry is contained a reddifh Pulp, and the Seed lying in the fame, which are many, fmall^ and flat, and of a pale yellow color.

IV. *The American kind*, has a fmall Root fpreading tender ground, but not fo far as the former, and perifhes every Tear. From this Root comes forth Branches with Leaves on the ground, fcarcely rizing up fo much as the other, feldom above eighteen or twenty Inches high, (which I obferved when in its perfeSion, and growing upon fertile ground) but the Branches are greater, a* alfo are the Leaves^ and fomething more uneven about the edges, of a fad, or deep green, almoft of a Sea-green color: at the Joints come forth the Flowers fingly, to wit, one at a place, and more towards the bottom than upwards (this I obferved not, for I always found each Plant very full of fruit almoft from the bottom to the very top:) but as they grow to the height of the Branches, both Flowers and Fruit are rather fmailer than thofe which are below: the Flowers_ are compofed of five fmall whitifh Leaves, with a Circle of red, or every Leaf is fpotted Circle-wife towards their bottoms: the Flowers being paft there follows the Fruit, enclosed in a thin Skin or Bladder, of a whitifh, or pale greenifh color * and not full out Jo big as the former. Within this Hmk or Bladder is contained the Berry, which never grows full out Jo large as our Englifh Winter Cherry, yet whitft recent, fills almoft the Bladder in which it is contained: when the Cherry or Berry comes to its perfeSion, it is never red, but of a pale ivtiti/h green

color, sometimes of an Amber color, or of a light palish yellow, and sometimes of a color which the Sun looks full upon, may have some small streaks of red, mixed with Amber-colored and pale yellowish green colored. The Berry contains a Pulp like the English, but whitish yellow, or green, in which Pulp is contained the Seed, which is small and flat, like the other, and of a whitish color.

V. *The Places.* The first grows by Hedge sides, and old Walls, and about the Borders of Fields, in moist and shady places (this it may possibly do, in several Southern Regions and Countries beyond Sea) but with us it grows chiefly in Gardens. The other grows wild in English Plantations in Virginia. I found it growing in a Plantation up Wadmalaw River in Carolina, and in several other Plantations of that Country, where it grew spontaneously, and that in vast plenty. Parkinson makes mention of a third kind of West India Alkengi, which I take to be the same with that before described, and differs from it only in largeness, and strength of its Stalks, Branches and Berries, which I believe arises only from the differing goodness of the Soil, they being in all other respects exactly the same. I have found them both growing on the same ground, but could not possibly take them to be two differing Species of the same Genus.

VI. *The Times.* They flower about the middle or latter end of July, and the Fruit is ripe about the latter end of August. In Carolina they flower something earlier.

VII. *The Qualities.* The Herb is cold and moist in the second Degree, not Aperitive: but the Berries are of the same Quality, and Opening, Diuretic, Alterative, and Lithontriptick.

VIII. *The Specification.* They are peculiar against Obstructions of the Reins, Ureters, and Bladder, and to help in the Strangury, Stone, Gravel, Sand, and Tartarous matter, lodged in those Parts.

IX. *The Preparations.* You may have therefrom, 1. A Distilled Water from the Fruit or Leaves. 2. A Juice of the fruit made with White Wine. 3. An Infusion or Decoction of the Berries. 4. A Diet Drink. 5. A Powder of the Berries. 6. An Oil of the Root. 7. A Cataplasm of the Leaves or Fruit.

*The Virtues**

X. *The Distilled Water.* It is Cooling and Diuretic: It may be Distilled from the Fruit or Leaves with a little Milk. It may be drank from two ounces to five or six, sweetened with a little Sugar, Morning and Evening, against the Strangury, heat of Urine, and all the Distempers of the Urinary Parts.

XI. *The Juice of the Fruit.* It may be given from one ounce to two, in a glass of White Port Wine, against Stone, Gravel, Sand, Tartarous Mucilage, or Obstruction of the Urine in either Reins, Ureters, or Bladder: but it is not so powerful as the powder.

XII. *The Infusion or Decoction of the Berries in White Wine, or Water.* It opens the Urinary Parts, and is an excellent thing against the Strangury, provoking the Urine plentifully when it is stopped, or grows hot, sharp, or painful in the passage. It is good to expel the Stone and Gravel out of the Reins and Bladder, helping (where it is composed of a gritty Substance) to dissolve it, and to expel and lend off by Urine in form of Sand or Gravel, it is good to cleanse inward Apertments, and Ulcers in the Urinary Parts, and to relieve such as make a foul, filthy, or stinking Urine, or that piss Blood. It is profitable also against the Jaundice,

by carrying off the Morbifick Cause by Urine. Ecce from four to eight ounces, Morning, Noon, and Night: and to be continued as the Exigency of the Disease requires.

XIII. *The Diet Drink.* It is made of the Berries put up into new Wine, when it is new made, that working with the Berries therein, their Virtues may be drawn forth into the Wine. Or because our Country affords not new Wine in the Month, you may put them into new Beer, or Ale, as you set them to Work, and allow them up therewith, that they may fully Work with the same. The proportion is two large handfuls, whitish green, to a Gallon of Wine or Ale: and one large handful well bruised when dry. This may be drank as ordinary drink, but at least a Pint of it Morning, Noon and Night. It has all the Virtues of the Infusion or Decoction.

XIV. *The Powder.* It is made of the dried Berries, in which the Seeds themselves are reduced into a Powder. The Dose is from fifteen grains to half a dram, Morning and Night, in a Glass of White Port Wine. Or you may Infuse it in the same Wine, two ounces of the Powder to three Quarts of Wine, letting it stand in a cold Digestion a Month before hand, shaking the Bottle every day. When you drink it, (shake the Bottle, and pour it out thick and thin together, and let the Patient take a quarter of a Pint at a time, Powder and all, Morning and Evening, and continue this course till he has found the desired relief. This Powder, and thus taken, is much more efficacious than either the Infusion, Decoction, or Diet, and ought to be very much valued of such as are troubled or afflicted with the Stone, Strangury, or stoppage of Urine.

XV. *The Oil of the Root.* It is good against the poison of the Scorpion: This Oil being applied, Parkinson says, it is powerful against their stinging. Pliny says, that the Root hereof is so powerful to stupify the Venom of the Scorpion, that if it be put to them, they will utterly lose their strength.

XVI. *The Cataplasm.* It is cooling and profitable to be applied to allay the heat of Inflammations, and to ease pains coming from a cold cause.

CHAP. CXXIII

O/CHERVIL Garden.

I. *The Names.* It is called in Greek, *Xanthoxylon*, and is thought to be *SvQuax*, or *Theophrasti*, lib. 7. cap. 7. translated by *Gaza*, *Enthuficum*: In Latin, *Cerfolium*, and *Chrysolium*: In English, *Chervil*.

II. *The Kinds.* It is threefold, 1. Garden. 2. Wild. 3. Tooth-pick Chervil. The Garden Chervil is threefold, 1. The Common Garden, called *Cerfolium Sativum*. 2. The Great Sweet Chervil, or Sweet Cifley, called *Cerfolium ?uignum*, five Myrrhis. 3. The Small Sweet Chervil, Small Sweet Cifley, called, *Myrrhis alter a parva*. The Wild we (hall treat of in Cap. 124. and the Tooth-pick Chervil in Cap. 125, following.

III. *The Description.* Garden Chervil has a small and long Root, which perfumes every Tear, and is raised up every Year, with Seed sown in the Spring, also in Autumn for Salleting. It rises up with Stalks not a foot high, and in its leaves much resembles Parsley, but after it is grown bigger, the Leaves are very much cut in and jagged, somewhat

rejhi blvng Hemlock, being a little hairy, and. of a
ivhtijh green color, but turning reddish in Summer,
with the Stalks al/o, bearing at the top of its Branch-
es /poked Tufts of white blowers, which being past,
turn into long and round Seed, pointed at the ends,
and blackish when they are ripe, of a fweet tafte,
but no/me II; but the whole Herb it /elf has a pretty
kind of/meet Scent.

IV. The Great Chervil, (called" al/o Sweet Gf-
hy) has a great Root, blackish on the out fide, and
Ufhitifb within, from which fprings forth many fibres-
it perifhes not, hit abides many years, and is of a

fweet, plea/ant, hot,/picie Tafte, pie a/ing unto ma-
ty : From this Root comes forth feveral Stalks of
winged Leaves, confifting of many heaves fet to-
gether, deeply cut in on the edges, and every one al/o
dented about, very like, and re/embling the Leaves
of Garden CrefTes, from which they are not eafily to
be diftinguifhed, but by good ob/ervation oftho/c who
know both : Their tafte is not unplea/ant (for which
re a/on many put them into Sq/lets) and is not much
differing from the Tafte of Anifeeds : There al/o ri-
fes up a Stalk rea/onable large, and a little crefted,
about a yard high, /preading it/elf out into many
Branches, at the tops whereof ft and many fpoaky
Tufts or Umbles of white Flowers, which being paf-
t away, there follows brown, long, cornered, great Seed
two always joined together.

V. The Small Sweet Chervil, (or Small Sweet
Cifley) has a Root not like the former, but confif-
ting of almoft nothing but fibres, thick and matted to-
gether h its Leaves, Stalks, and Umb/es of Flowers
differ not much from the laft, /aving that they are
every ways le/s. The Seed is long, f/mooth, /mall,
and/baped like to an Oat, and in tafte not much un-
like to that of Daucus Creticus.

VI. The Places. The two firft grow in Gardens,
and that almoft throughout this whole Kingdom:
The laft is found in fome parts, of the Alps, as a-
bout Genoua, and other places, but with us only in
Gardens of Botanifts, and fuch as are curious of
Plants.

VII. The Times. They Flower and Seed in May,
and their Seed is ripe in July : and therefore are
Sown again in the end of Summer.

VIII. The Qualities. It is hot and dry in the firft
Degree -, Galen fays in the fecond : Aperitive, Ab-
fterfive, Carminative, Digeftive, Diuretick and An-
odyn. It warms and comforts the Head, Brain,
Nerves and Stomach, is Peaoral, Nephritick and
Hyfterick: Alfo Alterative, Alexipharmick and Sper-
matogenetick.

IX. The Specification. It is found by great ex-
perience to comfort the Stomach, and provoke Urine,
even where it is ftopt.

X. The Preparations. You may have hereftom,
i. Tide Green Root. 2. The green Herb. 3. The
green Seed. 4. The Difilled Water. 5. The Li-
quid Juice. 6. The Effence* 7. The Bal/am, or
Ointment. 8. The Roots Candied. 9. The Decoftwn
of the Roots in Wine.

The Virtues.

XL The green Root. Gerard lays, they are excel-
lent to be eaten in a Sallet, being firft boiled, and then
dreft up to the Table, as the Cook can tell belt either
with Butter and Vinegar, or Oil and Vinegar. They
are good (iays he) for old People which are Dull
and without Courage: they rejoyce and comfort the
He^s lengthen and provoke Luft much.

XII. The green Leaves. They are very good,
wholfom and pleafant, bpng eaten raw as a Sallet
H^f with other Salleting, giving the whole a little
rehfh ofAmfeeds. Ufed as a Pot-herb, it is plea-
fant to the Stomach *, and is ufed by the Dutch m
a kind of Loblolly or Hotchpotch, which they call
Warmus.

YAW. The green Seed. Par/dn/on fays, they are
commended, being put into a Sallet of green Herbs,
and eaten with Oil and Vinegar, to ftrenghen the
Aged, and comfort a cold Stomach. Gerard lays,
that the green Seed eaten as a Sallet, with Oil, Vi-
negar, and Pepper, exceed all other Sallets by many
Degrees, both in pleaiantnefs of Tafte, fweecnefs of
Smell, and wholtbmnefs as for Food, being good
for a cold and weak Stomach.

XIV. The

XIV. *The Vifilled Water.* Being drank to four or fix ounces, it is good to diffolve congealed Bloody and provoke Urine.

XV. *The Liquid Juke.* It diffolves congealed Blood in the Stomach, Guts, Pleura, Lungs, Womb, or other Bowels: it provokes Urine, and the Terms in Women, and to expel Sand, Gravel, and Stones out of the Reins, Ureters and Bladder: and prevails alfo againft the Pleurifie, very much comforting a weak, fick, and cold Stomach. Dofe four ounces, Morning and Night, in a Glafs of Wine.

XVI. *The Effence.* It has all the Virtues of the liquid Juice, befides which it facilitates the Birth, and brings away the After-birth, is good againft Poifon, and the Venomous biting of the *PhaLingum*, *zsDiofcorides* faith, is nutritive, and reftores in Confumptions: Being often taken it breeds Seed, and very much provokes Lull, and has reftored foire who have been Impotent.

XVII. *The Balfam and Ointment.* They fo cure green Wounds, and digeft them, if Contufed or Lacerated: Applied to filthy, ftinking, and fordid Ulcers, they digeft, cleanfe, dry, conglutinate, and lie admirably: and applied to the Gout, they eafe the pain thereof, drawing forth the Morbifick matter thro' the Pores of the Skin.

XVIII. *The Candied Roots.* They are very good to warm, comfort and itrengthen a cold and weak Stomach, and excite *Venus*: And *Parkin/on* fays, they are thought to be a good Prefervative in the time of Plague.

XIX. *The Deccffion of the Roots in Wine.* It has the Virtues of the Juice and Effence, but not all out fo powerful: It is good againft the bitings of Vipers, Mad Dogs, and other Venomous Creatures -, Is profitable againft the Phthifick, and fuch as have an Impo&ncy, or are in a pining Consumption. Dofe, Morning and Night, from four to eight ounces.

CHAP. CXXIV.
Of CHERVIL Wild.

I. *HE Names.* It is called in *Greek*, *X<*>?i?>* JL *KOV iywv*: In *Latin*, *Cerefolium*, or *Cherifolium Sylveftre*: and in *Englifh*, *Wild Chervil*.

II. *The Kinds.* This is the fecond Species of *Chervils*, and is threefold: i. *Cheerophy Hum Bau>ini*, *Cerefolium Sylveftre Vulgare*, Common Wild Chervil. 2. *Myrrhk JEauicolorum nova t'abij Co>um*^ Small Hemlock Chervil. 3. *Cicutaria alba* *Adumenfts*, *Cicularia Palujhis Camerarij*, Wild

III. *TV ^r... <ti>onSi W n d Chervil ^ has a joMtifi*
... which have on their
tops Umbles offsmall and Very e
...
ers, which being fuffed away, are Succeeded by longijh
Seeds. The Leaves are commonly parted into three
principal parts j and each part again fubdivided into
five, ivibcb are frupt about the edges, foft, hatry,
and of a dark green, or reddijb color.

IV. Small Hemlock Chervil, has a Root Jtall ana
white, which tvhen it has perjeffed its Seed', penjh^
every Tear: from which rife up Stalks flender, bol-
low, fmooth, not hairy, and feldom exceeding the
height of two feet. They are divided into ifcer.il

Branches, agai/ifi the Leaves, S^o ^{l^{at}} they Spring
out of hofoms, as it were, of the Leaves, which car;
ry XJrnblei of J mall white flowers ^ after which jor
low the Seeds, rough, hairy, round and longijh, about
the bignejs of Anifeeds, aM growing ivco together.
The Leave f arè j mall, anijinely cut or divide d,
like thiSe of Hemlock, but of a whitifl) color, and
hairy.

V. *Wild Cifley*, has a Root very large^ and divided into feveral parts, white, and Spungy, of a pleafont firong Smell, and with a hot and biting tajie i
This Root, tho' the Stalks fade an I perifl?, yet lives;
and the Leaves are green all ths Tear. The Stalks
(if they grow in good ground) come to bē three or
four jeet high, are hollow, jointed, pretty thick,
green, and ?uuch Creffed, fend.ng forth out {f the
bofoms of the Leaves many Branches^ which have en
their tops, Umbles of white i'loKers, each Flower
confining of jive little Leaves; of which the loweji
is twice as big as the reft -, tld two fide ones lejs5
the upper mofi the leajl of all. The Leavès ate large
like thofe <?/Myrrhis, or Sweet Cüley, but of a dark
green color *, and thofe which grow on the Tops of
the Stalks, are commonly divided into three parts,
and thofe again Subdivided into Several long fharp
pointed and Snip* Leaves, like thofe in Sweet Cüley,
the Seeds arc longijh, round, jharp pointed, black,
and finning. This Plant may very well be called
Wild Cüley, for that it fo much refemUes the Gar-
den Sweet Cüley, not only in its form, but (as Au-
thors believe) in its Virtues loo.

VI. *the Places.* The firjt grows almoft in every
Hedge, and. by every Hedges fide: The Second, about
Mudd Walls, High Ways, and fuch like places, a-
bout London, and many other parts of the K tngdom:
it is but a imall Pl.mt. The third is found very
frequently in all pijet-s, efpecially where the ground
is moift and fat, in Meadows, Orchards, and the
like.

VII. *The Times.* The Jirft flowers in June and
and the Se^ ri^{efl} in r^{he} me³ⁿ Seafon ^{no}

not lo.£ utter. *The Jecond* comes up in *March*, flowers in *May*, and its *Seed* ripens in *June*. In *Italy* they eat the young *Leaves* in *Sailers*, and call it *Wild Chervil*. *The third* flowers also in *May* and *June*, and its *Seed* ripens in the mean *Seafon*, or not long after.

VIII *The Qualities, Specification, Preparations and Virtues*, are laid to be the fame with the *Garden Chervils*, io which I refer you. *Parkinson* fays, that *Wild Chervil* will help to diffolve any *Tumor* or *Swelling*, and that in any part of the *Body*, as also to take away the spots and marks in the *Flesh* and *Skin*, proceeding from *Congeaed Blood*, by bruifes or blows, in a fhort time, by applying it (bruied I fuppole) to the place.

IX. *A Gitaplajm of the green Herbs and Roots*. I once knew a *Man* who had been for a long time, even for many years, affiiled with the *Gouc* ^ fo that fometime for four, five or fix *Months* together he could neither go nor ftand, which put him fo much out of heart, as te think himfelf paf all cure. A *Beggar Woman* going by, and begging at the *Door*, at llich time as the *Paroxyfm* was upon him, and underftawding by fome *Difcourfes* the *Matters* illnefs, told them fhe would cure him: fhe advifed him to apply a *Pultice of green Wild Chervil* to the parts afflifted, and to renew it as of ten as he faw need: (fetching to him also at the fame time fome of the *Herb*, that he might know it:) he did fo, following exactly the *Beggar Womiins* advice, and he had in a little time eafe, and in lefs than a *Months* time a perfect *Cure*. If at any time afterwards he found any *Grumbling Pain*, in the fame parts, or in any other, he had full recourse to the fame remedy, and aver'd upon his faithful word, that he never apply'd this *Cataplajm* in vain.

CHAP. CXXV.

Of CHERVIL Tooth-pick.

I. /TP HE Names. It is called in *Greek*, *TiyyiJov*.

II. In *Latin*, *Gingidium*, and *Bifacuta*: In *Englifh*, *Tooth-pick Chervil*, and *Strange Chervil*. The *Syrians* call it *Vijnaga*, as *Rauwolfius* faith.

III. *The Kinds*. There are three principal kinds, I. *Gingidium vcrum*, five *Syriacum Diofcoridis*, *Syrian Tooth-pick Chervil*, called in that *Language Vijnaga*. 2. *Gingidium H if panic um Matthioli*, The *Spanifh* kind. 3. *Gingidium Chxrefolij, Foliis Tabernmontani*, *Tooth-pick Chervil*, with *Chervil* *Leaves*.

IV. *The Defcriptions*. *The fir'ft* has a *Root* almoji like a *Carrot Root*, not great, but long, white and woolly, perifhing every *Tear* after *Seed-time*, which is the fame *Tear* it is *Sown*, or elfe fpringing up late, and not (hooting up into *Stalks* for *Seed*, it will abide a *Winter*: from this *Root* it grows up with an upright *Stalk*, foniewhat rough, branching forth from the very ground almoft, on which are jet *Stalks* of fine cut *Leaves*, /mailer than *Fennel*, cfpecialy thojè on the *Stalks* and *Branches*, for the loweft are a little broader. At the tops of the *Branches* grow broad *Vmbles* of white *Ylowers*, fomewhat purplifh in the middle, which *Vmbles* before they flower, hang down their *Heads*, and after the flowers are paf, the *Umbles* do contract, or draw themfelves rounder, the outward parts being higher than the middle, which then is fo hollow, that it represents a *Birds Is'left*, fomewhat like to the *Umbles* of the *Wild Carrot*: *The Mowers* being paf, there fucceeds a great j> Sfn

ty of very fmall *Seed*. The whole *Plant* has a kind of *Refinous Tafte* and *Smell*. There is another fort also of *Syrian Chervil*, which has but a few *Stalks* of winged *Leaves*, almoft like to *Parneps*, but that every divided *Leaf* is broad and round, but leffer the *Stalk* is fomewhat hairy, crefted, fmall, low, and naked of *Leaves* to the top, zchereon grovo feveral long *Stalks* with *Umbles* of white flowers, and two or three fmall long leaves with them, whoe *Smell* and *Tafte* is like the former.

IV. *The Spanifh Kind*, has a *Root* long anu. from whence rifes up a *Stalk* higher than the fir'ft Syrian kind and is every ways greater, as to whole,

whole, but the Stalk is more slender than it, and the Leaves more tender at the Joints, thicker, and more finely cut at the tops, on which stand large Umbles of white Flowers, divided into many parts, and standing upon long Stalks, which when the Seed grows ripe and hard, being long and slender, will serve very well for Tooth-pickers. Genesys, that in its Leaves, flowers, and knobby Stalks, it is like unto Wild Carrots, faving that the Leaves are somewhat finer an, of; jagged, and tenderer, but not rough or hairy at all, of a reasonable good Smell, and a bitter Taste, among which rise up bushy rundles, or spiky Tufts, like those of the Wild Carrot or Birds Nest, which are closely drawn together, when the Seed is ripe, at what time the Joints Needles are hardned, fit to make Tooth-pickers of, and for which purpose they very well serve and from thence came the English name.

V. The third kind has a Root long, white, and bitterish, from which spring up divers Stalks of zinged Leaves, very like unto the Common or Ordinary Garden Chervil, but not divided into many parts: the Stalks round, forked and blackish, about a foot and half high, with Joints and Leaves like the others. The Umbles of white Flowers, are encompassed about with smaller and finer cut Leaves when the flowers are past, the Umble is comraded together, which are clammy, and in which lies small Seed.

VI. The Places. They all grow in Syria the second in Spain plentifully: but with us they are only nourished up in Gardens.

VII. The Times. They flower in July and August, and the Seed is ripe in October, but with us they flower late, and therefore the Seed is much later so that if the Year is not hot and kindly, the Seed will scarcely ripen, or come to perfection with us.

VIII. The Qualities. They are said to be temperate in respect of heat or cold, and dry in the end of the Second Degree: Aftringent, Stomachick, and Alterative. They are more used as Nutriment than Medicine, both in former times and now, for Dioscorides and Galen say more concerning their Edible Properties, being eaten raw or boiled, or otherways ordered, according to several Mens liking, for that they are bitterish, and a little Styptic, and for the more welcome and agreeable to the Stomach: But Galen says, that they are rather Medicinal than Nutritive, for that though they may have a temperate Quality, as to heat and cold, yet that they have a manifest bitterness and astringency, by both which properties, though they may be very agreeable to the Stomach, yet they are more of the Nature of a Medicine, than of Food for that by those Properties they cleanse and dry up the moist Humors, by superabounding, may offend the Stomach, and irritate the Liver, and other parts.

The Specification. Besides strengthening the Stomach, as aforesaid, they are proper against Diarrhoea, Urine, and Bladder, and to provoke Urine.

The Preparations. You may have therefrom, The Decoction.

The Virtues.

XL. It is good against Vomiting, and strengthens the Stomach, it provokes Urine, and expels Sand and Gravel from the Reins and Bladder. The Dose is three or four ounces, Morning and Evening, in a Glass of White Port Wine.

XII. The Efficacy. It has the Virtues of the Juice, but it strengthens the Stomach more, and is withal more Diuretick. Dose three or four ounces in White Port Wine.

XIII. The Decoction in Wine. It is an admirable Stomachick, and being drunk to fix or eight ounces, Morning, Noon, and Night, it opens Obstructions, and cleanses the Reins and Urinary parts of Sand, Gravel, small Stones, and Tartarous Slime lodged in those parts, but it is not so powerful as the Effence.

XIV. The Spirituous Tincture. It strengthens the Stomach, helps Digestion, cheers the Heart, revives the Spirits, and comforts Universal Nature. Dose a Spoonful at a time.

XV. The Acid Tincture. It stops Vomiting, cleanses the Stomach of Tartar, and Viscosity, causes a good Appetite, and helps Wheezing Hoarseness, and shortness of Breath.

XVI. The Oily Tincture. It is Nephritick and Diuretick, cleanses the Reins and Bladder, and is good against Stone and Strangury. Dose twenty or thirty Drops in White Port Wine.

XVII. The gills. Necessaries or Tooth-pickers. They serve to pick and cleanse the Teeth and Gums of any thing sticking in them, which they do without any hurt to them, and leave a good scent in the Mouth.

CHAP. CXXVI.

O/CHICHLINGS Annual

HE Names. I do not find that it has any Greek name: The Latins call it *Lathyrus* which is a kind of Pease, (and differs from *Lathyrus*, We in English call it Chickling.

II. The Kinds. It is either Perennial or Annual. The Perennial we shall treat of when we come to treat of Pease Everlasting. The Annual is the subject matter of this Chapter: They are 1. *Lathyrus annuus major Beticus*, The Great Spanish Annual Chickling. 2. *Lathyrus Beticus elegans, filiquis Or obi*, Spanish party-colored Chickling. 3. *Lathyrus major filiqua brevi*, The greater short-codded Chickling. 4. *Lathyrus minor filiqua brevi*, The lesser short-codded Chickling. 5. *Lathyrus, five Cerculariflore albo, Aracus Dodonai, Ervum Lacunatum, Ervum angulosum aliquibus*, White flowered Winged Chickling. 6. *Lathyrus, five Cerculariflore purpureo, Aracus five Cicera Dodonai*, Purple flowered Winged Chickling. 7. *Lathyrus, five Cerculariflore Caruleo, Aracus Hpanicus Lamerarij, Cicercula JEgyptica Clusij*, Blew flowered Winged Chickling. b. *Lathyrus, five Cicercula fiore rubente*, Red flowered Winged Chickling. 9. *Lathyrus, five Cicercula Bertica Dumetorum*, Wood Chickling.

III. The Descriptions. The first of these is a Root small, not running deep nor far, but penning every Year from whence proceeds two or three flat Stalks, three feet or more long, inched at it were with skins or films on both edges, having two small Leaves apiece at each Joint, from whence shoot forth the Branches, bearing two pretty long and broad Leaves about the middle thereof, one opposite to another, with a twining Oasper or Tendrel running between them. The Flowers fit and finely upon the stalks, of a deeper purple color, but leiser than the Perennial: MM. Perennial: MM. colored, A a . Cl.

Cods, very like the Perennial, as the Peafe within them alj'o are.

IV. The fieconl has a fmall Root, from whence fpring up Branches or Stalks five or fix Feet long, with fuch like Welts, or skinny Membranes on both edges, at every Joint, from whence come forth long Leaves -, and higher upwards fet with fix Leaves on both fides : and in the middle between them come forth a fmail Oaf per or Tendrel, by which it catches hold of every thing which jhinds next unto it. At the Joints alfo come forth the Flowers, either one or two at the moft; upon long Foot ft alks, like unto the other kind, the upper Leaf of a fine Crimfon, or Orange color, and the other in the middle of a perfect bite. After the Flowers are paf, comes the Peaje or Seed in long Cods, every Seed bunching out <w in the Cods of Orobus, and as large almoft a* the Smaller Peafe.

V. The third has a fmall /ender Root, from whence rizes up feveral Stalks, which lye upon the ground, unlfs fup'ported by fomethng ftanding near them : in its manner of growing it differs but little from the former •, but its Leaves are fomethng longer, turning a little roundifh, almoft Ciclefafhion'd. The Flower has its inner Leaves white, and the outward fomewhat purplifh, the Cods which follow are thick and fhort, which contain within them, fmall round blackijh Peafe.

VI. The fourth differs little from the Idji, but only in the fmallnefs of the Plant, and the Cods having a little roughnefs upon them.

VII. The fifth has a fmall Fibrous Root, perijhing every lear, from whence fprings up weak Wineed Stalks lying along on the ground, if not Supported by fomethng near them, like as ahl the forl, having alfo two fmall Leaves at the Joints, and two others narrower likewise on the Branches, T mx in drotted Claffpers or Tendrels.

ers are white, and ft and on long Foot ftalks •, which being paf away, there comes after them fhort Cods, Somewhat flat, with two little narrow films all alone the back of them ; which contain within them Seed, f rea J's ft* -> "bite and cornered, and Somewhat larger than thoSe of the former forts.

VIII. Thefixth in its Roots, Stalks, Leaves, and manner of growing, is like the former: the Flowers and Seed chiefly declare the difference -, the Flowers are of a dark dead purple color, and the Cods which follow, are fmaller, with films at their backs like the former. The Seed or Peafe within them, are alfo cornered, but of a dark brown color, fo that they are almoft black in appearance.

IX. The Seventh has a Small fibrous Root perijhing as the reft: do, every Tear -, and differs in nothing from the fifth andfixth, but in the Leaves, which are much larger -, and the Flowers, which are of a pale blew on the outside, the inner Leaves being

weak Stalks with films on the edges, are two fmall Leaves, and from Jerwen tlelT forth the Branches, which have feZral/mail Tfk green Leaves on them, fomewhat round It ends and are Sometimes three on a fide •, but not always one aYain) "a" fomet, but bofm of the Stilck andiZii, monly two Flowers, on a T, being njd u77/1/0 which come forth long smooth Cods, without at the back, containing within them, round

XII. The Places They grow in Spain, from whence they were rlrft brought to us : the firft foE grow Wild : the latter hve are Manured there • but grow only in Gardens.

XIII. The Times. They Flower in July, and the Seed is ripe in Auguft or September.

XIV. The totalities, Specification, Preparations and Virtues, are the fame with our Peafe or P«nc to which we refer you. The five laft forts, Boel fays, are eaten by the poor Spam lnstead of Bread ; for where thefe for Food, feldom any Bread Corn iseatpn. of a vey folid Subitance, and extreamW and therefore nourifhmore thanothe?X more hard of Concoftion Grain but are

CHAP. CXXVII.

0/CHICKWEED Common.

Called in Chickweed. There are three principal kinds, h Alfine Communis, Common Chickweed, of which in the next Chapter Atom, iiaw wzdf, Baftard Chickweed, of which we (hall treat in Chap. J. of the Lommon kind, there is, i. //? w « J ^ Lugdunenfis \

iumenfts -, Angustifolia Bâuhini, Our Greateft Chickweed : Gerard calls it, *Alfine major*. 2. *Alfine minor*, Our Common fmall Chickweed. 5. *Alfine Baccifera*, and *Baccifera repens*, *Cacubalum Plinij*, *Alfine repens Clufij*, Berry-bearing Chick-weed,* and Spreading Chickweed,

III. The Defcriptions. The firft has a tibte thready Root, fmall, and confifting of feveral little firings like hairs, from whence rife up Stalks a foot or foot and half high, andfometimes higher, a great many from one Root, long, and round, flender, full of Joints, with two Leaves growing out of every Knot or Joint, almoft as large, and a* long or longer than Fellitory Leaves^ to which they are very like in'Jhape or form, butfmooth, without any hairynefs or downnefs^ and of a light green color: The Stalks • are fomewhat clear, and as it were perlucid^ or transparent ^ and about the Joints they are often of a very light red color. The llowers are at the tops of the Branches, being white, and confifting of fix Leaves apiece, ftanding in long green Husks, not much unlike to the flowers of Stitchwort, but leffer. Which ^b*wg pafte, in their places fucceed long Knops, or *fed Veffels, but not great, containing within them ^lSmall yellowifh Seed.

little ^{ff}^e fecond has a Ro^o* white, and full alfo of Branch ^{mgs}* ^{fm} whence fpring many Stalks or ^{es}* f *n the former, which for the moft part are fmall, round, and very tender, and ^{leaves} are very round, and ^{flowers} are very white, and ^{knops} are very yellowifh.

***S.JZVS&Zi££Z**
manner white and /ntall ftalks in ^{lik}e ^fan^loned green long husks ^h which being pafte^ the ^faid Husks or Knops contain fmall yellowijh Seed.

V. The third has a Root which is white and long, creeping much under ground, and fbooting forth in divers places every year new fshoots, the old dying way every Tear : from this Root come forth many flexible Branches full of Joints, rifing higher than

a Man, if it flands by bufhes or other things, where it may take held; other wife, through weaknefs, they lye upon the ground^ and fo feem not fo long or tall. At every one of the Joints ftand two Leaves, one againft another, much like to the Common Great? Chickweed Leaves, but larger^ and coming fome what near to thofe of Pellitory of the Wall, and of ^af?fh green color. At the Joints alfo, on both fides of the Stalks come forth other Branches, jointed and fet with the like faJhioned Leaves in the fume manner, and at the ends of them large, green, round Husks, ending in jive points, with white Flowers growing out of them, confifting of five, and fome times of fix ukite Leaves apiece, cut in at the ends : in which Husks^ after the flowers are pafte (and fmall round Heads, like Berries, green at the firft, and blackifh when they are ripe, containing within them many flat, blackifh, purple Seed. This Plant, has only an herby tafte, like to the Common Chickweeds, and therefore the Learned botanifis refer it to them.

VI. The Places. The firft grows almoft every where throughout Engldnd, by Highways and Ditch fides, in moilt and watry places, efpecially if tire Earth is rich. The fecond is found alfo in imny of the like places, as alfo in Gardens, where irany times it is a moft pernicious Weed. The ^{laft}, ^C* ^fius fays, grows in lveral places of Spain and Ger* many ; as alfo in ^lnders and England^ as ^{Pend} and ^{Lobel} fay -, ^{Parkin}fon fays, that he had fome-¹ times ffound it by Hedge fides in our own Land.

VII. The Times. Chickweed is molHy green if Winter j they Flower in Spring and Summer j and their Seed is ripe in June and July.

VIII. The Qualities. They are cold and moift in the fecond Degree : Emollient, Arthritick, Anodyn, and Alterative : *Galen* and *Qnbajius* lay, they are without any Aftringent Quality.

IX. The Specification. Their Juice is peculiar againft the Inflammation called *St. Anthonie's fire*

X The Preparations. You may have therefrom, i. Juice. 2. An Ejjence. 3- A Dijilled Water. 4. An Oil 5. A Cataplafm. 6. A Compound oil

The Virtues.

XL The Juice. It is very Cooling and Emollient, without any binding property. Galen and others say, that it has the Virtues of Pellitory of the Wall; but that I doubt -, however it is commonly found to be as ette&uai as Purflain to all the purposes whereinto that ferves, except for Meat or Salleting only. Applied with Cloths or Spunges dipped therein, to the Region of the Liver, and as they dry, to have fresh applied., does wonderfully attemperate the heat of the Liver. The fame also is este&ual for all hot Apoftems and Tumors wherefoever, and is profitable againft Ignis facer, or Anthonies Fire, and the like : as also for all redifels of the Face, Wheals, Pufhes, Itch, Scabs, either fimply used, or iXiade into an Ointment with Lard. It is good for all heat and redness of the Eyes, being dropt into them •, also put into the Ears warm, it eases their pain proceeding from a hot caufe. The Piles bathed, or fomented therewith, it abates their pain, and takes away their heat and fharpness, and eases all other-pains of the Body proceeding from heat and iharpness of Humors. It is good againft hot and virulent Sores and Ulcers in the Privy Parts, Legs, or diewhere, they being often washed therewith.

All. The Ejjence. It cools Inflammations of the Lungs, without any binding property, and takes away the heat of the Stomach and Liver, breaking out into the Lips, caufes Appetite, being loft thro too much heat, is prevalent againft Heftick Fevers, as also the heat and pain in the Back, and the sharpness and folding of Urine. Dofe from one to two or thi^e ounces Morning and Night.

XIII. The Dijilled Water. It has the Virtues of the Juice, bitt much left effectual ; and may be used as a Vehicle to take the Eflence in.

XIV. The Oil. Made by boiling the Herb in Oil Olive, till it is crihp, and repeating it three or four times with fresh Herbs, it heals fore Legs, Ulcers, Wheals, Pufhes, Scabs, and the like : and being anointed upon ihrunk up Sinews, it extends them, eases their pains, and makes them pliable again.

XV. The Cataplafm. ^ of Chickweed four handfuls : Marsh-mallows, two handfuls; mix and boil them to a Pultife, with fenugreek Seed, Linfeed, ana, two ounces, briefed. This applied to Tumors, or Apoftems, ripens and breaks -them, affwages the Swelling, and eases the Pain.

XVI. The Compound Oil. Take green Chickweed, fresh Red Rose Leaves, of each two handfuls : Oil of Trotters, two pounds : boil till they are crihp, and ft rain out: repeat this boiling with fresh Chickweed, and Red Rose Leaves, twice more : strain out, and keep it for use. Being anointed warm, and well rubbed in upon Sinews which are strained, it is a molt excellent thing : Let it be used Morning and ^Evening, and in a little time the Patient will be ^cured.

XVII. The Virtues of the Alfine Baccifera. Some Authors say, that it is no less fatal to be eaten than the pepy Kightshade : but others say, of the Cacubulum Plinij otherwise : and that if the Leaves thereof be beaten with some Vinegar, and applied to the place itung with Scorpions or Serpents, it helps them : And that the Juice thereof taken, with twice as much honied Wine, it eases the pains of the Back and Loins •, alio the Head-ach (from a hot

Forehead and Temples : and that being bound to Wens or Kernels, or they bathed often with its Juice, it diffolves them. >

CHAP. CXXVIII

Of CHICKWEED, Water.

The Names., It is called in Greek, *ϕυλίσκος* In Latin, *Alfine Aquatica* : ^And in English, Water Chickweed.

II. Tide Kinds. It is fivefold, 1. *Alfine aquatica major*, The greater Water Chickweed; 2- *Alfine aquatica minor*, The lesser Water Chickweed. 3. *Alfine aquatica minima* ^ & *ffipillifolia Bauhini*, The smallest Water Chickweed. 4. *A/w» 8aA<»^ A fine marina*, Sea Chickweed. Label calls it, *Hip-pi a major* \ and *Cefalpinm, Centunculus*. ?* *Alfine reffa, flore Caruleo*, Upright blew Chickweed. There is another which some account a *Sea Chickweed*, viz. *Alfine Yaluftrh minor folio chlongo* ^ which others more properly call, *Portulaca marina*, *Sea Purflain*, and under that Title you will find it.

III. The Defcriptions.

longanlef, the thekness of aWheat s7rl, J> much unlike to the RBots of Qyfca-gSs "from whence rfe up divers upright Stalks, tender and jointed from the bottom to the top, U Zh pretty large sharp pointed Leaves, ftanting by pairs* eel tarn diftances, fomewhat like thofe of Pellitory of the Wall. At the tops of the Stalks growe fmall white flowers - like to the other Chickweeds, or like to; butchwort, fetf lejfer, having many fmall and pointed Leaves in each Flower^ after which come fmall whttijh yellow Seed.

IV. The fecond of thefe has a bunchy fibrous Root, from whence feveral weak and tender Stalks rife up, jointed like the former, and with Leaves at the joints, as in the other, not much unlike in Jhape

d, in thefarmer

 what broad, in which are contained three brfoitf
 greater Seeds.

Smaller Water Chick weed

Smallest water Chick weed

J. The third, orfmallefi kinl ScrpUifoliis, has
 ijmilt Root, wtb many fibres^ from whence firing

Sea chick nfce.cf.

VII. The fifth his a Root white and long, with feme
 fibres thereat, frm whence rife up for the moft part
 feveral upright Stalks or Branches, imnte£ in Jive*
 ral places, and divers fmall Leaves growing ihere-
 an at the manifold Joints, fnewbat divided like
 unto Leaves of Rue, and a little refembiing aTte?
 foil Leaf: at the tops of the Joints come forth fmall
 Steve Flowers, confining of four Leaves apiece .• which
 being pufl away, there appears fmall round^ Chick-
 weed like Heads or Husks, w'uhj'mallSeed therein.

VIII. The Places. The jrfl three, and the Jiftb,
 are found to grow in 01 rear Wacfers, and Waty
 places in moft Parts of England. Ths SerptUifolia
 may be found in Witty places, between Qapham
 Heath and Touting, and berwten Kenhjh-Tmn and
 Uamftead. And the fourth grows near the Sea
 liore, and in \$a/t Marjhy plans, upon* ferttal
 Coafis of this Kingdom.

IX. The limes. Their flowering time is in the
 heat of Summer, and their Seed ripens in the mean
 Safon, and in a little time a

• C H A P. CXXIX.

Of CHICKWEED, Baftard.

L HP // E Names. It[#] is called in Greek, *~~1-1-1~~
X v'ah : In Latin, *Al fine notha* ; and in ~~1-1-1~~
//&, *Bitjhird Chickweed*.

II, T: * JClz'x. There are many kinds hereof, but theie following are chief^e. i. *Alfme foli/\$ fubrotundis Veronica*, Speedwell Chickweed. 2. *Alfme folio TriJJaginis*, Germander leav'd Chickweed. 3. *ill fine jpuna prior Dodonji, Alfine folio he derate minor*, Ivy leav'd Chickweed. 4. *Alfne hirfutia foliis AuncuLc Muris*, Hairy Chickweed, with Moufe Ear Leaves. ? *Alfme Vifcofa*, Clammy Chickweed. 6. *Alfme Pctrta*, Stone or Rock Chickweed. 7. *Alfne fluiatilis*, River Chickweed.

III. The Defcriptions. The firft of thefe has a *fmall and thready Root*, which perijhes not in the Winter, from whence many Branches fpring up, and fspread abroad, full of J^mall and almoji round heaves, fet in couples or pdirs, very like to thofe of Veronica, or Pauls Betony, called Speedwell, but not like to Elatine or Fluellin of any kind. The Flowers glow at the Joints with the Leaves, from the middle of the Branches upwards, bei'ig very fmall, made of five blew heaves, after which come fmall flat Seed Veffels like Pouches, in which is contained fmall round yellowifh Seed.

IV. The fecond has a fmall long Root, full of many fibres or threads, which continue all the Winter, from which come forth fever alfmall weak Branches fpadding upon the ground, three or four Inches long, Jet with fmall and fomewhat round heaves, zvhich are dented about the edges, and pointed at the ends, fianding by couples one againjt another : At the Joints whereof iozwards the tops, come forth fmall blew flowers, and fometimes white, confijiing of five round pointed heaves ; after which fucceed fmall round Seed Veffels, two always joined together, having fmall round Seed within them.

V. The third or Ivy leav'd Chickweed, has a fmall and thready Root, from whence rife up hairy Under Stalks or Branches, many of which fspread themfelves upon the ground, Jet with two heaves at a Joint, hairy and Ivy like, but nothing fo large. The heaves, fays Gerard, refemble the Back of a ike when it Jlies. The Flowers grow at the tops,

and conjijt of jive J mall blew round pointed Leaves y which being pajl away[^] round. Heads or Husks ap+ pear, in which is contained fmall Ghickweed like Seed.

VI. The fourth, or Hairy leav'd Chickweed, *bdt* a very fmall Root, with a few Fibres at it\ from which fpring up fever al hairy Stalks or Brdnche?y which creep upon the ground •, upon which grow in pairs, fmall, long, whitifh, hoary heaves, of a^o Moufe Ear like fafhion : the Flowers grow at the ends of the Branches, of a blujlo color, which give long and pointed Seed Veffels, in which is contained fmall Seed, like that of the |jpmmon Chickweed.

VII. The fifth, ^Clammy Chickweed, has a fmall fibrous Root, from whence come forth Branches[^] which (land more upright than the lajf, with roughy hairy, and clammy heaves, fomewhat like the Common Chickweeds, but of a wore blewifh green. The Floi&ers are fmall and white[^] and fcarcely open tl^om-jelves but in the hot time of^mthe day, ftanding at the tops of the Stalks, which from the ?middle upwards arefo clammy, that they will flick to ones fingers if touched, whereby they are apt to catch Flies^{ad} ?[^]L mall things which jail upon them

VIII. The sixth, or Stone Chickweed, has a small and thready Root, which sends forth many small and upright Branches, thick set 5 which so interfere one with another, that the whole Plant (which is indeed but a small Herb) seems like unto a small Bush. The Leaves are small and pointed; and the flowers small and white, like the other Small Chickweeds. Which being ptiji away, round Heads or Husks come forth, like unto those of Line or fax, in which the Seed, (which is very small) is contained.

IX. The seventh is a kind of Chickweed, growing by River sides ; it is a very small Plant, but has an admirable thick matted Root, like a Haffock, made up of a vast number of fibrous or thready firings, from whence rise up many small tender Branches, stretching or trailing along the Stream, upon which grow long Leaves, having a long middle Rib, upon which grows on each side thereof a great number of other smaller Leaves, like those of Lentils, or the Wild Vetch. The Flowers grow at the tops of the Stalks, which are small and white after which comes in husky Heads a small Seed.

X. The Places. The sixth grows on Mountains, and in Stoney and Rocky places : the seventh grows in Rivers : the others grow in Fields, as well Tilld, 2S*UntilPd, and by Way sides, &c.

XL The Times. They do all Flower in Summer, some in the latter end of May, and some in June and July some earlier, and some later than others, and their Seed is ripe quickly after but the fourth or hairy Chickweed Flowers not till Autumn.

XII. The Vitalities, Specification, Preparations, and Virtues, Authors assent to be the same with those of the Common Chickweed, to which you are referred and therefore we shall say no more of them in this place.

spreading and creeping on the Earth, with long slender Branches, or Strings, like to the Strawberry Plant, which take Root again, and shoot forth many Leaves. These Leaves are five in number, (some times seven, though but rarely) long, finely dented about the edges, and ending in a pretty sharp pointy foreward hard, and of a lightish green color. The Stalks are slender, leaning downwards, and bear many small yellow flowers, with some yellow threads in the middle, standing about a smooth green Head, which when it is ripe is a little rough, and contains small brownish Seed.

CHAP. cxxx.
Of CINK-OIL.

I. Names. It is called in Greeks *penon* A-KOV. In Latin, *Pentapbyllum*, and *Ocinquefolium*, a numero foliorum: In English Cinkfoil, and Five-leaved Grafts.

II. The Kinds. Authors make at least sixteen Kinds, or more ; many of which grow not in England nor any place belonging to our Territories: The most usual with us are, 1. *Pentapbyllum Vulgatifolium*, Our most Common Cinkfoil. 2. *Pentapbyllum majus album Vulgare*, The Greater Common white Cinkfoil. 3. *Pentapbyllum magnum flore luteo vel albo*. The Great Common Cinkfoil with a white or yellow Flower. 4. *Pentapbyllum rubrum*, Red Marsh Cinkfoil. 5. *Pentapbyllum fuscum*, Low Silver-weed Cinkfoil. 6. *Pentapbyllum incanum repens minus*, Lesser hairy Cinkfoil. 7. *Pentapbyllum*

foil. The first of these is called generally *Pentapbyllum*, or *Quinquefolium vulgare*, *Pentapbyllum majus repens* Baubin. Common Cinkfoil. *Pentapbyllum fuscum*, and *Quinquefolium album* : The third is called, *Quinquefolium album majus caule-*

The first of these is called generally *Pentapbyllum*, or *Quinquefolium vulgare*, *Pentapbyllum majus repens* Baubin. Common Cinkfoil. *Pentapbyllum fuscum*, and *Quinquefolium album* : The third is called, *Quinquefolium album majus caule-*

IV. The second has a Root thick and long, blackish on the outside, but reddish within, having many Fibres appertaining to it. From whence spring forth Stalks with many heads, also Leaves growing from the Root. The Stalks are small, weak, and a little hoary, and the leaves springing from them are five-fold, or divided into five parts, a little dented and pointed at the ends, green on the upper side, and a kind of hoary white underneath: between these

grund near a foot long, with many such like Leaves of the same shape, but less than those below. The Flowers are about the size of the former, but not full out so large as the next following, of a white color, consisting of five rounder pointed Leaves than the others are, having a nick in the middle, and several small yellow threads in the middle of the flower, set with a woolly Head, having many small Seeds set together like unto a Crowfoot head of Seed. Of this kind there is another whose green Leaves are, not dented, about the edges, little differing in any thing else.

V. The third has a Root somewhat thick and long, of a blackish brown color without, and reddish within: From this Root spring forth many Leaves, also Stalks or Branches, the Leaves stand upon their own Stalks, and are divided into five parts, as if they were five several Leaves, dented about the edges, and almost sharp pointed, very like to the first or Common Cinkbil, but that these are every way larger, and a little hairy, from which rise up five or upright Stalks for a while, till they are grown up to a considerable length, then they incline, or lean somewhat down towards the ground, as both the former do. These Stalks are a little hairy also, and divided near their tops into two or three Branches, and they again into others smaller, upon the tops of every one of which grows one Flower, of a white color, and larger than in either of the former, consisting of five Leaves, as all the other sorts do, in the middle of which stands a small downy head, encompassed with many reddish yellow threads. This kind, says Gerard, is so common, and so universally known, that he thought it needless to give any Description thereof. Johnson upon Gerard says, it has many long slender Stalks lying spread upon the ground, out of which grow Leaves, made of five longish jointed Leaves, joined to one long stalk, the Flowers also grow upon the like stalks, and are composed of five yellow Leaves. The Root is pretty large, of a reddish color, and round, but dried, it becomes square.

VI. The fourth, or Marsh kind, has a Root of a woody substance, with some fibres, or thready fibres adjoining thereto: From which Root rise up Leaves almost like to the former, consisting of five parts, notched about the edges, and standing close together at their lower ends, upon one long stalk: the Stalks are about a foot and half high, and of a reddish color, the Flowers grow at the tops of the stalks, like unto the other Cinkbils, save that they are of a dark red color, in a word the whole Plant is very like to the other kinds, especially the great Kind first before this described.

VII. The fifth or Silver-weed Cinkfoil, has a Root small, long, and blackish, like the first Common Cinkbil: from which springs forth long Stalks of Leaves, divided into many parts next the ground, set on each side thereof, two at apace, one again another, and an odd one at the end, all of them dented about the edges, very like unto Wild Tansey Leaves but not hoary, or silver like, as they are, but only green. The Flowers come forth at the joints with

Stalks of Leaves on them. The Flowers which grow on the tops of the Stalks, are lesser, and less divided than those which grow below: they are single, every one by its self, small, of a pale yellow color, and with a head in the middle, which after it is ripe, is like unto the other Cinkfoil beads of Seed, viz. like to a small, hard, dry Strawberry.

VIII. The sixth, or Hoary Kind, is all over hoary, whence it took the name of Incanum: It has a long, slender Root, and woody, from whence rise up several

XX. *The Cataplam.* Made with Vinegar by boiling, and applied, it softens hard Tumors, is good against Contusions, stops the Flux of Humors to any part, and gives ease in the Gout.

XXI. *The Dijiiled Water.* It has some small matter of the Virtues of the Juice, Effence and Decoction, but is chiefly used as a Vehicle, to convey other Preparations in.

XXII. *The Spirituous Tincture.* It is a famous thing against all manner of Fluxes of Belly and Womb, but especially those of Blood, it stops spitting, vomiting and pissing of Blood, and wonderfully strengthens the Stomach, Bowels and Womb, and it timely and prudently given, prevails against a *Videtes* because by its Spirituous Nature, it so admirably strengthens all the Veins and Passages. Dose two drams Morning and Night.

XXIII. *The Acid Tincture.* It has all the Virtues of the Vinegar at *Sell.* 19. and going, besides which it is an excellent Scomatick, stops Vomiting, strengthens the Stomach, cures Fleem, causes a good Appetite and Digestion, opens Obstructions, and cleanses the Bowels: mixed in equal quantities with *Tinctura Martis*, and given Daily, Morning, Noon and Night, in some convenient Vehicle to one dram, more or less, it perfectly cures the Green-sickness in Virgins, and the Yellow Jaundice in Elder People.

XXIV. *The Oily Tincture.* It prevails against Defecations of the Skin, Scurf, Dandriff, Morpew, and that kind of Disease called *MVKHI* or the Spotted Leprosie, inwardly taken to half a dram, or one dram in White Wine, it admirably strengthens the Back, and eases the pains thereof, opens Obstructions of the Urinary Parts, and expels small Stones, Gravel, Sand, and other Tartarous matter.

XXV. *The Balsam or Ointment.* It digests contused Wounds, cleanses old, putrid, running Sores and Ulcers, dries them, and suddenly heals them. There are but few better Vulneraries than this Balsam and Ointment, and being applied to the Gout, especially the Balsam, it eases the pain, and effectually draws forth the Morbifick matter, that for the most part the Patient remains perfectly cured.

XXVI. *The Collyrium.* It is made of the Juice mixed with Honey, a quarter of a pound of Honey to a pint of the Juice. Put into the Eyes, it clears the sight, and stops fluxes of Rheum falling down into them: there is nothing better for curing Ulcers in that part, the Eye being washed therewith three or four times a day. It is all an excellent Lotion to heal a fore and ulcerated Mouth, as also Ulcers in the Throat and Gums, the parts affected being often Gargled and Washed therewith: and if the fore or Ulcer seems to be inveterate, or putrid, the *Collyrium* will be so much the more excellent, if to the former quantity two or three ounces of Common Spirit of Wine be added.

to us, and therefore not to be taken notice of: Those which are Natives of our Country are chiefly three: 1. *Helianthemum Vulgare*, *Cbam&cistus flore luteo*, *Flos Solis quorundam*, Our Common Dwarf Cistus, or small Sun Flower. 2. *Helianthemum flore albo*, White Dwarf Cistus. 3. *Charnitaftus ferpilli folm flore Cameo*, The Great Dwarf Cistus with Wild Time Leaves, and a bluish colored flower.

Jl I ? for plants. *The* *fofi* has a hard and woody Root, of a brownish color, and growing in time by small Branches at the lower end. From this Root come forth several small woody Branches, lying for the most part round about the Head of the Root, which grow by pairs, or hairy, or covered with Leaves, whereof find three or five round pointed Leaves, sometimes gold yellow threads, in the middle of some places, but less in part away, the softest of which are comestible, but the Branches, which are Juice, like unto Comfrey, astringent taste.

CHAP. CXXXI.

O/CISTUS Dwarf.

THE Names. It is called in Greek, *themum*. *JKP* makes Nine Kinds of this Plant, but a great part of them are Foreigners

differ's *S* *i* *S* *l* *V* foot like the former and what higher the *Z* *J* but the grows up a little longer, and not white color. The Flower has the same as the former, but its taste is Ancient like, the former. much under Goitnd: from whence rise up many red-dill)

dijh Branches like unto Wild Time, with fuch like fmall heaves Jet upon them very thick, or as it were in a double row, of a dark green color, and a little hiiiry or downey withal, but a little longer and whitr next unto the ilovoers, which fiand three or four together, every one on a pretty long hairy Foot/talk, confifing of jive fmall yellow heaves, like unto the other, and fomewhat fweet.

VI. The Places. They all grow in divers places of England, but the firft and fecond mote efpecially in Kent, in almoff all places throughout it, which in fome places are greater than in others \$ but that with the white Flower is more rare to be met with than the other. The third is that which Parkin/on thinks is moft ufual with us in England. Gerard fays, that thiofe of our Englilh growth, he has found in many places, efpecially upon the Chalky Banks about Grave/land and Southfleet in Kent, and for the moft part all the way from thence to Canterbury and Dover, they delighting to grow in rough, dry, and Sunny places in open Eields, and upon Mountains.

VII. The Times. They Flower in Summer, viz. in June, July and Augufth, fome earlier, and fome later: but their Flowers are fofoon fading, that they feldom endure above a day or two ^ and their Seed is perfe&ed in fome fmall time after.

VIII. The Qualities. They are temperate in repect of heat or coldnek, and dry in the fecond Degree : Abiterfive, Afringent, Vulnerary, Neurotick, Alterative, and Alexipharmick.

IX. The Specification. They are peculiar for ftanching Blood, and flopping all Fluxes of Blood in any part of the Body whatfoever, whether Inward or Outward.

X. The Preparations. You may prepare therefrom, 1. A liquid Juice. 2. An Effence. 3. A Decoction. 4. APouder. 5. A Diftilled Water. 6. A Spirituous Tintture* 7. An Acid Tintture. 8. A Syrup, 9. A Balfam or Ointment. 10. A Cataplafm.

The Virtues.

XL The liquid juice* It dries and afringes, flops Ueeding, fpitting Blood, piffing Blood, overflowing of the Terms, and all other lluxes of Blood, and heals Wounds, by ftrengthening the Parts, and conjoining their Lips together: it prevails alfo againft all manner of fluxes of the Belly, and confolidates Ruptures. Dofe from one ounce to three in a Glafs of Red Port Wine.

XII. The Effence. It has all the Virtues of the Liquid Juice, befides which it is powerful to Waff and Gargle fore Mouths and Throats, and to heal them, as alfo to cure Ulcers in the Privy Parts of Man or Woman, and old running Sores in other Parts of the Body, as in the Legs and Feet, which they End, and which by reafon of the depending Parts, by a defluxion of moifture are kept long from healing. It prevails againft Catarrhs of the Womb and violent Continuations of the Urine, and heals old Tibet, Green Wounds, and bleeding Sides, and is as effectual as the Juice in ftrengthening the Parts, and in curing other Ulcers, and Ruptures.

XIII. The Effence. It has all the Virtues of the Juice, but not altogether fo effectual, but drank from four to eight ounces, it flops Catarrhs, Coughs, and inward Bleedings, and heals a Rupture of a Nerve.

XIV. The Pouder of the heaves. It is wonderfully afringent, dries up moifture in running Ulcers, cleanfes and heals : it is a peculiar thing againft fpitting and pilling of Blood, and the Difeafe called Diabete. Dofe one dram, in fome proper Vehicle.

XV. The Diftilled Water. It is laid to be a good Cosmetick, to beautify or make fair the skin of the Face, Neck, Breasts, and Hands, or of any other Parts of the Body.

XVI. The Spirituous Tintture. It has the Virtues of the Juice, Effence, and Decoction, befides which it is good againft the flinging or biting of any Venomous Creature, flopping the farther fpreading of the Poyfon, and in a fhort time curing the fick. Dofe one or two drams in a Glafs of Canary, Morning, Noon, and Night.

XVII. The Acid Tintture. It prevails againft the Malignity and Venom of Serpents, or the biting of any other evil Beaft : it is good againft malign Fevers, and the Infection of the Plague, and of any other malign or infectious Difeafe : it may be inwardly taken, and outwardly applied, in any of the cafes aforefaid, where outward applications are requiite. It is good againft a heuce, or Spotted Leprofie, Scurf, Morpew, and fuch like, if it is mixed with the Diftilled Water, and then the parts affected to be Waffed therewith.

XVIII. The Syrup. It is an incomparable thing againft Coughs, Colds, Catarrhs, or fharp and Salt diffillations of Rheum, and fpitting of Blood, alfo all forts of Fluxes of the Bowels. Dofe two fpoonfulls in fome proper Vehicle, Morning, Noon, and Night.

XIX. The Bal/am or Ointment. They are roft incomparable Vulneraries, fo that few Medicaments exceed them. They not only fpeedily cure Green Wounds by conglutination, but alfo diftge Lacerated Wounds, and cleanfe, incarnate, dry, and heal, old, foul, hollow, running Ulcers.

XX. The Caiaplafm. Being applied, it is good againft the biting or flinging of any Venomous Creature, flaying the farther fpreading of the malignity. Applied alfo in the Gout, from what caufe it ever, it eafes the pain, prevents the defluxion, and quickly cures it.

CHAP. CXXXII.

Of CISTUS Male.

It is called in Greek, fo? & in Latin, Ciftus mus : And in Englilh, Mule Gftus, Sage Rofe, and Holly Rofe, as Gerard calls it.

IL The Kinds. It is either Male, of which in this Chapter: Or, Female, of which in die next. Parkin/on makes four feveral kinds thereof, of which the firft of them, viz. Ciftus mat, or Male uftus, is the chief which grows with us.

III. The Defcription* // has a woody Root, and will bide fome years with us, if care be taken to keep it from the extremity of our cold Winters, which it will Scarcely endure, from this Root grow up ajhrubby Plant, about a yard or wore high, having many flender, brittle, woody Branches, covert with a whitijh Bark ; on which grow many whitijh, green Leaves, long, and fomewhat narrow, crumpled, or wrinkled, as it were, with lews, and jome what hard in handling, ePeadly the older Leaves, the young ones are fofter, Jomething like unto

our Sage Leaves, for the form and color, but much smaller, two always set together at a Joint. The *chivers stand at the tops of the Branches, three or four together, upon several slender Footstalks, consisting of five small round Leaves apiece, somewhat like unto a small Jingle Rose, or the Rose of the Wild Bryar, of a fine reddish purple color, with many yellow threads in the middle, without any Smell at all, and quickly fading or falling away, abiding seldom one whole day blown at most : when the flowers are past, there come up round hard hairy Heads in their places, containing within them, small brownish Seed*

IV. *The Places.* It naturally grows in Italy, Spain, Portugal, and France, and other hot and Southern Countries: but with us it is only nourished up in Gardens.
 V. *The Times.* In its Native places, it Flowers generally in May : but with us about the latter end of June, also in July and August and the Seed is ripe quickly after.
 VI. As to its *Qualities, Specification, Preparations and Virtues,* they are the same in all respect with those of the Dwarf Chive, to which I refer you.

CHAP. CXXXIII
 Of CISTUS Female.

THE Names. It is called in Greek, *Kivoc* and in Latin, *Gymnocista* : and in English, *female Chive*, or *Sage Rose*.
 II. *The Kinds,* Parkinson makes eight several kinds of the *Ye male Chive* : but two of them are

chiefly nourished up in our Gardens, viz. *Cistusje-wina*, *The Female Chive*, specially called. 2. *Gymnus Annuus*, *The Annual* or *Yearly Gift us*’.

III. *The Descriptions.* The first Female Chive, has a woody Root like to the former, from whence grows a kind of offshoot, lower and smaller than *it, having blackish branches, less woody, and not so brittle as the Male. The Leaves are somewhat rounder and greener, but a little hard and rough withal, growing in the same manner upon the Branches, as the other, by Couples. The flowers grow at the tops of the branches like to the Male kind, consisting of five Leaves, but somewhat lesser, and wholly white, with yellow threads in the middle, as soon fading, and of an little Scent as the other, but the Heads and Seed, are somewhat larger.

IV. *The second, or Annual Chive,* has a small woody Root, which perishes as soon as its Seed time *past the Plant endures but a Year, and therefore requires you to Sow it every Year, if you will have it : From this Root rise up several, but slender hard Stalks, set here and there confusedly with long and narrow greenish Leaves, very like unto the Leaves of the Gum-Chive, being a little clammy withal. At the tops of the Stalks, and at the Joints with the Leaves, stand two or three pale yellow Flowers, consisting of five Leaves apiece, with a reddish spot, near the bottom of every leaf of the flowers, which as soon fades as any of the former. The Flowers being past, small three-square Heads follow after, which contain within them small Seed like to the Female kind, but somewhat paler or yellower.

V. *The Places.* The first grows naturally in hot Countries, as Spain, Portugal, Italy, Languedock, The second in Colder Countries, as Germany, Bohemia, Friesland, and with us they are both brought up in Gardens.

VI. *The Times.* They Flower in the Summer Months, as June, July and August and their Seed ripens in the mean Season.

VII. *The Qualities, Specification, Preparations, and Virtues,* are the same with the Dwarf Chive, in that no more need be said of them here.

CHAP. CXXXIV.

O/CIVES or CHIVES.

I. *The Names.* They are called in Greek, *Chives*. A 2 # 1 ^ W : In Latin, *Scenoprasum* though you should say, *Juncum Porri* Leek : In English, *Chives* or *Chive* * which kind of Small Grasses.

II. *The Kinds.* They are either Garden Chives : Field or Wild Chives.

III. *The Descriptions.* beaded Roots or Bulbs as they grow down into the ground, *single threads or roots* and Taste of Onions and Leeks, as if they were partaking of both. *Fronts* Roots spring tip about a handful high, long, slender, round, green Spire, almost like to those which grow up small and tender Stalks, which send forth certain knops, or heads, like those of the Onion, but much less, in which are contained the Seed.

IV. *The second, or Wild Kind,* has a small end somewhat bulbous Root, but nothing near so many joined together, from which Spring downwards a great

great many white threads or firings. And from the fame upwards spring forth a great number of small blades, almost as high again as the former, harder, and of a darker green, and sometimes not absolutely round: otherwise (excepting their thick growing together) they are much alike, and differ but a very little in their Taste and Smell.

V. *The Places.* The first are nourished up, and grow only in Gardens: the other grows Wild in the Yields, and by way sides in uncultivated places in several Parts of this Kingdom. I have found them by the sides of the Highway, and in the Field going from *Canbury-House* near *Illington*, towards the *Boarded River*, and that in several places as I walked along.

VI. *The Times.* They flourish long, and continue many Years, and well endure the cold of Winter.

VII. *The Qualities.* They are hot and dry in the third Degree. Aperitive, Absterfive, Digestive, Difcussive, Diuretick, and Suppurative, Stomackick, Pectoral, and Nephritick. Alterative, Emmenagogick, Lithontriptick, Alexipharmick, and Spermatogenetick.

VIII. *The Specification.* They are peculiar against the leaves of the Reins and Bladder.

IX. *The Preparations.* You may prepare from the following: 1. An *EJence*. 2. A *Seed*.

The Virtues.

It heats, warms, and strengthens the Stomach, opens the Mouth, and drives out flatulents, and is good against the bitings of Mad Dogs, Serpents, and other Venomous Creatures. It cures the Strangury, and is good against all Obstructions of the Reins, Ureters, and Bladder, expelling Stones, Sand and Gravel.

XI. *The EJence.* It has all the Virtues of the Juice, but is indeed more powerful; the constant use of this Preparation, Or the Juice, admirably encreases Seed, and excites Venery. And this, or the former Juice, being snuffed up the Noftrils, it purges the Head and Brain, of cold, moist, and Hegmatick Humors, and prevails against the Lethargy, and other Difeases of the Head and Brain, proceeding from cold and moisture. Dose from one to two ounces in any proper Vehicle.

XII. *The Decoition in White Port Wine.* It has the Virtues of the Juice and Effence, but not full out so powerful, and may be given against the Stone and Strangury, from four ounces to eight, once or twice a Day, as also in the Paroxyfm.

XIII. *The Difilled Water.* Being drank to fix ounces, or more, either alone, or mixt with White Port Wine, it provokes Urine, and is said by some to break the Stone, and drive it forth.

XIV. *The Cataplasfm.* Made by beating the whole Plant with Mithridate, and Pulp of Figs, applied, is good to ripen and break a Plague Sore, or any other Apoftem. It is profitably applied to Scaldings or Burnings by Water or Fire, or Gunpowder: As also to the Piles when extremely inflamed and swelled.

XV. *The Seed.* Made into Pouder, and given a dram at a time, it encreases Seed, and fits up Luft both in Man and Woman: and given to Children which have Worms, it kills and expels them: It is also good against the bitings of Venomous Beasts.

CHAP. CXXXV.

Of CLAVER-GRASS.

I. *The Names.* It is called of *Diccordes*, as

it is thought, in *Greek*, *MMM*: from its being brought from the *Medes* into *Greece*; and so the *Medicum malum*, or *Pomeatron*, was so called being brought first from *Media*: In *Latin*, *Medica* and in *English*, *Claver-grafs*. The *Arabians* call it, *Cot*, *Alafaleti*, and *Alfosfofa*: and this is that very Plant which the *French* call *Saint Win*, which our *Moderns* have found so mightily to improve Land.

II. *The Kinds.* This *Claver-grafs* it self is a Species of the *Trefoils*, but being better known under this name, we thought good to treat of it here; *Claver-grafs* is manifold, 1. *Medico legitima*, *Fcvmtnl Burgundiacum*, *Trifolium Cochleatum*, *Claver*, *Claver-grafs*, *Medick Fodder*, *Snail Claver*, *Snail Trefoil*, and *Saint Foin*. 2. *Medica Racemosa*, *Trifolium Cochleatum Polycarpon*, *Cluttering Snail Claver*. 3. *Medica Frutescens*, *Medica flore luteo*, *Trifolium Syhejire luteum*, *Siliaua Cornuta*, *Lens major repens*, *Tabernmontani*, *Woody Snail Claver*: 4. *Medica Marina*, *Trifolium Cochleatum Marinum*, *Sea Claver*. 5. *Medica Cordata*, *Trifolium Cordatum*, *Heart Claver*, or *Trefoil*. 6. *Medica Lunata*, *Trifolium Lunation*, *Moon Claver*. *Farkwjn* has four other kinds, but these are the chief which grow in *England*.

III. *The Defections.* The first of these has a Root which runs deep down into the barth, sometimes two feet or more; // " thick, and sends forth many tough thready firings, and continues sometimes ten, twenty or thirty Years. From this Root rise up several weak, green Stalks, with divers small green Trefoil Leaves, set thereon without order. The Flowers grow upon long Stalks, coming from the

Joins and Tops of the branches, cluſtering in thick ſhort Tuft, of a blewifh purple in thoſe which grow in our parts, but in others of divers and fever at colors, as more purple, near a violet, or paler blew, or of a browniſh blew, and yellowa colors, parted : In ſome parts of Spain, and at Narbon in France, they are of a yellow color alſo. The Flowers being ſmall, Snail-like, round Cods follow, Jet together, not ſo much twined as many other MedicaV are, containing within them ſmall pale colored Seed.

IV. *Obſervations*, T. the Author of the *Country tarm* gives a mighty commendation of this Plant; and ſays, That there is not any Pulſe, or other Food which is more agreeable, and good for the Feeding of Beaits, than this *Claver[^]grafs* or *Snail-Claver*, called by the *trench, Saint Win*, not only for the nourifhing and fattening of Cattle, but alſo to cure Beaits which are fick. It is called *Burgundy-Hay*, becauſe the *Burgundians* have always been very careful in Sowing this Herb, and managing Sandy and Barren Land therewith, for that it makes the Worſt and Pooreſt Land very Rich and Fruitful. The benefit of this Herb is ſo great, that every good Husbandman ought to reſerve a good part of his Ground to be ſown therewith.

V. *Obſervat*. 2. In Sowing of this *Saint Win* Seed, though it grows well in fat Grounds freed from Weeds, yet it grows alſo very well in Poor Lean, Sandy and Barren Grounds, eſpecially ſuch as are eaſie to be Plowed, and ſuch as have been thrice Sown with Grain, before this is put into it, that it may the eaſier take deep rooting in the Earth, which it naturally does : but in lowing of this Seed, you muſt not be ſparing of it, for by how much the more Seed you Sow, by ſo much the more will the Herb grow in thickneſs, nor will there grow any other Grafts or Herbs there by which the profit will be ſo much the greater.

VI. *Obſerv*. 3. As ſoon as it is Sown, it muſt be Harrowed ſeveral ways, as loag ways, broad ways, and corner ways, and if it is a dry Seaſon, and a dry Ground, it ought to be gently watered, but not in thoſe Months between the latter end of Sept

her and beginning of April, left any hard Froit ſhould come, which might nip it, and ſo kill it. Authors alſo ſay, it ought to be Mowed, or Cut down, five or ſix times the firſt Year, others ſay three or four times, but your Experience muſt guide you in this, and in after Years two or three times a Year, by which great advantages are made of it: and that Land which has not been worth twelve Pence an Acre *per Annum*, by the Improvements of *Saint loin*, have in a few Years been made worth forty Shillings, and three Pounds an Acre, and ſometimes more, which is much for the Encouragement of the Husbandman, to proceed in this kind of Husbandry.

VII. *Obſerv*. 4. The fit times for Cutting it down, are in *May, June, July,* and *Auguſt*, in the New of the Moon, but you muſt not let it lye upon heaps any longer than a Day in the Meadows, *« would endanger the killing the Roots which are under it, and utterly deſtroy it, for which reaſon it is neceſſary to dry it forthwith, and as ſoon as may be, turning and turning it every day from day to day, and then as ſoon as ever it is dry to carry it away.*

VIII. *Obſerv*. 5. This is alſo to be taken ſpecial notice of, That none of your Cattell ought to feed on the Grounds on which it is ſown, becauſe it is apt to be killed by them, by bruiling it with their Teeth in biting it oft, whereas cutting it with a Sythe hurts it not: nor muſt Cattell be ſuffered to eat it green, becauſe it is apt to make them Sick, by reaſon of its heat and moiſture : for which reaſon it is always cut down, dried, and made into Hay -, and then it is to be given to your Beaits, but in ſmall quantity, becauſe it breeds much Blood, Fleth and Fat, even to ſuch a Degree, as with Fatneſs to choak them.

IX. *Obſerv*. 6. You muſt always be careful to gather and reſerve Seed of this Graft, to Sow again, when you ſee you ſhall have occaſion for it, it muſt not be gathered the firſt Year it bears, by reaſon of its weakneſs and poornneſs, but in all the following Years - ſo ſoon as the Huſks in which the Seed is contained ſhall appear dry, and the Setf or Grains themſelves are turned yellow, which will be in the *TM 5 > «* and *July*, you may then ſave it.

X. *Obſerv*. 7. That this Graft being ſowed in barren Land is very profitable there is no doubt, and it is conſidered that the firſt charge is the principal charge, even for a loag time, it is ſo much the more valuable : for Land being once Sowd with this, it not only enriches the ground for a few years, but for many years after. *« following will be ſufficient for ten or twelve years, let the ground be what it will, and as the ground is, be, it may laſt twenty or thirty Years, according as it is carefully lookt after, managed, which is a matter of ſome weight, ought to put every prudent Husbandman, as thoughts and conſideration on the*

XL The Second Kind has running pretty deep into the earth, from whence it ſhoots up a foot in length or more, and bears a Uni-Trefoil purple color like Snail-like ſills, which come forth ſoft and many ſmall, which are many, hard, round, fit to be weak as not to be abU to fland upright but, Tngon the

long Snail Clave, has a ſtiff ſtalks, many, hard, round, fit to be weak as not to be abU to fland upright but, Tngon the

the Ground, about a foot or more in length, and divided into many branches, on which grow Jhall, long, and narrow Leaves, by three's on a long Footstalk, with a thick middle Rib, on the back of each : the Flowers are Jmall, and many together, of a yellow color, and jomewhatweet -, which being pajfed away, fever al Jmall, flat, twined Cods follow, like to thofe of the jirft kind, bat J mailer, which contain within them fmaller Seed likewife, flattifh, and almoji of a Kidney fajhion.

Xlil. The fourth, or Sea Claver, bat a Rootfome- what thick, and enduring many Tears, from whence rife upfeveral hoary trailing Branches fpreading them- selves on the ground a foot or two long, with many Jmall and very hoary round Trefoil heaves, onfhort Footstalks. The flowers are many, jmall, and yellow, growing at the end of the Branches ; which being pajt away, many jmall withered Shells or Husks do follow, much like to the other jmall Snail Clavers. There K aljb another kind of Sea Claver, whofe Root penfl.es Yearly, but it grows bigger and greener than the other, and the Flowers are jmall and yellow, coming from the Joints of the Branches, but one at a place, which are followed by jmall hard and round prickly Heads, and whofe windings are difficult to be dtferned.

XIV. The fifth, or Heart Claver, hat a thick and thready Root, which perifhes every Tear, from whence fpring forth feveral very flender, Jmall, and weak Branches, full of Joints, and round greenifh Trefoil Leaves, ftanding upon long loofstalks, broad at the ends, and dented in, in their middle, making the fajhion of a Heart, with dull, red, or purplifh, and fometimes almoji blachfh spots on them. The Flowers grow two or three together upon Footstalks coming from the Joints, they are jmall and yellow, which being pajt away, leave behind them jmall prickly twining Heads, like unto the other Jmall Claver- graiJes.

XV. The fifth, or Moon Claver, hat its Roots, Stalks, Leaves, and manner of growing, like to the other Snail Trefoils, or Clavers, before defen- bei, efppecially like to the Jirft : the Leaves are

hairy, and dented about the edge's : the flowers are jmall and ye Horn, which being fajfed away, crooked, flat Cods, of an indifferent breadth, after the fajhion of a Moon three quaters old, follow : "in which are contained Seed, in fajhe or form of jmall little Kidneys.

XVI. The Places. The firft grows naturally in Italy, Spain, Portugal, and France, from whence it was brought into Flanders and England, in both which places it flourifhes admirably, and ferves them and us for Hay for our Cattei, and Horfes; in Spain they have no other Hay with which they feed their Horfes, which makes them exceeding Fat: the fame they do in the Low Countries, whereby their Cows yield the greater abundance of Milk. It is fown in the Fields of Italy, Spain, France, the Low Countries and England, for Food for their Beasts. The fecond grows oftentimes in Fields, Meadows, and Paftures. The third grows in Meadows, by Hedge and Wood fides, and places fme- what fhaded. The fourth grows near to the Sea in federal places, as in our Marfhes and Fields at Wool- wich, heptford, &c. and by the Sea fide about Weft Chefter, as alfo on the Mediteranean Sea fhore, and about Venice. The fifth is often found in our Fields and Meadows ^ and though Carrier arim calls it Medica Arabica (I fuppofe becaufe it grows in that Country :) yet, with Johnfon^wc icy, it grows Wild with us in our Meadows in England, having feen it, I believe*, an hundred times. The fixth grows alfo plentifully in our Fields and Pafture grounds.

XVII. The Times. The firft of thefe, (the ground being firft made fit for its entertainment, by well Ploughing it up, and killing the Weeds thereof) is to be fown in the end of April, or fomewhat earlier, in the New of the Moon, and towards the latter end of the Day, that it may receive the re- freffing Dewes of the Night, by which means it will the fooner, and more eafily fpring out of the Earth, and you may Mow it in June, and July, and Auguft, for Hay, and after the firft Year fomewhat earlier. The firft, and all the reft flower in June and July, and their Seeds are ripe in the end of Auguft, or foon after. But the Seed of the firft is not to be gathered in the firft Year, by reafon of its weaknels, as is before obferved^ but in all the following it may be gathered in July, or as foon as it appears ripe.

XVIII. As to the Qualities, Specification, Prepa- rations, and Virtues, of the firft, or the other fire* Authors have obferved nothing concerning them, but that they (efpecially the firft) are a good nourifhing food for Horfes, Cows, and other Catcel, and that the firft is id powerful to fatten jhem, that they ufually Hint them to a quantity, for fear of fuffocating them, by reafon of their growing tea- fat.

XIX* Obfervation i< From this it appears, that it is of a nourifhing Virtue, and by reafon it increa- fes Flefh and Fat, I am of the Opinion, that the Liquid Juice or Effence, or Syrup thereof, may be very powerful in'reftoring fuch as are: in konjump- tions: it is indeed good againft Coughs, Colds, Wheelings, vehement Catarrhs, Obitraaions of the Lungs, and other Diftempers of thofe parts. ^ irfi ly of he cwland HsfX^r being fomewhae like a Kidney made me believe it might be good againft the Stone, Gravel, and Sand, or " : ** % > ! '* Matter in the Reins, Ureters, and Bladder, which I made tryal of mfuice, in White Wine, and the Syrup, Patient I gave it to, I found it ex- cenehdrtto^fwer my Ration : I have fine* made trU of it upon ieveral other Patients

very good succeds ; yet I cannot say, but in some cases it has not answered the end- *The Decoffion of the Seed in White Port Wine*, has the same Virtue, but I believe not full out so powerful as the Juice and Effence of the Plant •, but *the powder of the Seed* given to one dram is more effectual : So also *the Fixed Salt of the whole Plant* made by Incination.

XXI. *Obferv. 5. Diofcorides* says the *Green Herb* has a cooling property, and for that purpose it is chiefly used. *Evicen* commends the *Oil* made of it against the 'trembling of the Heart. *Gefner* says that a *Liquor* may be drawn out of it by fire (*Parkinon* fapposes he means an *Oil* to be drawn out of the *Seed*, as out of *Sweet Almonds*) good against the -*Scone*. From this I observe, and am apt to believe, that if an *Oily Tincture*, or a *Saline Tincture*, be made of the whole *Plant*, they may be very effectual for that purpose, being duly taken in a proper *Vehicle*.

C H A P . CXXXVI.

GOOSEGRASS, or GOOSE-GRASS.

It is called in Greek, as the most usual Name, but it has also several others, as *Galen* out of *Hippocrates* faith •, and *CASX**, as *Diofcorides* faith (because the *Seed* is *Navel* fashion:) it is also called, *quasi hominis amans*, and *Aparine*, *Lappa minor* *Plinij*, *Aperugo* : In *Englilh*, *Clevers*, and *Goo/e-grafs*

II. *The Kinds*. They are chiefly twofold, viz. 1. *Aparine Vulgaris*, The common or rough *Clevers*. 2. *Aperine Ltvis*, Smooth *Clevers*, not mentioned by any Author but *Thalius*, and from him by *Parkinon*.

III. *The Defcriptions*. *The Common Rough Clever* has a small and very fibrous *Root*, spreading in the *Earth*, but dying every *Year* from whence rise up divers very rough square *Stalks* not bigger than the lower part of a naked *Wheat* Si raw, creeping up so as to be sometimes two or three yards high, if it has any tall *Bushes* or *Trees* near it, or any *Hedge* on which it may *Climb*, but yet without any *Clappers* otherwise they are much looper, or lye upon the ground, being full of *Joints*; from every one of which shoots forth a *Branch* besides the *Leaves*, which are commonly six in number, Jet round the *Stalk* almost like a *Star*, or the *Rowel* of a *Spur*. From between the *Leaves* at the *Joints*, towards the tops of the *Branches* come forth very small white flowers, every one upon a small thready *Footstalk*, which after they are fallen, two small round rough brown colored *Seeds* (but at fir ft green \ joined together like a pair of *Testicles*, do appear. * When they are ripe, they grow hard, and of a whitish brown color, > having a little hole or hollowness on the side (some what like unto a *Navel*) on which the *Stalk* grows to them. The *Stalks*, *Leaves* and *Seeds* are so very rough, that they will cleave almost to any thing which shall touch them, and seem to be a little clammy withal.

IV. *The Smooth Kind* has a *Root* like the foregoing, and grows much like unto it, but it neither grows so high, nor are the *Leaves* so great, and not at all rough or flicking to what it touches, as the former is. The *Leaves* are the same in number, and fit and in the same order, and at the *Joints* also : the *Flowers* are small and white, consisting of four very little *Leaves*, like the other, and give such like *Seed* growing together in *Pairs*, but smooth also, and not rough as the first is. There is another sort of this Smooth *Kind*, but it little differs from it, excepting in the *Seed*, which is said to be rough, much like unto a *Coriander Comfit*.

V. *The Places*. The first *Kind* grows by *Hedge sides* and *Ditch banks* in most places of *England*, and almost every where in *Gardens*, it being there nothing but a *Weed*, and is rooted out with much labor and diligence, for that it will run upon every thing it grows next, and be apt to choak and kill it, if not *Weeded* up. The second is a *Native* of *Spain*, but grows in *England* in the *Gardens* of the *Curious*, where it is apt to be as troublesome as the other is, if it is suffered to *Sow* its *Seed*.

VI. *The Times*. They *Flower* in the end of *May*, and in *June* and *July* -, and the *Seed* is ripe and falls by the end of *July*, or in *August*, from which it springs afresh the next *Year*, and not from the old *Roots*.

VII. *The Qualities*. It is hot and dry in the beginning of the first Degree, according to *Galen's* Judgment, and are *Aperive* and *effusive*, and *Aperive* and *effusive*.

The Virtues.
 I. *The Green Herb*. *Tarkinson* says, that it serves the Country People well, instead of a strainer, to cleanse and clear their *Milk* from *Straws*, *Hairs*, or other gross things which fall into it.
 II. *The Liquid Juice*. Made of the *Herb* and *beed* together, being taken in *Wine*, is good against

The Virtues.
 X. *The Green Herb*. *Tarkinson* says, that it serves the Country People well, instead of a strainer, to cleanse and clear their *Milk* from *Straws*, *Hairs*, or other gross things which fall into it.
 XI. *The Liquid Juice*. Made of the *Herb* and *beed* together, being taken in *Wine*, is good against

the bitings of Vipers, or the great Spider *FbdUingiuw*, by preferring the Heart from their Poyfon, as *Biofcorides* and *Pliny* from him say. *Galen* (ays, that it cleafes moderately, and drys, and is of fubtil parts. It is generally taken in Broth to make fuch Lank and Lean, as are apt to grow Fat. It is alfo good to heal Wounds, and itanch Blood, being applied : and *Matthiolus* fays, it is commended to conglutinate, or clofe the Lip^ of Green Wounds : dropt into the Ears, it eafes their pain, though vehement.

XII. *The Effence.* It has all the Virtues of the Juice, but more powerful ^ befidcs which, it is very effe&ual to ftrengthen the Bowels, and flop all fort, of fluxes of the Belly whatfoever : and being taken thrice a day, it helps the yellow Jaundice.

XIII. *The Decoftion in Wine.* It is Stomack, caufes Leannefs, flops Bleeding, and being drank twice or thrice a day promotes the healing of Wounds, old running Sores and Ulcers.

XIV. *The Ponder.* It is an excellent Vulnery, and conglutinates the Lips of Green Wounds, being Itrewed thereon : it alfo cleafes old running Sores and Ulcers, dries up their moiflure, and induces their healing. Taken inwardly to a dram in Red Port Wine, Morning and Evening, it flops fpitting, vomiting, and piffing of Blood, and cures the Bloody Flux, as alfo other Fluxes of the Bowels * and being applied, the bleeding of Wounds.

XV. *The Ointment.* Being made with *Auxungia*, *ue*. Hogs-Lard, or other proper fat body, and anointed upon the part affe&ted, it helps all forts of hard Swellings, or Kernels (proceeding fro'tri the King's-Evil) in the Neck, Throat, or other Parts.

XVI. *The Balfam.* It is a fingular Vulnery, and cures Green Wounds (not Contufed, Lacerated, or otherwife compofed) at one, two, or three Dreffings. It digefts Apoflems, as alfo complicated Wounds, then cleafes them, incarnates, dries, and fuddenly heals them. It is indeed a very fingular Vulnery, or Wound Balfam.

XVII. *The Cataplafm.* Being applied to any wound or place which bleeds, it prefently flops the Blood *, and in a fimple Grep Wound cures it at the firft intention. It is beft to be made of the Green Herb, by beating, and made thick by the Powder of the fame.

XVIII. *The Difillrd Water.* It has in a weak manner the Virtues of the Juice, Effence, and Decoftion *, and may be ufed as a Vehicle for the two firft, or the Powder.

XIX. *The Oily TinSure.* It is an excellent thing to be applied to Wounds of the Nerves and Joints, and taken inwardly, prevails againft the Jaundice^ and gives prefent relief in the Colick. Dofe thirty Or forty drops in a Glafs of White Port Wine.

CHAP. <XXXVII.

of CLARY, Garden.

THE Names. *mulat*, as *Diofcorides* fay, and fo *erard*.

11. *Hortenfie*, *Garden* which this Chap. Wild of which uThe ne* Garden Clary,

is, r. 'Otfuirſy xcr/cv) *Horminum Com̄mune*, Common Clary. 2. *ticrniinum fai roam verum hijcondi?*, The true Garden Clary of *Diofcorides*. 5; *Colas Jovis, Lobc/i, Clufij, Cameranj, Lugdunenſis, Eyftenſis, Gerardi *Oroula Tertia Dodonxi **, *JWelium defa/pini, Galeopſis, Lute a Dalechampij, Honuiniun Luteum Qlutinqſam Baubini, Horminiat Tri lenti-num, horminum lutcum aioru?n; Camphorata Cf Sphacelus aliis*, Yellow Wild Clary, or *Jupiter's* Diflaff. 4. *Uorminuvi humile Germanicum, Gallitricum alter urn Gerardi*, The Smaller fort of Clary, or *German Clary*.

III. The Defcriptions. the firft, Common Clary *bata* Root which is blackijh andſpreads not far, but penjhes after Seed time h from whence proceed, s a dta/£ 0/00/- and half high, or more, which as it grows up branches it ſelf into others h theſe Stalks are fourſquare, thick and rough, fending forth broad\$, rough, wrinkled, whitijh, or Hoary green Leaves, fomewhat evenly cut in on the edges, and of a ftrongſweet Scent, ſome of them growing near the ground, and ſome by Couples upon the Stalks. The Flowers grow at certain diſtances, at the Joints, (with twofmall Leaves under them) fomewhat like unto Sage Flowers, butſmaller, and of a very whi+ tish pale blew color, the Seed is blackijh, or Joint* what flat, and not Jo round as the Wild, and is contained in long toothed Huſks, which Jerve inſtead of Cods.

IV. The fecond, or True Garden Clary of *Diofcorides*, has a Root which is Jmall, and perijhing every Tear, from whence it njes up but twitfy one Jqitare hairy Stalk, about afoot and half hijh, mere or lefs, as the ground is in godnejs : Thi* Stalk Jpreads it ſelf into fever alſquare Branches, on which are Jet at every Joint tuo Leaves, one agamft another, which are ſomething broad and round, a little rugged tike unto Horehound, but more green than white, and of a reaſonable good Smell: at the tops of the Stalks (land divers Leaves one row under another, of a very fine, deep, purple violet color', the lower being paler than the uſpermoſi, and Jeem ajar off to be Flowers, but approaching nearer to them, are found only to be Leaves, the Hovers coming forth

under them at fet Spaces about the Stalks, of a whitijh > purple color, fmailer than the flowers of any other J on of Clary, and ft anting in brownifb purple Husks\ which after the J aid Ylowers are paf, whilft the Seed ripens (which is then black) turn themfelves downwards, by reafon whereof if it is not gathered in due time, it is loft. Gerard fays the Leaves are Jomewhat round, and lafd over with a hoary Cottony fubftance, not much unlike Horehound: * the Stalks are fquare, fmall and hairy ^ and the Flow- ers coming forth between thofe beautiful purple heaves, towards the tops, are fmall, of a blewifh or watched color, in fafhion like to Rofemary-flowers.

...th divers fibres Jpringing therefrom, which perifh wt, but abide many years : from this Root come forth feveral fquare and fomewhat hairy Stalks, afoot and half high, on which do grow large Leaves, very like unto our common Garden Clary, hairy, rough, and rugged, but not all out fo large, nor of fo zwhite a color\ growing two at a Joint, on the contrary part thereof, one unto another, and fomewhat cut in on the edges, and deeply dented likewife, having alfo a lefs ftrong Jcent than they. The ^lowers grow at Spaces about the Stalks, to the tops, bowing their fpiky Heads, which are of a purple color, not much larger than Lavender-flowers, which being paf away, there comes after them, fmall blackifh Seed.

V. The third, or Colus Jovis, has a knobby Root, which is compojed of many long firings, by which it takes ftrong hold in the Earth, and abides many Tears : from whence rife up feveral four fquare rough Stalks, a yard high, or more, which branch forth themfelves into divers four fquare Stalks or Branches. The Leaves are many, large, hoary\ or of a whitifh green, dented about we edges, and ft anding upon long Yootflalks, rifingfome from the Root, and fome from the Joints of the Stalks, which are broader at the bottom, fmother alfo, and fomewha* fat or clammy in handling, and fomewhat hairy, a the fquare Stalks alfo are. Thefe Leaves upon the Stalks ftand by Couples, and are like the Leaves, which grow below, but fomewhat leffer. At the top, of the Stalks the flowers come forth at fet Spaces fet round about in Coronets or Wharls, which are gaping^ and like unto thop of Common Clary, but of a faint yellow cofa^ after which comes broim- blacktflh Seed. G@Qjif&Jtys; that this kind of Clary called Colus JoviSE, #eprefents in the very top of it, a Diftafc wt^R about with yellow flax am, that from thence it took its name ; and that the Leaves are like thofe of Nettles, rough, fharp pointed and of an overworn green color : both Leaves and Flowers have fomewhat a ftrong Smell.

VII. The Places. Thefe are all nouri/hed up with us in Gardens, the fourth of them being brought us out of Germany, and all of them (except the third ; are iometimes found to be in the feveral places. The Gfc, which is found in Gardens here, is found in the

VIII. The Times. The Seed rifes of its own accord for the Seed rifes of its own accord, but it alfo requires to be new fown in the Spring, for it feldom comes up of the Seed which fell in the Winter. Gerard fays; Clary is hot and

Aperitive, Abfterfive, A- ftergent, Traumatick or Vulnerary, Peftoral, Hy- netick, Analeptick, and Spermatoge-

X. The Specification. It lengthens weak Backs. Simulates to Venery, and caufes fruitfulnefs.

The Preparations. You may have therefrom, 1. A Decoction of the green Leaves. 2. A Juice of the Root. 3. An Effence. 4. A Syrup. 5. A Deco- tion.

8ion. 6. A Pouder of the Leaves. 7. A half an. 8. A Catatolafin. 9. The whole Seed. 10. A Pouder of the Seed, -ii.il Mucilage of the Seed. 15. An Eleffuary of the Pouder of the Leaves and Seed.

The Virtues.

XII. *The green Herb.* Because of its properties of Strengthening, and Uprovoking Venery, it is very much used by some people, especially in Country Towns, to be fried in a Frying Pan, being first dipt into a Batter made of Flower, Eggs, and Milk or Cream, and so (being served up to the Table) to be eaten.

XIII. *The liquid Juice of the Herb.* Used as an Errhine, it cleanses the Head and Brain of Cold, Flegmatick, and Viscous Humors, or other matter afflicting those parts: and taken from three ounces to six, mixt with a Glass of Tent or Alicant, it admirably strengthens the Back, and excites Venery: It thickens the Seed, warms and comforts the Womb, and is said to cause fruitfulness in Women, being taken and used Morning and Night for some considerable time. It allb cleanses, and heals green Wounds.

XIV. *The Effence.* It has the Virtues of the liquid Juice, besides which, it provokes the Terms in Women, warms and comforts a cold and moist Womb, and takes away the Weakness and Slipperiness thereof: it facilitates the Birth, and expels the Secundine, or Afterbirth. And as it is good to be given to Women which are Barren, through a cold and moist disposition of the Womb, it is also good to flop the Whites, and to comfort a cold and weak Stomach, oppressed with Viscous Flegm. Dose from one ounce to two, three, or four ounces, in a Glass of generous Wine.

XV. *The Syrup of the Juice.* It has the Virtues of the two former, but not so powerful, because it is so much clogg'd with Honey. But in other cases as a Pectoral, it is much beyond them, for it causes better Expectoration, and therefore is good against Coughs, Colds, Hoarseness, Wheezings, Shortness of Breath, difficulty of Breathing, and other like Distempers of the Breast and Lungs. Dose two or three ounces, Morning and Night.

XVI. *The Decoction in Wine.* It is weaker than the Juice or Effence, but has all the Virtues of the foregoing Preparations in a lower Degree. It helps to expel or rot the rotten and purulent matter from the Lungs and Pleurisy, as also in Coughs, and other Distempers of those Parts, and possibly may be good for such as are troubled with the Sciatica. Dose six ounces Morning and Night.

XVII. *The Pouder of the Leaves.* Snuffed up the Noftrils causes freezing, and thereby purges the Head and Brain of Rheum, and cold thin Flegm, and Tartarous Matter afflicting those parts, causing Head-achs, Vertigo's, Apoplexies, Drowfiness, Sleepiness, and Lethargies: and being taken inwardly to the Dram, Morning and Evening, in a little of the Syrup, it strengthens the Back, increases the Seed, and excites Venery.

XVIII. *The halfam.* Whether it is made with the Juice, or with the green Leaves, it is as singular a Vulnerary as is to be met withal. It not only cures Green Wounds at once or twice dressing them, but also digests, cleanses, and heals foul, putrid, or rotten and running Ulcers: and being applied, is an excellent thing to give ease in the Sciatica.

XIX. *The Cataplasin.* Being applied to Contritions, it diffuses them, if no Vessels are torn: and applied to Green Wounds, it suddenly heals them.

XX. *The whole Seed.* It is used to be put into the Eyes to clear them from Films, Clouds, Moats

or other like things which offend them. It allb clears them from Pearls, and white or red Spots, which chance to grow upon them.

XXI. *The Pouder of the Seed.* Put into the Eyes, it clears the sight, and being taken inwardly from half a dram, to a dram and half Morning and Night, in Syrup of Clary, it admirably stimulates Venery, strengthens the Reins, and eases Pains of those Parts.

XXII. *The Mucilage of the Seed.* If it is made with Water, and applied to Tumors or Swellings, it diffuses and removes them. It also draws forth Splinters, Thorns, or other things gotten into the Flesh. If made with Vinegar, it is good against hot Inflammations, as also Biles, Felons, and other hot Excretion in the Flesh and Skin, more especially if it is applied to them before they are come to too great a head.

XXIII. *The Eleuary of the Pouder of the Leaves and Seed.* Put into Sore or Ulcerated Eyes, it heals them, and being used Morning, Noon and Night, for some considerable time, it clears the Eye-sight of Pearls, Films, Clouds, and other like things, and helps dimness of sight, washing the Eyes also between whiles four or five times a day, with the Juice or Effence of the Herb. This Eleuary being also taken inwardly from one dram to two drams, Morning and Night, for some time, helps Coughs, and Ulcers of the Lungs, restores in Consumptions, strengthens weak Backs, breeds Seed, excites Lust, and admirably fortifies the whole Man.

XXIV. *Coins Jovis, yellow Clary, or Jupiter's Clary.* It is hot and dry in the second Degree, and its Juice and Effence, are singular good to cleanse and heal old Ulcers, and foul running Sores, being applied to the Parts afflicted, according to Art.

CHAR CXXXVIII

O/CLARY; Wild.

THE Names. It is called in Greek, *ἰξόχο*, *ixochos*: In Latin, *Horminum Sylvestre*, *Oculus Qhnsi*, and by some, *Geminalk*; and in English, *Wild Clary*.

II. *The Kinds.* There are several Species hereof, but the chief, and which we intend to handle in this Work, are these following, viz. 1. *Horminum Sylvestre vulgare*, *Oculus Cbrjili*, Wild Clary, especially so called by *Camerarius*, *Cor dm*, *Clufius*, *Yuchus*, *Gefner*, *Gerard*, *Lobel*, *Loniccrus*, *Lugdunensis*, and *Turner*. *Brunfelsius* calls it, *Saivta agrejii*; and *Besler* in his *Hortus Eystetenjis*, *Salvia agrejii fere purpureo*: *Gefner* and *Tragm* *Salvia agrejii vera*. *Galliticum venum* (in Italy) *Cefalpini*, *Sclarea Sylvestris Tabernmontani*. 2. *Horminum Sylvestre incanum flore albo*, *Hor?* *num 5)7-vejire quartu?* *Niveo flore Clufij*, *Sclarea Sylvestris flore albo Tabernmontan* *ufo*. *lvia agrejii flore albo horti Eystetenjis*, Hoary Wild Clary with a White flower. 3. *Horminum Sylvestre Lavendule flore Bauhm*, *Sclarea Hispanica Tabernmontani*, *Galliticum aherum Gerard*, *Wil* & Clary, with Lavender flowers. 4. *Horminum Sylvestre sahifolium majus & minus Bauhini*, *Horminum Sylvestre MatthioK Ctfalpim*, *Lugdunensis*, *Orvula alt era Vodonai*, *Horminum Sylvestre quintum Clufij*, *Verbujcum mgrumjcdvijcduan pre purpureo Lobeli* 5. *Salvui Sylvestris adulterina T/iv-£*, Sage Leav'd Wild Clary. Authors make many other kinds, but these are all that are found grow* ing with us. either Wild or in Gardens.

III. The Deicripcions. The firft kind, or Oculus Chriiti, has a Root which is long, tough, and black, attended with many fibres, by which it takes faji hid of the Earth, from whence rife up many Square Stalks two or three feet high, on which grow broad dark green Leaves, dented about the edges, and fomewhat rugged and hard in handling •, the ^lowers grow along towards the tops of the Stalks, like unto the gaping or hooded flowers of the Garden Clary, but fmaller, and of a pale or ixthitifh blew color; which being paji away, there comes in Jmall husks, round blackffh or brownifh Seed; the whole Plant ha* a firongS??tell, but it is nothing fo quick as that of our common Garden Clary. There are two other kinds hereof: One, the tops of whofe Stalks are purp(ijl), with blowers of a deeper purple color, and fomewhat larger Leaves. Another, differing only in this, that the tops of the Stalks are green, and not purple •, the blowers of a pale blew color, and the Leaves a little torn on the edges.

IV. The fecond kind, or Hoary Wild Clary, white blowers, has a long tough black Root, not much differing from the former, the Leaves in this wing almoft like thofe, but more hoary, and a little deeper dented in on the edges, the Stalks are Square, wd abouft a yard high, upon which grow the blowers in the lame manner, fliving that thefe are wholly white, which being paji away, there follows Jmall round brownifh Seed.

V. The third, or lavender flowred Wild Clary, has a Root not much differing from either of the former Wild Claries, from whence come forth fquarc hairy Stalks, two or three jeet high, Jet with harder, narrower, and fmoother Leaves, more deeply indented about the edges, and rounder pointed; the •tloivers are much lefs than the former -, and neither in bignefs, nor color, are they greatly differing from the blowers of Spike or Lavender, they growing in Jpacts and rundles as the reft do, the Seed is like

to the others, nor does the Smell of the whole Plant differ much from them*

VI. The fourth, or Sage Leav'd Wild Clary, has a long Root, tough and black without, but yellow within, which abides without perifhing for many Tears, as the Roots of moji of the Wild kinds do: from whence rife up low fquare Stalks, much about half a yard high, whereon grew hard rugged Leaves, yet two at a Joint, very like into Sage Leaves, but not hoary at all, of a dark green color, and dented about the edges: the Flowers grow at Jet Spaces round about the Stalks, as in rundies, in Jome Plants of a fair purple, violet color; in others more pale, and in others yet, of almojt an Afh-color \$ which be* ing paji away, there comes forth (when it is ripe) black Jmall Seed. The Smell of this Plant is more pleafing and lefs heady than moft of the former kinds be. There is another Species of this fourth kind, which differs chiefly from it in this, that it grows much higher, has thicker Stalks, larger and thicker Leaves, Jpotted with divers white Jpots and fireaks therein; elfe in form and color of Leaves and blowers, no difference appearing.

VII. The Places. The firft grows Wild in England, almoft every where by the Way fide, and it does the other with the purple Stalks: but that with the green Stalks is not common with us, but grows in many places of Germany and Hungary: Gerard fays, that the Oculus Chrifti grows in Barren places, almoft in every Countrey, efpecialy in Holborn-Jields, near unto Grays-Inn, w the Highway by the end of a Brick-Wall (there it might poffibly grow formerly, but none can be had there now •) alfo at the hither end of Dheljey towards London, and in the Highways leading from Richmond Palace to the Water-fide, and in divers other places. The fecond grows not Wild here, but only in the Gardens of the Curious. The third grew with Clufius, of the Seed which he had out of Spain, but he iaith he found it likewife near the Riding-place of Greenwich \$ fo that it is manieft, that it is a natural inhabitant of our Countrey. The third grows Wild in Hungary almoft every where, in their Vineyards, and by the Way fides/ but with us it is chiefly nourifhed up in Gardens.

VIII. The Times. They all Flower in June and July, as do the Garden Kinds; and their Seeds are ripe in the end of Augufi, or not long after.

IX. Their Qualities, Specification, Preparations^ and Virtues, are the fame with thofe of the Garden Clary, ib that little more need be faid thereof here.

X. Obfervation 1. Diofcorides faitL That the Seed of Oculus Chrifti, ov Wild Qary, drunk with Wine (from one dram to two drams) excites Luft and being mixed with Honey, and applied, cleanfes the Eyes from tilms., and other imperfections lodged in them: and being put whole in the Eye, it not only fimply cleanes, but alfo purges them very much from Waterifh Humors, and fo fis Rednefs, Inflammations, and divers other Difcafes which happen to them, taking away their Pain and Smarting, one Seed, and no more, being put into the Eye at a time. This, fayf Gerard, is a general Medicine in Chefhire, and other Countreies thereabout, known of all and wfd with good fucces.

XL Objerv. 2. The Liquid Juice, or Effence of the Leaves, given from two ounces to four or fix, mixed with a Glafe of Generous Wine, and drank warm, difTolves congealed Blood in the Stomach, warms and comforts it, and is very good to help againft dimnefs, and to reftore the Eyes to their Priltine State.

CHAP. CXXXIX-

Of CLOVE-GILLIFLOWERS.

I. 'Tpi/£ Names. If was unknown to the Greeks,

A as far as we can learn, but is called of the Latins, *Caryophyllm hortensis*, also *Vetonica*, *Vetonica alt His*, *Coromiria*, *Herb a Tunica*, *Ocellus Dama-cenus*, and *Barbaricus*, of some *Cantabrica P/inij*, *flos Caryophylleus*. Some will have them to be the *lphiumTheophrasti* in lib. 6.cap. 6 & i. others, to be his *Dios Anthos*, or *Flos Jovis*, but *Ruelliits* faith that they were unknown to the *Old Writers* 5 and his judgment seemsto be good, because the *Gilliflower* is not like to that of *Vetonica*, or *Cantabrica* -, and it is a wonder, fays he, that such a famous Flower, of so pleafant a Form, and fweet a Smell, ihould lye hid, and not be known to the Ancients, which may be thought not inferior to the *Rofe*, in its Variety, Smell, and admirable Beauty. The name *Caryophyllus* was given to it, I fuppoie, from its Smell, which is very like to that of the *Indian Clove*. We in *Englilh* call it *Clove-gilliflower*, and *Gillifimmrs* (*quafi July-flowers*, because they begin to flower in the Month of *July*) fome alfo are called *Carnations*, but that name arifes chiefly from the color.

II. *The Kinds*. They are either *Garden* or *Wild* : of the *Garden Kinds* we (hall treat in this Chapter. *The Wild* are vulgarly called *finks*, of which we (hall fay nothing, here, but refer you to the Chapter under that Title, where we lhall fully difcourfe of them. Of the *Garden Kinds*, or *Gilliflower*, fome are Single, and fome Double. The *Single Clovegilliflower* fome will have to be a *Fink*, but it is no fuch thing, for it is oftentimes produced by the Seed of molt of the *Double Clovegilliflovers*, and differs from *Pinks* in its Shape, Magnitude and Smell : That all the Kinds of Double Flowers produce Seed I am apt to believe \$ though fome of them, as the *Clovegilliflower* and *Carnation*, not very often -, and *Parkin/on* fays, that they feldom give any Seed, as far as he could obferve, and here in *England*, are ufually increafed by Slips.

III. As to the *Variety* of *Kinds* of this Flower in refpeQ: to their various and accidntal differences, they are *little* or *few* in their Roots, Leaves, Stalks, and manner of growing, but *manifold* in refpe& to the Flowers *, as to their Form, Magnitude, and Color, fome being of one Color, Ibme of another, fome of many, fome Striped, fome Spotted ^ fome finely DentQd only, fome Jagged or deeply Cut in, &c. I fay as to thefe, we fhall take no notice, leaving that work to their confideration, ¶ V make the *lower GarJ™ their whole bufinefs. Thofe, which we lhall trŝat of here, are only the three following, (which comprehend all the other ¶ n ¶ 2nd Varieties under them) viz. 1. *Caryophyllus bortenſis pleno rubro*, The *Clove-gilliflower* of a deep ^nmion Red. 2. *Caryophyllus maximus Angŝicus*, The ^Great Englilh *Carnation*. 3. *Caryophyllus minor fiore pleno*, The leffer *Carnation* with a Double Flower. As to the firŝt of thefe, viz. the *Clove-gilliflower*, there are the *Single Clove*, and the *Double Clove* y only of the Double Clove, there are fome more Double than others. As to the fecond, viz. *Caryophyllus maximus*, or *Great Carnation*, with that which we defcribe in Se8. V. following. *Parkin/on* in his *Garden of Flowers* makes twenty fveral Varieties *, to wit, *The Great Eng-*

Hfh, the *Grey Hub*, the *Red Hulo*, the *Blew Huh*, the *Prince*, the *White Carnation*, the *French Car pa** tion, the *Ground Carnation*, the *Cryŝal* or *Cryŝaline*, the *Red Cryŝal*, the *Fragrant*, the *firip^d Savage*, the *Blujh Savage*, the *Red Savage*, the *Oxford Carnation*, the *King's Carnation*, the *Grafiado*, the *Grand Pere*, the *Camberfine*, the *Great Red Lombard*. As to the *Caryophyllus minor*, or *Leffer Carnation*, called a *Gilliflower*, we have in *Parkin/on* thirty four Varieties, to W? The *Leffer Carnation*, the *Gallant* or *Wefiminfier*, the *Briŝol Blew*, *Red Dover*, *Light* or *White Dover*, *lair Maid*, *Queens Gilliflower*, the *Dainty*, • *Brafil Gilliflower*, *Small Granado*, the *Turkie*, *Pool Flower*, *Pale Pageant*, *Dainty Lady*, *beji White Gilliflower*, *London White*, *Stamell*, *Purple Gilliflower*, *Peach Color*, *blew Gilliflower*, *Blujh Color*, *Great Tawney*, *Light Tawney*, *SadTawney*, *Deep Blujh*, *Pale Blujh*, *Infants Blujh*, the *Great Blujh^ Marbled Tawney*, *Princeŝ* or *Vari-able Tawney*, *Flaked Tawney*, *Feathred Tawney*, *Speckled Tawney*, and *Rofe Gilliflower*.

IV. *The Defcriptions*. *The firŝt of thofe*, or *deep red Clove-gilliflower*, (which is that zvhich zve only ufe in *Phyŝick*) has a pretty long, hard, or woody Root, having fome fmall fibres appenJent thereto, which endures all the Winter long -, from this Root rife up one or more Stalks, like to thofe of the *Carnations* following, growing up fome times to be a foot and half high, or more, which is round, of an Afh, or whitifh color, and pretty hard, not Jò thick fet with Joints and Leaves, as are the *Carnations* following, but the Stalks are more in number, the Leaves are narrower, and whiter for the moŝt part, and in fome do a little turn. The Flowers are much fmaller than tbofrof tbeCzrmuñn^ of a deep redenmfon color, very thick, and double in moŝi -, the green hulks in which they ft and are aljojmaller : the en is of the Leaves in this Flower (M in all the reŝt) are dented or jagged, yet in feme more than in others. Some alfo have two white threads, crooked at the ends

ends like boms, in the middle the perfer-
 a* several others have none. These kinds, and espe-
 daily thh that has the Di-
 flower, do very well endure
 and are with much less care preserved
 scription take as a Prefident for all the
 Clove-gilliflowers.

V. The second, or greatest English Carnation, has a Root which is branched into several great, long, and woody Arms or Parts, having many small Fibres annexed to them, yet is very difficultly preserved in Winter, for which reason it is not altogether so common as the other Carnations and Glove-gilliflowers. from this Root rises up a great thick round Stalky divided into several Branches, some what thickly set with Joints, and at every Joint two long leaves, rather green than whitish, somewhat broader than Clove-gilliflower Leaves, turning or winding two or three times round (yet in some other kinds of Cairntions, they are plain, but bending their points downwards, and in some also of a dark reddish green color, in others not so dark, but rather of a whitish green color:) The Flowers set and at the tops of the Stalks, in long, great, round, green husks, which are divided into five points, out of which rise many long and broad pointed Leaves, deeply jagged at the ends, set in order, round and beautiful, making a noble great double flower, of a deep Carnation color, almost red spotted with many bluish spots and set rakes, some greater, and some lesser, of an excellent, delightful, and pleasant sweet Smell, not too quick, as many others of this kind are, nor yet too dull, and with two whitish crooked threads, like horns in the middle. This kind never bears many flowers, but as it is slow in growing so it is also in bearing, it is a magnificent Flower, and Jews a kind of stateliness, for it will not endure to be often handled. This deserves to be preserved for till them of this kind.

VI. The third, or Lesser Kind of Carnation, has a Root much like to the former but something shorter, having from it Stalks near the ground, thick set, but much smaller or narrower Leaves than the

Clove-gilliflower for the moi part. The flowers are like unto the Clove-gilliflowers, and about the same bigness and duplicity, yet in some they are much greater than in others, but of a pale yellowish Carnation color, (tending some thing to an Orange) with two or three white threads, and crooked at the ends in the middle, but some have none. The Smell is weaker than that of the Clove-gilliflower, is less able enough to that Sense. This kind is more apt to bear Seed than any other, which is small, blacky flat, and long, and being sown, yields wonderful varieties of flowers, both Single and Double; some being of a lighter or deeper color than the Original or Mother Plant; some with few ribs in moi of the Leaves, others are striped or spotted, like one of the great speckled Carnations or Gilliflowers, in various sorts or kinds, and that both Single and Double: Some again are wholly of one color, like the Original or Mother Plant, and are either single or less Double than it, or else are Single, with one row of Leaves, like to a Pink. And some of these are also wholly of a crimson red, or deeper, or lighter, or variably spotted, double, or single as a Pink, or bluish, either single or double, yet but very seldom white, whilst all of them in the green Leaves of the Stalks nothing at all perceptibly differing.

VII. The Places. These are all nourished in Gardens throughout all England: of the first kind I have seen whole Fields of them planted in Kent for the use of the Markets in London. The third was brought out of Silesia, but now is become a free Denizen, and absolute native of this Kingdom, it growing and thriving as well here with us, as any of the former.

VIII. The Time. They Flower not until the heat of the Year, which is about the latter end of June and in July, (unless it be an extraordinary hot Season) and they continue flowering, until the Cold of the Autumn nip them, or till they have wholly spent themselves out, and are generally, (as was laid before) increased by Slips, The Clove-gilliflowers by reason of their hardness, being better able to endure the Cold of Winter, are usually planted

in Gardens : but the Carnations and Gilliflowers, by reason of their tendernefs, are ufually Planted in Pots, that they may be houfed, ana kept and preferred from the extreame cold of our Winters.

IX. *The Qualities.* Thefe Plants as to their Roots, Leaves and Flowers, are temperate in refpeQ: to heat or cold : Afringent, Sudorifick, Traumatick, Cordial, Neurotick, Alterative, and Alexipharmick.

X. *The Specification.* It is peculiar againft Fainting and Swooning Fitf

XL *The Preparations.* You may have therefrom, I. An Infuffate Juice. 2. A Syrup, 3. An Effence. 4. A Conferve. 5. A Diluted Water. 6. A Spirituous Tinture. 7. An Acid Tinture with Tin-gar.

The Virtues.

XII. *The Infuffate Juice.* It is highly Cordial, and may be diffolved in white Port Wine or Canary, to make a Tinture of atpleaiure, againft fainting and swooning Fits, Sicknefs at Heart, Malignity of the Plague and Poifon.

XIII. *The Syrup made with Water,* as is taught in our Pharmacopocia Londinenfis lib. cap. 16. feft. 18. thus: Take Clove-gilliflowers (the Whites being cut off) a pound : infufe them all night in Spring Water two pounds : being (trained, with double-refined white Sugar four pounds, make a Syrup (without boiling) only by melting the Sugar. This Syrup is temperate in Quality, ftrengthens the Heart, Stomach and Liver, it is Pe&oral and Cordial, and may be mixt with other Cordial Liquors, againft malignant Fevers, and the Plague as alfo againft Faintings, Swoonings and the like. It refrefhes the Vital Spirits, cheers the Heart, and refifts Poifon.

XIV. *The Syrup made with white Port Wine or Canary.* It is made exactly as the former, and has all the fame Virtues only it is a greater and more famous Cordial, more powerful againft Faintings and Swoonings, to comfort a languifhing Stomach, as alfo to cheer the Heart and revive the Vital Powers.

XV. *The Syrup made with Wine Vinegar.* It is made exactly as that with Water, putting in the fame quantity of Vinegar inftead of the Water. It is opening, and refills Vapors which fly into the Brain, it fortifies the Stomach, comforts the Heart, cheers the languifhing and drooping Spirits, it helps Digeftion, and prevails againft all Difeafes proceeding from Cholera or heat of Blood, as Malign and Peftilential Fevers, and Fevers not Peftilential: it cools the Blood, refills Poifon, quenches Thirft, and is helpful againft the Vertigo. Dofe of any of thefe three Syrups, an ounce at a time in any convenient Vehicle.

T 5 " The Effence. It has all the Virtues of the Anipitate Juice and Syrup, it is good againft Difeafes of the Heart, Head and Stomach, very Cordial, fpecial good againft Heftick Fevers; to (top fluxes and help fuch as fpit Blood: and as it cheers the Heart and revives the Spirits, fo it powerfully refifts Melancholy. Dofe from two drams to four.

XVII. *The Conferve.* It is Cordial, cheers the Heart and ftrengthens the Stomach, and is only eaten as a fweet-meat. It is good for old People, to eat in a morning fafting.

XVIII. *The dijilled Water.* It is made by a very gentle heat in balneo, is Cordial, and may be ufed as a Vehicle, to convey other Cordial Medicaments in, befides which, it is of excellent Ufe to wafh fore Eyes withal, wafhing them therewith five or fix times a day.

XIX. *The Spirituous Tinture.* It is a great Prefervative againft all manner of Malign, Infectious* and Peftilential Difeafes, and ought to be ufed preventively, as firft in the Morning fafting -, fecondly about four in the Afternoon -, thirdly at Bed time. It more powerfully comforts the Stomach, cheers the Heart, and revives the Spirits, than any of the former Preparations. It may be prepared with common Spirit of Wine : and then it may be taken alone of it felf, from one fpoonful to two, according to the Age of the perfon ; or otherwife mixt with Wine, or fome other Vehicle.

XX. *The Acid Tinture made with Vinegar.* It comforts the Stomach much, cheers the Heart, helps Digeftion, ftops Vomiting, is good againft fputting Blood, and ftrengthens the Retentive Faculty. It cuts tough Flegm, corre&s the heat and malignity of Cholera, helps Expe&oration, and quiches Thirft in burning Fevers. It is an excellent thing to be given in the Cure of the Plague, and of all manner of Malign and Peftilential Difeafes.

CHAP. CXL.

Of COCKLE.

I**^ HE Names. It is called in Gmv£, 

A T» : In Latin, *Lychnis Segetum*, *Lychnoides Segetum*, by *Tragus*, *Githago*, and makes it *Roft mariana genus fextum* -, *Anthemion foliofurn Rue Hij Nigellafrum* & *Anthemion Dodonti*, *Pseudomelanthurum Matthioli* \$ *Lychrtis fegetum major*, *Bauhini* -, (becaufe he makes the *Alfine Corniculata Cluffj*, to be his *Lychnis fegetum minor*.) In Englifh^ *Cockle*, or *Corn Wild Campion*.

II. *The Kinds.* It is a fingulat Plant, and accounted to be one of the *Wild Kinds of Campions*. It is a kind of Wild or Baftard *Nigella*, as fome Authors think* for which fome Herbarift, from the found or hknefs of the word, thought it to be the true *Gith*, or *Melanthium*, but were abfolutely deceived -, for it not only differs in Leaves from the true G/V/?, but alfo in other properties : if it has any refemblance to *Nigella*, it is more in the blacknefs of the Seed, than in the Flower, or in any thing elfe 3 and therefore *Matthiulus* called it as aforefaid, *Pfeudomelathiw*n, as alfo divers others fince him.

III. *The Delcription.* It has a fmall and woody Root, which perifhes as foon as it has born Seed \$ from whence fprings up an upright hairy Stalk, (hooting forth Branches on all fides, with two long hairy, or foft Woolly Leaves at the Joints. The flowers grow forth at the tops of the Branches, in hairy long Husks, whofe ends or points are longer than any of the Campions, ftanding upright both before the blowers open, and after they are paf, and laying themfelves between the jive round pointed-Leaves, when they are blown, which are of a bright reddifh purple or crimfon color: The Seed which follows (which is in hard round heads) is bigger and blacker than in any of the Wild Lychnides or Campions. Here is to be noted, that fom have obferved another Kind of Cockle, with white Ylowcers, but hiving no other material difference befides.

IV. *The Places.* *Cockle* grows too plentifully in moft of our *Corn-fields*, (chiefly in our *Wheat-fields*) throughout this whole Kingdom : for which caufe *Hippocrates* calls it *Melanthium ex Tritico*.

V. *The Times.* It Flowers, in the beginning of Summer, and the Seed is ripe in HarveJUim*

VI *The^jlities*. It is hot and dry in the end of the fécond Degree ; Aperitive, Cleanfing, Narcotick, and Hyiterick.

VII. *The Specification*. It is peculiar againft Scabs and running Sores.

VIII *The Preparations*. You may prepare therefrom, 1. A *Decodion of the Herb in Red Port Wine*. 2. A *liquid Juice*. 3. A *DecocTwn of the flowers in Red Port Wine*. 4. A *Ponder of the flowers*. 5. A *Decoct ion of the Seed in Wine*. 6. A *Pouder of the Seed*. 7. A *Pejfyary of the Seed*. 8. A *Balfam*.

The Virtues.

IX. *The Decoffion of the Herb in Red Port Wine*. Being taken inwardly two or three ounces at a time, it is good j^p ftop the Terms in Women, as alfo the Whites, and to ftop any inward Bleeding ^ it is good alfo to open Obftu&ions of the Reins, Ureters and Bladder, and to provoke Urine, and expel Stones, Gravel, Sand, and other Tartarous Matter.

X. *The Liquid Juice*. It has the fame Virtues, but is feldom given inwardly : but outwardly applied, it ftops all forts of External Bleedings^ of Wounds •, cleanfes and heals Scabs and) running Sores, Ulcers, Cankers, Fiftula's, &c. by correfting the putrefaction, and drying up the moift Humors which offend them.

XL *The Decoffion of the flowers in Red Port Wine*. It is good againft all the Difeafes againft which the Deco&tion of the Herb is good 5 but is withal a niore plealant and delicate Medicine, and more powerful to ftop the Terms in Women, and may be given three, four, or five ounces at a time, Morning and Evening. It is a peculiar opener of Obftu&ions in the Reins and Bladder.: Ufed as a Gargle in the Mouth, it cleanfes, dries up, and heals Cankers, running Sores, and Ulcers in the Throat, Mouth, and Gums, ftops the Putridity, cleanfes and heals them. It is good againft Poi&on, flinging of Scorpions, and the bitings of Serpents, or other Venomous Beasts.

XII *The Pouder of the flowers*. It may be given to a dram in Red Port Wine, againft all forts of Fluxes, (and Bloody-fluxes in fpécial) of the Belly, Reins, and Womb : outwardly applied to Sores and old Ulcers, it cleanfes, dries and heals them. Inwardly given, it is good againft the Plague, Malign and Peflilential Difeafes, and the bitings of Serpents, or other Venomous Creatures. Outwardly applied to, or ftrewed upon Ulcerated Kibes, it e> fe&ually cleanes them, dries up the humidities, and heals them, tho' the Ulcer has penetrated to the Bohe.

XIII. *The Decoffion of the Seed in Wine*. It helps fuch as are flung by Scorpions, being inwardly taken to two or three ounces ; and the place outwardly bathed therewith. It has alfo an efpecial property to cure the Itch, as alfo Scabbinefs, and running Sores •, and to correct the putrid Humors flowing to any Wound, Ulcer, or Fiftula.

XIV- *The Pouder of the Seed*. Being given from a dram to two drams, according to the age of the Perfon, and irength of the Conititution, it has been found to purge the Belly of •Cholerick Humors, to expel Poi&on, and refill the malign force of the Plague: It is alfo of very good ule in all forts of running Sores, old Ulcers, inveterate Cankers, putrid and malign Fiftula's, and the like •, for it reftitutes the putridity, cleanfes and dries up the Moisture, and heals beyond all imagination. , *Offavius Horatianus* gives the Seed parched, and beaten to powder, to be drunk againft the Yellow *liffidk*.

XV, *Theffary*. Made of the Seed with Honey. Being put up ~the Womb, it provokes the Terms, as *Hippocrates* teftifies in his Bock of Womens Dif-
'afes.

XVI. *The half am*. It is made of the Juice or green Leaves and Flowers, by boiling in Oil Olive to crippnefs, firaining out, and repeating the boiling three times, then mixing with every pound of that Oily Decoffion, twelve ounces of Venice Turpentine, and fix ounces of Wax, boiling to a thicknefs. It heals Wounds, Ulcers, old running Sores, Fiftula's, by digefting, cleanfing, incarnating, drying, 'Cfc.

I. *HE Names*. It is called in *Greek*, (by the X AncientHerbarifts) *O^%f*, and is thought to be the *Qnobryclm of Vt&fcortdes*, in *Lain*, *Onobrychsz^CaputGallmiceum* : I_n *Engltjh*, *Cocks-head Mick letch*, and *Red Fetch/he*,

II. *The Kmds*. Authors make many varieties hereof j *Farhnfon* makes, nine Kinds h bit whereas they are not all Natives of OUT Country, we (hall only defenbe thofe which are natural to the place, and to be had with us, which are chiefly Siree viz • *i.Ombrw&^s vulgaris*, *Caput Gallinaceum* • *Onobrychx D*do»**† *Clufa Xba!ifh*, *Ghux five Onobrychis Gejneri inbortis*, *Qaput Gallinaceum Belgarum Lobeh* ; the leffer fort of which is called- by *Bauhinus*, in *P&odromo^ Caput Gallinaceum minus* Y *Cocks-head*, the Common Kind, alfo *Me dick Fetch' li fig* -, and by the *French*, *Saint Win* • But this is not the *Saint Foin* fo much talked of for the Improvement of Land, that we have difcourfed of before in Chap. 135. where we have (hewed the excellent lufes thereof in Agriculture. 2. *Qnobrychis* •• *fpicata-flore*

fibre fur pure a, *Onobrychis Pannonica prima Clufij* .
Cicer Afragaloides Pon<e -, fpiked Cocks-head with
purple Flowers. 3. *Onobrychis floribus Cerule*[^]
Onobrychis Pannonica fecunda Clufij, Bew Flowered
Cocks-head.

III. The Defcriptions. *The firft or common kind*
has a Root which is tough, and fome what woody ;from
whence ffiring forth feveral weak but rough Stalks,
leaning doxhnwards, about 01 foot and half high, befet
with Winged Leaves, each being longer and more
pointed, than thofe of Lentils, and whitifh under-
neath h from the tops of thefe Stalks rife up other
tender Stalks, naked without Leaves, unto the tops,
where there grow many mall flozvers, in manner of
a fpike, of a pale reddijh color, with fome. blewnejs
among them f after which rife up in their places
rough, round, and fomewbat fiat beads. Of this firft
Species, Bauhinus has given us the Defcnp^twn of a
leffer, differing in nothing from the former, but only
in the magnitude, or rather fmallnefs thereof.

IV. The fecond has a Root great and long, bard,
and of a woody fubftance, fprending it felf far abroad,
and growing very deep into the ground -> from whence
1 Tfo U P man, y ^ks, efpccially when it is grown to
an old Plant, round, hard, and leaning to the ground
like the other Pulfes, and has Leaves very like Ga-
legã, or the Wild Vetch, of a bitter Tajie, and loath-
fome Savor : among which come forth fmall round
Stems-, at the ends of which m do grow flowers /pike
faffion, three Inches in length, and in Shape like
ibofe of the great Lagopus, or Meadow Trefoil, but
longer, of an excellent fhining purple color, but
without Smell: which flowers being paf^t away, fmall
cods follow, containing little, hard and black Seed[^]
in tajie like to the Vetch or Tare.

V. The third has alfo a fmall, tough, and woody
Root, from whence fpring up many twiggy Branches,
about afoot and half high, full of Knots, ramping
and creeping on the ground. The Leaves are like
the former, but fmailer and fhorter : among which
come forth fmall flendet Stems, upon which do grow
little Flowers, like thofe of the Tare, but of a blew
mcolor, tending to purple. The Fleers b^ring fallen,
fmall Cods come forth in their places, which contain
little black Seed like a Kidney, and of a black color
vibe nit is full ripe.

VI. Note. It is fuppofed that the firft of thefe
is the *Onobrychis* of *Diofcorides*, alfo of *Pliny*: for
Viofcorides defcribes it thus -, *Onobrychis has Leaves*
like a Lentil, but longer, a Stalk a Span high, a crim-
fon Flower, and a little Root \$ and grows in moi-ji
and unfilled places. Pliny vrites thus •, Onobry-
chis has the heaves of a Lentil, but fomewbat longer,
** red Flower, and a final and flender Root -, and*
that it grows about Springs, or Fountains of Wa-
rr-.

VII. The Places. The firft and fecond grow (fays
Gerard) upon *Barton-bill*, four Miles from *Lew-*
ton m Bedfordshire, and likewife upon the *Graffie*
Balks . between the *Corn Lands* two Miles from
^ n ^ r to a Water Mill towards *London* h
and m divers other places in the way from *Cam-*
bridge ^London . The third grows not Wild here,

VIII. Time of V* * all Flo wer from the end
of June of Auguft and Seed is ri-
pened in the mean Seafon, and in fome little time
after.

* Tjey feem to be temperate
in refpect of heat or coldnefs, drynefs or moifture;
and *ja/en* fays in his Books of the Faculties of
Simple Medicaments, That they rarifie, or make
thin, and wafte away. This is certain, by Experi-
ence from the feeding of *Cattei* with them, that
they are *Galafogen tick* ^ or breeders of Milk.

X. The Specification. They have been found to
be fingular good for the difcuffing, confuming, or
wafteing away of hard Tumors or Swellings.

XL The Preparations. You may have therefrom,
1. A liquid Juice. 2. An Effence. ? 4 Powder
of the Leaves. 4. An Oil. 5. A *Cataplafm*.

The Virtues.

XII. The Liquid Juice, Taken from two ounces
to lix, either alone by it felf, or mixt with a Glais
of White Port Wine, it prevails againft the Stran-
gury, and all Obltru&ions of Urine, caufed by
Stones, Cravd, Sand, or Tartarous Matter in Reins
or Bladder : and taken by Nurfes, it caufes them to
breed abundance of Milk.

XIII. The Effence. It has the former Virtues, but
opens and cleanfes more, being taken in like man-
ner, Morning and Evening: Bathed upon any Tumor
or Swelling, not malign nor maturated, it difcuf-
fes or wafte it away. Dofe from two, to three or
four ounces.

XIV. The Ponder of the Leaves. *Diofcorides*
fays, that if it is drunk with Wine (I fuppofe from
one dram to two dram, Morning and Brening) it
cures the Strangury. It has indeed a fingular facul-
ty to open Obftr&itions of the Urinary parts.

XV. The Oil, made by boiling the Green Herb in
Oil Olive to Crifpnefs, and repeating the Operation
three or four times, and fo ftraining it out. This,
fays *Diofcorides*, being anointed on the Body, it
provokes Sweating. Anointed on hard Tumors, it
foftenes them, is difcuffive, and caufes them to wafte
away.

XVt The Cataplafm. Being btuifed green, and
laid on (in the form of a Cataplafm.) upon hard
Tumors or Swellings, or waxen Kernels in the
Neck, or Throat, or in other Farts 5 it caufes them
to confume and wafte away -, and this more efpe-
cially, if the Juice or Effence, afbrefaid, betaken
daily, Morning and Evening, in a Glafs of White
Port Wine, as is directed ; and the Patients withal,
je once or twice a Week (according as their
ics will bear it) with my *Family Pills*.

ChAP. CXLII

O/COCKS-COMB;

I. n^p HE Names. The Ancients, we cannot find"

X kneW any thing of this Plant, unlefs it be
AMWOW®- *Plinij*, i. e. *gallinacei Crijiam habens*.
Our Moderns Call it *mLatin Crijla Qatt*, vel *Galli**
nacea, becaufe the Flowers, as iome think, ftand at
the tops of the Stalks, like a Cocks Comb; others
think it to be fo called from the form of the
Leaves, whofe dentings on the edges, refemble the
Comb, or Creft of a Cock : In *Englijb*, it is cal-
led *Cocks Comb*, *Tellow Rattle*, and *Telloio Louje-*
moort.

II. The Kinds. - It is one of the Kinds of *Rantie-*
Grafz, or *Loufe-wort*. Now *Rattle-Grafz* is either
Tellow or *Red* >, the *Tellow*, which is called *lcc&S-*
Comb^Q (hall treat of in this ghice i the *Red* vie
(hall treat of under t^{ap} Title of *Rattl*&'s Red*, TM
fome of the Chapters following. Of the *eflow*,
Kind there are four Species, of which two of them
are only found to grow in *England*, vtz. i • *nja*
Galli Lutea, *Crip Gallinacea*, *Crifta Gatl Bwb^tmi*
Pedicularis pratensis lutea haubmi ^ *edic^laris*
Campeftrit Tragi -, *Crifta Galli vel Qallinacta* IV
Dd bcnd&t,

Lobelij, Qiify ; Cocks Comb, Yellow Rank, and Yellow Loufe-wort. 2. *Criftu Galli Lutca Umbellata Bauhini*, Yellow Rattle, with Tuited Flowers.

III. The Defcriptions. *The Common Cocks Comb, or Yellow Rattle, hat a Root /mall and flender, which peri/hes every Tear -, from which Root feld&m grows more than one round green Sttlk, which nfes up about half a yard, or two feet high, and with but few Branches thereon, having two long, and jomewhat broad Leaves fet at a Joint, deeply dent-ed, or cut in en the edges, refembling therein the Creji or Comb of a Cock, broadefi next to the Stalk, and narrower or /matter towards the end. The Flow-ers grow at the tops of the Stalks, with fame Shorter heaves with them, being hooded as the Red Rattle-Grafles are ; but of a fair yellow color in mofl, or elfe in fame paler, and in Come more white .- The Seed is contained in large Husks, which being ripe will rattle, and make a noife, it lying loofe within them.*

IV. *Tlje fecond has afmall flender Root, which fends forth a few narrow Leaves, of about an Inch long apiece ; and a Stalk from among them but a little more than an hand breadth high, on winch grow manyyrlmv flowers, Jet together at the top, as it were in an Vmble or Tuft, fafhioned like the other jpitb hooded and gaping yellow blowers, but three times longer than thefe; which being pafi away, leave great broad husks, containing the Seed.*

V. *Hie Places.* They grow in our *Meadows and Woods* generally through the Land ; where their ate rather a *Plague and Annoyance* to it, than of a good Lfe for *Cattel*. *Gerard* lays, that the firft grows in dry *Meadows and Pafures*, and is accounted as an unprofitable tiling. #

VI. *V?e Times.* They *Flotter in June, July, and AK&tft*, and the *Seed* ripens in the mean *Seaftm*.

VII. *T?e Qualities.* It is held to be cold and dry of an *Alterative* property, and *PeEtoral*.

VIII. *The Specification.* Ir is peculiar againft *Coughs, and Difeafes of the Lungs.*

IX. *T?e Preparations.* You may have therefrom, 1. A *liquid Juice*. 2. An *Etfence*. 3. A *Dec'oSi-on in Wine or Water*. 4. *TXr -whole Sted*.

The Virtues.

X. *Tfv liquid Juice.* If it is mixt with *Honey*, and put into the *Eyes*, ir takes away *Milts, Clouds, feilms,* and other things which dim the lighr: mixt with a little finall, or weak *Lime Water*, it dys up *Rheums* in the *Eyes*, and heals any-*Soie OI Ulcer* with which they may be affeted.

XI. *The Effence.* It has the *Virtues* of the *Juice*, oeiides which, being dulcified with *White or Brown Sugar Candy*, it is an excellent thing againft *Coughs* Colds, Hoaribeis, Wheezings,* and fhornefc of

VM* *o*ne a Jyp⁰⁰¹! or two at a time.

XII. *The Decoclion in Wine, or in Bean Broth, or ***;* < may be fweemed with *Honey*, and then . ^ v i c h n ? h i t e s ^ E g g s . It is a good thing againtt *Coughs and Colds, caufes eafie Expectorat-ion ;-* and is a good *Cblhrwm* to wafli weak, dim, lore^ and juiming *Eyes* withal, for it admirably cures

XIII. *The whole Seed.* If it is put into the *Eye* it cures dimneft of fight from *fy, ptire ext Qufe,* and removes *Milts, QoudW^iFilms, Skins,* or *fearls,* or any other outward matter which obfufcates the fight.

CHAP. CXLIII

O/COLEWORTGsrdo.

I- T H E *Nmet.* k h called in *Greek,* &t

1 A 7 ^{Attice} > X*ffl*, vd *KWPSwr*. It is alfo cal-*lea Af<tl^@-*, (not hecaufe it arives away drunken-*nels,* but allb becaufe it is like in color to the *Amt-tyft*.) which name is intended of the firft fort of tilt following *Gicwris* •• la *Latin, BrojjiUa,* and by the

the Apothecaries, ^/; * : In Englifi, Cole, and Colewort*

II. The Kinds. There are two principal Kinds, T.S. i. The Headed Colewort, which is our Common Cabbage, of which we have at large Treated in Chap. 103. aforegoing. 2. The not beaded^ or open Colewort, of which there are several Species, viz. 1. The Garden Kinds, of which in this Chapter. 2. The Cole-Flower, of which in Cap. 144. 3. Wild KM^ffifisiKLW Cap. 145. 4. ~~of the~~ ~~or white in Cap. 146.~~ Of the there are many Species, as 1. *Brassicavulga*. Our common Garden Colewort. 2. *Brassicacurta*, Curled Garden Colewort. 3. *Brassicarubra*, The common Red Colewort. 4. ~~all which~~ ~~l<J<~~, The open Cabbage Colewort :

In Th^e Descriptions. The firjt which is our common Garden Colewort, has a woody JirongRoot, with many Fibres or Strings adjoining to it : from whic^h Root rife up many broad, thick, fat Leaves, of a deep black green color, through the middle of w^hic^h Leaves runs in each a great Rib, which is thick and high on the backside, with many fmaller Ribs or Banches rijing from that middle Rib, of Reddijh, Whitijh, and- AJb-colors. The Stalk grows out of the midft from among thefe Leaves, which Spreads it Self forth into Several Branches, bearing at the top, Small yellow Flowers : which Flowers being paf, long Cods Juceed, full of round Seed, like thofe of the Turnep, but Smaller.

IV. The fecond, or Criped Kind, has a Root, Stalk, Flowers, Cods, and feed not much differing from the former: but the greatek difference lyes in 'the magnitude, this being something ' leffer than the former -, and in the Leaf, this being divided with many deep Cuts, even to the middle Rib on both fides, by which means it becomes rough every where in its edges, and very much CriSped or Curled.

V. The third Kind, is So like unto thefirft in its

Roots, Stalk, broad, thick, fat Leaves, Flowers, Cod^s, and Seed, that it would Seen: to be wholly the Same individual Species, did not the color maty^e the difference, that being of a green color, this of a Red, fome of a deep purple, others of a lighter Red, and fome of a reddijh Green.

VI. The fourth Kind, has a Roet Somewhat thick, frong, and woody, filled with almfi an innumerable company of fibres. Some greaterjome Smaller, Some Jhorter, and Some longer, like in number as it were to the lairs of ones head -, from which Root Springs up one thick Stalk, having at top thereof a great thick head of crumpled Leaves: the Leaves are large, and of a white green color, and fet with thick large white Ribs: the outermoft of which gather the refi of the Leaves clofely together, which are leffer than thafe next the ground, thefe lye open moji part of the Summer, without any Seemingnels to cloje -but towards the end of the Summer, being grown to have a great many Leaves, it then Seemras if it muld (hut up or elofe together ; but fianding a while at a flay it on the contrary rather dilates and Spreads it elf abroad, looking Something like a thick, hard, whitened Colewort, and is indeed nothing elfe.

VII. There are befides thefe, feveral other Species of edible Coleworts; fome Curled, and wholly oi^a a Green color, fome of divers colors in ope Plant, as White, Yellow, Red, Purple, or CnmiorL fq van ably mixed as to caufe admiration, the: Lea, es -be ing curled on the edges like a Ruff, very beautiul to behold. 2. There is alfo another f**TMTM* of lefs beauty and refpea, being but a little curld on the edges! whole ^ J \ ^ l ^ whfe,

areafonable Turnep, but longer^ and from tg

fwhich bear yellow Flowers, and Seed^

FoxLs, almoit as imall as Muidard Seed, whofc Root is very long, and very thick or buffy, with 20 valt number of Hbres.

VIII. *The Places.* They all of them grow every Where through *England, Scotland* and *Ireland*, in *gardens*, being chiefly nursed up to supply the *Market* use of the *Kitchin*.

IX. *The Qualities.* They are temperate in respect of cold, but are laid to be drying in the first Degree, and of a binding Faculty; and yet the Broth of the first boiling, some Authors say, loosens the Body. the second Decoction (say they) is only Afringent. They abound with a certain Nitrous or Salt Quality, whereby they mightly cleanse the Bowels, whether in their Juice or Broth: but the substance of the *Colewort* is of a drying and binding Faculty, because in boiling it looses its Saline Particles, and leaves them in the Decoction or Broth.

X. *The Specification.* They are peculiar against Asthma's, breathing Obstruction, and shortness of Breath, for being of a cleansing quality, by taking away the superfluity of matter in the Lungs, and other Bowels, they do open the Passages, as to leave the parts for respiration free and clear.

XI. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Syrup made with Honey. 4. A Lobeck, 5. A Decoction. 6. A Collyrium. 7. A Cataplasm. 8. Aches of the Stalks. 9. The Seed. 10. A Sal let.

The Virtues.

XIII. *The liquid Juice.* *Pliny* says, that if it is mixed with Wine, and dropt into the Ears, it is beneficial against Deafness. *Dioscorides* says, if it is mixed with Juice of *Flowers de Lee* and *bare*, that it will make the Body soluble. The Juice having some Nitre dissolved in it, and used

as an Errhine, up the Nostrils, it purges the Head and Brain, of Cold, Moist, and Pituitous Humors.

XIV. *The Effence.* Being mixed with Wine, and fo drunk, it helps such as are bitten by Vipers or Adders, or any other Venomous Serpent. It is also good for those who have been Poisoned by eating Venomous Mushrooms. Dose three or four ounces twice a day.

XV. *The Decoction.* It is good for the Shortness of Breath, and loss of Voice: and being often used, it causes easy Expectoration; heals the Lungs, and forens of the Stomach, and fo is good for such as are entering into a Consumption. Dose two ounces two or three times a day, in Tent, Mailaga, &c.

XVI. *The Lohoch, or EleSuary.* If it is made of the Pulp of the Stalks with Honey, it is good for such as are short winded, and are purged, breath difficultly, and have a vehement Cough. You must take the middle fleshy Ribs, boil them in Milk till they are soft, then take out their Pulp, and mix it with Honey to a Lohoch or EleSuary.

XVII. *The Decoction.* It encreases Milk in Nurses, and being drunk, strengthens the Nerves and Joints. And *Gerard* says, that if those fores in the Eyes called *Carcinomata*, be washed therewith, it heals them, though they could be healed by no other means. The first Decoction loosens the Belly, but the second binds it: The first is said to provoke the Terms, and cause Conception, but the second hinders it. If the Decoction is made in Cock Broth, by boiling the Coleworts with the Cock, it will be a singular help for such as are troubled with Wind, and Gripping rains in the Stomach and Belly. The same Broth, is also very good for those who are troubled with Obstructions of the Liver and Spleen, and for such as have Stones, Gravel, Sand, or other Tartarous Matter in the Reins, Ureters, or Bladder. Taken before meat, it is a very good thing to keep one from Surfeiting, as also from Drunkenness, though they drink much Wine, by refraining and keeping down the Vapors, which otherwise would ascend up, and intoxicate the Brain, and this it will the more effectually do, if it is made pleasantly or gratefully mixed with Juice of Limons. Swollen and Gouty Hands, Knees, Legs, and Feet, (into which gross Humors are protruded or fallen) being bathed with Decoction of Coleworts Warm, eases the Pain, dissolves the Humor, and takes away the Swelling. The Decoction (as also the Juice and Effence) cleanses, dries and heals Scabbiness, old Ulcers, and filthy running Sores, being often washed therewith. And *Galen* says, it cleanses strongly, that it will even Cure the Leprosie.

XVIII. *The Collyrium.* It is made of the Juice or Effence or Decoction, by dissolving Honey in the same, three ounces of Honey to every Pint. This being often dropt into the Eyes, it clears the sight by removing the Cloudiness, Film, or Pearl: it is helpful against Inflammations and Blood-shot, and also cures sore and running Eyes.

XIX. *The Cataplasm.* Made of the Juice or Effence with Powder of Fenugreek, and applied, it eases the Pains of the Gout, and dissolves the Tumor: it also heals filthy running Sores, and old putrid Ulcers. If it is made of the Leaves Beaten to a Pulver, it prevails against all sorts of Inflammations, and hot Tumors. If it is made of the Herb or Juice, made into a Body with Barley Meal or Flower, and a little Common Sak, it is said to break Carbuncles, or at least some kind of Tumors, which much resemble them. If it is made up into a Pef-

fary,

ury, and* fo put up the Womb, it provokes the Terms,

XX. *The Afhes of the Stalks.* They are wonderfully drying and piercing, fo that they almoft become Caufftick * being mixed with Hogs Lard, the mixture is very effectual to anoint the fides and Stomach of fuch, who have of a long time been pained in thofe parⁱ, or in any other place, where the pain arifes from the oppreffion of the Spleen, or ^{^^faJH^by^TO} melancholly Humor, by helping to difcuffit, and difcuffing flatulencies.

XXI. *The Seel* Being bruifed and drunk, it kills Worms, as *Galen* fays : it alfo rakes away freckles of the Face, and other parts of the Skin, Sunburnings, Tanning, Scurf, Motphew, and other Deformities thereof *Athen&ts* alio fays, that it takes away Drunkennefs.

XXII. *The Sailer.* The fourth fort eaten raw, being chopt fmall, and drefs'd up with Vinegar, Oil, Salt, and Muftard, ftrengthen the Stomach, caufe a good Appetite, preferve from Drunkennefs, and caufe a good Digeftion. The firft kind, or any of the reft, being boiled with Meat till they are foft, then chopt fmall, and drefs'd up with melted Butter, Vinegar and Salt, become an admirable Sallet * for fuch as have weak Stomachs, or are going into a Cenfumtion, have dim Eyes, are affected with the Spleen, Flatulencies or Melancholly, or are troubled with Tremblings of the Limbs, or the Palfie. The Ancient *Romans* thought them to be effectual againft all Difeafes of the Body, whether Inward or Outward, for which reafon *Chryfippus* wrote a whole Volume of their Virtues, applying them to all parts of the Body. And that the Senate of *Rome* having expel'd all the Phyficians out of their Territories for the fpace of fix hundred Years, did for all that length of time, preferve and maintain their health, againft the affaults of all Difeafes, by the only ufe of thefe Plants.

CHAP. CXLIV,
Of COLE-FLOWER.

I. *HP HE Names.* I cannot find that this Plant X ^ was ever known to the *Greeks*, for which reafon it has no *Greek* name : or yet that the Ancient *Romans* had any knowledge thereof : but our Modern Authors call it in *Latin*, *Brajjica florida*, *Caulk florida*, *Cauliflora*, *Brajjica Cypria*, in *Engliff*, *CoU Flowers*, and *Colle-Flowers*.

H- *The Kinds* It is a fingular Plant, but is certainly one of the Kinds of *Coleworts* : and that Species, which *Pliny* lib. 19. cap. 8. calls *Brajjica Pompeurna*.

III. *The Defcription.* It has a Root: freat out into feveral pretty thick Branches, which are full of Fibres or Strings from which fpring forth divers large If***** are large, of a Jhitijh green color, very like to Cabbage Leaves, flightly indented

of which Leaves, fonetimes in the beginning of Autumn, andfonetimes fooner, there rifes up a great white Head of white hard Flowers clofely thruji together, fo?netimes they are of a Milk, or Cream, or yellowifh white color : thefe never open, or fpread much with us, and are then Jitteft for the Table, the green Leaves being cut away clofe to the Head: in all the other parts, the Plants like* to- the Cole-

worts. *Thefe Flomrrs have a much pletfanter tajle, than either Coleworts or Cabbages of any kind, and therefore are the more Valuable a* for Food.*

IV. *The Places.* They grow in moft parts of *Europe*, but very plentifully in *England*, *Scotland* and *Ireland*^ and are only nourifhed up in *Gardens*.

V. *The Times.* The *Colle-flower* muft be planted in *April* in a Bed of hot Horfe-dung, and covered with Straw, or the like, to kee> it from cold and frofty Mornings -, and having gotten about fix Leaves, then it is to be removed into the place where you defign it fhall grow. The *Flowers* are in their Prime in moft of the Summer Months.

VI. *The Qualities, Specification, Preparations and Virtues,* are the fame with *Cabbages* and *Coleworts*, of which we have already ipoken in *Cap.* 103. and 143. aforegoing, to which you are referred : only take this Note, That for the Table and Food, this is much .the more excellent and noble Plant. *Note alfo*, That being boiled in Milk, and then eaten with Sweet frefh Butter, and Salt, and Juice of Limons, they have been found to reftore admirably in Confumptions.

CHAP, CXLV;
O/COLEWORT Wild.

THE Names. It is called in *Greet*, *K&pfa* &V<* : In *Latin*, *Brajjica Sylvefttis* : and in *Engliff*, *Wild Colewort*.

II. *The Kinds.* It is a fingular Plant^and the fecond Species of *Colewortis*, being the' Wild Kind.

III. *The Defcription.* fr has a Root pretty thick? fpread into fome Branches^ with feveral Fibres ad? joining, white, hard, and fomewhaf woody^ from whence rife tip federal heaves, and one principal Stalk The Leaves are lon\$ arid, broad, not much unites

"Unlike the common Garden Cole wort leaf in shape, substance, and color; but that they are lefs, (as is also the whole Plant) being greyish, long, roundish leaves, it is gathered or torn on the edges. Among these ground leaves rises up the said Stalk, bearing such like, but smaller Leaves, which is spread forth into divers Branches: at the tops of which Branches, grow small yellow flowers, which being past away, they are succeeded by small rough Pods, which contain within them small round Seed. This Plant is of its own nature Wild, and therefore not used as Food, or sought after for that purpose.

TV *The Places.* It grows in most parts of England in open Fields, and new digged Ditch Banks, and such other like Grounds: and is in some places Husbanded and Sown for the Seed sake, which many times very gainful.

V *The Times.* It may be Sown in the Spring time, as in March and April, and sometimes in July. It Flowers in July, and the Seed is ripe in August or September.

VI *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Garden Colewort: (except in the matter of eating them as Food, which is wholly forbidden:) and for any Medicinal Use, whether internal or external: The Wild is much to be preferred, as being much stronger, and so more powerful to all the purposes and intentions, the Garden is said to be good for, or against.

.. CHAP, CXLVI. Of COLEWORT, Sea.

THE Names. It is called in Greek, *ἕλιον*; in Latin, *Braffica Marina, Braffica Marina fruhiflora, Braffica Maritima Baubini, Braffica*

Marina Monospermos, Braffica Marina Anghed Gerardi: In English, Sea Colewort.

II. *The Kinds.* It is the least of the principal sorts of Coleworts, and a singular Plant of the Kind,

III. *The Description.* It has a Root somewhat Great, shooting forth many Branches underground, having many fibres also adjoined, and keeping its Leaves green all the Winter. From this Root rise up several somewhat broad and large, thick wrinkled Leaves, and as it were curled about the edges, growing each upon a several thick stalk, very easy to be broken, and so tender, that they can scarcely be handled without breaking, of a greyish green color, from among which rises up a (strong thick stalk) two feet or more high in Cubits, says Gerard, with some Leaves thereon, up to the top, where its branches much out, on every Branch stands a large Bush of pale whitish Flowers, consisting of four Leaves a piece, which being past away, small roundish, or thick and short Pods come forth, containing each but one roundish, greyish Seed a piece, of the bigness of a Tare, or Vetch, and much greater than Soldanella, or Sea Bindweed, to which Plant this Sea Colewort is not in the least measure akin, though some Authors have mistaken the former, viz. Soldanella, for this latter.

IV. *The Places.* It grows in many places upon the Coast of England, as well on the Kentish as Essex shores, at Lidde in Kent, and at Colchester in Essex: Gerard says it grows Naturally in the Bayche and Shores of the Sea, where the Earth is not to be seen but Sand, and Rolling Pebble Stones, which they who grow near the Sea, call Bayche: he found it growing between Whitlithip and...

V. *The Times.* It Flowers in the end of June, and is ripe towards the end of...

VI. *The Qualities, Specification and Virtues,* are the same with those of the Garden Colewort: (except those various Preparations and Uses of them for Food) but in all the cases there mentioned, this is the stronger and more efficacious.

VII. *Note I. The Decoction of the Sea Colewort,* (some Authors say) doth by its bitter Quality, and sharp Nitrous Particles, open the Belly, and purge the Body, but as Galen thinks, not without some hurt or damage thereto, because it differs much from the Temperature of our Bodies, being hotter and drier than the Garden Kinds: For as all other Wild

Wild Herbs are more potent or fronger in the Operations, Co also this *, for which reason it diffefts and cleafes more powerfully than the others do.

VIII. Note 2. The young Leaves boiled in Lymp of Pot-Athes, (as Diofcorides fays,) or in Fair Water (as is moll ufual in our times) are eaten as other Coleworts arg, by feveral poor People near the Sea, the boiling taking away much of the bitternefs thereof.

IX. The Juice of the Leaves or their Juice, applied to Sores or Ulcers, cleafes and heals them; diffolves Tumors, or Swellings, and takes away Inflammations.

CHAR CXLVII
O/.COLJS.FOOT.

THE Names. It is called in Greek, Βϕϕiv, alfo A XctjAaihvxi: In Latin Tuffilago; but by the Apothecaries, Farfara, and Ungula Caballina, of fome Eppulago, (from its likenefs to the Poplar Leaves,) Farranum, and Farrugium Plinij of divers Palæguma^Ko Bechium, Chamxleuce, (from the Poplar tree, called in Greek, AWCΜ,) In Englifh, Colts-foot, role-foot, and Horfe hoof: Gerard lays, it may very well be called Cough Wort.

In the first Chapter of the second Book of Gerard's Herbal, he describes this Plant, which he calls the Colts-foot, and the reason of the name, which he says is because the leaves are like the hoofs of a colt. He also mentions that the plant is found in many places, and that it is used for medicinal purposes. The text is somewhat obscured by the image and other markings.

III. The Descriptions. The Englijh, or Tuffilago Kind, has a Root small and white spreading very much in the ground, so that where it once takes, the ground is very difficultly cleaned from it again; for if any little piece or bit of it remains therein, it will from it Spring forth afrejh. From this Root /ender naked Stalks Jhoot up very early in the beginning of March or April, about aspan long, bearing at their tops small yellow Flowers, which quickly fade away, and after they are past, Leaves broad and somewhat roundish come up, yetfometimes a little dented about the edges, much leffer, thicker, and greener than those of Butter Burr, with a little doigny hoarhiej over the tepper side of the green Leaf, which maybe rubbed away, and whitish or mealy underneath the Leaf

IV. The American has a Root which confists of a Bubb of blackish Threads or Fibres, (which abide the hardnefs of the Winter, both the Stalks and Leaves perishing yearly,) but grow brownish at the end: From this Root rife up many round Stalks about afoot and half high, and two broad, and somewhat round, but pointed Leases, a little dented about the edges, at each Joint of them; the upper Leaves being smaller and little or nothing dented: at the tops of the Stalks come forth feveral Branches with many pure white Flowers, being small, and made of five Leaves apiece rising out of each husk, which King past, there succeeds small long Seed, flicking each to a little Downe, which are carried away together with the Wind: The whole Plant has little or no Smell, neither Root, Leaf, nor Flower, whatsoever Comitus fays to the contrary.

V. The Places. It, viz. the first, usually grows in wet grounds, as also in dryer places: It is found likewise near unto Springs, and on the brinks of Brooks and Rivers, in wet Furrows, by Ditch sides, and in Ditches, and in other moist and watry places near unto the Sea, almost every where. The latter grows in America in many places of Canada,

Virginia, New York, New Jersey, Pennsylvania, Virginia and Carolina, in which last place I have found it several times, travelling through moist, wet, and Moorish places.

VI. *The Times.*—The first begins to Flower in the end of February, or beginning of March, and the Leaves appear about the middle or latter end of March, when the Flowers are all gone, and remain green all the Summer long, and for this cause it has been thought that *Colts-foot* had never born Flowers, as *Vliny lib. 26. cap. 6.* has hinted.

VII. *The Qualities.* They are cold and dry in the first Degree. **Appetitive, Astringent, Traumatick or Vulnerary, restoral, and Analeptick.**

VIII. *The Specification.* They are peculiar against Coughs, and Diseases of the Lungs.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Effence.* 3. *A Syrup.* 4. *Aide coition.* 5. *A Cataplasm.* 6. *Dryt & Leaves.* 7. *A Difilled Water.* 8. *Tinier.*

***The Virtues.**

X. *The liquid Juice.* Taken alone, or sweetned with Sugar or Honey, it is prevalent against Coughs, Colds, Wheezing, Hoariness, and other Distempers of the Lungs. Dose from one to three <unces. Morning and Night at Bed time, and at other times of the Day, if the Cough is vehement.

XL. *The Effence.* It has all the Virtues of the Juice, but more powerful, besides which, it is singularly good to cure Ulcers of the Lungs, and Stomach, as also the Bloody Flux, and Ulcers of the Bowels, it stops thin Rheums and Distillations, or Catarrhs, and helps in Consumptions. Dose from one ounce to three, two or three times a day, either alone, or mixed with the Distilled Water.

XII. *The Syrup.* It cures Coughs, chiefly dry Coughs, but has an Influence against all Distempers of the Breast and Lungs, being often taken, even by spoonfuls, as also with a Liqueurice flick.

XIII. *The Decotion.* If it is made of the green Leaves and Roots, it cures a Cough proceeding from a thin Rheum, and helps Hoariness, you may sweeten it with Sugar or Honey.

XIV. *The Cataplasm of the green Leaves.* If it is made alone, or with Honey, it is good to abate hot Inflammations, and Anthonies fire, and to cure either hot excretions of the Skin, and being applied, it is good to heal Ulcers, and other old and running Sores.

XV. *The Dried Leaves.* Taken as Tobacco, they are good for thin Rheums, Distillations and Coughs: so also the Root taken in like sort, as *BioJcorides* and *Galen* say: viz. the Fumes of it, taken (from burning Coles) into the Mouth thro' a Funnel, as also the Fumes of the Leaves so taken (for I suppose the Ancients knew nothing of Tobacco Pipes, that being a Modern invention,) they effectually help such as are troubled with Shortness of Breath, and draw their Breath thick and often. The Fumes also ripen and break Apoptems of the Thorax and Lxxxi, and that without any danger.

XVI. *The Drilled Water.* Used simply or it self, or mixed with *Elder-flowers* and *Nightshade*, it is a singular remedy against all hot Agues, to drink two ounces at a time, and to have Cloths wet therein, and to be applied to the Head and Stomach. The same applied to hot Swellings, or any Inflammation, does much good, and prevails against Burnings and Scaldings, and Anthonies fire. It is singular good also to take away red Pimples, Wheals, and other final eruptions of the Skin, which arise through heat, and is profitable against the inflammation of the Piles, and burning heat of the Privy Parts, cloths being wet therein and applied,

XVII. *The Tinder.* It is made, as *Matthiolus* says, of the Cotton or white Wool, which grows in some parts of the Root, the said Cotton being cleaned from the Roots, and bound up hard in Linen Cloths, and boiled in Lye for a while, then adding some Salt-petre to it, it is to be dried in the Sun. This, says *Farkinson*, is the best Tinder to take Fire that can be, being (truck from a Flint) Applied to moist Ulcers, it dries, and their Humidities.

CHAP. CXLVIII O/COLUMBINE.

The *E Names.* It is said to be called in *Greek*, as *Coftxus* thinks from *Theophrastus*, *lib. 6. cap. 7.* and yet some think the *Greeks* knew nothing at all of it: *Dalechamp* upon *Athensus* calls it, *Awwp*, *Diofantos's* i. e. *Flos Jovis. rabin Columna* in his *rhytobafanos*, to whom *Quifus* gives the greatest approbation, refers it to the *icimv, Ifopyrum Dioscoridis.* In *Latin*, it is called, *Aquileia, Aquilina, Aquilegia, Aquilegia Ro/ea, Aquilegia Stellata, Leontostimum Gefnen, Herba Leoais*: and in *English*, *Columbine.*

II. *The Kinds.* Authors describe many Kinds hereof, but those which we shall treat of, are these seven **Mowing**: 1. *Aquilegia Vulgaris flore simplic* The Common Single Columbine. 2. *Aquilegia Vulgaris flore pleno*, Common Double Columbine. 3. *Aquilegia inverfis Corniculis, Double inverted* Columbines. 4. *Agria Ro/ea* The Rose Columbine. 5. *M. Degener, The Degenerate Columbine.* 6. *Taltrum vel Thahetrum tiipanicum album V furgureum, Ruta, Palustris, Ruta Fratenfis, Pseudorbabarbarum, Tutted Columbines, White and Purple.* 7. *Aquilegia Virginiana fiore ru-beffinte prcxox*, The early fed Columbine of *Virgi**

III. *The Descriptions.* The first has roots thick, and round, for a little way within the ground, and then it is divided into Branches furnished with many

ny Jmall fibres, abiding many Tears ; and from the round Heads of the Roots which abide all the Winter, shooting forth afresh every Spring, both Leaves and Stalks. The Leaves are divers, and large jpread, Jianding on long Footstalks, every one divided intojeveral parts, and roundly indented about the edges, in color tf a blewijh green, and not much inilike to the Great Celandine. The Stalks rise up jyme times two or three jeet high, reddifb, and flight-^k haired[^] wjich ufuffijpread themjelves into msi-^{m^kmttfflg} one long divided Leaf at the lower Joint, above which the Flowers grow, every one ft an ding on a long Footstalk, conijling of five hollow Leaves, crooked or horned at the ends, turning backward, the Flower is open, fhewing almoft like to little Birds (Jays Gerard) and hollow. The variety of their colors are very m-uch, for Jome are wholly white, Jome blew, Jome of a violet color, others of a blujh orflejh color h, some of a deep Red, Jome of a pale Red, Jome of a dead Purple, or dead Murry, and Jome oj mixt colors, as nature is pleaed to exert her powers, all which to diftinguifh Jeverally would be to little purpoje, they being Jo commonly known. Tlie Flowers being paf, Jmall long Cods appear, four or five together, in which are contained Jmall black, and glittering or fhining Seed.

JNBS Columbine, has a Root like the former, and differs not in T from the Single % th^fj: »Mmr ^ they cannot be £59^d TMf om. ^ther h the only or chief difference is, Jc & h the only double Floler, tba\ sX * TM*? * ihol: low Leaves Jet together
 n this Double kind is as treat or VktijuL or rather more than in the Single, for oj thojc there are party-colored blew, and fvh/e, and fatted variably^ich are not in the Single Kind, as aljo, a very de*ep Red, very thick and double, but flower,, and lejs plentiful in bearing, than

many other of the Double forts. Theje Double Kinds do give as good Seed *s the Single Kinds, wind) thing is not obferved in many other Plants?

V. The third, or Double Inverted Columbine, is not to be differenced either in Roots, Stalks, Leaves^ br Seed from the former, but only in the Flowers^ isohich makes the chief Dijtinfion : ltheje are as double as the former, but the Heels or Horns of theje are turned Inwards, and ft and out in the middle of the Mowers together : neither is there that plentiful variety of colon in this Kind, which is in the former^ there being never above three or four colors Jeen in thisjort, to wit, White, Purplijh, Reddifb, and a Dun, or dark overworn purpli/b color. Theje double Flowers being pãli away, there come in their places Jmall long Cods like the former, bearing Seed, continuing its kind, and not changing into any of the former.

VI. The fourth, or Rolè Columbine, in its Roots, Stalks, and Leaves differs little or nothing from the former Columbines \ the chief difference confifis in the Flowers, which although they jland in the Jame manner Jeverally upon their Jmall Footstalks, but Jomewhat more Jparingly than the others do, yet they hai)e no heels or horns, either inward or outward^ or veryjeldom -, but Jtand Jometimes yfjtb eight or ten Jmall, Jmooth, plain Leaves, Jet in order one by one, as in a Compajs, in a double row, and Jometimes with four or five rows of them, every one direftly before the other, like unto a Jmall thick double Koje laid open, or ajpread Marigold : but Jometimes it happens, that Jome of theje Flowers will have two or three of the firft rows of Leaves, without any heel -, ana the reft which are inwards, each of them with apiece of a Jmall heel or horn at them, as the former have. The colors of theje Flowers are al* moft as variable, and as variably mixt, as the former double kinds. This alfo gives its Seed, which for the moft part prejerves its own kind in perfe*

VII. *The fifth or Degenerate Columbine holds the proper form of a Columbine* being much like to the Double Ranunculus, but that the outwardmost row of Leaves are larger than any of the rest inwards, and is of a greenish, or of a purplish green color, which is not altogether so apt to give good Seed like the former. This kind of Columbine might seem to come to be but a gradual Degeneration, and no true natural kind, happening by some cause of Transplanting, or other wise by Art -, but finding it to hold and keep its own proper Species, (being raised from its own Seed) and not variously to change into other forms, I am obliged, I think, to conclude the contrary.*

VIII. *The sixth, or Spanish Tufted Columbine, has a Root made of many long yellow Branches and Strings, which endure many Years, and increase much These Plants (whether white or purple) have both one form in Roots, Stalks, Leaves and Flowers, and therefore need but one Description: The Leaves are both for color and form, so like unto Columbine Leaves (tho' lesser and darker, yet more spread, and on larger Stalks) that they may easily deceive one, that does not considerately observe them, for the Leaves are much more divided, and in smaller parts, and not so round at the ends. The Stalks are round, firm, and a yard high at least, branching out into two or three parts, with Leaves at their several Joints at the tops whereof (and many flowers, which are nothing but a number of threads, made like unto a small round Tuft, breaking out of a white Skin or Leaf, which incloseth them, and which being unblown, appear like unto little Buttons. The color of these Threads or Tufts are whitish, with yellow Tips on them, and somewhat purplish at bottom, having a strong, but no good or pleasant Smell. They abide in their Beauty (more especially if they grow in the shade, and not too hot in the Sun) a great while, and then fall away like short Down, or Threads : The Seed Vessels are three square, containing small, long, and round Seed. The purple Tufted Columbine differs only from the white, in that it is not full out so high, nor so large, and that the color of the blowers or Tufts, is a bluish purple, with yellow Tips, and is much more rare than the white.*

IX. *The seventh, or Virginian Columbine, has a Root long, with many fibres thereat, but differs little from our common single sort, except in the following particulars. The Stalk (Cornutus makes it to be a Dwarf, but) is as tall as our common English, and of a reddish color. The Leaves are smaller, and so like to those of the Thalictrum last described, of Meadow Rue, but of a paler green color. The Flowers are of a sad reddish color, and single from the middle of them to the ends, but yellowish from thence to the bottom ; the ends of whose Leaves are not blunt as in ours, but stiff, rough, and pointed within which horned Leaves there are five other smaller, and of a reddish color also, their points bending downwards, having many small white Threads, in the middle tip with yellow, after which come five pointed or horned Seed Vessels, containing within them black shining Seed.*

X. *The Places.* They all grow with us in our Gardens, as Garden Flowers: but Clusius says, that the single Kinds have been often found on some of the Woody Mountains in Germany. The seventh Kind is a Native of Virginia, and was brought us from thence by John Tradescant.

XI. *The Times.* They most of them flower not until May, and for the most part of June, and (as Gerard lays) in July, their Seed ripening in the mean time. The Aquilegia Virginiana, or Virginiana Kind, flowers somewhat earlier than any of the other Kinds, usually sooner by a Month.

XII. *The Qualities.* They are Temperate in respect of Heat or Coldness, Dryness or Moisture; Aperitive, Absterfive, and Astringent \$ Hepatick, Nephritic, and Hyfterick, Alterative, Vulnerary, and Lithontriptick.

XIII. *The Specification.* It facilitates the Delivery of Women in Child-bed. *

XIV. *The Preparations.* You may have, 1. A It quid Juice from the Herb and Root. 2. An Effence from the same. 3. A Decodition, in Wine. 4. A Tincture. 5. A Powder of the Seed and Affinity of the Common Kinds. 7. The Root of the Tufted Kind.

The Virtues.

XV. *The liquid Juice.* Mixed with Milk and Honey, it is good to heal sore Mouths : and taken four or six spoonfulls at a time in White Port Wine, Morning and Night, it opens Obstructions of the Liver, and prevails against the Jaundice.

XVI. *The Effence.* It has more potently the Virtues of the Liquid Juice, besides it is of excellent use to heal old running Sores, and putrid Ulcers: and being taken for some time, it is an admirable thing against Obstructions of the Reins and Bladder.

XVII. *The Decodition of the Herb and Root in Wine.* This being perfumed with some Grains of Ambergrise, is good against those Swoonings, which the Greeks call *dwayia* as also to open the Obstructions of the Liver, Reins, and Womb.

XVIII. *The Lotion.* It is made of the Leaves boiled in Milk or Pot-Tet-drink, and sweetened a little with Honey, it is good against the soreness of the Throat, also prevails against the Inflammation, Swelling, Falling and Excoriation of the Uvula ; Cankers in the Mouth and Gums, and other moist and running Sores in those parts, all which it heals by Virtue of its drying and binding Quality.

XIX. *The Powder of the Seed.* Given to one dram in Wine, with ten grains of Saffron, it opens the Obstructions of the Liver, and helps against the yellow Jaundice, as *Tragus* lays, but he advises that the Patient after taking of it should be laid in a warm Bed, and made to sweat well thereupon. *Clusius* says; that a Physician in *Bruges* gave it to Women in Travel (in a Glass of Wine) to cause speedy Delivery, repeating it two or three times as need required.

XX. *The Roots of the Common Kinds.* *Camerarius* says, that in *Spain* they eat the Root for many days together, to help such as were troubled with the Stone in the Reins.

XXI. *The Roots of the Tufted Kind* (besides their being yellow) they have an onemiff and a C&A Umasl hi. They a Sodd (as *Dioscorides* says) to cleanse and dry old Ulcers, and to heal them. *Camerarius* says that in

Pretty broad, and Sharp pointed. At the Joints of
the Stalis, it !s divided into many Branches with
fame Leaves thereon ; and at the ends jjnd many
Viewers in order, one before, or above another, which
are fomeihing long and hollow, like the finger (f 9
Sieve, of a pale whitijh color, after f&bich comes /hall
black Seed.

IV. The fecond' Kind in its Roots, Leaves, Stalks,
Flowers, and. manner of growing, is altogether like
the former ^ and differs from it only in this, that,
as to the whole body of the Flam, it is Jbmttisbat
lefs ? and as to the i'lowers[^] that tbebe are of a pale
l color.

V. The third Kind/Aux a large Tuberous or Knob-
bed Root, which Branches it felf out into oihcrThkk
and Tuberous parts, More Tuberous or Kncbbed to-
wards their ends, voith fneral fibres adjoining, black
on-the outside, and yellowish within, rcpL'tiifhed
vaithfiah Vifcous, Glutinous or QlammyfuKt at the
others, but not altogether fa Rimy. The Rods ate
alfo as tender and eofte to be broken, or mere eafie
than the others, andfspread tbemfekes under ground
in like manner, from thU Root rifts tip a hairy,
crefled, or cornered Stalk, not fo high its the fortetr,
with fmaller Leaves, and more thinly fit tkeret-n*

of the same form, and greenness, that thereby it may at the first sight be known to be a Comfrey, by any who has well observed the Common Kind -, but more especially when the top Branches are in Slower •, which being placed after the same manner, and of the same hollow fashion, but smaller, are of a more faded yellowish color; whose Seed following is also like the seed of the other Kinds. The Stalks and Leaves Dye away, or perish every Year, as they do in the others, the Roots abiding and increasing in the Earth, and shooting forth new Stalks and Leaves every Spring. Some make a lesser Species of this Tuberosous Kind, which if there is any such thing, I am apt to believe, arises only from the differing goodness of the Soil • a fat and rich Soil making or producing a larger Plant than that can do which is poor and lean.

VI. *The Places.* The two first grow by Ditches and Water sides, and in divers low, fat, and moist Fields, Orchards and Grounds *, for in such they chiefly delight to grow : The first is found generally through all England, the second but in some particular places : The third grows with us only in Gardens, but is found Wild in Woods and moist places in Austria, Hungary, and Germany.

7. *It Times * rhy* Hower in June and July, and perfect their Seed in August. There are several of the *Confolida* which have their different times of their flowering and feeding, as, 1. The *bympnitum*, or *Confolida Petraea*, of which *Diofcorides* speaks. 2. *Confolida Sarafenica*, Saracens Conboud. 3. *Confolida Media*, Bugle, or Middle Conboud. 4. *Confolida minor*, *Prunella*, or Self-heal. 5. *Unfohda Media*, vel *Bellis major Vulgar**, The Great White Wild Daifie. 6. *Conflda minor*, vel *Minima*, *Bellis minor Sylvestirk*, The Common Small Field Daifie. But as these are all of them different Plants, and not a *Species* of one and the same *Genus*, nor properly any of the *Comfrees*, so we shall say nothing of them here, but to avoid Confusion treat of them in their several and respective Chapters •, our intention being in this Chapter, to treat of that Plant, which we properly call *Comfrey*, and the *latins*, *Symphitum majus*, which is of several sorts, as are before described.

VIII. *The Qualities.* It is cold and dry in the first Degree : Afringent, Anodyn, Reperoiflive and Vulnerary : Neurotick, Pe&oral, and Arthritick, h Alterative, Antiemmenagogick, and Analeptick.

IX. *The Specification.* It is of a Clammy and Glewing Nature, and is peculiar against Fluxes of Blood, of what kind soever, whether internal or external.

X. *The Preparations.* You may have therefrom, 1. A Juice of the Leaves and Roots. 2. An Effence of the same. 3. A Syrup of the Juice of the Root. 4. A Decoction of the Root. 5. A Powder of the Root. 6. A Balsam of the Root. 7. A Cataplasim of the Root. 8. A Difilld Water. 9. An Acid Aqueous Tinturc.

The Virtues.

XL *The Juice of Leaves or Roots.* *Camerarius* says, that two ounces of it being drunk at a time, does much good in the Lethargy, and Dead Sleep; it is drying and binding in a great measure, and is good for such as spit Blood, bleed at Mouth, or make a bloody Urine ; yet it opens Obstructions of the Lungs, and causes easie Expectoration.

XII. *The Effence.* It has all the former Virtues, but is much more effectual to stop any Flux of Blood, in any part whatsoever. It prevails against all inward hurts, bruises and wounds, cleanses Ulcers of the Lungs, dries and heals them ^ and being taken Daily, Morning and Evening, it prevails against Ca-

arrhs, and stops the dettuxion of Rheum from the Head upon the Lungs; fluxes of Blood, or Humors by the Belly, and the immoderate or overflowing of the Courtes in Women : It stops also the overflowing of the Whites, and (universal being premised) it cures a Gonorrhoea, or Running of the Reins in Men, coming from what cause soever. Dose two or three ounces in Red Port Wine.

XIII. *The Syrup of the Jek of the Root.* It has the Virtues of the Effence, but has more easie Expectoration out of the i'auilp, "is good against Coughs and Colds, Wheefings, and other like Distempers of the Parts. It is said to be good for such as have broken Bones, because it hinders the breeding of the Callous •, and for the same Reason, it is said also to be good to cure Ruptures in Children. It is so powerful to Confbldate or Knit together, whatsoever needs knitting, that if the Roots be boiled with flesh cut into pieces, or very deeply flah'd, in a Pot, they will join them together again.

XIV. *The Decoction in Wine or Water.* It is good against inward Bruises and Wounds, inward Bleeding, Spitting, Vomiting, or Pissing Blood, as also the Bloody or Hepatick Flux -, and has indeed all the Virtues of the Juice, Effence and Syrup, (but not full out so effectual as they are) being drunk to six or eight ounces, Morning, Noon, and Night. It is also good to cleanse, dry, and heal external Wounds, Ulcers, and Running Sores, they being washed therewith once or twice a day.

XV. *The Powder of the Root.* Being taken inwardly to one dram in a little of the Syrup, it stops inward bleeding, heals Wounds in the Stomach and Thorax, as also Ulcers in the Lungs. If it is applied to green Wounds, as soon as the Wound is made, it conglutinates or joins the Lips thereof together, and causes it speedily to be healed : mixed with the Syrup, and applied to the Hemorrhoids or Piles, it cools the Inflammation, and represses their over much bleeding, and allays the heat of the Parts adjacent, taking away, and easing all the pain.

XVI. *The Balsam of the Juice of the Root.* It is a singular Vulnerary, and cures simple green Wounds generally at one dressing. It is digestive, and cleansing, and dries up and heals running Sores, and old Ulcers, in any part of the Body, but chiefly in those parts which are not depending * refitting Gangrenes Mortifications, Cfc.

XVII. *The Cataplasim of the Root.* If it is made of the simple Root, beaten into a Mucilage raw, and then spread upon Leather or Linnen Cloth and applied to parts pained with the Gout- it gives present ease to the pain, and so admirably it works the part, as that the Disease never returns any more from the old Cause, and this I have several times proved. If it is made of the Root boiled till it is soft in Water, and then beaten into a Pulp, adding to it the Powder of the Root, enough to bring it to the Consistence of a Qntiafin. and it is ~~not~~ applied to any Green Wound, or Cut, it relieves the pain, and conglutinates or conbouds the Lips thereof together, and causes it to be healed. It is also good for the Ulcers and Issues of the Lungs, inducing the Callous, and strengthening the Part, and applied, is also profitable against Ruptures in Children. It is good also to be used to Womens Breasts, which are hard and fore by the abundance of Milk flowing into them, which it does by a repressive Virtue : It also cools the Inflammation, abates the Swelling, and eases the Pain of the Piles, as experience has sufficiently proved. It is also very profitable against moist and running Ulcers,

Gangrenes,

Gangrenes, Sphacelus, and the like, in which cafes it has been experienced, and found often helpful.

XVIII. *The Difilled Water from the Leaves, Stalks, and Roots thinficed.* It has the Virtues of the Juice and EJfence, but very much weaker, yet Authors fay, it is good for outward Wounds or Sores, whether in the flefhy or nervous parts of the Body wherefoever fas alfo to take away the Fits of Agues, and[^]ftlay the ftiarpnefs of the Hu- iSW[^]Si[^]iifts it the more effe&ually does, if it is mixed with equal parts of the Liquid Juice or E- fence.*

XIX. *The Acid Aqueous Tintfure.* Take Spring Water, a gallon : Oil of Vitriol, or Oil of Sulphur per Campanum three ounces, mix them : then put into it oftbe powder of the Root, fix ounces : digest in a gentle Sand heat for a Month, fbaking the gla/s three or four times a day : afterwards being well fettled, decant the clear Tintfure for ufe. Given inwardly in Wine, or any other proper Vehi- cle, it flops inward bleedings, and ftrenthens and reftores the Tone of the Stomach : And mixed with Red Port Wine, it makes a good Lotion to cleanfe, dry, and heal any old Ulcer, or running Sore, and effe&ually deftroys the Putridity (if any) therein.

C H A P. C L.

0/CONSOUND Saracens.

I. > T p HE Names. It was unknown to the Greeks, JL and therefore among them we Jhave no name for it. The Latins call it *Confolida* (from *Confoli dare* to Soder, Clofe, or Glew up :) *Confolida Saracenic*a, (becaute ufed by the Turks and Saracens in healing of Wounds: } *Herba fort* is, from its ftrong Smell and Tafte : Alfo *Solidago*, and *Herba Vulneraria* : In Englifh, it is called *Saracens Confound*, alfo *Saracens Wound-wort*.

II. *The Kinds.* Authors make four Kinds there- of viz. I. *Solidago Saracenic*a vera *falicis foli*U, *Confolida Saracenic*a vera[^] The true Saracens Confound, or Wound-Wort- 2. *Solidago* vel *Confolida Saracenic*a major *Lugdunen*fis, The greater Saracens Confound, or Wound-Wort. 3. *Solidago* vel *Confolida Saracenic*a, vel *Germanica Siliquofa*, Codded Saracens, or German Confound, or Wound-Wort. 4. *Solidago* vel *Confolida Saracenic*a, vel *Germanica altera*, *Confolida Tertia Tragi*, *Herba Vulneraria Tragi*, *Tragus* his third Saracens Confound, or fecond German, which he alfo calls Wound Wort: jhefe Plants the Germans generally call *Vulneraria* *Wound Wort*.

III. The Defcriptions. The firft (which is the true Saracens Confound*) has a Root confifing\ of many Fibres or Strands, for many ood growing from a hard, woody, or rather a ftony, but not round, Root, which is the way, without being as a Leaf growing from the Root: From the Root grow many long and narrow green Leaves, fet about the Root, and a few from the Root of the Root, from amidft thefe Lewes rife up a Stalk or Stalks, very high, fometimes to a Man's height, Jich are of a brownjh, or brownifh green color, and hollow, having many long and narrow green Leaves (as before defcnbed) fet thereon. At the tops of the Stalks grow many pale yellow Star-like flowers, ftanding

in green Heads ; which when they are jail en, an! the Seed ripe (which is of afomewhat long, fndll[^] and yellowifh color, and wrapped in Down) is carried away with the Wind. The Root and whole Plant is of a ftrong and unpleafant S?)iell and Tap.

IV. *The fecond, or Greater Saracens Confound*, has a Root compofed of a great Bufh of white Fibres or Threads, growing very deep and ftrongly in the ground, and fhooting forth firings on all fides, which produce new Plants, encreafing in a little time, and over-running a great quantity of ground, from this Root fprings forth a head of Leaves[^] which is fome- what brown at the firft fhooting out of the ground[^] (and fo alfo is the head of the Root before the Spring,) which is of a bitter Tafte, and binding withal: This Plant differs not much from the former, and therefore from amidft this head of Leaves[^] there rife up upright, hard, round holloa Stalks, a* high AS the former, with many dark green Leaves at the firft, fet (as aforefaid) at the head of the Root, which afterwards rife up with the Stalks, and are fet there without any order, fomewhat larger than the others, and a little dented about the edges. The Flowers are much greater than thofe of the fir ft Kind, more in number, and with yellower long Leaves, Star fashion,ft an ding in green heads many together -, wherein, after they are paf-> is contained the Seed, which with the Down thereof, flies away with the Wind, in the fame manner a* the former does.

V. *The third, or Codded Kind*, has a Root which in time grows to be very great, even to the bignefi of a Mart's Arm, and tuns very deep alfo into thi- ground (ai thofe who are acquainted with the Plant well know:) It is of a ftrong unpleafant Smell and Tafte, Jharper than Crefles, and very like unto that of Flixweed, abiding many Tears, but the Stalks perfih Annually[^] fpringing forth afrefh from the fame Root etery Spring. Thefe Stalks thus Annual* ly rifting up, are great, rGund and woody, and xt height equal to any of the former, or rather (voheti

they have attained to their height) higher, but are Jo weak, by reason of the length and weight of the Leaves thereon, that they cannot (iand upright, but fall down upon the ground, bearing many dark green Leaves thereon, long and narrow like to the firft.. "zvith a white Rib in the middle, and fnipt gently, or denied about the edges. At the tops of the Branches or Stalks, come forth many yelloxmf flowers, but fmailer than thofe of the other kinds, which being pq ft away, there come jorth very fmall and long round dark Pods or Cods, a* fmall and long as thofe of Sophia Chirurgorum, or Flixweed, which contain within them fmall brownifh Seed, of a hot and quick, fharp and unpleafant Tafte, as the whole Herb it^Jelf is, but much more the Root.

VI. The fourth, or Tragus his German Confound, has a Root which creeps in the ground, and/hoots up Branches round about it, which are fomewhat lifa. both in Stalks and. Leaves unto the middle kind of Nep or Catmint, with long Leaves, and white as they are. The flowers come forth at the tops of the Stalks, many together, upon fmall, round, green^ beads, not unlike to the firft fort, being fmall, and yellow. After that they are paf, and the Heads, with the Seed, are ripe, they open themfelves, and with the Down in them, the Seed is carried away with the Wind, after the manner of the firft.

VII. The Places. Thefe do all grow in moift and wet grounds, by Wood fides, and fometimes in the moift places of fhadowy Groves, as alfo by Water fides. The firft of thefe has been found growing in Shropjhire, in the Hedge, by the way as one goes from Dudfon in Cherberry Parifh, to Guarthlow. Gerard alfo fays, that it grows by a Wood, as you go from Great Dumnou in Eljex, unto Clare in the fame County.

VIII. The Times. They Flower in July, and the Seed of the two firft is fopn after ripe and carried away with the Wind. The third has not its Pods and Seed ripe until the end of Augujl, or beginning of September.

IX. The Qualities. Saracens Confound, (under which fingular name we comprehend all the kinds) is temperate in repect to heat or cold, but dry in the third Degree •, Aftringent, Anodyn, Incarnative, and Vulnerary : It is Neurotick, Arthritick, Alterative and Analeptick.

X. The Specification. It is not inferior to any of the Wound-Herbs whatfoever, being inwardly given, and outwardly applied in fuitable Preparations.

XL The Preparations. You may have therefrom, I. A liquid Juice. 2. An EJfence. 3. A Decoffion in Wine or Water. 4. A Gargarifm. 5. An Oil by infolationcr boiling. 6. An Ointment. 7. A Balfam. 8. A Cataplafm. 9. A Diftilled Water, lo. A Spirit.

TI?e Virtues.

XII. TI)e liquid Juice. It cures internal Ulcers of the Lungs : I fuppoze it was with the Juice thereof, that Gerard (as he fays) cured one Cartwright^ a Gentleman of Grays-Inn, who was grievouly wounded into the Lungs ± and that in alhort time: In this cafe, it will be the beft way to make it into a Syrup with Honey.# It cleanfes, dries, and heals old ulcers, and foul running Sores, and Confolidates Wounds by wafhing them.

XIII. The EJfence. It has all the Virtues of the liquid Juice, exalted, and is an excellent thing to give inwardly, for the cure of thofe who have lain long languifhing with old, running Fiftula's, ill-natured Ulcers, and other itubborn and rebellious putrid bores h warning them alfo outwardly therewith or

injefting it with a Syringe. However the application of it to Green Wounds is a matter beyond ail Exception. Inwardly taken, it opens Obftruaiions of both Liver and Spleen, and is profitable for the cure of the Yellow Jaundice,

UTTM P f ^{Decoffion} of the Leaves in Wine or Water. It has the Virtues of the former, but in a much lower Degree h and being made in Water, it is faid to cure Agues or FevSns, even of a long continuance : Made with Wine,N^>pens Obftrua? qns of the Gall Bladder, as alfo <8^V&m&Wi^ bpleen, and therefore is faid to be prevalent againft the Dropfae in the beginning thereof, and heals all inward Ulcers of the Reins, Ureters, or Bladder, or elfe where: It cures alfo inward Wounds and Bruifes.

>> ^ V , The Gar^{Sari}f^ Take of the Decoffion in Wine a pint: oj the DecoZion in Water half a pint: Alum in fine Pouder a dram : mix and Molve: S ? / ^ ^ ? ^ ^ ^ ^ diffolvejndjuft Uo^ZrVhZ^ k is <<ilent to heal a fore

Quid. It is made by infusing the ... of 6 hours in Wine, and then draining ... head in warm Water, and to ... Difera-

Difcratie of the Liver and Spleen : It is good affe- to ease gnawings in the Stomach, Pains and Tor- ments in the Bowels, to expel Wind, and ease the Pains of the Mother. Dole one spoonful in a glass of Wine Morning and Night.

C. HVA P. CLI.

CONFOUND Daijie.

L ^ P HE Names. It was unknown to the Greeks:

X the Latins call it, *Confolida media*, *Oculus Bovis Brunfelsij*, and *Bupihalmus*, *Bcllium majus Tabernmontani* : but by all other Authors, *Bellis major*, and *Bellis major Vulgaris* live *Sylvestris* : in EnglijbM is called *Dai/re* or *Middle Confound*, *Ox Eye*, the *Great Hie Id White Dai fie*, and *Maudlin-wort*.

II. The Kinds. It is a *Species* of the *Daijie*, being the first and great Kind of *White Field Daijie* * and is twofold, 1. *Confolida media Anglica*, *Confolida media Vulnerariorum*, *Bcllk major agrefik Anglica*, The *Englijb Middle 'Confound*, or *Entfijh Great field Daijie*. 2. *Confolida media*, vei *Bellis major Americana* vel *Virginians*, The *American* or *Virginian Middle Confound*, or *Great Field Daijie** ?• *Confolida media*, or *B/zgt**, which see in *Cap. 92.* aforegoing.

l / • P F D f t l ^ t o n s , The fir (I or Englijb Kind, if ? *OPJ ahch u TM?y a hufi of White Strings, x j > ic » abide many Winters, with the Leaves floating e f y S p w g a n e . : F r m this Root come forth the * 7 n a r m - > and r m n d . pointed Leaves next ~ / > . f . q m d f i p r e n y d e e p i y i u t i n on both fides, ma- 06 u i l l i k e the div } p v n s of fame forts of Valun Leaves, or rather like thofe of Groundfel : iron among thife Leaves com forth the Stalks,

which grove. to be about a foot and half high, with divers like Leaves thereon, but Jmailer, and lejer divided than the lower. At the tops of the Stalks and Branches grow large Flowers, each upon several Footstalks, confining of many white and narrow Leaves, a* a Pale, or Border, about the yellow Thrums in the middle^ like thojc of Mayweed, having no Smell at all: The Seed ts fomeyohat long, and is blown away with the Wind. OJ this Kind there is one which bears double Flowers, differing from the former in nothing elz.

IV. The fecond, or *Virginian Kind*, has a Root full of Fibres not much unlike to the former *, from ivhich Root rife up Stalks higher and greater than thofe before defcribed : the Leaves aljo are larger, and broadest towards the ends, but longer and fnaU ler at the bottoms, dented like wife about the Edges, fhooting forth fever a! Branches, at the tops of all which they bear many white Flowers, as it were in an Umbel, yet not Jo great, nor the white Leaves fa large as the former, but fmailer, and more in number, with a greenifh yellow in the middle ^ and fome a little larger than others, and fucceeded with Seed fomewhat J mailer than the former.

V. The P'faces. The first grows every where hy Hedge fides in Meadows, and in the Borders of Fields, and other waite Grounds, The fecond grows in *Virginia*, from whence it was first brought to u* here.

VI. The Tims. It Flowers in *May* < 1 *June*, and the Seed is ripe in fome ihott time after,

VII The Qualities. This *Confound*^ or *Great daijie*, is cokf in the end of the first Degree, and ay in the fecond Degree : It is *Anodyn*, *Vulnerary*, *Stenrotick*, *Anhritick*, and *Alterative*.

VIII. The Specification. It is a famous thing for lie immediate cure of Wounds in any part.

IX. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Syrup, 4. A DecoUion in Wine or Water. 5. A Lotion of Argarifm. 6. An Ointment or half am. 7. A & 8. ADijilled Watfr.

The Virtues.

X. *The liquid Juice.* It much attemperates the heat of Choler, refreshes the Liver, and other Inward Parts, and Consolidates Wounds, whether Inward or Outward, after an admirable manner. It is good to cure the Wounds of the Thorax or Breft, being taken two, three, or four ounces at a time, either aione, or mixed with a Glafs of Wine, Morning and Evening. Outwardly it alfo Confolidates Wounds, cleanes old running Sores and Ulcers, and dries and heals them : Dropt into fore and running Eyes, it cleanfes, strengthens, and heals them.

XI. *The Ejfence.* It has all the Virtues of the Juice, and is indeed more efieQual, outwardly applied, it heals Sores in the Privy Parts, gives eafe in Pains of the Gout, difcufles Tumors, and difperfes Kernels in the Flefh •, and helps bruifes and hurts which come by Falls or Blows. Inwardly taken, it induces the cure of Wounds, Ulcers and Filtula's, whether inwards or outwards, and haftens the Callus breeding, in Fra&cures of the Bones : for which reafon alfo it is faid to be good againft Ruptures, and other inward Breaches of any Veffel within the Body* Dofe tv^p or three ounces Morning and Night. • 5 j o , -...* • i

XEJ, ^ Syrup. It has the Virtues of the Juice and tiencie_h and is better to be given to Children in Ruptures becaufe of its pleafantnefs. And if it is made with Honey, it is more effectual in Wounds and Ulcers of the Breft and Lungs, or of any other Bowel : It thickens Rheum, and is good againft Coughs, Colds, Wheezings, or any Obftru&tion of the Vifcera.

XIII. *Tffe Decoffion in Wine or Water.* It helps to cure Wounds of the Thorax, and may be ufed Dietetically in all the Cafes for which the Juice, Efience or Syrup are commended. It fingularly refreshes the inward Parts, removes the Difcralie of the Blood and Humors, and as a moft admirable Vulnerary induces the healing of Wounds and Ulcers. If there is any Inflammation in or about the part affli&ed, or if a Fever is pxfent, the Deco&ion is belt to be ipade with Water -, but otherwife with Wine. It is alfo of good ufe to wafh the Wound, (if made with Wine) or cleanfe foul Ulcers or Filtula's, by inje&ing it with a Syring, or otherwife, as often as they are dreft, by which they are daily cleanfed and kept clean, and if hollow, incarnated -, by which means the healing fpeedily ^ follows. If it is made with Wine, with the Addition of a third part of Agrimony and Angelica, and the parts affli&ed with the Palfie or Sciatica, be daily, Morning and Night, fomented therewith very Warm for half an hour, or thereabouts, it gives great eafe and relief

XIV. *The Lotion. Take of the Decollion in Wine eight ounces, oj the Effence four ounces : Alu?n in fine powder three drams : Honey of Mulberries four ounces : mix and dijfbve.* It heals and cures all Wounds, Ulcers, Sores and Puftules of the Mouth, Gums or Throat, as alfo of the Secret Parts of Man or Woman, if duly wafld therewith. Dropt into the Eyes, it clears the fight, taking away, Clouds, Films, Inflammations, Flux of Humors, ©V.

XV. *The Ointment or half am.* They do wonderfully help all Wounds which have an Inflammation about them, or have a Flux of iharp and moift Humors upon them, by which they are kept long from healing. Any fimple green Wound the Balfam many times cures at the firft intention : and other degenerated Sores it digefts, cleanfes, incarnates (if flefh is wanting) and quickly heals them, and this although in the Joints, whether of the Arms or Legs.

XVI. *The Cataplafm;* It is excellent to difcufs Contufions or Tumors coming upon fimple Bruifes, if applied upon the Spot. Applied to die Testicles, ot to any other part which is Swoln, and Inflamed, it allays the Beat, difcufles the Humors, and refolves it : Applied alfo immediately to a fimple green Wound, it prevents Inflammation, conglutinates the Lips, and heals it ; and this more efpecially if it is made of the raw green Herb., And fo made and applied, ^ is very effectual to eafe the pains of the Gout, dif^fbj^ T^mor^ ftrengthen the Part: but whether it is altogether fo effectual as the Cataplafm of Comfrey Roots, I will not presume to fay.

XVII. *The Dijilled Water.* It has the Virtues of the Juice and Effence, but much lefs efterajal Dropt into the Eyes, it allays an Inflammation there : and if Pouders of White Sugar Candy, or clarified Honey be added, j. ounce, to vj. ounces of the Water, it makes a Collyrium which cures dim, cloudy, fore, and running Eyes, being often dropt into them*

C H A P . CLII

O/CORALWORT.

L n r * HE Names. *Dio/corides* nor *Pliny*, nor any

X other of the Ancient Writers, knew any thing of this Plant, fo far as I can learn <, but it feems to be purely an invention of the Moderns. The *Latins* (from the Form and Color of the Roots) call a' *Coraloides*, *Dent aria*, *Dentillaria*, *Dentillaria ot Dent aria Corolloide Radice*^, *Alaba-Jrites Lobelij*, *Viola Dent aria Dodonai*, (from the Roots and Flowers, being like unto Stock-Gilli' flowers:) bjr *Gefner*, in *Hortis*, *Sanicula alba*, *Pulmonaria*, *Saxifraga montana* (from its Virtues) but *Columna* takes it to be the *Qeratia Plinij*, becaufe it has all the Virtues which *Pliny* afcribes unto his *Ceratia*, but this is doubtful. *Dalechampius* in *Lugdunenfis* took it to be an *Aconitum*, but this was wholly Error. In *Englilh* it is called *Coralwor^ Toothwort*, and *Toothed Violets*.

II. *The Kinds.* *Matthiolus* places this between *Symphita* and *Confolidx*, it being wholly of their Nature and Qualities. *Parkin/on* makes feven Kinds thereof ^ fome other Authors more ^ but we fhall only difcourfe of thofe which are to be had with us, either Wild, in our Fields and Woods, or nurfed ? ^ n ou * G Z ^ de / j * an £ fey are, i. *Dataria Bulbifera*, vel *Bacafert*, Bulbed, or Berrybearing Coralwort. i *Dent aria minor ox minima*, *Alabafriri* ? ^ q m ; a ^ C < ? talWOrt, I; *Dmaria Pentaphyllos*, CmkfoilCoralwort^A., *Dent aria Pentaphyllos d-ter*, The fecond Cmkfoil Coralwort. They are generally called *Dent ana*: and moft of them frim the number of their Leaves, as, *Triphyll*os, *Ventaphyllos*, and *Heptaphyllos* but t h e ^ ^ ^ r *Enneaphyllos Lobehj*, and the *Heptaphyllos*^ arc frangers in our Country.

III. *The Defcriptions.* *The fofi of thefe ha* a Root very whitejmoob, andjhinwg, Lde if divers fmall round knobs jet together, not sromng downwards, but lying along, and encreafing under the tip. per craft oj the Earth, having very few fibres thereat; its tap tsfomewhat bitter, hot and fharp, like Radifh, as all the reft of the Kinds are. from this Rootjhoots jorth one or two Winged Leaves, upon long brownifh foottalks, which in their rifing out of the ground, are, as it were, doubled, or folded downwards, and then open them/elves^ moft commonly,*

into

into even Leaves, and sometimes into hut five each of which is something long, dented about the edges, and pointed, of a sad green color, and set on both sides of the middle Rib, one against another. The Stalk, which beareth flowers, rises up in the same manner with the leaves, and is bare or naked of Leaves, to the middle thereof, where it shoots forth a Leaf and Jo one or two more up higher, each con- jingling but offive Leas Uh, and sometimes but of three, sving also the ufrKfmsi Jingle -, at each whereof cottefjm'o'mill' rdknd' Bulb, cloven, or as it were divided into sever al parts or cloves, of a sad pun p/ish green color, whch being ripe, and put into the ground will grow to be a Root, and bear Leaves, like a* the Bulbs of a red Bulbed Lilly -, about which, at the very top, Hand four or five Bowers in long Husks, upon short footstalks, opening into four se- veral Leaves, of a furplish color, and very like unto the flowers ^/Stock-gilliflowers, or Dames Violets. These being past away, fmall long horns, or Cods, pointed at the ends come forth •, in which Pods or Cods lyes such like Seed a* are in the Cods of Dames Violets j which a* soon as it is ripe, the Cod opens, and the Seed falls out : The Leaves, and indeed the whole Plant, is of a bitterish, hot, sharp, Radish-lik Jf r.

a small round greenish yellow head which Ifreais nor into Leaves, -A«t rho four or five moiffe beads inf Threads, and so abides a while, (having no other flotver) which pafs azvay leaving in their room many small kernelly-Seed. The Leaves have a bitter sweet scent, somewhat like unto the Musked Cranes Bill, yet more sweet when it grows Wild in its natural places, than when it is tran)planted out of them into Gardens. This Plant is referred bymdky unto the Ranuncali or Crowfeer, to which it has ha a small resemblance, and ought rather to be incertd in this place, for the likenefs of its Root fake;

/mail Qorall tuori

Bulbed Coral root

The Small Coral root has a Root growing upwards, having many white fibres at the head of them, of a little J'etish bitter, sharp and stringent Taste. from this Root sprim forth three Zi/°/j°? P°le Sree! Sral so of Leaves f owe- what divided on their edges, not half a foot high, and nat of half that height infome places, very like unto those of the hollow Root, but J'mailer, and of a paler jhining green color •, from among which rise p one or two fmall Stalks, with two such like Leaves thereon, but /mailer, and a little above them,

V. The third Kind, which is the first CU^ui Joralwort, has a Root which is greater yum. the Jifit, and made as it were into, Jointsing fe white as hat is^ but with longer fibres coming fi'cjin Uiztrrt he Joints, from this Root rife-s cm or 7h# L^vcs

upon long bootstalks, confijng of jive Parts, or Leaves, each of them fomewhat like the firft, and dented about the edges, but they are longer, rougher and harder in feeling, and more cbfely fet together, fifing for the moft part from one Joint, like as the Cinkfbilstfo: upon the Stalks alfo are fome fuch like Leaves Jet one above another-, at the top four yr five fuch like ilowers, but fomewhat larger, of a purplifh color, fomelthing deeper than the firft, which turn into fuch like Pods, with thejike Seeds in them, but has no Bulbs on the Stalks.

VL Tho fourth, orjecond Cinkfoil Kind of Coralwort, has a Root very like the firft, confifing of 7itany round clear ivbite Knobs, but more in number, Jet together by pieces, with divers long Fibres growing out of it : trom this Root fhoots forth a lower andjmaller Stalk than the former, being not above afoot high, with fo)ne Leavesfet thereon ; as alfo there is Jome of thefe very like the laft, but narrower*, more Jhoot h and gentle, and alfo of a paler green color : the Flowers ft and at the top, like unto the other, and are of a purplifh color, after which come the like Pods with Seed in them, as in the reft.

VII. The Places. The firft and fecond are found Wild in England, the firft at Mayfield in Suffex, in a Wood called Highreed *, and in another Wood there alfo, called Fox-holes -, as alfo in divers fliadowy and dark Mountains, or Hills : the two laft are only nurs'd up with us in Gardens.

VIII. The Times. They Flower about the middle of April, and beginning or middle of May, and the Seed is ripe in Auguft, after which they quickly wither and perifli •, the Roots abiding fafe all the Winter.

IX. The Qualities. They feem to be Temperate in refpect of heat or cold, but are drying in the firft Degree. They cleanfe, aftringe, dry, bind, and ftrengthen.

X. The Specification. They are dedicated to the Curing of Wounds.

XI. The Preparations. You may make therefrom, 1. A liquid Juice, i. An EJJence. 3. A DecoSitn in Wine, 4. A Syrup. 5. A Ponder. 6. A Balfam.

The Virtues.

XII. The liquid Juice. It ftrengthenes the Bowels, and makes them able to perform their Offices, provokes Urine and is faid to expel the Stone and Gravel, being drunk, Morning and Evening, from three ounces to fix, in a Glafs of Port Wine.

XIII. The Effcnce. It has the former Virtues, befidcs Which it is faid to cure any inward Wounds, efpecially thofe Wounds which have pierced into the hollownefs of the Thorax. It is alfo good to eafe the Griping Pains of the Bowels, and Sides, being taken to four or fix ounces in a gktfs of * Red Port Wine, or old Malaga.

XIV. The Decoftion in Wine. It has the former Virtues, but much weaker, and is good againft Lasks or Fluxes which proceed from hot and cholerick Humors: you may give it to fix or eight ounces, Morning and Evening, for many Days together.

XV. The Syrup. It is made of the Juice or Effience, and is proper to be given to Children which have Ruptures, or are troubled with Gripings, Vomiting, or other Difeafes of the Bowels.

XVI. The Pouder of the Root. It has the Virtues of the Juice and Effence, and heals Wounds of the Brett and Lungs, being given to a dram in Red Wine for fome considerable time. It is alfo profitable againft Burftennefs, being given in the Syrup abrefaid.

XVII. The Biilfam. It is good to be applied to green Wounds, for it quickly confolidates and heals them -, it alfo digefts, cleanfes, incarnates, dries, and heals old, running, filthy and hollow Ulcers -, facilitating the cure after an admirable manner.

C H A P. JCLIII Of C O R I A N D E R ;

I. *Tp HE Names. It is called in Greek, Κόριανδρον, and A Koriandron (from Kori, Cimex, the Wall-Lo'w?, which we call Bugs •, for that Coriander in its fcent, very much refembles their (linking Smell when they are killed:) In Latin, Conon, and Corknon, butmoftly in the Shops Coriandrum : In In^i, Casberra, and Elcosbur : In Englifh, Coriander.

II. The Kinds. There ate but two forts of it which are found with us, viz* 1. Coriandrum vulgare, The common Coriander. 2. Coriander minus odorum, The leffer fweet Coriander. And by the name Coriander thefe Plants are known in almclt all Nations.

III. The Defcriptions. The Roots are five or six broad, and are fmailer and finer at the top, than at the bottom. The Stalks are four or five feet high, and are fmailer and finer at the top, than at the bottom. The Leaves are feathery, and are of a whitifh yellow color when it is young, but a great deal fmailer, tenderer, and looje Vmbles, like unto Dill, when it is grown away, there comes forth roundM a whitifh yellow color when it is Plant, Seed and all, wh/c it is *./J

has a yRong and loathfom Smelly fcarcelly to be endure! h but when the Seed, is full ripe and dry\ it is &f a very good Scent, and of an agreeable Tajie.

IV. *The second has Roots and Stalks almoft like the former -, but the Leaves, the lower as well as the higher, are all finely cut in, and jagged •, the Stalks are *much lower, not abeve half a foot high, (fays Parkinſon) and lying almoft on the ground: the Flowers on its Tops are white ^ and the Seed round as the other, hut fuller and larger, and two always joined together.:*

V. *The Places.* They are only Sown in Gardens now, as in old time. \ *Fliny fays,* they are not found Wild •, nor are their natural places known.

VI. *The Times.* They Flower in July, and their Seed is ripe, in Auguſt.

VII. *The Qualities^* The green Leaves are ſaid to be Cold and Dry. The dried Seed is Hot and Dry in the end of the ſebnd Degree, or beginning of the third. It is Aperitive, Anodyn, Carminative, Difcuffive* Stomatick, Snd Alexipharmick.

VIII. *The Specification.* It ſtays Vomiting, and helos Digeſtion.

IX. *The Preparatioſs..* You may have therefrom, 1. A Juice from the Green Herb. 2. An Effence of the fame. j. An Ointment or Balfam of the fame. 4. A Cataplafm of the Grgen Herb. 5. Coriander Comfits. 6. APouderoſ the Seed. 7. A Spirituous Tinſure of the Seed. 8. An Acid Tinſure there of * 9- An Oily Tinſure of the fame, ' 10. A Saline Tin&ure thereof, n. A Spirit. J2. An Oil by Diſtillation.

The Virtues.

X. *The Juice of the Green Herb.* Authors ſay, it is of a cold Quality, and that being drunk, altho' but to half an ounce, it kills them that take it. But outwardly applied, it diſſolves Knots and Kernels, and difcuffes bothS hard Tumors, being affiduouſly ufed.

XL *The Effence of the fame.* It has the Virtues of the Juice, and being applied by Rags dipt therein, it is ſaid to cure *Anthonies iire^* and other hot Tumors.

XII. *The Oint?nent or Balfam of the fame.,* It is made with Cerufe, Litharge, Vinegar, and Oil of Rofes. It is commended againſt an Erylipelas, running and fretting Sores, Wheals, Pulhes, Carbuncles, and Botches, rifting in the Skin or FWh ^ it cools the Inflammation, and takes away alfo the Swelling of the Cods.

XIII. *The Cataplafm of the Green Herb made with Barley Meal, or Barley Bread.* It has the Virtues of the Ointment, but is more powerful t° allay Inflammations, and difcuffs hot Tumors or Swellings. -It is alfo good to diflblve or difcuffs Wens, fleſhy Tumors, and protuberances of the KingV Evii, being duly applied.

XIV. *The Comfits of the Seed.* Gerard ſays, they prevail much againſt the Gout, being eaten upon a falling Stomach, before Dinner -, and alfo after Dinner without drinking after the fame for three or four hours' time : and they have yet a greater power over that Difeafe, if they be eaten in the fame manner alfo after Supper.

I. *YLV.ThePouderoftheSeed.* If it is taken falling to almoſt a dram in a Glaſs of Generous Wine, j it ſtrengthens the Stomach, cauſes an Appetite, and makes a good Digeſtion, depreſſes Fumes and Vapors rifting from the Stomach, Spleen or Womb, and aſcending up into the Head. It flops Catarrhs, helps the noiſe in the Ears, and difcuffs that Tumor in the Throat, vulgarly called the Quinfey.

i XVI. *The Spirituous Tinſure of the Seed.* It is a moſt ſingular Stomatick, ſtrengthens the Ventricle, iftops Vomiting, helps Digeſtion, and eaſes the moſt inveterate Pains of that Bowel : and is indeed a moſt excellent thing againſt the Gripings of the Guts.

XVII. *The AcidTinſure.* This is yet a more excellent Stomatick than the former, where there is alaffitude or weakneſs of the Stomach, and the Tone thereof ſeems to be depraved or undone, and the Acidities thereof fo diminifhed, as that the Patient wants an Appetite, and cannot at all digeſt their Food, but that it comes up again undigeſt* ed> with Vomiting, manifold Reachings, and vehement Sickneſs thereof being taken in Red or White Port Wine, or ih a generous Canary, to a pleaſing Acidity; it reſtores the Tone of the Stomach, and kills Worms in the Body.

XVIII. *The Oily Tinſure.* If it is daily taken, viz. Morning and Night, in any generous Vehclle, from twenty drops to forty, it cures the Colick, and Griping of the Guts, and mightily ſtirs up Venery. It prevails alfo againſt the bitings of Serpents, eſpecially of that called *Amphisbena*, the place bitten feeling alfo anointed therewith. And as it is comfortable to the Stomach and Bowels, by its healing and drying property, and prevails againſt a *Paralyſis*, or *Palfie*, fo alfo it is eminently good againſt that Difeafe by anointing the whole length of the Back-bone therewith, as alfo the parts affe&ed, twice a day before a fire, and rubbing it very well in for a long time : And by outward application in like manner, it prevails againſt Cramps, Conuulſions, Gouts, and the Sciatica, and all cold and moiſt Difeaſes happening in what part of the Body foever.

XIX. *The Saline Tinſure.* it opens Obſtru&ions of the Reins, Ureters, and Bladder, provokes Urine, and cauſes an Evacuation of Sand, Gravel, and Tartarous Matter out of thoſe parts. Dofe to one dram, or more, in a Glaſs of generous White Port Wine,

XX. *The Spirit.* It is very comfortable to the Stomach, and exceeding Cordial, by heating and refreshing of it, and taking away the cold and moist Temperature thereof, which is the ground and foundation of Catarrhs and Rheumatisms, it helps Digestion, reprefes the Vapors, which ascend thence up into the Head, and forcibly refills the Tortures of the Colick, proceeding from Cold, Wind, and the like: and being moderately used, it firs up Venerie by an encrease of Blood and Seed, and by a gentle warming, and, as it were, vivifying the same. Dole one spoonful, or more, in the Morning fasting, a little afore Dinner, and at Bed time, either alone, or in a Glafs of Canary.

XXI. *The Oil by Difillation.* Being taken inwardly from ten to fifteen or twenty drops, and in some very cold and moist Constitutions to thirty or forty drops, first dropt into, and mixt well with White Sugar, and then mixed well with a glafs of Wine, and so taken, it is a famous thing against the Palfie, Cramps and Convulsions, whether in Old or Young, and the Gout in the Stomach, anointing all those parts which are affected with those Diseases, outwardly, Morning and Night, and rubbing or chafing it well in. It effectually opens the Urinary Passages, and powerfully firs up to Coition, by encreasing Seed, making it Spirituous, and strengthening the parts of Generation.

XXII. *An Observation.* The Arabian Physicians, and others of the Ancients, tell us how we should correct *Coriander Seed* before we use it, viz. by Keeping it all Night in Vinegar, and then drying it again, thereby to take away (as they think) its Venene Qualities. But this *Lobe* seems to despise, and that truly with very good reason, because no such thing can be extracted from it, for after it is ripe, if it is suffered to dry of it self; or in the Sun, all those pretended Obnoxious Qualities will vanish away of their own accord, nor needs it any other Preparation when it is made into Comfits, and is so far from being hurtful to the Stomach, and Bowels (as some Authors have affirmed) that on the contrary, it has been found by great Experience to be an excellent Stomack, exceeding many others: and this even Country People have found by the use of it, without any Preparation at all: for being only Dry, it has a warming Faculty, and a Sweet, and no Noisome Smell or Taste, that being contained only in its Humidities whilst it is Green, and not in the Seed when only dried.

CHAP. CUV,
Of CORN-FLAG,

I. *HE Names.* It is called in *Greek*, $\chi\lambda\alpha\delta\iota\sigma$, χ and $\epsilon\delta\rho\alpha\nu\alpha$: In *Latin*, *Gladiolus*, and of some *Enfis* (as it were the *Sword Flag*;) of some *Gladiolus Segetulis*, *ViUorialis flemina Cordi*, and *ViUorialk Rotunda*: In *English*, *Corn-Flag*.

II. *The Kinds.* There are several sorts thereof, as
1. *Gladiolus Narbonensis*, The French Corn-Flag!
2. *Gladiolus Italicus binis florum ordinibus* The Italian Corn-Flag. 3. *Gladiolus Byzantinus* The Constantinopolitan \llcorner *Turkifli Corn-Flag*. 4. *Gladiolus Jiore r^w/^Biuffh-colored Corn-Flag*. \llcorner *Gladiolus flore albo*, White-flowered Corn-Flag. 6. *Gladiolus purpureus minor*, The small purple Corn-Flag. 7. *GWi^^^TheWAC* hword Flag, descnbed by *Clujius*.

III The Descriptions. \llcorner is somewhat great, round, \llcorner if it was netted, having anoL?i \llcorner derit, which when \llcorner Stalk d \llcorner thatthry \llcorner to whebomh, \llcorner jof which mill quickly grow, \llcorner it is suffered any long time in a Garden; \llcorner From this Root, three or \llcorner long, and \llcorner en Uaves rift \llcorner one, as it were \llcorner fising

r if ing out of the fide of another, being joined together at the bottom, fomewhat likè unto the Leaves of Flower-de-luces, but stiffer, more full of Ribs, and longer than many of them, and sharper pointed, The Stalk rifes up from among the Leaves, bearing them on it as it rifes, having at the top divers Husks, out of which come the Flowers, one above another^ all of them turning and opening themselves one way, which are long and gaping, like unto the Flowers of Yox-Gnojf, a little Arched or bunching ^njhemidd^ *אורניתוס קופר*, having wolSbiie spots within the mouth thereof, one on each fide, made of a Lozenge fahion, viz/square, and long pointed. After the Flowers are paji, round Heads or Seed Veffels come up, in which is contain- ed reddifhfiat Seed, like unto the Seed ^/Fritillana, but thicker and fuller.

IV. Thefecond, or Italian Corn-Flag, is like unto the former French kind, in its Root, Leaf, and Flower, without any other difference, than that the Root is ^fmailer, and browner, the Leaf and Stalk of a darker color -, and the Flowers (darker also in their color, and a little fmailer) fianding out on both fides the Stalk. ^

V. The third, or Turkey Corn-Flag, except that it is larger in its Roots, Leaves, and Flowers, is like in all things to thejirji Corn-Flag ; the Ffoppers on this fianding only on one fide, of a deeper i i \$ color, and being later in the Tear before they appear, itz. after all the rest are paji. The Root is netted ? & this, as plainly as in any of the others ^ it as plentifully also enCreafes, but is more tender, and lefs Able to abide our cold Winters.

VI. The fourth is like unto the French Corn-Flag in all refpeUs^ excepting only that the flowers are of a pale red color, tending to whiten^ commonly coiled a Blufh color.

VII. The fifth differs not from the loft, excepting that the Roets are whiter on the out fide, the Leaves are greener, without any brownnefs or darknefs, as in the former, and the flowers are of a pure Snow white color.

VIII. The fixtb differs not from any of the former, but in the fmallnefs of the Leaves, Stalk and flowers, which fiand all on one fide, like unto the French kind^ and of the fame color: and the Root of this fort is netted more than any of the others.

IX. Thefeventh, or Water Gladiol has a matted bufhy fibrous Root -, from whence rife up Leaves about aspan long, thick and hollow, with a Partition in their middle, like as you fee in the Cods of Stock-gillitowers, and the like : their Color is green, and Tafte fweet, (O that they are an acceptable Food to Wild Ducks, diving to the bottom of the Water ^ for they fometime lye fome Yards under Water ; which notwithstanding are over-topt by the Stalk, which Springs up from among thofe Leaves, and bears Flowers of a white color, and larger than thofe of Stock-gilliflowers ; but in that hollow part which is next to the Stalk, they are of a blewijh color, almoji in fhape refembling the Flgwers of the Corn-Flag, but not absolutely like them. They confift of five Leaves^ whereof the two uppermoft are refieUed towards the Stalk; the three other being broader, hang downwards : after the Flozvers are paji, round pointed Veffels follow, filled with red Seed.

X. The places. Their Titles, of the chief, generally (how from whence they firft came : but with us they are only nurs'd up in Gardens : they seem to be Natural to Barbary, where John Trade/cant faw many Acres of Ground overfpread with them. In thofe Countries where they grow Wild, as in Turkey, Italy, Spain, and France, they grow in Meadows, and in Earable Land among Corn : and we have great plenty of them in our Gardens near, and

about London, which iverve for their Beauty and Ornament. The Water Gladiol is tbund in fome places oilVest Friefland, growing in Waters which have a Gravelly bottom, and which fcarcely bring forth any other Plants belides.

XL The Times. They Flower from May, to the end of June, and fometimes in July ; but the Byzantine, or Turkey, after all the rest, as is above-faid.

XII. The Qualities. They are hot and dry, but in what Degree Authors have not faid : but Galen fays, they have a power to Dry, Attraft, Waite and Confume *, and that they have a fubtil and digeftive Quality.

XIII. The Preparations. You may have therefrom, 1. A liquid Juice of the upper Root. 2. An Effence of the fame. 3. An Emplajler. 4. A Cataplajm. 5. A Pouder of the Cods and Seed.

The Virtues.

XIV. The liquid Juice. If it is dffirkt with Red Port Wine, it is faid to cure the Rupture in Children, called Enteroccele^ which is when the Guts fall into the Cods.

XV. The Effence of the fa7tie. It has the former Virtues, and being drank Morning and Evening for fome time, to four or fix ounces in a Glafs of Sherry Wine, it is faid to provoke Luft, and ftrenghen the Vifcera.

XVI. The Emplafter. It is made of the Root mixed with Frankincenfe and a little Wine: Being applied, it eafes the Pains of the Gout: it also draws forth Thorns, Prickles, Splinters, or broken Bones out of the Flefh^ it t)igefts, Maturates, and Clearfes.

XVII. The Cataplajm. It is made of the Root beaten up with Meal of Darnel, and Honey, and a little Lard. It waftes and difcuffes hard Nodes, lumps of Flefh, and other like hard Tumors. It is also found to be a certain and approved remedy againft icrophulous Swellings in the Throat, vulgarly called the KingVEvil.

XVIII. The Pouder of the Cods and Seed. If it is drank in Goats, or Afles Milk, to one dram, or more, Morning and Evening, as also in the time of the Paroxyfm of the Colick, it eafes the pains of the Colick: but if it is drank in Juniper Water, it is much better.

CHAR CLV.

Of CORN-SALLET,

OR,

LAMBS-LETTICE.

I. THE Names. It may be called in Greek AwKQcLxtvoy: In Latin, Laffuca Agnina, anfl Olus Album Dodonai : In Englifk^ Coru-Sallet, or Lambs-Lettice.

II. The Kinds. It is not a Kin to the Lettice, though called by that name, which I fuppofe was, becaufe it is eaten for a Sallet, as the Lettice is. And is a fingular Plant by it felf

III. The Defcription. It has a Root confining of many fmall and long Fibres ; from whence fpring up many flender, round, weak Stalks, trailing, as it were, upon the'ground, about a foot high, if it grows in good and fenil ground 3 other wife but a Tand or

two high, imthjéveral Joints*, and two Leaves standing at each Joint, narrow and long. Likewife from the fame Root, at its fir ft coming forth out of the ground, many Leaves, long, narrow, and round pointed, of a whitifh green color, firing forth, which grow clofe upon the ground, which live all the Winter, and from among which, in the beginning of the Spring (if it is/own in Autumn[^] as is ufual, when it is toferve for an early Sallet) feveral fmall, round Stalks rife up, branching forth at the top, and bearing Tufts of fmall black blew Flowers, (but Dodonæus fay, they are very fmall white Flowers, clofely compaft together :) Thefe Tufts of white Flowers are broad, but the Flowers thefelves are very fmall, fo that they can fcarcely be known to be Flowers, faying that they grow many together, like a Tuft or Umble.

IV. *The Places.* This Herb grows Wild in Corn-Fields: (whence the Name) but fince it has grown into ufe amongft us for Salleting, it is alfo fown in Gardens for a Sallet Herb.

V. *The Times.* It is found Green all Winter and Summer: and runs up to Flower and Seed in March, April, and May.

VI. *The Qualities.* It is Temperate in refpect of heat or cold^h, and moid in the firft Degree. It is Emollient, Hepatick, Alterative, and Galactogenetick.

Y^{ll} As to the *Specification, Preparations, Virtues and X^{es}* of this Herb, Authors have been filent. It is doubtlefs an innocent Plant, and pleafant to be eaten: for which reafon it is ufed as a Winter ballet, at leaft wife very early in the Spring; for which purpofe it is drefs'd up to the Table as Garden Lettices are, with Salt, Vinegar, and Oil, and fometimes with Sugar alfo, as the Eater beft likes.

CHAP. CLVI

0/COSTMARY.

I. *THE Names.* It feems not to have any Greek Name: but the Latins call it *Cofthus hortorum major*: fome call it *Balfamita major*, *Mentha Græca*, *Mentha Romana*, *Mentha Corymbifera major*, *Mentha Saracenicæ*; by Gefner, in *Hor^{***}* -> *Oviaria*: by Cæfalpinus, *Herba MarU-*, and *hajjulata* by others: In *Englifh*, *Cofmary*, or *Alecoaft*.

II. *The Kinds.* Of the *Cofthus hortorum*, there are two Kinds, viz. 1. The *Greater*, which is *Cofmary*, of which in this Chapter. 2. The *heffer*, which is *Maudlin*, of which in its place, in fome one of the following Chapters of this Book: Many Authors join thefe two Plants together in one Chapter, making them as two *Species* under one *Genus*: But in my Opinion, notwithstanding the Unity or Samenefs of the *Latin* Name, they are truly two differing Herbs.

III. *The Defcription.* *Cofmary* has a Root which is fomewhat hard, and very full of Strings, which being divided with the Heads of heaves, may be replanted in the Spring time for encrease. From this Root faring forth many bread and long pale green heaves, dented, or cut a little about the Edges, every one ftanding upon a long Footstalk*, among* which rife up many round green Stalks, with fuch like heaves thereon, but leffer up towards the top, where it ff reads into three, four, or more Branches-, every jne bearing an Umble or Jcaly Tuft of gold yellow

Flowers; fomewhat like unto Tanfie Flowers, but leffer*, which afterwards are the Heads which contain the Seed, which is fmall, flat, and long: Thefe Flowers being gathered before they be ripe, keep their color and beauty a pretty while- without Withering*, and the whole Plant is of a very pleafant Smell and Tafte, and very agreeable with the Stomach.

IV. *The Places.* It grows almoft every where in Gardens, and is mirs'd up with us for the fweet Smelling of its Flowers and Leaves. But in *Italy* it has been found to grow naturally Wild in rough and untilld places, efppecially in the Duke of *Tufcans* Dominions.

V. *The Times.* It Flowers in *June* and *July*, and the Seed is ripe fome time after.

VI. *The Vitalities.* It is hot and dry in the end of the fecond Degree. It is Aperitive, Abfterfive, Carminative, Digeftive, Difcuffive, Diuretick, Traumatick or Vulnerary-, it is alfo Cephalick Neurotick, Stomatick, Cordial, Nephritick, and Hyftentck ^ Alexipharmick, and Analeptick.

VII. *The Specification.* It is fagular in curing all forts of Green Wounds.

VIII. *The Preparations.* ¶ may prepare therefrom, 1. A liquid Juice. 2. An Effence. 3. jⁿ Infufion or Decottion. 4. A Ponder. 5. An OH by Infolation. 6. An Ointment. 7. A Cataplafm. 8. A Spirituous Tinture. 9. A Saline TinUure. 10. An Acid Tinture. 11. An Oily Tint^{sure}. 12. A Saline TinUure. 13. A Spirit. 14. An Oil Diflilled. 15. Potefates or Powers. 16. An Elixir. 17. A Fixed Salt.

¶ Virtue.

¶ Kⁱ* fwetf the Herb. It provokes Urine mightily, by opening Obftruaions of the Urinary Parts, and fy injeaion takes away the hardnefs of the Womb, if* it be not c S o u s i It gently evacuates Choler and f legm, attenuates

thac

that which is thick and grofs, cuts and divides that which is tough and glutinous, cleanses that which is foul, hinders Corruption or Putrefaction, difflaves without Attraction, opens Obstructions, and removes their evil effects. It strengthens the Stomach and Liver, and all the other *Vifcera* and if it is taken from two ounces to four, or fix, in Clarified Whey, it operates the more effectually to all the aforementioned intensions. Being also duly given Morning and Evening, as alib about two or three ItBttts before the coming of a Quotidian Ague, it is very powerful in repressing it, and for the most part Cures it.

X. *The Essence* * It has all the Virtues of the Juice, and indeed more powerful to all the intentions, besides which, it is an excellent thing to be used Dietetically by all those who have composed Wounds, running Sores, old and putrid Ulcers, inveterate Fistula's, or have a Cachexia, or are inclinable to the Green-sickness, in which last case, it does as much as most Vegetables can do. It may be given either alone of it self, or mixt with a glass of White Port Wine, from one ounce to fix, every Morning fasting, and last every Night at Bed time. Thus taken, it is also very profitable against continual Pains of the Head, to stop, dry tip, and consume all thin distillations, which are apt to fall upon the Lungs, and helps to digest raw Humors. It is a truly beneficial thing to the Bowels, and kills Worms in Children.

XL *The Infusion, or Decoction in Wine.* They have the Virtues of the Juice and Essence, but not full out so powerful, and therefore may be given to half a Pint, Morning, Noon, and Night. It opens Obstructions of the Womb, and if feebly taken, viz. about a Week before the time, it provokes *Yib* Terms in Women.

XII. *The Powder of the Leaves.* It is a good Stomack, and may be taken from half a dram, to two drams, Morning and Night, in any proper Vehicle. I commend it to such as are apt to have the Gout to fly upwards into the Stomach: it is Afringing, refills Poison, and the bitings of Venomous beasts, and kills Worms in Humane Bodies.

XIII *The Oil by Infusion, or boiling in Oil Olive.* It warms and comforts Parts affected with any Preternatural Coldness, and refits the afflux of cold and moist Humors, it dissolves Swellings, and gives ease in the Gout, Sciatica, and other like Pains.

XIV. *The Ointment.* If it is made with the addition of *Adders-tongue*, it is an excellent thing to cure Burnings and Scaldings, whether with Fire, Water, or Oil, and to cleanse and heal old Ulcers, and particularly to dissolve hard Tumors in Womens Breasts.

XV. *The halfam.* It not only cures simple Green Wounds at the first Intention, but also digests and maturates those which are Composed or Complicate. It digests putrid and eating Ulcers, and by its Anodyn quality eases their Pains, it cleanses them, and if hollow, or Wanting in flesh, it incarnates, and by its Afringing property, it dries up their Humidities, strengthens the part, and brings the Sore to a speedy healing.

XVI. *The Cataplasm.* Applied, it dissolves recent Contusions, cleanses old and running Sores, refits the putridity of Ulcers, eases the Gout, strengthens weak Limbs and Joints, abates Inflammations, and draws out the fire in Burnings, being applied before they are blister'd.

XVII *The Spirituous Tincture.* It warms and dries a cold and moist Stomach, and is an especial thing to help an evil, weak, cold, and distempered Liver. It prevails against Convulsions, and the distemperature, or tortions of the Bowels,

strengthens the Nerves, Head and Brain, and helps all cold and moist distempers of those parts. By the constant taking of it, (tops and dries up Catarrhs, and the affluxes of cold Rheums to other parts of the Body, and is very profitable against an inveterate Head-ach, proceeding from a cold and moist Cause. Dole one spoonful Morning and Night, in a Glass of Sherry, Canary, White Port, or other Generous Wine.

XVIII. *The Acid Tincture.* It is a most singular Stomack, refits Crudities and Putrefaction, and therefore is very good against all Putrid, Malign, and Pestilential Fevers: it quenches Thirst, causes a good Appetite to Food, and helps digestion. And being prudently administered, it is a very effectual Medicament to kill Worms in Children. Bathed well in, Morning, Noon, and Night, upon places affected with the Gout, it opens the Pores, attracts and draws forth the malignant Humor, eases the Pain to a Miracle, dissolves the Tumor, and quickly restores the Patient to his desired health. When it is taken inwardly, it is to be given in some proper Vehicle, or Wine, to a grateful Acidity, it represses Vapors from the Womb, and is to be taken Morning, Noon, and Night.

XIX. *The Oily Tincture.* It eases all external Aches or Pains in any part of the Body whatsoever, proceeding from a cold and moist Cause, it takes away the relaxation of the Nerves, and Muffles, prevails wonderfully against the Palfie, and strengthens the Muscles, Nerves, Tendons and Joints, being weakened through Pain, or any afflux of Humors. But in case of the Palfie, the Back-bone, from the Neck to the Anus, is daily, Morning and Night, to be well anointed therewith, as also all the Parts which are affected, rubbing and chafing it in. It cures the Nerves, befrigid Prick or Wounded immediately easing the Pain, and abating the Tumor; and in a short time after heals the Wound. If it is taken inwardly from twelve to twenty or thirty drops, in any Homogeneous Vehicle, it cures cold and moist Distempers of the Head, Breth and Lungs, and prevails against the Head-ach, Megrim, Vertigo, Carus, Lethargy, Apoplexy, Falling-sickness, Palfie of the Head and Tongue, and other Diseases of like kind. It alib opens Obstructions of the Reins and Womby and is prevalent against Vapors, and Fits of the Mother.

XX. *The Saline Tincture.* Given to one dram, or more in a Glass of White Port Wine, Morning and Evening, it singularly opens the Urinary Passages, and powerfully provokes Urine, expelling all preternatural, or Tartarous Matter out of the Reins, Ureters, and Bladder, and is very prevalent against a *Sarcites*, or *Anafarca* which is a *Dropfie* in the fleshy parts of the whole Body.

XXI. *The Spirit.* It is Cordial, and refits Poison, and is prevalent against Fainting and Swooning Fits, Vapors, and Fits of the Mother: it refits the malignity of the Plague or Pestilence, and the contagion of the Spotted Fever, or other infectious Diseases, it is good also against the Venom of Serpents, as of the Viper, Rattle Snake, and others of that kind, the poison of Mad-Dogs, for which there is but few better remedies. It is a singular thing against Vomiting, and sickness at Heart, by reviving the Spirits, and lengthening the Parts.

XXII *The Distilled Oil.* Taken inwardly in any proper Vehicle (being first dropt into White Sugar) it comforts the Head, Brain, and Nerves, dries up cold and moist Humors, and is helpful against all those Diseases which are caused by the distemper in any of the Parts aforementioned. It cures Palfies inwardly taken and outwardly applied, so also Convulsions, happening in what part of the Body

ibever. Taken 10 a dram at a time, in some proper Vehicle, two hours before the coming of the fit of an Ague, it cures it -, more especially if it is taken or repeated two, three, or four times : The best thing to take it in (in this case) is the frongelt Wine: in the same (and in the same Dose) also in a Palfie₅ but in other Distempers it may be taken from ten to twenty or thirty drops: outwardly also anointed upon Cramps, and parts Convulged, it gives relief in a short time.

XXIII. *The Powers.* They have all the same Virtues with the Oil, and are much more Subtil and Penetrative, yet may be taken in a much larger Dose., as from a dram to four drams, in any proper Vehicle. They have also all the Virtues of the Spirit, aforementioned, and strengthen the Stomach admirably. Given Morning and Night in White Port Wine, or in some other Diuretick Vehicle, as in Pailley, or hot Arsmat Water, Decoction, or Infusion of Winter Cherries, &c. they powerfully open Obstructions of the Reins, Ureters, and Bladder, provoke Urine, and expel all Tartarous Matter, as Stones, Gravel, Sand, Slime, Matter, &c. lodged in those Parts.

XXIV. *The Elixir.* It has all the Virtues of the Spirit, Distilled Oil, and Powers, exalted, performing more effectually, and more gratefully to the Stomach, all that it is possible for those Preparations to do: It renovates, as it were, the Blood, and all the Juices, strengthens the Heart, and comforts the whole Universal Frame, making the Patient pleafant, lively, cheerful, and giving him a healthful habit of Body. Being bathed upon parts affected with, the Gout, in a cold habit of Body ^ it gives relief and in a short time. Taken inwardly in a Glass of Canary, from one dram to three or four, it gives present ease in the Colick, by dissipating and expelling the Wind.

XXV. *The fixed Salt.* It is good against Distempers of the Nerves, by carrying off the Matter which obstructs them, by the Reins for it dissolves Viscous Juices in all parts of the Body, especially in the Blood, and causes them to be purged forth ^ for as it opens Obstructions of the Urinary Parts, and provokes Urine, by its mixture with the Blood, it carries off the Morbifick Matter of Palfies, Numbness, Rheumatifms, and Obstructions (be they where they will) the right way, viz. by that way which Nature seems most inclined to promote, which is most commonly by Urine. Dose twenty, thirty, or forty grains Morning and Night, in a large glass of White Port Wine.

CHAP. CLVI
Of COWSLIPS.

THE Names. Some doubt whether, the Greeks knew this Plant or no ^ however later Authors have called it *nigella* & *Mmu* £ *Bo-mvn* m&. *Kumlt* • In *Lati*/ty *Paralyjis*, *Herba Paralyjis*, *Herba Paralytica*, *Alisma Dioscoridis*, according to *Fabius Columna*, *Alisma Praiorum*, *Arbitrica*, *Herba Arthritica*, *Dodecatheon*, *Primula veris major*: an4 in *English*, *Cowslips*, *Oxlips*, and *Paigles*.

II. *The Kinds* There are several sorts hereof, as, I. *Paralyfis vulgaris pratensis flore jlavo simpliciter odor at 0*, The Common Field Cowflip- 2. *Paralyfis alta odor at a jlore palii do polyantbos*, The Primrose, or many flowered Cowflip. 3. *Paralyfis jlore*

Viridante simplici, The tingle green Cowflip. 4. *Paralyfis jlore & Calice Crippo*, The curled Cowflip. 5. *Paralyfis jlore geminato odor at 0*, The double Cowflip, one within another. 6. *Paralyfis jlore jlavo simpliciter invdoro jine Calicibus*, Single Oxlips. 7. *Paralyfis Jiore geminato • inodora*, Double Oxlips, hole in hole. 8. *Paralyjis inodora calkib?** *dijjelhs* ^ Oxlips with Jagged Husks. 9. *Paralyfis jlore fatuo*, The foolish Cowlips. 10. *garalyjiv hortensis jlore pie no*, Double Garden Cowlip. 11. *Paralyfis jlore viridante pleno*, Double green Cowslips. 12. *Ptilyfis jlore viridante, jive Calamijtrato*, The Double green feathered Cowlip, or green Rote Cowflip.

III. There are several Plants called by the name of *Primula veris*, (from their being the first Flowers which appear in the Spring) and to which that name is *Genus*, they being all various *Species* of the same, viz. 1. *Primula veris major*, five *Paralyfis*, The Cowflip or Oxlip, of which we have before enumerated twelve several Kinds, whose Descriptions we shall give in this Chapter. 2. *Primula veris minor* ^ The Primrose, Single and Double, of which hereafter. 3. *Primula veris Pachyphyllos*, *Auricula Urvi*, Bears Ears, three several Kinds of which we have treated in Chap. 59. part. 4. *Primula veris minor jlore Rubro & Albo*, The Whje and Red Birds Eye, of which; in Chap. 72. foregoing: this being said, we come to the matter in hand*

IV. *The Descriptions.* The roots of the Common Cowflip, have roots like *the roots of the* with many fibres annexed to the *from which*

more crumpled ^fa^fy TMA green color, every one standing upon its green stalk, Inch or two long. From the stalk divers round naked stalks, of a whitish color, more or less bearing at the top many small flowers.

V. The second, which is the Primrose Cowflip, or many Honored, has a Root like the former, from which spring forth Leaves, which are larger than the Common Field Cowflip, and of a dark yellowish green color * from the midji of which spring up several Stalks like the other ; at the tops of which are the flowers, which are manifold, and growing together in Husks like the former, sometimes to the number of thirty in one Head, at the top of one Stalk; and sometimes more, j/bery one of them having a longer footstalk than the Common Kind, which is reyujite by reason of their great number : they are of a pale yellowish color, almost like those of the Field Primrose, with yellow spots at the bottom of the Leaves, as the Common Kind have, and of a sweet Smell.

VI. The third, or Single Green Cowflip, has a Root like the first, with many fibres annexed, from which there is but little difference either in its Root or Leaf*, the chief difference in this Kind being, that the Leaves are somewhat greater, the flowers being in all respects like inform to the first field Kind, but somewhat larger, and of the same color with the whitish yellowish green Husks, or rather a little yellower, and of very little Smell. In any other thing there is no diversity, but that it is longer in flower, before it Jades, epe daily if it grows out of the Sun.

VII. The fourth, or Curled Cowtip, differs chiefly in the flowers, which are folded or crumpled at the edges, the Husks of the flowers being larger than any of the former, more swelling out in the middle, as it were Ribs, and crumpled on the sides of the Husks. 1

VIII. The fifth, or Double Cowflip, one in another, which some call hofe in hofe, has each Single flower growing out of another, which makes the same Double for which reason Ifha calls it Geminata, for that the flowers are brought forth like Twins: The Smell is the same with the common Field Cowflip, but something weaker.

IX. The sixth, or Single Oxflip, is a kind of Cowflip, which has Roots, and Leaves, and Stalks like the first Kind, but somewhat smaller : the flowers are yellow like the first Cowflip, and smaller also, standing many upon a Stalk, but bare or naked, without any Husk to contain them, and having no other thing besides differing from the Common, or Field Cowflip.

X. The seventh, or Double Oxlip, called, Hofe in Hofe, is almost like the former Double Cowflip, or Holé in Hole, having its Jingle flowers one within another, faving that this has no Husks to contain them, no more than the former Oxlips, but stands bare or naked, and of the very same bigness each of them, and of the same deep yellow color with it, and with as little Smell as the Single. There is another of this Species whose Leaves are somewhat larger, as also the flowers, but of a paler yellow color.

XI. The eighth, or Cowflip with Jagged Leaves, differs not from the first Single Oxlip in the smallness of the green Leaves, but in the flower, which Jiandhg many of them together on a reasonable high Stalk, are very small and yellow, and scarce open, or lay abroad themselves, but appear only, as having a green Husk under each flower, which is divided into six several small long pieces.

XII. The ninth, or Foolish Cowflip, differs not much in Leaves from the former Cowflip, but bears at the top of the Stalk a Tuft or Bujh of small, long, green Leaves, with some yellow Leaves, as it were pieces of flowers broken, and pnding among the green Leaves. And sometimes some Stalks among those green Leaves at the Top (which are a little

larger than when it has but broken pieces of flowers) do carry whole flowers in Husks like the Single Kind.

XIII. The tenth, or Double Garden Cowflip, has smaller and darker green Leaves, than the first Single field Kind has, and longer footstalks also, on which the Leaves do sit and : It bears several flowers upon a Stalk, but not so many as the Single Kind, every one of which is of a much deeper and fairer yellow color than any of the former, standing not much above the brims of the Husks which hold them, consisting each of two or three rows of Leaves, set round together, which makes it very thick and double, of a pretty p leaf ant fweet Smell, but not Heady.

XIV. The eleventh, or Double green Cowflip, is so like to the Jingle green kind, before described, that until it is near flowering, it can hardly be distinguished from the Single Kind: but when it is in flower, it has large Double flowers, of the same yellowish green color, with the Single Green, and more laid open or spreading than the flowers of the former Double Cowflip.

XV. The twelfth, or Double Green Feathered Cowflip has but little difference in the Leaves from the Double Green last described, but that they are not of so dark a Green. The principal difference, consists in the flowers, which are many standing together at the tops of the Stalks, but far differing from all others of these kinds ; for every flower standing upon its own Stalk, is composed of many very small and narrow Leaves, without any Husk to contain them, but spreading open like a little Rose, (whence came the name of Role Cowflip) of a pale yellowish green color, and without any Smell at all, abiding in flower (especially if it Jiands in a shady place out of the Sun) above two Months, almost in as perfect beauty, as in the first Week.

XVI. The Places. All these Kinds have been found growing Wild in England, and from their natural places of growth, they have been transplanted into our Gardens, where they abide, and being in a richer Mould, grow larger and fairer than in their natural places.

XVII. The Times. They all Flower in the Spring of the Year, some earlier, and some later, according as they are defended from Cold and Frost, and as the mildness of the Season will permit. They Flower at the latter end of April and in May, (later than Primroses do) and the Single and Double green Cowtips the latest, and continue flowering a pretty while after all the rest.

XVIII. The Qualities. They are all hot and dry in the first Degree, They are Aperitive, do Attenuate, are Digestive, Discurfve, Incarnative, Traumatick or Vulnerary -, Cephalick, Neurotick and Arthritick.

XIX. The Specification. They are singular for the cure of Pallies and Gouts-

XX. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Wine of the flowers. 4. A Powder of the Leaves. 5. An Ointment of the flowers. 6. A Cataplasm of the Whole Plant. 7. A Distilled Water of the Whole. 8. A Spirituous Tinure of the leaves and flowers. 9. An Oily Tinure of the same. 10. A Saline Tinure. 11. A Spirit. 12. A fixed Salt. 13. A Balsam.

The Virtues.

XXI. The liquid Juice. Snuff up the Nostrils, is an excellent Errhine to purge the Head and Brain of cold, gross, viscous Humors, which obstruct the Roots of the Nerves, and parts adjacent. Given inwardly from two ounces to four it eases

Pains HI the Back and Bladder, and opens the paJuges of the Urine, caufing a free and eahe

XXII. *The Effence.* It has the former Virtues, and as it is an admirable Neurotick, fo it helps all infirmities of the Head, Brain, and Nerves, coming of Cold, Wind, or moiff Humors, as the Vertigo, *Ephintes* or Night-mare, false Apparitions or Whimfies, Phrenfies, *Epilepfies*, or Falling-ficknefs, Palfies, Convulfions, Cramps, and other Pains of the Nerves and Joints. Dole three ounces or more in a Glafs of Wine, Morning and Night, bathing alfo twice a Day very well, the parts affe&ed- with the fame.

XXIII. *The Wine of the flowers.* It is Cordial and Confortative, refrefhes the Spirits, and is conducive to all the purpofes aforementioned : The Patient may drink a Glafs of it half an hour afore Dinner, or any other time of eating.

XXIV. *A Ponder of the Leaves.* It is a small kind of an rrrhine, being flufft up the Nostrils, and fo purges the Head, but yet very gently. Being ftrewed upon old running Sores or Ulcers, it cleanfes, dries, and heals them, and takes away the fharpnefs of Humors, Pain, or Inflammation therein, if prefent : it may be ftrewed on dry, or mixed with *Unguentum Nicotian*, and fo applied.

Ointment. If it is made of the Flow-
of Infolation, or a boiling to Crifpnefs,
repetition of the fame, it is faid by
away spots and wrinkles of the
A I S T b_urmils, and Freckles, adding Beauty
the Complexion*. If the Ointmc

it is ufed as a Vehicle for other *Cephalkk* and *Neu-
roicn* preparations : In the mean Seafon it is faid
<> be *Lofmetick*, and therewith the Face and Skin
may be wafhed every Morning after the Ointment
is rubbed off

XXVIII. *The Spirituous Tinfure.* It has all the
Virtues of the Effence •, and is much more Cordial,
and therefore better againft Fainting and Swooning
Fits, ficknefs at Heart, and other Diftempers in
which the Vitals are concerned. Dofe half a fpoon-
jul or more in a Glafs of Generous Wine.

XXIX. *The Oily Tinfure.* It is peculiar againft
the Palfie and Gout, as alfo Convulfions, Cramps,
Punftures of the Nerves, &c. in all which cafes, it
has fcarcely any equal : In Palfies anoint with it
Morning and Evening, all along the Back-bone, from
the *Vertebra* of the Neck, almoft to the *Anus*, as
alfo the Parts affe&ed, rubbing it very well in •, in
Gouts, (from a cold Caufe) Convulfions, Cramps,
Pun&ures, ©V. you may only anoint the parts af-
fected •, but in Convulfions, it will be good alfo *
take it inwardly (in fome Neurotick Vehicle,
Morning and Night, from fifteen drops to thirty of
- U y v as the Exigenay may req uire.

XXX. *Tlx Saline TinUure.* If it is daily taken
twice a day, from half a dram to one dram, in a
good Glais of White Port Wine or Canary, it
powerfully opens Obftuaions of the Urinary parts,
and eafes pains in the Reins, Ureters and Bladder,
and if any Sand, Gravel, Small Stones, or Tartar
ous Mucilage be lodged in thofe parts, it cleanfe-
them thereof, and expells it.

XXXI. *The Fixed Salt.* It is Neurotick and
Diuretick, peculiarly dedicated to the Head, Brain,
Nerves, Reins and Bladder: It is good againft the
Jaundice, and carries it off, as alfo Febricitick Di-
ftempers by Urine, being given to half a dram in
White Port Wine.

XXXII. *The Balfam.* It is an admirable Vulne-
lary, curing fimple Green Wounds at the firft inten-
tion : If they be compofed, it digefts them, or
brings them to maturation^ refills putrefaction,
cleanfes, incarnates, dries and heals them in a very
fhort time. If it is mixt with equal parts ofl/tf-
guentum *Nicotiana*^ it performs all thefe things the
more admirably, and is a Medicament which every
Good Country man ought to keep always in his
roufe.

CHAP. CLVIII.

Of COWSLIP Spotted.

THE Names. It does not appear that tiis
Plant was known to the *Greeks*, yet fome,
as accounting it among the Kinds of *Gmfrey*, have
called it st^ . TM i**ei : ll * . h . h r i V n L y m > Pu ~
monaria, (and yet it is no Species or the *Lung-
Zrts*, as we fhall, God willing., hereafter fhew :)
alfo, *Symphitum maculofum* = and in *hngfh*, *Jeru-
falem Cowflip*, and *Spotted Cowflip*, (and yet it is
not of the Species of *Cow flips* :) alfo *Sage of Jeru-
falem*^ *Sage of Betlem*^ *Spotted Lungwort*^ and
Spotted Comfrey.

ft; T^ J?»*. Authors make three Species or
Kmdsof this Plant, viz. 1. *Pulmonaria^a Slofa*
vulgans, Common spotted Jerufalem Cowflips.

2 *Pulmo-*

2. *Fulmonaria maculofa altera*, (*Parkinſon* ſays, *non maculofa*) *Fulmonaria Echij foliis*, *Bugloſ* Leav'd *Jerufalem Cowflip*. 3. *Fulmonaria angujifolia* (*fecunda Clufij*) *Narrow Leav'd Jerufalem Cowflip*. All which Plants, *Gerard* ſays, are the *True Lungworts*.

III. The Deſcriptions. *The Jirji of theſe has a Root compoſed of many long and thick black firing, from whence ariſe many roughs large, and round Leaves, but pointed at the ends, ſtanding upon long Footstalks, ſpotted with many round white ſpots on the upper ſides of the Leaves, which are of a fair green or brown color on the tops, but of a graye green underneath, from among theſe Leaves ſpringing up fever at brown Stalks, a foot, more or leſs, high, bearing many flowers at the tops, very much reſembling thoſe of Cowflips, being of a purple or reddiſh color, while they are Buds, and of a dark blew iſh color when they are blown, ſtanding in brown iſh green Huſks (ſometimes this Plant has been found with white flowers :) The flowers being paſſed, round Heads, like Buttons, come up, in which is contained ſmall black Seed.*

IV. *The ſecond, or Bugloſ Jerufalem Cowflip, is like unto the former, but greater in each reſpect: the Roots black like unto the Jirji, the Leaves, ſays Gerard, are bigger than the former, (but Parkinſon ſays ſmaller) being rough like the former, reſembling Wild Bugloſ Leaves, of a fairer color above, and of a whiter underneath, ſpotted with white ſpots like the firſt ſays Gerard (but without any ſpots at all, ſays Parkinſon:) The Stalks are a little more branched than the other: at the tops of which come forth flowers like to the Jirji in form and of an exceeding red ſhining color.*

V. *The third, or Narrow Leav'd Jerufalem Cowflip, or lungwort, which is the ſecond of Cluſius, has a Root which is black, and ſtringy, in which laſt reſpect it is like unto Cowflips, as are both the ether, from this Root ſpring forth Leaves ſomewhat longer than the laſt deſcribed, and much broader, which are rough and hairy like unto the Leaves of Echium or Wild Bugloſ, but narrower, and ſpotted with whitish ſpots alſo like the former. The Stalk is about a foot high, or better, ſet with the like long hairy Leaves, but ſmaller, bearing at the top a bundle of many flowers, ſtanding in Huſks like the firſt (in ſiſhion, ſays Gerard, like thoſe of Bugloſ, or thoſe laſt deſcribed;) being ſomewhat reddiſh in the Bud, and of a dark Purpliſh blew color, when they are fully blown, and having Seed alſo like the others. All theſe Plants do well reſemble Bugloſ or Comfrey in moſt parts, excepting in their Roots: And theſe are they which, Gerard ſays, Are the true Lungwort (but Cowflip is indeed the more uſual name.)*

VI. *The Places.* All theſe grow naturally in the Woods of *Germany* in divers places: *Parkinſon* ſays, that the firſt Kind is found in *England*. *Johnſon* upon *Gerard* ſays, that the ſecond *Fulmonaria folij Echij* was found by *maſter John Goodyer* flowering in a Wood by *Holbury Houſe* in the *New foreſt* in *Hampſhire*. Their natural place is in moiſt and ſhadowy Woods, but with us they are for the moſt part Nurs'd up in *Gardens*.

VII. *The Times.* They flower generally very early in the Year, for the moſt part in *March*, and in the beginning of *April*.

VIII. *The Virtues, Specificatwn, Virtues and Uſes,* are much like thoſe of *Comfrey*, in Chap. 149. aforegoing, to which you are referred; but doubtleſs as theſe have not ſuch a Viſcoſity, as our common *Comfrey* has, ſo in many caſes they may not be all out ſo powerful: but as theſe are more drying and binding than *Comfrey*, ſo alſo in ſome other caſes,

they may exceed *Comfrey*. And whereas in theſe Plants, the *Leaves* are the moſt conſiderable.

IX. *An Obſervation.* *The liquid Juice or Effence of the Leaves, or whole Plant,* have been found by large Experience to be ſingularly good for the (*Jure* of *Ulcerated Lungs*, which are full of corrupted and rotten Matter: and it has been found to be a Cure for thoſe whoſe Blood. Doſe two, three, or four ounces in a Glaſs of pure Red Port Wine. But the greateſt uſe which our Country People make of it, is for a Pot Herb.

CHAP. CUX.

O/CRANE SBILL Garden.

I. *The Names.* It is called in *Greek*, $\nu\sigma\alpha\mu\alpha$ in *Latin* *Geranium*, alſo *Gruinalis*, *Roflurn* *Gruis*, or *Gruinum*, *Rojirum* *Ciconix*, (from the form of the Seed Veſſels:) in *Englijh*, *Storks-bill* and *Cranes-bill*.

II. *The Kinds.* There are many Kinds of this Plant, as, I. *T&yjtor vpsesv** *Geranium Hortenſe*, Garden *Cranes-bill*, of which in this Chapter. 2. *Geranium Moſchatum*, *Masked Craneshill*, of which in Chap. 160. 3. *Geranium Batrachoides*, *Crowfoot Craneshill*, of which in Chap. 161. 4. *Geranium agreſte*, *field Craneshill*, of which in Chap. 162. 5. *Geranium Columbinum*, *Doves-foot*, of which in Chap. 163. 6. *Geranium Robertianwn*, *Herb Robert*, of which in Chap. 164. following.

III. *The Garden Kinds,* of which we treat in this Chapter, are manifold, viz. 1. *Geranium Tuberosum*, *Tuberous or Knobbed Craneshill*. 2. *Geranium Anglicum Variegatum* *Be fieri*, *Geranium varicolor*, *fivejlriatum*, the *Variable*, or *Striped Craneshill*. 3. *Geranium fufcurn five moadatiw* *Brown*, or *ſpotted Craneshill*. 4. *Geranium HJ* *Gg 2 mat aides*

v. *aundes, vel Sanguine urn, Geranium Gruinale* *bxma-*
ciles Lobellij, Bloody Cranes-bill, or Red Rofe
Cranes-bill-

IV. The Defcriptions. The firſt or Tuberous
 Cranes-bill has a Root Tuberous and round, like al-
 moſt unto the Root of Cyclamen, or common Sow-
 bread, but ſmaller, and of a dark ruffet color on the
 out ſide, but white within, which increaſes under
 Ground by ſeveral firings running from the Mother
 Root, ſwelling out into ſmall *and Tubercles or
 Knobs, like unto the Roots of Ground Nuts, which
 ſoon quickly ſhoot out *Leaves, and in a ſhort time
 bear Flowers*, but will not endure to be kept long
 out of the ground, without danger to be quite ſpoiled.
 From this Root ſpring forth three or four large
 Leaves ſpread upon the ground, of a greyiſh, or ra-
 ther duſty green color, every one of them being as it
 were of a round form, but divided or cut into fix
 or ſeven long parts or diviſions, even unto the mid-
 dle, to which makes it ſeem to be ſo many Leaves,
 each of the cuts or diviſions being deeply notched or
 indented on both ſides. Among theſe Leaves riſes
 up a Stalk a foot or more *high, bearing thereon at
 the Tops and Joints, ſeveral pale, but bright purple
 Flowers, made of five Leaves apiece, after which
 come ſmall Heads, with long pointed Beaks, reſem-
 bling the long Bill of a Stork or Crane, or ſome ſuch
 like-Bird, which after it is ripe, parts aſunder at
 the bottom, where it is biggeſt, into four or five
 Seeds, every one of which has a piece of the Beak-
 head ſtuck unto it, and falls away if it be not ga-
 thered*

V. The ſecond, or Striped Cranes-bill, has a Root
 made of many ſmall yellow threads or firings, from
 which riſe up many broad yellowiſh green Leaves,
 divided into five or ſix parts, but not unto the mid-
 dle, as the former is, each of theſe Leaves has a
 blackiſh ſpot at the bottom corners of the diviſions
 the whole Leaf, as well inform, as color and ſpots,
 is very like unto the Leaf of the Geranium Fulcivm
 or Spotted Craoes-bill, next to be deſcribed, but

that the Leaves of this are not ſo large as the Leaves
 of that: From among theſe Leaves ſpring up ſeveral
 Stalks a foot or more high* jointed and knobbed
 here and there, bearing at the Tops two or three
 white Flowers, conſiſting of five Leaves a piece, ſo
 thickly, and variably (riped with fine ſmall reddiſh
 Veins, that no green Leaf, which is of that bigneſs,
 can ſhow ſo many Veins in it, nor ſo thick running*
 as every Leaf of the Flower of this beautiful^ Cranes-
 bill doth. In the middle of the Flower jlands a ſmall
 pointel, which when the Flower is paſt, does grow
 to be the Seed-Veſſel, on which is ſet ſeveral ſmall
 Seeds, like unto the ſmall Seeds of the other Cranes-
 bills.

VI. The third, which is the Brown, or Spotted
 Cranes-bill, has a Root conſiſting of divers great
 Strings, joined to a^uberous or Knobby Head, from
 which head ariſes Leaves in all reſpects like thoſe
 of the laſt deſcribed, as well in the form and divi-
 ſions, as in the color of the Leaves, being of a yel-
 lowiſh green, and having a blackiſh ſpot at the bot-
 tom of every diviſion in every leaf, whence came Wj*
 name, but larger and fironger by much, xjo* Stalks
 of this riſe much higher alſo, and are jointed or
 knobbed with reddiſh Knees or Joints, on the Tops
 whereof kand, not many, but large Flowers, conſiſt-
 ing of five Leaves apiece, each whereof is round a*
 the end, and a little ſnapt round about, and do bend
 or turn themſelves back, towards the Stalk, making
 the middle of the Flower to be the higheſt, or moſt
 eminent part: The color of the Flowers u of adark,
 or deep blackiſh purple, the bottom of every Leaf
 being whiter than the reſt: it has alſo <i middle
 Pointel/ growing forth, which afterwards turns into
 Seed, like unto the other kinds of Cranes-bill.

VII. The fourth Kind, or Bloody Cranes-bill, hat
 a Root which is hard, long, and thick, with ſeveral
 Branches ſpreading from it, of a reddiſh yellow color
 on

on the out side, and whitish within, which abides, and perishes not, but shoots forth some new green Leaves, which abide all the Winter, although those which turn red, do fall away. From this Root divers leaves if you spread them upon the grounds very much cut in or divided into many parts, and each of them again slit or cut into two or three pieces, growing upon slender long Footstalks, of a fair green color all the Spring, and Summer, but reddish in Autumn, from among these Leaves Spring up several slender and weak Stalks, beset at every Joint (which is something reddish) with two Leaves for the most part, like unto the lower. The Flowers grow severally on the Tops of the Stalks, but not many together, in Bunches or Branches, as in all the other kinds of Cranes-bills, every Flower being as large as a Single Rose Campion Flower, consisting of five large Leaves, of a deeper red color than in any other Cranes-bill at the first opening; but changes more bluish afterwards: when the Flower is past, there does arise such like Beaks, or Heads of Seed, as are produced in the other kinds, but they seem to be smaller.

VIII. *The Places.* All these grow Wild in Foreign places, but are only nurs'd up with us in Gardens. Matthiolus says, that the first grows very plentifully in Dalmatia and Illyria: and Camerarius, Clusius, and others say, that the rest grow in Germany, Bohemia, Austria, &c.

IX. *The Times.* All these Cranes-bills do Flower for the most part, in April, May, and June: but the Variable or Striped Cranes-bill Flowers usually later than any of the rest.

X. *The Qualities, Specification, Preparations, Virtues and Uses,* of all the Cranes-bills, being one and the same, we shall forbear the declaring thereof in this place, as also in some of the following Chapters, till such time as we have fully described all such kinds as are to be found growing in our Country: and therefore I refer you to Chap. 162. where we shall (God willing) discourse the same at large, and to full satisfaction.

CHAP. CLX.

Of CRANES-BILL Musked.

I. *THE Names.* It is called in Greek, *Βόρα*. In Latin, *Geranium Moschatum*, alib *Acus Mojchata*, *Rofirum Gconu Moschatum*, *Myrrhida Plini*, and *Acus Pafforis*: In English, Musk'd Cranes-bill, or Storks-bill, of the Vulgar, Musk'd Muschata, and Herb-Musk.

II. *The Kinds.* We have four several sorts of this Plant, viz. 1. *Geranium Moschatum vulgare* vel *Hortenfe*, *Herba flloSchus*, the Common, or Garden Musk'd Cranes-Kill, or Herb Musk. 2. *Geranium Moschatum inodorum*, Musk'd Cranes-bill without smell, being only called Musk'd from its form. 3. *Geranium Apulum odorum*, *alterum odorum folio Coriandri*, Italian Musk'd Cranes-bill. 4. *Geranium Creticum*, Candy Cranes-bill.

III. *The Descriptions.* The first, or Musk'd Cranes-bill, has a Root somewhat long, with divers fibres thereat, from whence Spring up several long winged Lexoes, of a dark green color (and sometimes of an Ash green color) lying upon the ground, and cut or divided into many Parts or Leaves, and each of them cut in or split on the

Edges, among which life up several tenier scarce able to fit and upright I about a foot, more or less high, with some such like Leaves growing upon them, but you find below, but smaller the higher they grow on the Stalk, and the jointer cut in on the edges on the Tops; also among the upper Leaves sometimes, several very firm Red or Crimson flowers grow after which very small and long beaks or Bills come forth, with Seed at the bottom, as all the rest of the Cranes-bills have, which twines itself, as most of them do. The whole Plant, and every part thereof above ground, has a very fine and pleasing Sort of Smell, very much resembling that of Musk, whence came the name.

IV. *The second kind, or Inodorous, in its Roots Leaves, Stalks, I lowers, Magnitude, form and manner of growing, so much resembles the former that at first sight there seems to be no difference: but that which makes the difference is that this whole*

F/a'ir has no Smell at all, or if it has any, it is not of the Musky kind, this has Red flowers: But there is also another Species of this Inodorous kind, nothing differing from the last, but in the color of the blowers, the color of these being white.

V. The third, or Italian Musk'd Cranes-bill, a Root small and yellow, lifting up its head a little above ground, from whence spring several long Leaves, somewhat hairy, lying upon the ground, and a little knipt or cut in on the edges, -and divided into parts, even to the middle Rib, not much unlike to the Geranium Mofchatum first described, which fit and upon reddish Footstalks, the two lowest Jags being greater than the rest, but those which rise up with the Stalk are more cut in, somewhat like unto the lower Leaves of Coriander or Fetherfew, but with rounder dents, the Stalks are Jointed and Kne'd, with two such like Leaves at them, but more finely jagged: at the tops of the Stalks and Branches the Mowers grow, of a pale blewish purple color, each fit an ding in a green hairy Husk, wherein afterwards fit and the heads of Seed, very like to the other kinds, great below and small above. The whole Plant above ground is of a leafing Sweet Musky Smell, like the first of these, and of which it is a Species.

VI. The fourth, or Candy Cranes-bill, has a Root which is long and white, with some Fibres adjoining to it, and perishes when it hath used its Seed: from this Root Spring up several long and tender Stalks, soft and full of Juice, upon which grow several broad and long winged Leaves, not much unlike to the first Musk'd Cranes-bill, cut in, or notched on the edges. These Stalks spread themselves out into many Branches, more especially towards the Top, on the Tops of which grow many flowers made of five Leaves apiece, of a reasonable bigness, and of a fair Blew, or Watchet color, with a purplish Point in the middle, which being past, beaklike heads follow, as in the other Cranes-bills, but greater, and coming larger, greater, and sharper pointed Seed, able to pierce the skin. This Plant springs up many times of its own Sowing, if the Winter is not too sharp, otherwife being Annual, it muji be Sown in the Spring of the Year.

VII. The places. The two first grow Wild (says Parkinson) in many places of this Land, as well in Meadows as waste Grounds. But the first is now nurfed up in Gardens for its pleasant sweet Smell. The second is found sometimes upon Heaths, and dry Gravelly places, but much smaller than when it grows in better or richer Ground. The third was brought to us out of Italy, and the fourth out of Candia, and in England are only nurs'd up in Gardens, where they grow very well.

VIII. The Times. They Flower in June and July, and the Seed ripens not long after: the Candy Cranes-bill, Gerard faith, flowered with him for the most part in May.

IX. As for the Qualities, Specification, Preparations and Virtues (these being of the same nature with the Wild Cranes-bills) see them in Chap. 162. following. These here are accounted excellent Wound Herbs, and equal to Doves-foot: The Cretick or Candy Cranes-bill being used in Wound Drinks, does far excell (as Gerard says) any of the Cranes-bills, and is equal with any other Wound Herb whatsoever for the same purpose.

CHAP. CLXL

Of CRANES-BILL-Crowfoot.

I. History. Names. It is called in Greek, *Βατραχίαιος*.

In Latin, *Geranium Batrachioides*, *Gratia Dei* fuchij *Runculus ceruleus* and in English, *Crowfoot Cranes-bill*.

II. The Kinds. There are six several kinds hereof, 1. *Geranium Batrachioides flore Ceruleo*, Blew Crowfoot Cranes-bill. 2. *Geranium Batrachioides flore albo*, White Crowfoot Cranes-bill. 3. *Geranium Batrachioides alter urn, flore purpureo*, Purple Crowfoot Cranes-bill. 4. *Geranium Batrachioides, pullo flore*, Dark Red Crowfoot Cranes-bill. 5. *Geranium Batrachioides flore albo iff Ceruleo vario*, Party colored Crowfoot Cranes-bill. 6. *Geranium Batrachioides longius radicum Lobelij*, Long Rooted Crowfoot Cranes-bill.

III. The Descriptions. The first, or Blew Crowfoot Cranes-bill, has a Root which is composed of many reddish firings, spreading in the Ground, from which head made of divers red heads, which lye oftentimes above ground, from this Root spring forth many Uree Leaves, cut into five or six parts or divisions, even to the bottom, and gaged on the edges, fit upon very long slender Yootstems, very like to the Leaves of the Field Crowfoot: from among which Uwet divers Stalks spring up with great Joints, somewhat reddish, Jet with Leaves like to the first Garden kind: The Stalks towards their Tops spread themselves into many Branches, on which grow several flowers made of five Leaves apiece, as large as any of the Field Crowfoot, round pointed, and of a fair Blew, or Watchet color, which being past, such like heads and bills do succeed, as are found in other Cranes-bills.

IV. The second, or White Flowered Crowfoot Cranes-bill, is in Leaves, Stalks, Branches, flowers Magnitude, form, and manner of graving, altogether like

like to the former, excepting in tiao particulars, viz. i. In the Root, which has not/uch red heads as the former Blew floteered has. 2. In the flowers, the former being Blew, whereas the Flowers in this an twholty White, and fully its large as thv firif.

V. The third, or Purple Crowfoot Cranes-bill has a Root wbkh is eempofed of a great Tuft of firings, fafined to a Tuberos or Knobby tiead, from whence many Lewes fpring forth, Jit upon long footstalks, jomevihitt like unto the other, yet not jo broad, but more divided or cat, viz. into/even, or more flits, even to the middle, each of tobich is affo cut in on the edges, more- deeply than the former. The Stalks are a little Knobbed or Gouiy at the Joints, Jet with Leaves like unto the fewer, and bearing <t great Tuft of Buds at the Tops of the Blanches, which bud and put out into fair targe flowers, made of five purple Leaves, which dojbme-thim> refemble the flower of a Mallow, before it be too full blown, each whrcrnf has a reddijh Pointel in the middle, and many/mall threads compajfing ** it, (ten in number) as GOOii/ays. This Vmble ... Tuft of Buds, does flower by Degrees, and not all at once, and every flower abides open but a little more than one day, and then Jheds its Leaves 5 Jo that, foery day yields frejh flowers, which becaufe they are fo many, are a long time before they are all blown and/pent. The flowers being paji,/mall Beak or Bill Heads come forth, lite uata ibe other Cranes-bills," with/mall turning Seed.

VI. The fourth, or Dark Red Crowfoot Cranes-bill, has a tisot with great reddijb heads above, with many long firings and fibres de/cending from it 5 from this .Root fpring/everal broad Jpread, fyt, and fomewhat hairy Leaves, growing upon long footstalks^ cut into five, jix, or leven deep gajhes or divifwms^ with a blaikifi /pot at the bottom of every- one of them, and dented alfo about their edges. The Stalk ri/es up about two feet high, /ported with many bloody /pots, and is fro/tgj fomewhn hairy, and Jpread forth into three or jour Branches, wnbfuch like Leaves on them, bat hjfer, and at their Tops, two or three flowers apiece, each of them confifing of five Jpraves, cut in on the edges (tobkh lj a mode differing from all other Cnnes-bills) of a deep red color, almoft blackijh, and, in the middle a long St'le or Pointed will) many withered threads about it. T}e flowers being pafi, there follows brown pointed Seed, like to the other Cranes-bills.

VII. The fifth, or Party-colored Crowfoot Cranes-bill, is in its Roots, Stales, Leaves, flowers, Seed, Magnitude, form, end manner of growing, fo like to the firfl defehbed in this Chapter, that until it is perfeUly in flower, this cannot be known from that: but when it is blown out, the tZ'ewers are found to be variably firiped and/potted, and fometimes divided, the one half of every Leaf being white, and the other half blew ; fometimes with greater cr- leffer/pots of blew in the white Leaf veiy variable, and more is fame years than m ethers ; fo that it would be <f very difficult matter * to exprefs all the varieties which may be ob/erved, et the/aitit and differing times, in the blown flowers.

VIII. The fixih, or Long Rooted Crowfoot Cranes-bill, b& " Roar very long and great, with fmat fibres adjoining thereto of a reddijh color without, and abiding all the Winter , from this Root fpring forth LeeW (%*ⁿ [m& **?**) & T' what large, but yet lets than tfofe of tibe other Crowfoot Cranes-bills, vtherwile very like, horn among thefo Leaves rife up fivrtit Stalks, bearing fair vutd beautiful red flowers, of a more excellent red color than thofe of the Tuberos Cones-bill, mi <JSM fighter red than theft of the third kind be

We drjertbed in this Cbpttf t they are ajo tained in thicker and Jborter Cups, and are of a fweet Musk-like Smell: The flowers being fw7, thf Seed fucceeds, which is like to that of the other Cranes-bills./roi/£ that the Bills are a little Jbster.

IX. The Places. Tlttfe are all Wild of their own Nature, and grow in Barren Places, and in Vallies, rather than in Mountainous Grounds. Some fay, that the firtt has been lbund growing naturally in **England**, bur Paikm/on fays, he never could find it: but with us rhey are for the moftpan Nurs'd up in Gardens.

X. The Times. They all Flower in June and July, and their Seed is ripe in a (hort time afterwards.

XI. The Vitalities, Specification, Preparations and Virtues, being the fime with all the aforegoing Cranes-bills, as alfo with thoe in the **follo** Chapter, where we have declared them at large, we fhall foTbear to fpeak any more in this place, referring you thither.

CHAR CLXII.

Of CRANES-BILL Field.

THE Najnes. It is called in Greek, r%bwj *yet& : In Latin, Geranium agrejie 1 and n Eng!{fh, field Cranes-bill

II. The Kinds. The field Cranes-b' H 's man, but thofe which we defign under that Name, we, i. Geranium agrefte, Geranium Viefacim, field, or Violet colored Oanes-bill. 2. **Germum Qsute folio inodarint**, Field Oranes-bill without Sir. of this we have difcourfed in **Chap. 16<***. Set **I. 4'** ? . Geranium Coumbimtm. Doves-toot. 4. **Germum Rffbertidmm**, Herb Robert, of which two lait we Hull Jpeak in tome ol the Clujncrs ibttowwy,-

111. The Description. *It has a Root which is thick and woody \$ having fomic few firings adjoining there-to^ and is wholly red, both within and without, not fmelling of iron a* the Root of Herb Robert: from this Root rife up feveral /ender hairy reddifh Stalks, about two or three feet high -, at the Joints of which grow heaves, upon fhorter, yet reddifh Footstalks. The Stalks fpread them/elves out alfo into other fmall Branches, whereon are fet confufedly broad Leaves, made of three, four or five Leaves apiece, and thofe jagged or cut about the edges. Parkinson fays, the Leaves are moft ufually divided into three parts, as Urge, or rather more than the other, and turning red likewife. The flowers which conjift of Jive Leaves apiece grow at the Tops of the Stalks and Branches, and are of a perfett Violet color, (whence tame the name) or as Parkinson fays, of a Purplij) Red, of the bignefs of the flowers of Herb Robert •, which being pa ft away, the Seed comes in fuch headed Beaks or Bills as the other Cranes-bills produce.*

IV. *The Places.* It is often found by Way-fides, Ditch-banks, Borders of Fields, and other wafted Grounds.

V. *The Times.* It Flowers in June and July\ and the Seed ripens in the mean Seafon, or not long after.

VI. *The Qualities.* All the *Cranes-bills* feem to have one and the fame Qualities -, they are temperate in refpect of Heat or Cold, and Dry in the firft Degree. They are Abfterfive, Afringent, Diuretick, Traumatick or Vulnerary and Incarnative: Peftoral, Nephritick, Hyfterick, and Anti-emmenagogick, Hemoptoick and Analeptick.

VII. *The Specification.* They heal Wounds fpeedily, conglutinate their Lips, ftop Fluxes of Blood, and cure Ruptures.

VIII. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Effence. 3- A Syrup. 4. A De co ft ion in Red Port Wine. \$-A Poultice of the Herb. 6. A Balfam. 7. A Cataplafm.

The Virtues.

IX. *The liquid Juice.* It is faid to be good againft Fluxes of the Bowels, whether Diarrhara, Dyfenteria, Lienteria, or Hepatick Flux, healing them, and fo eafing the Griping Pains, it prevails againft Hyfterick Fits, and is good againft Sand, Gravel, and Stone in Reins and Bladder. Dofe four ounces, or more, either alone, or in Wine, Morning and Night.

X. *The Effence.* It has all the former Virtues, and more powerful to all the lame Intentions •, befides which, it is a famous thing to ftop the overflowing of the Terms in Women, and to confolidate Ruptures, whether in old or young. It is good againft Fits, and the extream Tortures of the Colick, as alfo to heal Wounds, whether inward or outward, h cures Spitting, Vomiting, or Piffing Blood, diflblves coagulated Blood, whether in the Stomach, Bowels, or Reins, and expels it, and is a fingular thing to be taken as a Wound drink, for them who have any Wounds, running Sores, old Ulcers, or Fiftula's, to induce them to a fpeedy healing. Dofe three ounces, Morning, Noon and Night in a Glafs of Red Port Wine.

XI. *The Syrup.* It has all the former Virtues (being made either of the Juice or Effence) but is fo much the weaker by the Sugar which is added to it: however it is more fit for Children and fqueamifh Stomachs, and may be given to them againft Ruptures.

XII. *The Decoffion.* It has the Virtues of the

Juice and Effence, but very much weaker, and may be given to thofe who cannot be induced to take them. However you make thereof an exceeding good Wound drink, to all the purpofes aforementioned. Being inje&ed into Fiftula's, or running Sores, and Ulcers, being washed therewith, it perfe&ly cleanfes and heals the»i, and alfo conglutinates the Lips of Green Wounds.

XIII. *The Ponder.* It is good againft Ruptures, or Burftings, given to one dram, in fome proper Vehicle: outwardly ftrewed upon Old running Sores or Ulcers, it cleanfes, dries and heals them, and is good to ftop Bleeding in Wounds, and to confolidate their Lips.

XIV. *The Balfam.* It is a fingular Vulnerary, and cures fimple Wounds at the firft Intention : it digefts, cleanfes, incarnates, and dries old running Sores, and rebellious Ulcers, and by ftrengthening the Part, brings on the healing after an admirable manner : applied in the Gout, it gives eafe, and by continuing of it, cures it in a fhort time.

XV. *The Cataplafm.* Being applied to fimple Contufions, it Difcuffes, prevents Pain and Inflammation, and fo cures them : It conglutinates fimple Green Wounds, and gives eafe in the Gout, as alfo in all other Pains of the Joints, Nerves, or Tendons, coming from blows, ftrains, or the like*

CHAP. CLXIII.

Of CRESS Garden.

I. *'T * HE Names.* This Plant is called in *Greeks* JL K&\$fo(iov, dn nfe mJiat, *Cardamon quod cordatos fgiat, vel quod Corfoveat, quia in Jincope Cardiacaplurimum valet* : And .of this Herb, the *Greeks* had this Proverb, Wn 4 ^ m , Ede Nafturtium, propterea quodNafurtio inefje Credebant arimivigorem excitanii. In *Arabick*, Narf, vel Nafalchaf: In *Latin*, Naflurtium, a'narium tormento, as *Pliny* faith : And in *Engliffh*, Crefs.

II. *The Kinds.* They are manifold, as, I. Nafturtium Horten/e^ Garden Crefs, of which in this Chapter. 2. Naflurtium Indicum, Indian Crefs, of which in Chap. 164. 3. Nafturtium Pratenfe^ MeadowCrefs, of which in Chap. 165. and 166. 4' Nafturtium agrejie, Wild Crefs, of which in Chap* 16].m. %NafurtiumJchiadicm, vel Ifcbiacum, Sciatica Crefs, of which in Chap. 168. 6 Kf*] iurtium Hibernum, Winter Crefs, of which in, Chap. 170. following

III. Of the Garden Kind, S there are thefe following, viz. 1. ifajAriti, vulgare, The common Garden Crefs. 2. tmm Hortenfe Latifolium, and Nafturtium liumUifpanicum, Broad Leav'd GarW 3. Nafturtium Angujtifolium, Curled and Narrower Leaves. A ^ 5 with B™ader and

Y 'B eDeAriPtio ns. The firft has a long Root with fome fibres adjoined to it, which penfhes every Tear a J^, the opening of the Seed, or upon the approach of Winter h from this Root the Stalks grow up half a y^ or two feet high, having many Jmall tender, whitijh, broad, indented, or torn Leaves fet thereon, growing together upon a middle rib next themound- but

tut those which grow higher upon the Stalks are Smaller and longer : The Leaves in general are fo like to those of Garden Cheryil, or Sweet Cicely, that it must be a very obfervant Eye which can diftinguifh them, and whilft young are fcarcely to be differenced but by the tape. The tops of the Stalks ere replenifhed with white Flowers, which turn into flat Pods or Pouches, not much unlike to Shepherds Purfe ; in which is contained flat reddifh Seed 5 the Smell of both Leaves and Seel is ftrong and fpicey 1 and their Tafte is hot, Sharp, and biting, almoft like Pepper, for which reason fome call it, Pepper-wort*

V. The second, or Broad Leav'd Garden Cress, has a Root which is small and long, perijoiq every year, and therefore must be constantly SOZCJ in the Spring ; antfor this reason also, because after it is Sown, *t sprigs up quickly, and will not endure the cold of Winter. Its fir ft Leaves are small like Bafil, among which rises up a Stalk about half d yard high, Jet with larger Leaves thereon, without any divijion, but finally Aentel about the edges, and pointed at the ends, every one standing upon a lo??g Footstalk, branched from the middle to the Top with lejjer and narrower Leaves, like to the Top Leaves Of Garden Cress : From whence break forth many white Flowers set in spikes, one above another, after which come Pouches or Purfes containing brownijh Seed like to the other Cresses, but much more bitter, and yet not all. out fo fiery or floor p.

VI. The third, or Curled Cress, has a Root like to the former, which goes pretty deep into the Earth, and perishes every year after Seed time, as the other does. It grows like the fir ft, or common Garden Cress, and differs therefrom only in the Leaves, which are of two sorts : the one with broad Leaves, cut, and roundly dented, and curled about the edges, every one by it self, on a long Stalk. The other, consisting of many smaller Leaves, set one against another upon a middle rib, each part of which is in the same manner cut in, and curled as are the other** The Flowers are white, like the common Garden Kind 5 and the reddish Seed also like the same in Form and Magnitude.

VII. The fourth, or Impatient Cress, has a small Root spreading forth it self into many Branches *, from whence arise many winged Leaves, not much unlike to the smaller Slum, which spread themselves at first upon the ground, not much above an Inch or two long, which so abide from Autumn, when it springs up, all the Winter long. In the Spring of the year, they grow somewhat bigger^ and the fati Leaves are a little dented about the edges, the bottom of the Leaf being for the most part the biggest, From among these Leaves rises up a slender Stalky abt a foot and half high, which is divided into several Branches, from the middle thereof to the Top* On the extremities or tops of all which Branches grow many very small white Flowers, which being past away, as many slender long pointed Cods follow, in which is contained small yellowish Seed ; when these Cods are ripe, they are so impatient of being touched, and the Seed is so hard to be gathered, that the Pod breaks it self, even of its own accord, upon the least touch of the hand, or any thing else, and so the Seed flies away, not being then possible to be gathered : This Seed has little or no heat in it.

VIII. An Observation. It is indeed the Nature of this Impatient Cress, that if you but touch the Cods when the Seed is ripe, though you do it never so gently, yet will the Seed fly all away with a great Violence, not suffering it self to be touched, from whence came the name, *AWi meq, tangere*, and *Nasturtium hnpatiens* *, as for the like quality, the *Perficaria Siliquosa* is named. The nature of this Plant is somewhat admirable, for if the Seed is fully ripe, though you put your hand but near the Cods, as proffering to touch them, though you touch them not, yet will the said Cods be apt to open, and the Seed to fly our upon you, when you may expect no such thing. *Proffer Alpinus* is the only Man who formerly wrote hereof, from whom our *Parkinson* and *Johnson* have taken their *Difcourses*.

IX. The Places. These Plants are all of them nurs'd up with us in Gardens. The first matters not what Soil it grows in, for it likes any ground, especially if it is well watered : The second came

againſt Sleepineſs, Droufineſs, and ſuch as are troubled with the Lethargy.

C H A P . CLXIV.

Of CRESS Indian.

L^w T^p HE Names. It is called in *Greek*, Μ&#.w ± tvSiKov: in *Latin*, Nasturtium Indic.um, Flos Sanguine us Monardis: and in *Englijh*, Indian Crefs, or Yellow "Larks-heels, from the Form of the Flower*

II. The Kinds. It is a fingular Plant of the kind; and by its Taſte declares it ſeif to be one of the kinds of *Creffes*. Some do account it among the tie'matides or Convolvuli, the Clamberers or Bind-weeds, but any of theſe it cannot be, becauſe it has no Clappers, nor does it wind it ſelf about any thing, but by xezfon of the number of its Branches which run one within another, it may ſeem to climb up a Pole, or the like, which yet it does but only-dole, as having ſomething whereon to reſt or lean its Branches. But *Parkin/on*, from X^/, makes two kinds, viz. the *Round Leaved*, (which is the Common) and the *Cornered Leaved*.

III. The Description. This fair and noble Plant has Roots which are ſmall, and Spreading under Ground, ivbicb perijh with the Jirjl Trojls, and wuf be /own afrejh every Tear : from this Root arife viavly long trailing Branches, interlaced one, within another very eoñfufedly, (yet it does not withdit Jélj with any Clappers, about either Pole, or any other Prop, but if you would have it lye cloje thereto, you muji tie it, or elfe it will lye upon the Ground) four or five feet in length at the leaji, for which keafon it takes up a great deal of Ground, the Leaves are

ſmooth, green, and ax round as the Pennywort which grows on the Ground, without any Cut or Incifure in any part, the foot Stalks of which Jtand in the middle of each Leaf, and grow forth at every Joint of the Stalk, where they are a little reddijh, and knobbed or bunched out: the Flowers are of an excellent Gold-yellow color, and grow all along the Stalks, almoji at every Joint, ttfith the Leaves, upon pretty long foot Stalks, which are compoſed of five Leaves apiece, not hollow or gaping, but ſtandwg open, each Leaf apart by it ſelf two of them, whicf are larger and longer than the other, ft and above, and the other two, which are Iciffer, Jtand below, which are a little jagged or bearded on both fides 5 and the fifth loweft. In the midji oj each of the three lower Leaves, (yet ſometimes it is bat in two of them) there is a little long Spot or Streak, of an admirable Crimfon color, (whence the Name Flos Sanguineus:) and the Flower has a long Heel or Spur behind it, hanging down, (from which and the Color came the Name O/Yellow Larks-heels:) the whole Ylower has a great Beauty, and Sweetneſs withal, very pleajing, which being placed in the middle ofjbme Carnations or Clove-gilliflowers, (which are both in flower at the ſame time) make a noble Nojegay, both for Sight and Smell. When the Flowers are paſt, come the Seed, which are rough or uneven, round, greenijh, yellow Heads, ſometimes but one, and ſome* times two or three ſtanding together upon one Stalky bareornaked of themſelves, without any Huſk, con* taining a white pulpy Kernel.

IV. The ſecond, or Cornered Leaved kind, in its Root, Stalks, Branches and Flowers differs little or nothing from the former : the chief Difference is in the Leaves, for a* in the former they are round, and are fafined upon a long foot Stalk underneath, nearly in the Center or Middle of each Leaf, and bunched out h in thk, they are broad, and Jeven, eight or nine cornered, of the ſame Smcothnejs and Co lor, (harp pointed at thèir tops, and growing upon a long foot Stalk, which is joined to the LeàJ at the lower

part thereof. the Vlowers are Lark-fpurred, like the other, and in the whole, differs nothing from it m its Manner and form of growing. Parkinson/^^; / ^ to fay it vo.i# taken from the Life, which tho* it has not been feen here with us in England Jince, yet that hinders not (fays he) the Verity of the thing. When I was in the Weft Indies, in my Travels up and Jozvx, I faw it feveral times.

V. The Places. This goodly and beautiful Plant was firft found in the Weft Indies, and brought thence into Spain by Monarhts ^ from whence it was afterwards conveyed into France, Ylanders and England. It grows now familiarly in moft of our Gardens, where ir flourifhes, and is become as it were a natural Inhabitant. It need not be planted or ibwn in Beds of Horfe-dung, or die like, for the natural Ground will be futhcient, fo that it is but a little defended from tholè Frofts in the Spring of the Year, which are ape to nip it whilft but tender, or newly fprung up.

VI. The Tunes. It maybe fown in March or April •, the which, when it is fprung up, and having gotten three Leaves, muft be taken up, and carefully replanted abroad, in the hotteft place of the Garden, and in the fineft and fatteft Mould. It flowers fometimes in June, but ufually in July, if it is well defended, and in good Ground 5 and fo continues flowering till the cold Frofts and Weather in the latter end otOftober, does check it, and put a 4op to its Luxuriant Nature •, the Seed growing continually ripe in the mean Seafon, which after it is ripe, foon falls down on the Ground, whence

VII. The Qualities, Specification^ Preparations and Virtues, are exaaiy the fame with thofe of Garden Creffes in the former Chapter, to which I refer you h fo that no more need be fpokenof them here, except that the fame Preparations of this Plant, as they are ftronger, fo they are more Efficacious.

CHAP. CLXV.

Of CRESS'S Meadow

OR,

CUCKOW-FLOWER, SingU

~T*HE Names. It is called in Greek, r. ^ m ^ K xuptivuv: in Latin, FlosCuculi, Najlurtium Pratenfe, Sifymbrium alterum Dioscoridis, and Cardamine: and in Englifh, Meadow Crefs, or Cuckow-flower: in fome Countries it is called, as Gerard fays, Ladies Smocks.

II. The Kinds, They are either Single or Double: the Single we (hall treat of in this Chapter the Double in the next following. Of the Single, fo many as grow with us in England, there are three Varieties, viz. I. hajlurtium pratenfe majusTragi: if hejnen, Cardamine latifolia, Najlurtium aerch. Uchfu, & Sylvejire Loniceri, LepUium minus Cordi, illos Cuculi Dodonei & Brunfelsii, The Great Broad-leaved Crefi, or Cuckow-flower. 2. Cardamine altera minor, Sifymbrium Cardamine Lacunt. 13 Lugdunenfis, Sifymbrium aquaticum alterum Mat thiohp fabemmontani, Hiberis luchfii, iberisThn. In, Lardamine altera Lobelii V Cluftii, Agriocardammm, five ^ardamantica Najlurtii foliis, Najlurtium pratenfe magno flore Baubini, Najlurtium aquaticum fm,phci flore Befleri, The Small Cuckow

flower. 3. Cardamine alteraparvo flore, The Small tiowred Cuckow-flower.

III. The Defections. . The frfi has a Rm ptfed of many white Heads or Fibres, from which shoot jorth feveral long Stalks of winged Leaves that is, many together, fomewhat broad and round tender, and darkgreen Leaves fet one again ft another upon a middle Rib, the greateft banghbe mds j among these winged Leaves rife up divers tender, weak round, green Stalks, fomewhat lirked i on which grow muchfmaller and longer Leaves very like the fnalleft dividedLeaves ^/Garden Crefs at the tops whereof fiand feveral Flowers made of four Leaves amece, fomewbat large, and almoli like to Stock-gilliflowers, but rounder, and not full out Along, whittjh in Color, or a little dajbtover with BluJ), and many times but at the edges only eachnf them growing in a green Husk, which beLf/l

IV. The Small Cuckow-flower with its Roots, Leaves, Sili and Manner of Growing, l i h i t Form defcribed, excepting that itt n(t bujhing ou/Jbfo and the Pods of Seed-Lf..l f* bda J ^ of that aforegoing.

FIL ^ ^ ? >> 7 / ? th the Cuckow-flower iforegin 7 f* h 10 the of this are fmalleranilongeV(TM) th n d e y w times alfo, growing in thef round fomedoes: thefloweri arell^TT^ nias th e p o r p and the Pods of Seed-Lf..l f* bda J ^ Th, Pi tojfomewbat longer. Th g are all found in fev parts f L, l and near unto paffingthr? » *e Cape

VII. The

VII. *The limes.* They flower ibmewhat early in the *Spring* about *April* to *May*, at fartheft, and concinue with the lower *Leaves* all the *Winter*.

VIII. *The Vitalities, Specification, preparations and Virtues* are the fame with *Garden Crefs* in *Chap. 163.* aforegoing, to which you are referred.

divers places : from this Root Jpr ing forth feveral winged Leaves, weak and tender[^] lying on the Ground, very like to the fingle Meadow kind-, from among which rifes up a round green Stalk, fet here and there with the like Leaves that grow belozy, the top whereof has a few Branches, on which ft and feveral Flowers, every one of them uf)on a f?nall foot Stalk, confifting of many fmall whitifh round Leaves, a little dafkt over with a blew Blufh, fet round together, which make a double Flower.

IV. *The fecond, or Trefoil Cuckow-flower, has a Root[^], cjmifofed alfo of feveral white Fibres, from the Htyds thereof run forth fmall Strings, of a dark purple color, by which it encreajts. From this Root fpring forth feveral dark, round, green Leaves, a little uneven about the edges, and always three Jet together on a blackifh fmall foot Stalk, among which rife up fmall, round, blackifh Stalks, fix, feven or eight inches high, with three fmall Leaves at the Joints whhre they branch forth: at the tops whereof grow many" Flowers, confifling of four Leaves apiece, of a whitifh, or very pale blufh color. The Flowers being pa*i, fmall, thick and long Pods come forth, in which is chfitumed fmall round Seed.*

V. *Tfie Places.* The firft generally grows with us in *Gardens*, bnt is alfo found Wild in divers parts of *England*, as near *Mitchain*, about eight Miles from *London*, alfo in *Lancafhire*, in feveral places: the other was brought to us at firft from beyond Sea, and is here[^]efly nurft up in *Gardens*.

VI. *The Times.* They flower ufually in the end of *April* or *JAay* h but the latter of them commonly flowers before the former.

VII. *The Qualities, Specification, Preparations, Virtues and Ues,* are the lame with thofe of *Garden Crefs* in *Chap. 163.* or with thofe of *Water Creffes*, to which you are referred.

CHAP. CLXVI.

Of CRESS MeadnPy

O R,

CUGKOW-FLOWER, Double.

I. **-T*HE Names.* This is called in *Latin*, *Car-damine flore pleno*, (that it was known to the *Greeks*, I cannot learn) and in *Englilh*, *Double Meadow Crefs*, and *Double Cuckow-flower*.

II. *The Kinds.* Taken as *Garden Flowers*, there are two of them, viz. 1. *Car damine flore pleno*, being the double kind of that Plant, which growing Wild abroad, is called, *Car damine alt era*, and *Symbrium alterum Diofcoridjs*, *dfoFlosCuculi*; but this Name is more ufually given to the *Wild feathered Campions*, both fingle and double: in *Englilh* we call it *Double-flowred Cuckow-flower*, or *Ladies Smocks** 2. *Car damine trifolia[^] Trefoil Meadow Cteft* or *Cuckow-flower* -, this is not truly a double-flowred Plant, but rather a Plant very full of *Flowers* which at firft fight makes it look as if it was double-flowred. Thefe two being the faireft of all the *Meadow Creffes* or *Cuckow-flowers*, and for their Beauty being brought into *Gardens*, we thought belt to place them both in one Chapter.

III. *The Defaiftions.* The firft double-flowred has a *Root* which creeps under *Ground*, fendng jorth many/mall white *Fibres* or *Strings*, and jheots up in

CHAP. CLXVII

Of CRESS Wild.

I. **Tp HE Names.* It is called in *Greek*, *K*!A^o** A TTUW [^]rt[^]oj: in *Latin*, *Nafturtium agrcfte*, *Nafturtium Sylveftre*: in *Englilh*, *Wild Crefs*.

II. *Tta iC/^.* There are three which go under the Name of *Wild Crefs*, viz. 1. *Nafturtium Sylveftre Ofyridis foliis*, *Narrow-leav'd White Creffes*. 2. *Nafturtium agrcfte Carolinianum*, *The Carolinian Wild Crefs*. 3. *Nafturtium Petraum*, *The Stone or Rock Crefs*.

III. *The Defcriptions.* The firft of thefe has a *woody Root*, which perifhes after *Seed* time, from whence fpring forth many *fmall, round and hard Stalks*, with feveral *fmall, round and narroxv Leave** growing thereon without *Order*, branched from the middle upwards into many parts, at the tops of which come forth a great number of *fmall white Flowfrs*, (but fome have been found with *yellow Flowers*, the? not often) one ftanding above another, *Spike* fafhion, after which appear *husks*, containing *fmall Seed*.

IV. *The fecond, or Carolinian Wild Crefs, has a long andflender Root, with many Fibres proceeding from it, which alfo perifhes every Tear ; from which Root grows up a round, green and hairy Stalk, about afoot high or more, and if it grows in rich or fertile Ground, fometime about afoot and half high *, fometime but one Stalk grows up, and fometime more \$ which Stalk or Stalks fpread imo Branches from the very Ground, at every Joint whereof ft and long winged Leaves, very much divided, like unto the*

Common

Common Garden Crefs, but yet more finely cut or divided, and floarp in Taſte, like Creffes. The flowers are many, and of a pale vohitijh yellow color, ſtanding in long Spikes at the tops, which being paſyd away, finally Jhort touches appear^ divided into two parts, which ſtand not upright, but hang downwards, in which is contained Jmdll reddifh Seed, like unto Crefs Seed.

V. The third, or Rock Crefs, hat a ſmall and thready perifhing Root, fibm whence riſe up ſeveral Leaves upon long Foot-ftalks, which Leaves are jagged and cut about the edges, much like to OdkLeaves, or rather the Leaves of Shepherds-purfe : from amidſt theſe Leaves riſe up fever al Stalks, with ſmall jagged Leaves growing thereon, one only at a place, without any Foot-ftalk, and not being above one, two or three in number, to the top of each Stalk: on which tops ſpiked Heads of Flowers very thick ſet, which are ſmall, and of a white color, like thoſe of the Garden Crefs. The Seed is contained in ſmall Pouches or Seed-Vejfels, which are flat, like to Thlapfi, or Treacle-Muttard.

VI. The Places. The firſt grows Wild in the Fields, by High-ways, and Hedge-fides, and among Rubbilh, and in many other places. The ſecond grows plentifully in many places, Wild in the Fields which have been formerly Manured, and afterwards lye as Fallow or Waſte: I found a great quantity of it in Capt. Abbot's Plantation up Wanio River, not above four or five Miles from Charles Totvn in Carolina. In grows alſo very plentifully in the Kingdom of Valentia in Spain, (from whence it was brought to us in England) for which Reaſon it is called alſo "Naſturtium Sy heſt re Valentianum. The third has been found growing in Shropjhire, in the Fields about Birch, in the Pariſh of EZefmere, and in the Grounds formerly belonging to one Richard Hirbert, and that in great plenty : alſo on the farther ſide of Black-heath, by the Highway ſide, leading from Greenwich to Luſam.

VII. The Times. Theſe flower later than ſome of the former Creffes, viz. in June and July^ and the Seed ripens not long after,

VIII. The qualities, Specification^ Preparations and Virtues, are the ſeme with Garden Creffes in Chap. 163. aforegoing, and to them you are referred.

CHAP. CLXVIII.

Of CRESS Sciatica.

I. 'T^p HE Names. It is called in Greek, $\nu\alpha\sigma\tau\upsilon\tau\iota\upsilon\mu$ JL $\nu\alpha\sigma\tau\iota\kappa\alpha\ \&\ \alpha\mu\gamma\alpha\ \omega$: in Aralnc^ Seitaragi^ and Haufab :^J in Latin^ Iberis five Cardamantica, (quod Cardamo^ id eft Naſturtio firmilis eſt :) and in tingliſh, Sciatica Crefs.

II. The Kinds. It is twofold, viz. I. Iberis naſturtii foliis^ Lepidium Campeſtre Anguilara^ Iberis fecunda Tabernmontani, Iberiſ Cardamantica Gerardi^ Iberis Najiurtii folio Baubini, Sciatica Crels. 2. Iberis Latiore folio Bauhini^ Iberis Lugdunenſis Dodonai, Lacuna^ Gefneri in hortis^ & C<tf^b who alſo ſays it is Lepidium forte ColumellU, Lepidium ho&enfe Anguilara^ Iberis Cardamantica *->pbelii, Lepidium Iberias Pauſi JEGinet<e₀ Sciatica Crefs with broader Leaves.

ffl. The Deſcriptions. The firſt ha* a Root which * long white and woody, from which riſes up a round Stalk about two feet high which ſpretds !t%?nfo divers Branches, whoſe lower Leaves are fomewhat larger than the uppen yet all of them cut or torn on the edges, fomewhat like unto Garden Creffes but mailer-followers are Jhah^ and white, ~~the firſt has been found growing in Shropjhire, in the Fields about Birch, in the Pariſh of EZefmere, and in the Grounds formerly belonging to one Richard Hirbert, and that in great plenty : alſo on the farther ſide of Black-heath, by the Highway ſide, leading from Greenwich to Luſam.~~ in the other, which is only ~~the firſt has been found growing in Shropjhire, in the Fields about Birch, in the Pariſh of EZefmere, and in the Grounds formerly belonging to one Richard Hirbert, and that in great plenty : alſo on the farther ſide of Black-heath, by the Highway ſide, leading from Greenwich to Luſam.~~ more than thoſe of ~~the firſt has been found growing in Shropjhire, in the Fields about Birch, in the Pariſh of EZefmere, and in the Grounds formerly belonging to one Richard Hirbert, and that in great plenty : alſo on the farther ſide of Black-heath, by the Highway ſide, leading from Greenwich to Luſam.~~

IV. The ſecond, or Sciatica Crefs with broader Leaves, bat a Root like the former, and Jharp in Tap as it, from which ſpſine up heaves fomewhat long and broad, not rent or torn at all, but whole, only a little dented about the edges towards tlx ends, very like to thoſe of the Thlapfi Creticum. From among theſe Leaves riſes up a Stalk pretty thick and pong, much about the height of the other, which Juidently ſpreads it ſelf out into fever al Branches, on which grow Leaves, which are leffer, Jhorter and narrower,

narrower, a* they grow in height, and ft and on the Stalks without any great Order. The flowers grow at the tops of the Branches in /piked Heads, wh^l with their Seed, are very like the former, the Seed of this t aft ing as hot, Jbarp and biting, as the Seed of the other.

V. The Vlases. They grow by the Way sides in rough and untUTd places, and by the sides of o< Walls, and fuch-like : they have been found in Corn-fields about Southfleet, near to Grave/end in Kent.

VI; the Times. They flower according as they are early or late fown in the Fields ; but for the most part in June and July, and their Seed is ripe not long after.

VII. The Qualities, Specification, Preparations, Virtues and Uses, are in the main the lame with those of Garden Crefs in Chap. 163, aforegoing. Bit more especially these are laid to be Spegficks in curing the Sciatica and Gout in any Part.

VIII. Obfervation. A Cataplastm made of the green Leaves, but especially of the Roots^ either alone or mixed with old Hogs Lard, and applied to the place pained with the Sciatica, letting it to lye on for four hours in Men, and two hours in Women, is said by Galen from Dapiocrates, to cure the Difeafe •, and not only this Difeafe in the Hips or Huckle-bone, but also the Gout, and all other rains and Aches in the Joints, whether of Hands, Knees or Feet •, likewise all other inveterate Grievs of the Head, or other Parts of the Body difficult to be cured ; as vehement and long continued Catarrhs, universal Rheumatifms, OV. he also says, that Damocrates cured hereby all those Difeases, to which Sinapi, Thlapfi and Thapfm are applied. Pliny recites the same method and manner of Application, and says farther, that if any part of the Grief remains, that the same Medicine after twenty days is to be applied again. And applied to the Skin, it takes away the Blemifhes thereof is Freckles, Lentils, Scars, Scabs, Scurf, Lepfafie, &c. it is true, that it exulcerates or blisters the Part, but that is to be healed with a Balsam made of OH and Wax, with the Addition of a little Strasburgh Turpentine. After the Application of the Cataplastm in the Sciatica, the Part, says Gerard, is to be bathed with warm Watet •, or, as Parkin/on says, with warm Wine and Oil mixed together \$ and then wrapped up with Wool or Skins, or a Lamb-skin may be applied whilst it is yet hot., and but newly taken off from the Creature. DioJ.corides and Pliny say, that if the Root is hung about the Neck, or tyed to the Arm, it will give ease in the Tooth-ach.

CHAP. CLXIX.

O/CRESV Winter-

1. THE Names. It is thought to be that Plant X which the Greeks (as DioJcorides) call Viv-A&ivfay (tho⁵ k.js ***h&vtov in the Text, which I judge is by a mistake in tranferibing, Bivfop Bunium "being Earth-nuts, and Biv/<^ Bunias, the Navew or Wild Turnep, to which latter, this our Winter Crefs is something a kin:) in Latin it is called Nafturtium hybernium, Pfeudobunias Dodonai, Nafturtium Barbaric urn, Barbarea, Santfi Barbara; Herba, Scop Regia Angular*, Sideritis Latiffima fuchfu, finapi quint i generis Tragi 5 and in EngHJh, Winter Crefs.

II. The Kinds. They are threefold, I. barbarea* vimplex, Barbarea five Eruca lute a lot if olio, Nafturtium Palufire Gefneri, Eruca Falufms Lugdunenfis* (it is called also by all the Names in the former Sett ion >) Common Winter Crefs. 2. Barbarea fiore pkno, five Eruca lute a Bauhini^ Double-flowered Winter Crefs. 3. Barb are a minor, Herba fan* tti Alberti Cfalpini, Small Winter Crefs, or Winter Rocket.

III- The Defcriptions. Thejirfi has a Rootfome-thing fibrous, which always perifhes after the per* feffing of its Seed, from which fpring up fever at "Leaves indifferent large, and of a fad green color, lying upon the Ground, and torn or gap't into feve* tal parts, fomething. like unto Racket or Turnep heaves, (but nothing like to Crefles) which Leaves have/mailer pieces next the bottom, and broad at the ends, which fo abide all the Winter^ (if itfprings up 'n Autumn, when it is ufed to be eaten either green jr ft ewe d:) from among thefe Leaves rife up divers fmall round Stalks, which fspread* themfelves into many Branches, bearing in a fpiked manner many fmall yellow Flowers, each having four heaves apiece* which being paf, fmall long Pods come forth^ containing fmall reddijh Seed within them.

IV. The fecond, or double-flowered, has a Root like the former, which perifhes not in Winter, but abides many Tears: the Stalks are bigger than the former, 2nd crefted withal The Leaves are fhorter, and fwe about an inch in length, cut in on the edges in the fame manner as the others are. The flowers are yellow, like the former fingle, but fomething larger % and double withal, which makes the great eft part of the difference.

V. The thirds or Small Winter Crefs, has a Root like thejirft, and perifhing asjt -, from which fpring forth blackifh green Leaves, fomewhat jagged or torn in on the fides, refembling Moth-mullein : the Stalks and Leaves both are lefs than the fir ft, nor does it grow fo high. The Jloweri are yelth alji

a* the others, but fingle and lejjer -, andfo alfo are the Cods which follow the flowers, and yield much thejame kind of Seed, but lejjer in proportion to the Magnitude of the Cods.

VI. The Places. The firft gtows oftentimes of its own accord in Gardens, as alfo in Fields by Paths and Ways fides in feveral places of England, as in the next Fields beyond that called Lambs-Conduit, (from whence comes Lambs-Conduit Water a little below Snow-hill:) the other two are only nurs'd up in Gardens.

VII. The Times. They all flower in May, and the fingle ones feed in June, and then perih ^ but the double kind abides green both Winter and Summer. The Italians and Spaniards are fcarcely acquainted with any of thefe Winter-Crejjes, or rather Winter-Rockets, they being more peculiar to thefe our colder Climates.

VIII. The Vitalities, Specification, Preparations, Virtues and Ufes are the fame with thofe of Garden-Crejs in Chap. 163. aforegoing, to which you are referred : But befides all that is there faid, we have thefe following Observations.

- IX. Obfervation 1. The Green Herh It is ufed as Rocket or Crejs to be eaten as a Sallet in Winter, and that with greatpleafure and fatisfaction, when other Salleting is difficult to be gotten.

X. Obferv. 2. The Liquid Juice. If it is drunk inwardly, it is found by good Experience to be a fingular good Wound Herb, to cleafne and heal inward Wounds ^ and being outwardly applied, to wafh filthy running Sores, and putrid old Ulcers, cleafning them by its Sharpnefs, and removing the dead Flefh, and hindering proud Flefh from growing therein, and fo healing them by its drying Quality. It is alfo profitable to provoke Urine, hejpe the Strangury, and expel Gravel and the Stone. Dofe two or three ounces Morning and Night for fome time, in fome proper Vehicle.

XL Obferv. 3. The Effence. It has all the Virtues of the liquid Juice exalted ; befides which, it is a molt powerful thing to be ufed againft the Scurvy, Dropfie and Gout, in cold Conftitutions : it may be taken Morning, Noon and Night, from 1. to 3. ounces, in fome proper Vehicle, the Ufe of which is to be continued a Month, two or three, according as the occafion or force of the Difcafe requires. It is truly a good thing againft the Bloody-flux, and all other Fluxes of the Bowels whatsoever.

XII. Obferv. 4. The Seed. It provokes Urine, is good againft Dropfies and Gouts -, warms and comforts a cold and moift Stomach, and caufes a good Appetite and Digeftion. And if it is made into a Lohoch with Honey, it is good againft Afthma's, Coughs, Colds,-Wheezing, fhortnefs of Breath and difficulty of Breathing, by cutting the tough, thick, vifcous Flegm or Matter, and caufing an eafy Expectoration. Dofe as much as a large Nutmeg three or four times a day.

XIII. Obferv. 5. The Spirit. It comforts and warms a cold and weak Stomach, chears the Heart, exhilarates the Spirits, abforbs Acidities, eafes Pains and Gripings of the Bowels, expels Wind, prevails againft the Colick, diffipates inward Apoftems, diffolves coagulated Blood, and prevents or helps its Stagnation, and thereby refrefhes wearied Nature, and Strengthens the whole Body. Dofe 20, 30, or 40 drops in a Glafs of Wine or Ale. But this is to be obferved, That it is only to be given to fuch as are of a cold Conftitution, or Habit of Body, for fuch as are hot, it puts all into a Flame, and therefore fuch are to avoid it.

C H A P. CLXX;

Of CRESS Water.

i/1? Names. It is called in Greek, Νάχιουρτιον Aquaticum & v: in Latin, Najurtium Aquaticum and in Ehglifh, Water-Crejjes.

IL The Kinds. There are four feveral forts of this Plant, viz. 1. Najurtium aquaticum vulgare^ which is generally taken to be the Sifymbrium alterum Diofcoridis, and by Cefalpinus and Tabernmontanus, it is called Sifymbrium aquaticum: by Cordus^ Gefner and Thalius, Sifymbrium alterum, by fuchfus and Lugdunenfis^ Sifymbrium Cardamine The Common or Vulgar Water-Crejs. The fecond is called Najurtium aquaticum, rotundifolium Matthioli Sifymbrium aquaticum Matthioli, Sifymbrium alterum Species fecunda Thalii 3 Najurtium aquaticum alterum^ & aquaticum amarum Bauhini ^ The Greater round-leaf'd Water-Crejs. 3. Najurtium Aquaticum rotundifolium minus, Sifymbrium Aquaticum minus Matthioli * The Lesser round-leaf'd Water-Crejs. 4. Najurtium Aquaticum eretum folio hlt giore Bauhini^ Slum vulgare Matthioli, Sium Matthioli, & Sium Italarum Lobelii^ V? Lugdunenfis? Matthioli his Water-Crejs, or the Italian Water-Crejs.

III. The Defcriptions. The Ln which is filled withhothin? butPff** *ro***x white Fibres or Thread gf? kh,hs or ff.7 of *»«wmp»h hnJ? aas-> Pom whence fpring forth many weak boffaw, JapPy Stalks or Bellches trail- ing upon the Water and Earth grows taking hold in J. J. J. J. J. which means it f«real's h Jf much J^ forth hbres at the Joints/ As theSta/kfuf wards, they are filled with long winged Leaves L

againlt another, excepting the Stands by « J^ „ does Leaf which upper

upper iace of the whole Plant is of a brown green color, and the Leaves are green underneath, which, Jays Gerard, is the ferfett mark to know the Phyfical kind from the others. The flowers are many and white, ftanding on long Foot Jla Iks at the tops of the Branches : which being pajs daway, are fucceeded by a like number off mall long Pods, like horns-, which contain within them fmall yellow Seed. The whole Plant abides green in the Winter, and tafies Jharp and biting, Jo me what like to other Creflès.

IV. Thefccnd, or great round-Wd, *h* a Root dm-ifl like'ike former, footing forth many fibres at

the Joints-, from whence rifè one or more Stalks, which are hollow* zveak and Jappy, with a great number of long winged Leaves ^which are made up of fever a' broad-
 fffpy> ^{um}L^{a^}ft rffund Leaves, off a reddiljh brown green color en the top, and green underneath. when it runs up into Stalk, the higher Leaves are longer and ?nore pointed, yet round pointed withal. The flowers grow at the tops, of the Branches, like the former, nor does the Pods and Seed differ much therefrom. Parkinfont fays, that it is Jo extremely bitter, that it cannot be eaten till it is boiled in Water, and fhifted again : I have Jeen it grow feveral times, and have gathered it, but never could find that bitter Tafte in it, but only a very Jharp biting Tafte, like other defies ; Matthiolus Jays, Naiturtio fimile quiddam gufiu prafert.

V. The third, or leflèr round kind, has a white fibrous Root, fro?n whence fpring forth a great number of long winged Leaves, very like to the laft, in their Subftance and Form, being fat, broad and roundifh like them, but very much lejs: from amidji theje Leaves Jpring forth Jeveral long Stalks, when run up to Seed, which are almoji naked, Jave that here and there they have a Jingle winged Leaf, cut into five long flender parts, almoji to the middle Rib. The Stalks at their tops, abound with a great number of little Branches, filled with Jmall fine whitifh Flowers, which in the very tops of all, appear exceeding Jmall and diminutive, Jo cut they are not eajy to be Jeen afunder.

VI. The fourth, or Italian kind, ha* a long Root, which creeps not Jo much a* any of the former, nor is it Jo full of Fibres : the Leaves grow many on a winged Stalk, and differ not much from the fir ft, Javing that the Stalk is crefted, and the Leaves are dented onfnript in a little round the edges, being in fhape between the Garden-Crefs and Cuckow-flowen, the Stalks are crefted, and divided into many Branches : the Flowers are white, which being pafsd away, are fucceeded by Cods, like the Ordinary or Common Water-Cref's, and with like Seed. The Tafte of both Herb and Seed is more mild and pieafant than that of the other Water-CrefTes.

VH. The Places. They all grow for the moft part in fmall ftanding Waters, and fometimes in fmall Rivulets of running Water: but the laft is fometimes found growing in Gardens.

VIII. The Times. They fpring and grow green in March and April. That Water-Crefs which is eaten in Sallets, is beft in March and April: they flourifh all the Summer, and flower in June and July, their Seed ripening in Auguft.

IX. The Qualities. They are hot and dry in the third degree: are Diuretick, Cephâlick, Neurotick, Stomatick, Hyfterick, Nephritick, Alexipharmick and Antifcorbutick.

X. The Specification. They are peculiar againft the ſcurvy in a cold Habit of Body.

XI. The Preparations. You may have, 1. A Sallet. 2. A liquid Juice. 3. An Effence. 4* -An Infufwn. 5. A Lotion. 6. A diftiled Water. 7. A Spirituous Tintfure. 8. An Acid TinSure. 9. An Oily TinSure. 10. A Saline TinSure. 11. A Spirit. 12. A fixed Salt,

The Virtues,

XII. The Sallet. It is made of the green Herb, gathered in March and April, pickt and wafhc clean, and drefſU up with Salt, Vinegar and Oii, or Sugar, and fo eaten raw : it is generally eaten iu the Spring time, to cleanfe and purifie the Blood, fvyecten the Juices of the Body, and cure the Scurvy/

XIII. The liquid Juice, It is more powerful than thar of Brooklime againft the Scurvy in JL CO14

habit of Body, tor it cleafnes the Blood and Humors : it is alfo faid to be good to break the Stone, and to expel it, as alfo Sand, Gravel, and other Tartarous Maiter * it provokes Urine and the Terms, it given in a proper time. If 2 parts of the Juice is mixed with 1 part of the Juice of Oranges, it will be fill more prevalent againft the Scurvy. Dole of the Juice is "from i ounce to 2 or 3, twice or thrice a day, being mixed with any proper Vehicle

XIV. The Effence. It has all the Virtues of the Juice, but much more Stomatick-, it ftrengthenes the Stomack and warms it, creates an Appetite, and catifes a good Digeltion, and very powerfully provokes Urine and the Terms. Taken from 1 to 2 ounces or more, well fweetned with Honey, it opens Obftructions of the Lungs, and takes away Hoarfenefs, Wheezing, difficulty of Breathing, and floirtnefs of Breath. Both the Juice and the Effence, being bathed on, or applied to the Face or other parts of the Skin, it takes away Freckles, Lentils, Pimples, Spots, Sun-burning, Tanning, Yellownefs, and other Deformities thereof.

XV. The Infufwn in Water or Wine, in a fimmering or fcalding heat. It has the Virtues of the Juice and Effence, but not full out fo powerful. It is good to wafh filthy foul Ulcers, Fiftula's, running Sores, Herpes, Scurf, Morphew, C?V. cleaning them, and making them much the more fit to be healed.

XVI. The Lotion. Take of the Juice 3 parts-, of White-wine Vinegar 1 part, mix them. It is an excellent thing againft almoft all Deformities of the Skin, as Freckles, Pimples, Scurff, Leprofy, &c. and it is good alfo to bath the fore part of the Head therewith, Morning and Evening, for fuch as have the Lethargy, or are dull, drowfie, and very fleepy 2 but in this laft cafe, the Patient ought to fuff up the Juice of Water-Creifes every day for fome time 5 both in the Morning, * and at Night alfo, an hour before Bed-time •, becaufe as an Errhine, it purges the Head and Brain of all cold, moift and noxious Humors caufing the Lethargy, and other the like Difeafes of thofe Parts.

XVII. The difilled Water. It has much Spirit and volatile Salt in it, and may be ufed as a Vehicle, to convey any of the other Preparations into the Body.

XVIII. The Spirituous Tinfure. It cures the Scurvy in a cold Conftitution, and is of excellent Ufe to re&ifie the Diftempers of the Stomach : it warms and comforts it, caufes a good Appetite and Digeltion, and prevails againft Gripings, Colicks and Convulfions of the Bowels. It is a fingular thing againft cold and moift Diftempers of the Head, Brain and Nerves ^ and is good againft Dullnefs, Droufinefs, Heavinefs, Sleepinefs, Apoplexy, Falling-ficknefs, Convulfions, Palfies, and the like Difeafes, being bathed outwardly upon the Parts affe&ed, and taken inwardly Morning, Noon and Night from 1 dram to 3 drams, in any proper Vehicle. In Difeafes of the Head, it will be alfo good to fmell to it often, and fometimes to fuff it up the Noftrials, by which it eafes Pains of the Head, and helps againft Vertigo's, and other cold and moift Diftempers of thofe Parts.

XIX. The Acid Tinfure. It is more Stomatick than the former, and a powerful Refifter of the Scurvy, and all its Symptoms. It opens Obftructions of the Vifcera, provokes the Terms, prevails againft the Cachexia and Green-ficknefs in young Women, more epecially if it is given with a proportional quantity of Tinfura Mart is. It removes Lazinefs and Wearinefs of the Body, comforts the weak Bowels, and ftrengthenes the whole univerfal Frame, Dofe fo much as may make the Vehicle

pleafantly fharp ^ and may be taken three or four times a day, according as the Occafion may require. Outwardly applied to the Skin, it is of fingular good Ufe againft Freckles, Lentils, Spots, Sun-burning, Tanning, Yellownefs and Brownnefs of the Skin, Scurff, Morphew, Leprofie, and other like Deformities thereof being gently applied or laid thereupon.

XX. The Oily Tinfure. It is a fingular good thing againft Palfies, Gouts, Lamenefs, Numbnefs, Coldnefs of any Part, Pains and Aches of the fame * as alfo Crimps and Convulfions, being daily taken inwardly Morning, Noon and Night in any proper Vehicle, fropt 20 drops to 60, according to the Occafions and Neceffities for the fame h but it is alfo to be ufed outwardly at the fame time, by anointing it well upon ill the parts affe&ed, twice a day, viz. Morning and Evening. Inwardly taken, it is alfo good againft the Stone, Gravel, Sand, or any Tartarous Matter in the Reins, Ureters and Bladder, opening Obfiru&ions of thofe Parts, and caufing Urine plentifully evacuated.

XXI. The Saline Tinfure. It may be given inwardly againft Obftructions of the Urinary Paffages from 40 to 80 drops, or more, in any Diuretick Vehicle ^ but is ufed chiefly externally againft allforts of Defoedations of the Skin, as Scurf, MorpheW, Leuce, Leprojfy, Tettars, Ring-worms, Pulhes, Boils, Pimples^ arid, other like Difaffettions. It is alfo faid to cure the Itch, being well rubbed in twice a day upon all the Parts affe&ed.

XXII. The Spirit. How this Spirit is to be made fee the Second Edition of our Pharmaccpeia Bateana^ lib. 1. cap. 2. eff. 6j. It has all the Virtues of the Spirituous Tinfure, with this Advantage, that it is a muc^ fine* and purer Medicine to fee to, and a much fteafanter Preparation to be taken. It may be given from 20 drops to 60 in any proper Vehicle, two or three times a day. It prevails againft the Scurvy, Dropfie, Jaundice, Stone and Gut.

XXIII. The fixed Salt. It is admirably Diuretick and Antifcorbutick, and carries off the Morbifick Caule of the Scurvy, Dropfie, Jaundice, Gout, Stone, Struma, Cachexia, Chlorofis, Rickets, Cfr. by Urine, opening all manner of Obftru&ions. Dofe from x Scruple to 2 Scruples-

£ ft A P. CLXXI.

Of CROSS-WO'RT,

X to the Name of the Plant, it has no Greek Name, but is called in Latin, Crucifera, from the fignification of the Leaves. Thailus calls it Crucifera, and it is alfo fcd. Galium Secundum T%J% pnyum is Genhanc, CrucMa5 Bauhinia, &c. & Perula^aw

II. The Kinds. Authors make four kinds thereof, as the, Crucifera vulgaris^ our Common Crosswort, Cruciau minor lutel, Small yellow Crosswort: Owata minor mntanaSm^M6i£ttin Crosswort; W&Crucifera minima muralis, The leaf Wall Cross-wjrt: but as of thefe, Acre is but one, and the other three are not found in England, fo we mall take the Pains only to defcribe it.

III. The Defcription. It bat a Root which is very Jmall and full of Fibres, which taking hold of the hartb, freads with the Branches over^a great deal

Ground, which perishes not in the Winter, tho' the Leaves die away every Year, and spring again afresh. from this Root spring up square hairy broad Stalks, something more than a foot high, having four small, broad and pointed hairy, yet fringed, yellow green leaves, growing at every Joint, each against the other cross-wise, from whence proceeds the Name. Towards the tops of the Stalks, at the Joints with the Leaves, in three or four rows, upwards, stand small, pale, yellow flowers, after which come small, blackish, round Seed four for the most part contained in every Husk,

IV. *The Places.* It grows in many moist Grounds, as well Meadows as other wild and uncultivated places about London: in the Church-yard at Hampstead, near London: at Wye in Kent: at Rand near Ringmore in Suffex along the High-way * and in a Pasture adjoining to the Church-yard at Hampstead by the Mill: also in a Lane or Highway beyond Charlton a small Village near Greenwich, and in several other places.

V. *The Times.* It flowers for the most part from May all the Summer long, in one place or other, as it grows more or less in the Sun * and the Seed ripens soon after.

VI. *The Qualities.* It is temperate in respect of Heat or Cold and dry in the second degree. It is singularly Astringent and admirably Traumatick or Vulnerary.

VII. *The Specification.* It is dedicated to the Cure of green Wounds, Ulcers and Ruptures.

VIII. *The Preparations.* You may have them from, 1. A liquid Juice. 2. An Effence. 3. A Decoction. 4. A Powder. 5. An Ointment or Balsam. 6. A Cataplasme. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture.

The Virtues.

IX. *The liquid Juice.* Taken to 2 or 3 ounces in Red Port Wine, or Wine mixed with Water, it stops inward Bleedings, as also the Bleedings of inward Wounds, and consoletes and heals them: applied also outwardly to green Wounds, it does the same, for by doling the Lips of Wounds quickly together, the Cure soon after succeeds.

X. *The Effence.* It has the Virtues of the Juice, but more powerful for the same Intentions; *Caustarius* says it helps to expectorate Phlegm out of the Thorax, and is good against the Obstructions of the Lungs or Stomach; as also other Obstructions in the Meferick Veins, Laeals, and other Veicera. Dose 2 or 9 ounces in Wine, &c.

XI. *The Decoction.* It has the same Virtues with the Juice and Effence, but not full of effect: nevertheless, (the Decoction being made in Wine, or in Water with Wine added to it) it is often given as a Wound-drink, in which way of Exhibition it is very efficacious: and mixed with Spirit of Wine, it is good to cleanse old running Sores, and putrid Ulcers, cleansing the lame, and inducing them to a speedy healing. It cures also Ruptures.

XII. *The Powder.* It is made of the dry'd Leaves. Taken to a dram Morning and Evening, it is good to stop any inward Bleeding, spitting of Blood, pissing of Blood, or Bloody-flux: the lame it does also being applied to any bleeding Wound. It also dries up Moisture in ulcers, and stops the Flux of any running Sore, being applied after washing the same with the Juice, Effence or Decoction of the same Plant before specified.

XIII. *The Ointment or Balsam.* They cleanse, and are admirably drying and healing, give Ease where the Pain is extravagant, allay the Inflammation, breed Fleth where it is wanting, dry up the Moisture, and produce the Cicatrice in a Very short time.

XIV. *The Cataplasme.* Made of the green Herb with the Powder of the dried Herb, and applied, it stops the Bleeding in Wounds, prevents the Afflux of Humors, and so by consequence Pain and Inflammation. Applied to simple Contusions, it dissolves them, and quickly restores the Part to its former State of Health.

XV. *The Spirituous Tincture.* It heals inward Wounds, and stops inward Bleedings, restores the Tone of the Bowels being hurt, is good against Ruptures, Bloody-fluxes, Diarrhea, Lienteria, and the Hepatick-flux, and has indeed all the Virtues of the Juice and Effence. Dose 1 or 2 ounces in Wine, or any other fit Vehicle.

XVI. *The Acid Tincture.* It is good to expectorate tough and viscid Humors, opens Obstructions of the Viscera, strengthens the Stomach, and helps a decayed Appetite: it may be taken inwardly in Wine to a grateful Acidity every day, two, three or four times a day: if mix'd with Water for a Gratefulness, and a little dulcified with Syrup of Clove-gilliflowers, it abates the Heat of Fevers, allays Inflammations of the Lungs, quenches Thirst, and represses Vapors, being taken as ordinary Drink.

XVII. *The Oily Tincture.* It is eminently good against Punctures of the Nerves, heals nervous Wounds, gives ease in the Gout tho' never it extreme, and in a short time cures it: it strengthens the Joints, and is singularly good against Convulsions and Palfies, being duly anointed upon the Parts affected.

CHAP. CLXXII

Of CROWFOOT Meadow.

THE Names. It is called in Greek, *Βιολιαν*, (*Yrog-wort*:) in Latin, *Ranunculus*, also *Pes Corvi*, and *Pes Caduini*: in English, *Crow-foot*, *King Cob*, *Gold Cups*, and *Butter-flowers*.

ii. i be h indt. Authors are in a Wood about this Plant, and make fo many general kinds thereof, that it is difficult to reduce each Species to its proper *Qiilfis*. However, since we intend only to treat of them which grow in England, (fetting aside the *Ranunculi Montani*, which were never known * to grow with us in our Country) and that we may be intelligent to the Vulgar, we shall divide them into the five following *Gaffes*, viz. 1. *B*T&%QV Miuavior*, *Ranunculus Pratenfis*,* Meadow Crowfoot, of which in this Chapter, i. *^AT^OVT&JIVQV*, *Ranunculus Agrestis*, Field, or Fallow-held Crowfoot, of which in Chap. 173. 3. *R&T&WV tvjiff&t^* *Ranunculus JVV-moralis*, of which in Chap. 174. 4. *W&?f0? W*&r*, *Ranunculus Aquaticus*, Water Crowfoot, of which in Chap. 175. 5. *B^r^ov Sy.i^*, *Ranunculus Hortensis*, Garden Crowfoot, of which in Chap. 176. following,

III. Of *Meadow Crozyfoot* we have growing with us five severall kinds, 1. *Ranunculus Pratenfis communis*, The Common Meadow Crowfoot. 2. *Ranunculus pratenfis dulcis*, *simplex* and *multiplex*, Meadow Crowfoot fweet, (or not biting) fingle and double fiowred. 3. *Ranunculus pratenfis repens*, Common creeping Meadow Crowfoot. 4. *Ranunculus Bulbojus five Tubcrofus*, Knobbed or Tuberous Crowfoot. 5. *Ranunculus Globofus*, Globe Crowfoot.

* IV. The Descriptions. Common Meadow Crow-foot (vohofe Branches or Stalks ft and upright, and bend not down again unto the Ground, neither creep thereon, ofppuac, taking root again in divers places^ as the third kind following does) has a white Root, which is almost wholly fibrous ; from whence fpring up many large dark green Leaves, cut into divers parts, Jomevohat refembling the fpreading of a Crows Foot, having a very Jharp, hot and burning Tafte, very much biting we Tongue, and bliftering the Skin, if laid thereon, not much lefs than any other hot Corroding and Exulcerating Herb can do; which Leaves have now and then fome blackijh Spots upon them, but thefe Spots happen not in all, nor in all places.

Among thefe Leaves rife up fmall twiggy Stalks, which ftand upright, a foot high, or higher, fome-times (according to the goodnefs of the Ground) a foot and half high, at the tops of the Stalks and Branches come forth many fine yellow Flowers, gli* tering of a Golden color, having five heaves apiece \ the middlepart of which Flowers are filled with many fmall Threads of like color; which being pafte, the Seed follows, contained in a rough Ball or Husk. Of this kind there is alfo one with double Flowers.

V. Thefeconi^ or fweet kind, has a Rootconfijl* ing of many white F'jbres^ as the former, from whence rifes up feveral great, broad, dark, green Leaves, fpread upon the Ground, a little hairy, cut in on the edges into five X>ivifions, and a little dented alfo about, efppecially at the ends, and of a paleryellowijh green on the under fide, of a fweet and notupleafant Tafte I for I call it Sweet Crowfoot, not becaufe it fmells fweet, but becaufe it has no Jharp, biting* or exulcerating Tafte, as moft of the other Crowfoots have, being fo fweet, foft and pieafant, that the People in many places doftewthe Leaves, when they are young ^{TMCS?TM*} to eat them after the

yg f blf sllt l manner of a boiled Sallet. rfm j L rife up feveral hairy Stalks, a foot. orfootandtlf high, withforne Leaves upon them more divided and cut into/mailer and narrower parts than thefewtneh are lower. At the tops of thefe Stalks and Branches hand many fair Golden yellow colored Flowers with yellow Threads in their middle. Of this kind there is alfo one with double Flowers.

VI. The third, or creeping kind, has a whit? and thready Root from whence fpring forth feveral Leaves, vJbich are divided into many parts, commonly into three, Jometimes into five, cut here and there jnthe edges as if they were fnipt, of a deep green color; ^{p^m} which are found divers white Spots. From among thefe Le^s fpring up the Stalks, which arc round

rounds and something hairy: some of them bend down towards the Ground, trailing as it were, and put forth many Roots at the Joints, which are small white Fibres, by which it takes hold of the Ground, and so encreases or spreads itself far about. Some of the principal Stalks sit and upright, a foot high or higher, and sometimes they seem to be rather leaning than upright: at the tops of these Stalks and their Branches come forth the Flowers, consisting of five Leaves apiece, and of a glorious Gold yellow color and a Golden-colored Tbrumb in the middle, which being past, yield knobby rough Heads of Seed, very like to the first* The sharp Tajie of the leaves and flowers are also like to the same. Of thk kind there is also one with double Flowers, which is nursd up in Gardens.

VII. The fourth, or tuberous kind, has a Root white and round, of the bigness sometimes of a Wall-nut, and sometimes much less, not much bigger than a Bean or large Filbert, with some long Fibres, especially at the end of it, which is of a more sharp and biting Tajie than any of the former: from this Root spring up divers heaves, much more cut in and divided than any of the former, every one of them standing on a short Foot-stalk, of an over-worn green color: among which rise up several slender Stalks, a foot or foot and half high, with some Leaves thereon at the Joints, more divided, and into longer and narrower parts than those below, at the tops of the Stalks and Branches come forth fair shining Gold-colored Flowers, consisting of five Leaves apiece, like the former kinds, with many Threads in the middle, standing about a green Head; which after the Flowers are past grows to be more rough or prickly than the feedy Heads of any of the foregoing. Of this kind is that thought to be which bears double yellow Flowers one out of another, called Anglicus bulbosus or tuberosus. Also another, whose Flower is single, and red, like an Orange.

VIII. The fifth, or Globe kind, (called in the Northern Countries of England, where it grows, JLocker Goulous) has a Root composed of many blackish Fibre* or Strings, from whence rise many Jair, I

broad, dark green Leaves next the Ground, rising upon long Foot-stalks, which Leaves are deeply cut or jagged into five, six or seven Divisions, which rises up a Sialk, divided towards the top into some Branches: on the Stalk are set such-like Leaves as are below, but smaller. On the tops of the Stalk and Branches grow several large fair yellow Flowers, consisting of five Leaves apiece, or rather of eleven Leaves for the most part, set or placed in three rows, and always folded inwards, or rounded up together like a round Ball or Globe, like a clove Flower never blowing, (from whence came the Name?) they have many yellow Threads in the middle, standing round about a green rough Head, which in time grows to be full of small Knobs wherein is contained small black Seed.

IX. The Places. They all grow in Fields and Meadows, or Pasture-Grounds, thro' all England, especially the four first kinds. The fifth kind grows wild in most places of Lancashire and Yorkshire, and other bordering Shires in the Northern parts of this Kingdom, almost in every Meadow but has not been yet found wild in any of the Southern or Western parts of England.

X. The Times. They flower in May and June, and the Seed is ripe in July and August.

XL The Qualities, Specification, Preparations, Uses and Ufes, see in Chap. 176. following, where they will be handled at large.

CHAP. CLXXIII.

O/CROWFOOT Field.

THE Names* It is called in Greek, *ἰσχυρὸν* X. *iyvlfymv \$ n' *ty**; *V??*. *ἰσχυρὸν ἄρβυτον* arbits, vel arvorum; and in English, Field or Fallow* Field Crowfoot.

II. *The Kinds.* It is a fingular Plant, and is called by *Lobe I* in his *Icones*, *Ranunculus arvorum* and fe the fame with *Ranunculus arvensis Gefnert*, *Ranunculus arvensis echinatus Bauhini*, *Ranunculus fegetalis Cordi*; *Ranunculus Sylveliris tertius Dodo* nxi iff *Lobelii* in *Obfervationibus*, *Fallow-field Crowfoot*.

III. *The Defcription.* It has a *small white fibrous Root*, from whence *spring forth fome deeply jagged Leaves upon long Foot-ftalks*, but *fmaller than any of the former*, and *divided into many narrower parts*, of an *over-worn green color*; they are *fat and thick*, much *jagged*, and *some thing refembling* (*fays Gerard*) *the Leaves of Sampire*, but *not near fo green*, from among *theft Leaves rifes up a Stalk about a foot or more high*, which *towards the top is divided into other Branches* -, *the Leaves on the higher part of the Stalk are more jagged or divided than thojc which are lower*. *The Flowers grow at the tops of the Branches*, which are *confifting of five fmall Leaves*, of a *pale or faint yellow color*, *vobich being pdfid away*, there come *Clufters of rough and fharp-pointed Seed*, fet as it were in *Heads*, many together.

IV. *The Places.* It is found chiefly in *Ploughed Lands and Fallow Fields* in many parts of *England*; the *Latins* called it *Ranunculus arvorum*, becaufe it is commonly found in *Fallow Fields*, where *Corn has lately been fown*, and fo may be called *Corn Crowfoot*.

V* *The Times.* It flowers in *May and June*; the *Seed ripening in the mean while in Auguji and September*.

VI. *The Qualities, Specification, Preparations and Virtues* thereof are the fame with the *Common Meadow Crowfoot*, which may be found at large in *Chap. 176.* following.

G H A P. CLXXIV.

Of CROWFOOT Wood.

I.**Tr HE Names.* It is called in *Greek*, **reExw JL* 'iv<hvfv' in *Latin*, *Ranunculus Nemoralis* ^ and in *Englilh*, *Wood Crowfoot*.

II. *The Kinds.* There are, 1. *Ranunculus nemorofus albus fimplex* ^ *Ranunculus Phragmitis Gefnert*, *Ranunculus Sylveftris Tragi*, *White fingle-flowered Wood (Crowfoot)*, 2. *Ranunculus nemorofus alb us minor*, *Ranunculus nemorofus Anemones flore minor Bauhini*, *The leaft or leffer white Wood Crowfoot*. 3. *Ranunculus nemorofus flore Cameo*, (*fflore purpui-eo*, *The fingle blufh and purple Wood Crowfoot*. 4. *Ranunculus nemorofus luteus*, *The yellow Wood Crowfoot*. 5. *Ranunculus nemorofus dulcis*, *Ranunculus fylveftris fecundus Tragi*, *Ranunculus Auricomus Lobelii*, *Sweet Wood Crowfoot*. 6. *Ranunculus montanus albus minor fimplex*, *Ranunculus Alpinus albus*, *The leffer fingle white Mountain Crowfoot*. 7. *Ranunculus Virginenfis vel Virginianus albus*, *White Virginian Crowfoot*.

III *The Defcriptions.* *The firli, or White fingle-flowered, has a Root commonly of the bignefs of a Wheat Stratio*, not growing right down, but *creeping at length*, under the upper *Cruji of the Earth*, *fpreading into feveral fmall Knobs*, like *Branches or Arms*, of a *dark brown color on the out fide*, and *white within of a fharp biting Tafte*, inflaming the *Mouth*. From *ihh Root rife up two or three Stalks*, about an *Hand*

breadth high or more, about the middle whereof come forth ufually *three Stalks of Leave**, each being *fomething broad, hard*, and *cut in on the edges into three parts*, of a *fad green color*, and *dented alfo*: the *Stalk rifes up two or more inches high*, bearing at the top one *fingle Flower*, hanging down the *Head for the moft part*, *confifting of five Leaves*, *fomewhat broad*, and *almost round-pointed*, of a *light blewifh color on the out fide*, before it is *blown open*, but with *few white Threads in the middle*, *the infide being yellow*, *ft ending about a green Head*-, which growing ripe in *length of time*, is *fomething like the other Heads of Crowfee*, *compofed of many fmall Seeds compacted together*.

IV. *The fecond, or leaft, or leffer White kind hat a Root fmall and long*, and *creeping under the upper Cruji of the Earth*, like the former, and it has *Kh-hke heaves at the other fingle White kind*, *divided into three parts*, and *each of them into others again*, *ftanding upon little long Foot-ftalks*, but they are *much leffer*, fo that the *vnhole Leaf hereof is not much bigger than one of the Divifions* § *Farts of the other*: the *Stalk* i* *very fmi*; with *few Leava thereon*, *divided in two places more than the lower*, *Uttemore than twoinfes high* : at the top grows a *white Flower* *confifting of* x *white* L^u J^h *afew yellowifh Threads in the middle*, which being *pafsdaway*, leaves a *round Head compofed of many fmall Seeds*, not much unlike the former.

V. *The third, or fingle blufli-colored Wood Crow-foot*, v in its *Roots, Stalks, Leaves, Flowers, Heads, Seeds, and Form of Growing* like unto the former -, fo that until it is in *flower* * there can *fearcely any difference be difcerned* : but when the *Flower appears*, it *hews it felf much more reddijh on the out fide*, and of a *fair pale purple or blufh color on the infide*, which makes it a *diftinli Species of it felf*, differing from the reft. But *fometimes different Varieties are found of this kind* having it s *Stalk fome- thiqq.*

thing browner, and its Flower of a pale purplish blew color, (from whence it is called *Ranunculus nemorosus flore purpureo cceruleo*) like unto a pale Violet flower, without any great Smell. These three aforegoing kinds the Italians call Wild Ginger, either because the Roots of them all are very sharp, hot and biting the Tongue, like Ginger, or because their Roots do grow a little spreading into several Arms or Tuberosities, like to Ginger.

VI. The fourth, or yellow kind, has Roots very like to the first described in this Chap, from whence spring forth such-like Stalks of heaves, and growing in the same manner, but the Leaves are not so broad, nor so hard in handling, and are more deeply cut into more long and narrower parts, each also dented about the edges, especially about the ends of the Leaves, which are of a darker green color. From between these Stalks of Leaves shoot forth sometimes but one, and sometimes two or three Stalks, at the top of each of which grows one Flower, something smaller than the former, consisting generally of six or seven, and sometimes of eight Leaves, which are of a fair pale yellow color, with many small Threads in the middle, which being parted away, there succeed like Heads of Seed, as in the others. These Flowers have the least Smell of them all. And unto this kind belongs that sort of Anemone (but rather Crowfoot) which Dodonaeus calls *Trifolia*, having the Leaves parted into three, snipt about the edges, and which bears a whitish flower.

VII. The fifth or Auricomus of Lobel, which is the sweet Wood kind, has a Root composed of many white Strings or Fibres, like unto some others, but

is

leaf; but those which spring up next after them, are divided and so also those which grow after up-

on the stalk are still more divided than the former. The Flowers are small, and of a fair shining Gold-yellow color, standing at the tops of the Stalks, like unto the Common kinds of Crowfoot. After the Flowers are parted away, come the rough Heads, like a small Strawberry, in like manner as other Crowfeet have, in which Heads are contained the Seed, many set together.

VIII. The ninth, or lesser single white Mountain Crowfoot, has Roots greater than any of the kindred Crowfeet; from which Root spring forth fair, large, well-spread Leaves, (Handing upon a long Foot-stalk) which are cut into five Divisions, and somewhat dented about the edges, green on the upper side, and paler underneath, having many Veins running thro' the Leaves: these Leaves are like those of the Common Crowfoot, but greater, of a deep green color, much like to those of the yellow Aconite, called *Aconitum luteum Ponticum*: it has great fat Stalks, about two feet or more high, spread into many branches; at the tops of which come forth white Flowers, consisting of five Leaves apiece, with small yellow Chives in the middle, melting like the Flowers of May or Haw-Thorn, but more pleasant; after which comes the Seed, which is contained in Heads, like to the other Crowfeet.

IX. The tenth, or Virginian Crowfoot, has a reddish, thick, tuberous Root, with some small Fibres springing from it: from which shoot forth three or four somewhat large, broad, whitish-green Leaves upon long Foot-stalks, rent or torn on the edges for the most part among which rises up a slender, round, naked Stalk, five, six or more inches high, bearing one white Flower at the top, made of ten or twelve small, narrow and pointed Leaves, with a few yellowish Threads in the middle, set about a greenish Head, which in time grows to be a long slender Pod, in which is contained round whitish Seed.

X. The Places. They are almost all found growing in Woods, Groves and Orchards in most places of this Land. The fourth is found as well by Brook-sides, which pass by Meadows, as in Woods, and by Hedge-sides. The sixth, is called *Ranunculus Alpinus*, because that those which first found it, met with it upon the Alpine Mountains; however, since it has been found to grow plentifully Wild in England, especially in Hampstead Wood, from whence it has been transplanted into Gardens. The tenth bears in its Name the place of its Growth, but it has been found in many other parts of Florida.

XI. The Times. They flower pretty early in the Springy sometimes in March, but for the most part in April, and sometimes in May, and the Seed is ripe in June, July and August.

XII. The Qualities, Specification, Preparations, Virtues and Uses, see in Chap. 176. these being of the same Nature with those others, where you may have them at large.

CHAP. CLXXV.

Of CROWFOOT Water.

THE Names. It is called in Greek, ἄροπον "ivuf&v: in Latin, *Ranunculus aquaticus* -, and in English, Water Crowfoot.

II. The Kinds. Authors make several kinds of Water Crowfoot; as, 1. Water Spear-wort. 2. Water Ivy. 3. Water Star-wort, none of which we can admit into this Kindred -, for tho' they be herbes like the

the u object, yet they have nothing of the Form, and we think that something more than the Taste ought to conclude the several Species, otherwise *Gm^{cr}* may as well be admitted into the same Stock, which I am sure no Herbarist will ever grant: for this Reason we refer you for the three afore-named kinds of Plants to their proper places, which you will find in some of the following Chapters of this

III! The Water-Crowfeet then, which we shall treat of in this Chapter, are four § i. *Ranunculus aquaticus vulgaris major*-, *Ranunculus aquaticus Hepatic # facie Lobe Hi*; *Ranunculus aquatilis Dodonai hepatic a aquatica Lugdunensis*; *hepatica palujiris Tbalii*; *Ranunculus aquaticus folio rotundo & capillacco Baubini*; The Common greater Water-Crowfoot. 2. *Ranunculus aquaticus Communis minor* § *Ranunculus Hederu folio aquaticus* -, The lesser Water-Crowfoot. 3. *Ranunculus palujiris Sardonus Uvis*; *Strumea*, & *Apia firum Plinii*; by some *Apium Rifus* -, *HerbaSardoaGuilandini*, (who says, when he was taken Prisoner by Pyrates, and carried into Sardinia, he saw this Herb growing plentifully there:) *Apium aquaticum Tragi*; *Apiajirum Cordi*; *Scelerata Apicleu* -, *Ranunculus palujiris Cordi* in *Hifloria Lugdunensis, Tbalii, &c.* *Ranunculus palujiris Apii folio Uvis Bctubini* *, *Ranunculus palujiris rotundwre folio Lobe In* h, Smooth-leav'd Marth-Crowfoot. 4. *Ranunculus palujiris Sardonus languinofus* *, *Ranunculus Sardonus verus Diofcoridis*; *Ranunculus Sardonus Anguilar* *- , *Apium Syhe fire*; *Ranunculus palujiris Apii folio languinofus Baubini*; *Ranunculus palujiris secundus Matthwli*, iff *Cordi* in *Hijoria* ^ The true Sardinian Marth-Crowfoot,

IV. The Descriptions. The first, or Common Water-Crowfoot, has a small fibrous or thready Root, from whence comes forth a long trailing tender Stalk with several Joints therein, at every one of which, that are under Water, come forth fine jagged or feathred Leaves almost like fibres but that they are

green but towards the tops of the Branches growing above the Water, there be none of those fine Leaves, at the Joints, or very few of them, but only round Leaves, growing upon short stalks, cut in a tie, and dented about the edges: and with them come forth likewise small Milk-white lowers; consisting of five Leaves apiece, with some Tellowness in the middle, after which come small, rough, round Heads of Seed, almost like to those of the Land-Crowfoot,

V. The second, or Small Water-Crowfoot, with Alehoof or Ground-Ivy Leaves, has a great number of fibrous Roots, from whence come many long, slender, trailing Branches or Stalks, shooting forth at almost all the Joints under Water many other fibrous Roots, by which it spreads and very much encreases itself. From the several Joints, as well under as above the Water, spring forth several small, roundish, indented Leaves, not much unlike to those of Alehoof, (landing each upon a pretty long knot-joint from some of the Joints with the Leaves, and at the tops of the Stalks, come forth pale flowers, having five pointed Leaves apiece; which being past away, leave roundish Heads of Seed after them.

VI. The third, or Smooth-leav'd Marth-Crowfoot, has for a Root a Bush of small white fibres -, from whence shoot forth several Leaves upon long Foot-joints, rounder than those growing higher upon the Stalk, and not so deep cut in, but dented about the edges: from among these Leaves shoot forth a round hollow Stalk, near a foot and half high, spreading itself forth into several Branches, the lower Leaves whereof are more round than those above, and are divided some into three parts, which are the first and lowest others into five Divisions, and each of them dented about the edges, somewhat like unto Coriander Leaves smooth and of a pale green color, but those up higher on the Stalk and branches are full more and more divided, so that some of the highest have no Division or Dent in them. At the tops of them are small yellow flowers, (but Cordus, who has observed some to bear purple;) which being past away there come in their places small, long, round heads, of many crooked Seeds set together, as in some other sorts is to be seen: the whole Plant is as hot, sharp, biting, and as exulcerating as any of the other kinds, whether of the Land or Water.

VII. The fourth, or True Sardinian Marth-Crowfoot, has a Root consisting of a Bunch of white Strings, from & which spring forth several large winged Leaves, upon short stalks of a moderate length, divided into several parts and dented about the edges: from among which spring up one or more Stalks, spreading themselves out into divers Branches, on which grow Leaves some winged, and some single

Leaves

Leaves not winged, more divided than the former kind, and fo hairy withal, at if there wa* a jmal: foft Cotton upon them : at the tops of the Branches and Stalks come forth the Buds of flowery confifting of five broad-pointed heaves apiece, each Leaf bent on its end hollowed in a little ; which being pafs'd away, there fucceed Heads of Seed, much like to the former.

VIII. *The Places.* Thefe all grow in moift, wet and morifh Grounds, and fometimes by the fides of Waters, Ponds and Ditches, and in plafhy places. The firft is common in many places of this Kingdom : the fecond is more rare to be met with: the third and fourth are often found here, but not altogether fo frequent to be feen as the firft.

IX. *The Times.* They all flower in May and June here, and their Seed is ripe fome time after.

X. *The Qualities, Specification, Preparations, Virtues and Ufes,* fee in the following Chapter, thefe being of the fame Nature and Temperature with the former and thofe following.

CHAP. CLXXVI

Of CROWFOOT Garden.

L'T^V *HE Names.* It is called in Greeks $\kappa\alpha\lambda\alpha\mu\alpha$ Kimviiv \$ wow?, \$ % { ** & * * * n Latin, *Ranunculus Sat'vus. vel hortenfis'*: in Englijh, *Garden or Manured Crewfoot.*

II. *The Kinds.* Of the *Ranunculi* which Florifhs now fill their Gardens withal, there is fuch a great number of them, that it would not be eafie to name them all, much lefs to defcribe them a great part of them being originally Exoticks or Foreigners, but being brought to us, and profpering well by a Cultivating in our Gardens, they were made free Denizons, (as it were) and fo at length became Natives of our Soil. The chief of thofe which we fhall take notice of in this Work, are the eighteen following.

III. 1. *Ranunculus montanus alb us major,* Great fingle white Mountain Crowfoot. 2. *Ranunculus montanus albus humilior duplici flore,* The low double white Mountain Crowfoot. 3. *Ranunculus aU bus flore pleno,* The double white Crowfoot. 4. *Ranunculum pratensis flore multiplier,* The double yellow Field Crowfoot. 5. *Ranunculus Anglic m maximus multiplex,* Garden double yellow Crowfoot, called alfo Batchelors-buttons. 6. *Ranunculus Gramineus duplici flore,* Double-flowred Grafs-like Crowfoot. 7. *Ranunculus Creticus Latifolius,* Broad-leav'd Candy Crowfoot. 8. *Ranunculus Creticus albus,* The white Candy Crowfoot. 9. *Ranunculus Afiaticus flore Rubro,* Single red Afian Crowfoot. 10. *Ranunculus Afiaticus flore Amplo rubro,* The large fingle red Afian Crowfoot. 11. *Ranunculus Afiaticus flore rubro vario fimplici,* The fingle red tript Afian Crowfoot. 12. *Ranunculus Afiaticus flore luteo vario fimplici,* The fingle yellow tript Afian Crowfoot. 13. *Ranunculus Afiaticus flore rubro pleno,* The double red Afian Crowfoot. 14. *Ranunculus Afiaticus flore pleno prolifero,* The double-buttoned red Afian Crowfoot. 15. *Ranunculus ThaliBri folio major,* The greater Columbine-leav'd Crowfoot, if *Ranunculus Tbalitfri folio minor Aphodeli radice,* Small, Columbine-leav'd Crowfoot. 17. *Ranunculus Illyncus,* Illyrian Crowfoot. 18. *Ranunculus folio Plant agin**,* The Plantain-leav'd Crowfoot.

IV. *The Ddcriptions.* *The jirji, or Great fingle white Mountain Crowfoot, ha* a Root con fj Ring of many long, thick, ixfoitfh Strings, running out jru/ri a thick head, trom this Root j[ring forth large ani green Leaves, divided into three parts, and Jome-times into five fpecial Divijions, and befides each of thofe parts arc dent el about the edges, femewhat.re- fembling the heaves of Globe Crowfoot, but larger. The Stalk k two feet and half high, having three f ?iall Leaves, Jet at the Joint of the Stalk, where it branches out into Flowers, which ft and. four or five together upon long Fed-ft a lks, 711 ade of five zwhite Leaves apiece, very fwet in Smell, with fome yellow Threads in the middle, encompassing a green Head, which, with the Seed, is very like to other Crowfeet of the Wild kind. There k one of thk kind which is alfo lejfer.*

V. *The fecond, or Low double white Mountain Crowfoot, has a Root compofed of many white Strings, from whence proceed three or four broad, thick Leaves, almojl round, and pretty deeply cut in on the edges, of a fine green and fhining color on the upper fide, but not fogre en underneath; among which rifes up afnall floort Stalk, bearing one Snow-white Flozver en the top, pretty large, a7id a little double a* it ivere7 with two rows of Leaves, with divers yellow Threads in the 777iddle, fianding about a green head, which in t'une grows to be like to a fmall green Strawberry, and full of Seed. There k alfo a fingle fort of this kind, having only one white flower on the top of each Branchy which is lejfer, and confijh only of five round-pointed Leaves, being in all things elfe like the other.*

VI. *The third, or Double white Crowfoot, is of the fame kind with the firft, but lejfer \$ its Roots, Stalks and Leaves being alike in all refpefls • tb\$ chief Difference is in the flowers, which in this Plant are very thick and double. The Leaves are fair, cut into five Divijions, and a little dented about the dges, green on the upper fide, and pale under* neath, having many Veins running thro" the Leaves: the Stalk grows not very high, not much above ajoot and half in height, which isfpread into many Branches^ whofe tops are reasonably (lored with double white blowers, as aforefaid.*

VII. *The fourth, or Double yellow Field Crowfoot, has a Root running and creeping under the Ground, like as the fingle does ^ fro7n zvhence proceeds its Leaves and Stalks, in which there is but little difference from the fingle Wild kind, which grow in every Meadow, being large, and divided into four or five parts, and indented* about the edges, but they are fomething f7valler, and of a brisker green. The Flowers ft and on the many Branches, much divided or feperated, being not very great, but very thick, and double.*

VIII. *The fifth, or Great Englijh Garden double yellow Crowfoot, ^///^Batchelors-buttons; has a Root round, like unto a fmall white Turnep, with feveral Fibres adjoining to it : from which arife 7nany great black, green Leaves, jagged and cut into three Divifions^ each to the 7middle Rib; from a7nong thefe Lewes fpring up the Stalks, which fpread themfelves out into feveral Branches, and tffbich have fome f7naller Leaves on them ; and thofe zybich are next under the Branches, are long and narrow, the higher up, the longer and narrower. The Mowers are of a greenijh yellow color, very thick anl double of Leaves •, in the middle of which rifes up a fnall Stalk, bearing another double Flower, like to the 0-ther opt of which it grows, but j mailer •, which being pafs'd away, tl?ere comes a roundijh rough Head of Seed, much like to the other Crowfeet.*

IX. *The fixth, or Double-flowred Grafs-like Crowfoot, has a Root compofed of many thick, long**

roun.l, white Strings, from whence proceed long and narrow Leaves, fomewhat like unto Grafs, or rather like to the heaves of Jingle Gilliflowers or Pinks, being fmall and Jharp-pointed, a little hollow^ and of a whitijh green color. Prom among thefe heaves fprng upjveral Jtender Stalks, bearing at the tops each one j mall yellow Plover, which is double, as confining of two rows of heaves, with/one Threads in the middle. There is alfo a Jingle fort of this Species, the Plover being fmall, and confifting of five yellow heaves, with yellow Threads in the middle, like to other Crowfeet.

X. The feve nth, or Broad-lea y'd Candy Crowfoot, has a Root fomewhat like thofe of the Afian Crowfoot, or compofed of a number of tough Roots, like thofe of the yellow Afphodil: it has the great eft and broadaji heaves of all the forts of Crowfeet, being almoft round, and without any great Divijions, dented a little about the edges here and there, as large or larger fometimes than the Palm of ones Hand_h of a light green color, yet fome of the heaves are here and there deeply divided. Among thefe heaves rifes up a Stalk, not very high when it does firft flower_h but ajterwards as the blowers do open themfelves, it grows to.be about a foot and half high, having fome heaves on it deeply cut in and divided. The Stalk is alfo thick, round and ft iff, and fhoots it fe If forth into two or three Branches, at the Jetting on of which $\frac{1}{2}$ o w r $\frac{1}{2}$ giJh Uaves $\frac{1}{2}$ a little dented about their e $\frac{1}{2}$ s. $\frac{1}{2}$ je Branches bear many fair yellow Plovers^ conjijting of fi_{ve} round-pointed heaves apiece, (landing l each a little diftance from other, fo that the^n points of the Cups fhew themfelves between them, $\frac{1}{2}$ Cot $\frac{1}{2}$ mgy m Threads_m the $\frac{1}{2}$ iddl $\frac{1}{2}$ but become Jomewhat whitijh when the Plover has flood blown a little time.

XL The eighth, or White Candy Crowfoot, has a Root confining of many fmall Grains or Kernels, $\frac{1}{2}$ a dark or dusky grcyijh color, fet together, and $\frac{1}{2}$ r. Le $\frac{1}{2}$ m $\frac{1}{2}$ s are very like to the heaves of the Red Allan Crowfoot, $\frac{1}{2}$ b $\frac{1}{2}$ f $\frac{1}{2}$ h $\frac{1}{2}$ u $\frac{1}{2}$ b $\frac{1}{2}$ d $\frac{1}{2}$ d $\frac{1}{2}$ e $\frac{1}{2}$ b $\frac{1}{2}$ e $\frac{1}{2}$ d $\frac{1}{2}$ i $\frac{1}{2}$ y $\frac{1}{2}$ making thereby as it were three Divijions, of pale green color, with many white Spots in them. $\frac{1}{2}$ be Stdk rizes up a foot high, with fome heaves on it, which are more divided than the lower, and divided at the top into two, and fometimes into three Branches, each of them bearing a fair Snow-white Vowcr, fomethin'g large, included at firft in a brown-Jh tvsk or Cup of heaves, which afterwards ft and under the Plovers, confift'ng of five white large, round-pointed heaves, having in their middle many blackijh purple Thrumbs, encompassing a fmall, lmg green Head, compofed of many Scales, or chaffie whit^{*ijh} Husks when they are ripe. They yield Seed. $\frac{1}{2}$ t it is unprofitable, as yielding no new Plants. Some of this kind have their Plowers purple-edged: fome again have their plowers with Veins of the fame purple_h and fome of them are edged with a bright red color, not differing in any other particular.

XII. The ninth, or Single red Afian Crowfoot, has a Root made of many Grains or fmall Kernels fet together, and clofing at the Head, but fpreading it $\frac{1}{2}$ f $\frac{1}{2}$ > > if it likes the Ground, under the upper Cruft $\frac{1}{2}$ i the Earth into many Roots, encreafing from long Strings $\frac{1}{2}$ hich run from the middle of the fmall Head of Grains, as well as from the head it felf The lower heaves are always whole, without Divifwms being only fomewhat deeply indented about the edges, but the others which rize after them, are more cut in Jomctrms into three, and fometimes into five Divifions, and notched alfo about the edges. The Stalk rizes higher than any of the former, and has on it two or three Jmaller heaves, more cut in and divided than thofe below_h at the top whereof ft ands one

large Plover, conjiftrng of five Leaves, every one of them being narrower at the bottom than at the top, and not ftanding round and clofe one to another, but with a certain diftance between, of a d/Asky yeli: wifb red color on the out fide, and of a deep red o?i the infide, the middle being fet with many Thrumbs of d dark purple color. The Head for Seed is long, and fcaly or chaffy, and not profitable Jor Jowing, as not Jpringing again.

XIII. The tenth, or Large fingle red Afian Crowfoot^ has a Root much like the former, its Leaves are broader and greater. The Stalk is much of the fame height as the other, and branched out, with like Leaves thereupon: the Plover is alfo larger* and the Leaves thereof broader, being fometimes eight in a Plover, ftanding round and clofe one to another, of a deep red color, which makes it look the fairer^ and have the more excellent J)ew: in all other re* fpetts, it is like the Lift.

XIV. The eleventh, or Single red ftript Afian Crowfoot, has a Root, Stalk and Leaf very like to the two laft aforegoing, and in the manner of growing, differing chiefly in the Plover, which being red, like the two bejoregoing, has yet fome yellow Stripes or Veins thro* every Leaf: thefe Stripes are fometimes but few and little, and fome times fo much that it feems to be party colored red and yellow. It is a very tender Plant, and apt to penjh, unlefs carefully lookt ajter...

XV. The twelfth, or Single yellow ftript Afian Crowfoot, has a Root not much unlike to any of the three laft defcribed, but the Leaves are very diprent, being very much divided. The Plover is large, of a fine palijh green yellow color, confifting of fix and feven, and fometimes of eight or nine round Leaves $\frac{1}{2}$ the tops of which have reddijh Spots upon them, and the edges alfo fometimes, with* like purplijh Thrums in the miMle as the other have. It has been obferved, that none of the kinds of Crowfeet with thefe kernelly Roots, ever bear fo good Seed, which being fown, will fprng up and grow in England: fo that with its they can only be propagated from their Roots, by a careful and skilful looking after.

XVI. The thirteenth, or Double red Afian Crowfoot, has a Root fo like to the Single red kind, At feft. 12. above, that none can perceive any difference between them, fo alfo it is the fame in its Stalk and Leaves, that the difference or kinds are not to be known till the buds of the Plovers do appear, Jt which after it is any thing forward, may be perceived to be greater and fuller than the Buds of the fingle kind This double fort bears moft commonly but %one fair large double Plover on the tops of the Stalks, coipojed of many Leaves fet clofe together in three or four k $\frac{1}{2}$ ws, of an admirable Crmfcm color, declining to Scarlet, the outer Leaves being larger than the inner $\frac{1}{2}$, and inftead of Thrums, it hat many fmall Leaves fet together p h*a/fo fix fman/>&rM, green Leaves on the back-fide of the Plover Jbefi the Poot-ftalk is joined ten.

XVII. The fourteenth, or Double buttoned red Afian Crowfoot, ha* Roots, Stalks, U^ and flowers folike the former, that bef $\frac{1}{2}$ on, th?time of flowering they are not to be diftinguujh_{ed} one fro* another. The flower ts of th'e fame Color and Dupctybut herein they differ, that this has Another double flower growing upon a Poot-ftalk ifuing out of the middle of the firft Pl $\frac{1}{2}$ omr of ibe fame color, but much fmaqler, which Gerard thinks does happen by reajon, of the Strength of the Root, and Gobdnefs of the Soil where it ^ planted. It h a noble Flower, and of great Excellency.

XVIII. The fifteenth, or GreaterC&lumbine-teav'd $\frac{1}{2}$ r $\frac{1}{2}$ o $\frac{1}{2}$ f $\frac{1}{2}$ d. has a Rcmt made of a tuft of white Fibfs

or Strings, very bitter, and creeps here and there putting up new Shoots. The Leaves of this Crow-foot have lofig Stalks, and are very like unto the mailer heaves 0/Columbines, or the Great Spanish Thaliftrum, or Meadow-Rue, which has Leaves very like unto Columbine Leaves, four or five several ones rifmg from the Root. The Stalk grows up to the height of about half a yard, fo me thing reddijh, and befet here and there with the like Leaves : at the top A and feveral fmall white Flowers, confijing of five Leaves apiece, with fo?ne pale white Threads in the middle : the Seed is round and reddijh, and contained in fmall Hmks or Horns. This is the Aquilegia minor Dalefchampii, and Ranunculus praecox fecundus Thalietri folio Clufii.

XIX. The fixteenth, or Small Columbine-leav'd Crowfoot, has a Root confijing of three, four or more, thick, fhort and roundijh or oval yellow Bulbs or tuberous Produftions from the main Root or Head, like unto the Aphodil Root. From this. Root fpring forth three or four winged Leaves fspread upon the Ground, Ji an ding upon long Stalks, and confijing of many fmall Leaves fet together, fspreading from the middle Rib, every Leaffomewhat refembling the fmalleft and youngeft Leaves of Columbines. The Flowers are white ^ Jianding at the tops of the Stalks, rnsde of five round Leaves.

XX. The feventeenth ^ or Illyrian Crowfoot, h/i? a Root which conjifts of a Bunch of fmall oval tuberous Roots or Grains ^ growing clofe together, with fome Fibres adjoining, not much unlike to thofe of Pilewort: from whence fpring forth (upon long Foot-Jlalks) three, four or more narrow greyijh green Leaves, divided into four, five or more long Jlenner parts, of a Silver-white Jhining color underneath, and covered with a certain Downinefs. The Stalks are firm and round, but fmall, a foot high or more, having flme fuch-like Leaves thereon about the middle, and fspreading into three or four Branches, every top bearing a fmall Jhining pale yellow flower, confijing of five Leaves, ana fome times two together upon a Stalk. • There is a greater kind of this Plant, like to it in all refpefs, but only that the Leaves, Stalk and Flowers are greater and larger, the Leaves broader and greener on the upper fide, and not fully of fo Silver a white color underneath : the Flowers are of a fair deep yellow color, and greater than the former ^ but the Root has not fo many fmall Grains of Kernels fet together, from whence white Strings fhoot forth by which it is nourifhed and encreafed.

XXI. The eighteenth, or Plantane-leav'd Crow-foot, hai a Root compofed of many white Strings or Fibres, proceeding from a Head which is fomewhat hairy, and abides many Tears \$ the Leaves wholly perijhing in the end of Summer, and Springing again in March : from this Root rife up three or four Leaves fet on pretty long Footstalks, being fomewhat long and broad, like unto Plantane Leaves, with Ribs therein, but more pointed at the ends ^ not divided or dented about the edges, but fmooth and plain, with fome Veins running thro" the length of them, and pointed at the ends, of a whitijh grey green color, circled as if were with a white Down. The Stalk is firm, round and green, about half a yard high, bearing two or three longer Leaves, broad, at the bottom, and encompassing the Stalk, zvhich divides it felf at the top into two or three fmall Branches, having every one of them a fmall long Leaf at the foot thereof, and a reafonable large Flower at the Head, (without any Smell) confijing of five white round-pointed Leaves, with many yellowijh Threads in the middle, which growing ripe, ha* many Seeds fet together, like to divers other kinds of Crow-foot.

XXII. The Places. The Names of molt of thefe Plants lthew whence they originally came -, however, by Tranfplanration, they are how Natives of our own Land, being all of them found in loms one or other of our FlorijVs Gardens, Where they flourifh admirably well.

^ XXIII. The Times. The Broad-leav'd Candy Crozofoot flower more early, viz. in March or April: the others flower from April to the end of June \$ and the Seed is ripe in July and Avguji.

XXIV. The Qualities. The hot, biting and ex-ulcerating kinds, (which are thofe only whole Vir-tues we defign to give you in this place) are hot and dry in the fourth Degree ^ and exulcemtjng.

XXV. The Specification. They are peculiar for curing the Scrophula or Kings-Evil.

XXVI. The Preparations. You may have therefrom, 1. Aliquid Juice of the Roots or Leaves. 2. An EJJence. 3. A Pouder of the Roots, Flowers or Leaves. 4. A Cataplafm of the fame. 5. A Deco-Qion. 6. An Ointment. 7. A dijilled Water. Some are for ufing the Roots only, fome for the Flowers, fome for the Leaves, but they may be all taken and ufed promifcuoufly, according to the Intentions -, but none of them to be ufed inwardly, being but little better than Poyfon, by reafon of their exulcerating Property -, more epecially die Illyrian Crowfunt, 'which im<=>, call Af*it**n Syllipp m <in4 fome Apium Rifus, but is not the true' Apium Rijus, of which we ipeak in its proper place. But as to this Illyrian or Laughing Crowfoot, if it is taken inwardly, it is faid to caufe the Perfon to fee divers ftrange Sights, and to kill them Laughing : without doubt, it hufts the Senles and Underftanding, and rather caufes Cramps, Convulfions, and Wringings or Drawings of the Mouth and Jaws awry, feeming to the Standers by as if the Patient Laughed, and dying in this Condition, to dye Laughing, whereas if was no Laughing, nor was the Party in any Condition to Laugh, but rather it was a violent Convulfion of the Nerves, caufing the Man or Woman to die with great Torment.

The Virtue.

XXVII. The liquid Juice. It is (harp and biting* good to bath gently thofe Parts of the Skin which are affe&ed with Scurff, Morphew, Leprofie, Freckles, Spots, Yellownefs, Roughnefs, &c. The Skin is firft to be wafhed with warm Water very well, to loofen and open the Pores thereof-, then being wiped dry, to be immediately bathed with this Juice, which is to be done twice a day. It is good allb to dry away Scabs and Itch.

XXVIII. The EJJence. It is powerful to all the Intentions aforefaid, but more drying. It is good to wafte away and confume Warts, Corns, hard Scabs of the Skin, Ruggednefs of the Nails, ando* ther like Deformities of the Cut is. The Head being wafhed with it, it kills Worms at the Roots of the Hair, which eat the fame and caufe it to fall off. Neither Juice nor EJJence, by reafon of their Violence, are ever ufed inwardly.

XXIX. The Pouder. It is cleaning and drying, and is good to be fitted into old, running and putrid Sores, and Uteers which have Worms in them. Snufft up the NoftHls, it purges the Head and Brain by Sneezing.

XXX. The Cataplafm. Laid to the Wrifts of the Hands, it is faid to drive away Agues, epecially if a little Bay Salt is alfo mixed with it. It is made of the Root of the Bulbous or Tuberous kind, the Germans, as Carrier anus fays, apply it to Plague Sores and Pdilential Bubo's, to induce Maturati-on : and it is not unlike, for it will fuppurate and

break other Apoitems or Tumors, being wifely applied. *TragHs* fays, That a bit of this Tuberous Root put to Teeth which do ake[^] or into an hollow Tooth, takes away the Pain^h, but Authors alfo fay, That many times it breaks thofe which are hollow, or caufes them to fall out. This Cataplaim (or the fimple Root) being applied to the Finger of one troubled with the Tooth-ach, eafes the Pain, which it 4oes by Attra^lion, and thereby caufes a Pain in the Part to which it is applied. Applied to a foul Ulcer, it will cleanfe it, and take away all the filthy and corrupt Matter therein, leaving the Sore fair, and eafily to be healed with other Vulneraries[^] but the Caraplaim is not to lye too long upon the Sore, by reafon of its Violence. Applied to Scrophulous Tumors or Kernels in the Neck, or under the Ears, called the Kings-Evil, it breaks them, and caufes them to waft away. Authors fay, That applied to Hemorrhoids or Piles vyhich fwel and bleed not[^] it helps to difcufs or take them away [^] but that if is in no wife to be applied to thofe which are open and bleed. Applied to a *Leuce* or fpotted Le^rofie, it kills the virulent Humor, and clears the skin.

XXXI. *The Decoffion*. It has the Virtues of the liquid Juice and Effence, but not full out fo efficacious. It cure§ Scabs and Itch, they being often walhed therewith^h and is good to take away Tannings, Sun-burnings, Freckles, Lentils, Yellownefs of the Skin, Scurf; Morphew, &c. It is good alfo to hinder the falling of the Hair, the Head being warn'd therewith warm •, and then afterwards to be » again with warm Water.

XXXII. *The Ointment*. It has all the Virtues of the Catapjbim, being anointed upon the Parts affected. The; Cataplaim may alfo be made therewith, inthead of Hogs-Lard, by which means it will be yet fo much the more effe^ual.

XXXIIL *the Allied Wuter of the whole Plant*, whilft it, UVik flower, is fafe to all the Purpofes aforefaid^v and, as fome fay, is given with good Sue* cefs inwardly, with Species *Lithontribon*, to provoke Urine when it is ftopt, and to break the Stone : and being uftd as a Wath, it takes away moft of the ufual Deformities of the Skin.

XXXIV. *An Obfervation*. Tho' all thefe Preparations and Virtues aforegoing, are applicable to all the hot, biting and exulcerating *Crowfeet* promifcoufly, whether of the Land or Water, and that probably they may all do the fame things -, yet they ate generally and for the moft part predicated (-except in the Cafes where any particular one of them is named) of the moft *Common* and *Meadow Crow-foot*.

XXXV. *Obferv. 2*. That the *Sweet Crowfoot*, or that which has no fharp or biting Tafte, is held to be harmleis, *fox the Germans, as Tragus fays*, do eat it familiarly among other Herbs. *Tragus* alfo fays, That even this fweet kind will difcufs and d/ible hard Tumors in aiay Part of the Body, being applied.

have it to be the *liemerocallis* of *Dwfcndes* : in *Englifb, Crown Imperial*.

II. *The Kinds*. It is of the Stock or Kindred of: *Lillies* \$ and among the wonderful Variety pf *Lillies* known at this day, of which fome are White; fome Orange Tawny, fome Red, fome Yellow; fome BluQi, fome Purple, fome Spotted, others without Spots [^] fome Handing upright, others turning downwards, *fff*. This *Crown Imperial*, for its excelling Beauty and Statelinefs, exacts the firft place among them. Some have called it *Lilium Verficum*, but there is another which is more ufually called by that Name, as (hall be lhewed hereafter -, and therefore we rather chufe to call it *Corona Imperialism* the *Crown Imperial*, than by any other Name, for that this Name is now alfo more generally received. It is a fingular Plant of the kind, yet fome will have it, that there is a *Jngle* and a *double fort*; but the Truth is., that as the Plant grows old, fo does it grow rich, bringing forth a Crown of Flowers among the uppermoit green Leaves, which is, their *double kind*, altho' indeed they are but one and the felf-fame Plant, which in time is thought to grow to a *Triple Crown* -, all which is but accidental, and happens by the Age of the Root[^] and Fertility of the "Soil

Fig. 1. The Crown Imperial, with its thick, firm and bulbous Root, covered with

CHAP. CLXXVII

Of CROWN-IMPERIAL.

I. *Trp H E Names*. It has no *Greek* Name that we T f. ^{kn}g^w f • : the *Turks* call it *Tufai*, *Toufai* *Jufchat*, *Jurfam* u*ATurfandi* : in *Latin*, *Corona imperialism* iff *Lilium Byzantinum* ^h *Clufms* will

than any other Lilly, except the *Perfian* and does grow/onetimes to be a* great M a pre% big CbUds Head, and fomewhat fiⁱst whhal ^{^^} the fldes whereof arid m from tbB.bottom, it ft**' Mb long tbcü% which per ijh every Tear, hmng a hole in the mdft thereof at the- end of the tear, when the old Stalk is dry and uibered, and out of the which a new Stalk doeifpring again (from a hud or Head to be feen within the Hollownefs oft the or* fide) the following Year : the Stalk then filling up tbt Hollownefs,

Hollowne^S and thus SP^r jⁿ & "P. > rifes up to be three or four feet high, being great, round, and of a purplish color at the bottom., but green above, befest from thence to the middle thereof, with many long and broadgrien Leaves,- very like to the Leaves of pur Common White Lilly, but Something jhorter and harrower, confusedly without Order, and from the middle upwards it is bare or miked without Leaves, for a certaiñ SP^{ace} ' - > an & 'Nen %ett bears four]; Jix or ten Flowers, more or lefs, according totJW Age of the Root, and the Fertility of the Earitf where it grows. The Buds at the first appearing We hhitifh, jftanding upright among a Bujh or Tuft of green Leaves, [mailler than thofe belotx>, arid /funding above the ffovbers h, after a while they turn themfehts, and hang downwards, every orle upon its own fbot-ftalk,] round about the great Stem dr Stalk, Sometimes of an even depth, andSo/netimes again one lower or higher than another, which Flowers are almojl in Form like to thofe of art ordinary Lilly,* but fomewhat leffer and clofer, confining of Jix Leaves, of an Orange color, ftriped with purplifh Lines and Veins, which add a great Grace and Beauty to the Flowers. At the bottom of the Flotwrs next unto the Stalk, etery Leaj thereof ha* on the out fide a certain Bunch or Eminence jüicking forth, of a dark purpliJJ? color \$ and on the infide there lies in thofe follow bunched places, certain clear drops of Wai er, like unto Pearls, of a very Sweet Tajie, almojl like to Sügar or Höney.' In the midji of each Flovoer is a long ziohite Stile or Vointel, jerked or divided dt the end -, and fix white Chives tipt with yellowijh Pendants, Jianding clof^ about it: after the Flowers arepaj], fixS^reSeed-Veffels appear, jianding upright, winged a* it were, or welted on the edges, yet Jeeming but three-S^are, becauSe each couple of thofe welted edges are joined clofer together. In thefe Pols or Veffels are contained broad* flat and thin Setds, of a pale brownijh color, like unto other Lillies, but much greater and thicker alfo. The Stalk of this Plant dots foretimes grow fiat, two, three or jour Fingers broad, and then bears many more Flowers, but then generally they are fmaller than when it bears rotirid Stalks. Sometimes it happens that the Stalk is divided at the top, carrying two or three Tufts oj gre^n Leaves, without any Flowers on them: and fométimes HkewiSe it bears two or three Heads or Crown\$ of Flowers (as we have before hinted at feL 2. above) upon one Stalk\ this is not often feen, but when it happens, it is meerly accidental The whole Plant, and every part thereof, of Roots, Leaves and Flowers do fmell S^{omev^at} ftrong, mmh like to the Scent of a Fox\ which, if any do but come near it, they cannot chufe but S^ell it.

IV. *The Places.* This Plant was first brought from Conjiantinople into our Country among other bulbous Roots, and being made *Denizons* in our Gardens, they are now become Natives of our Land, where they thrive admirably well.

o V. *The Times.* They flower in April, and sometimes in March, if the Weather is mild *, and the Heads with Seed are ripe in the end of May and in June. It is quick in its Growth, but it fprings not out of the Ground till the end of February or beginning of March.

VI. *The Qualities, Specification, Preparations, Virtues and Vjes^* are the fame with thofe of the White And Orange-tawny Lilly, treated of in some of the following Chapters, to which you are referred. .

VII. *Obferv.* I. To obtain the true color of the Flowers of this noble Plant: Take Sap-berries, and lay them in fteep in a proportional quantity of fair Water for two hours, and mix a little Safron in that Infusion, and it will give the perfect color, to limne or illumine the Flower withal

VIII. *Obferv.* 2. As in the bottom of each of these Bells, there is placed fix. drops of molt pure clear finning Water, fweet in Tafte, like to Sugar, refembling in Shetv fair Oriental Pearls; these drops, if you take them aWay, nev andfreih drops will immediately come in their places again. But if they may be fuffered to contiinue in the Flower, they will never fall away, no, tho' you ftiike the Plant tH it is brdken.

CHAP. CLXXVHL

Of %tt" C M R E R Garden.

The Names. It is called in *India* . bñi^t^t^ \$5[Chethete : in Greek, ^iKV; u^@-: in Latin,, Cucumis & Qucumer Sativus: in English, Garden Cucumber.

II. *The Kinds.* Of these we make four several forts, viz. 1.1. *Cucumis velCucumer vulgar is*, The Common garden Cucumber. 2. *Cucumis Anginum*, The Ion^ Snake-like or Serpentine Cucumber. ?- *Cucumis pel Cucumer Pyfiformis*, Pear-fafhiowd Cucumber.* 4. *Cucumis vel Cucu?ner HiSpanitus*, The Spanijh Cucumber.

III. *The Defcriptions.* The first has a Root which is long and white, with divers Fibres adjoining to it, from whence fpring jorth many trailing rough green Branches, lyng on the Ground -, all along whereof grow Several Leaves, which are rough, broad, uneven at the edges, and pointed at the ends, with long crooked twijhng Tendrels or ClaSpers, coming jorth at the Same Joint with theLeaj, but on the 01 her fide thereof Between the Stalks and the Leaves, at the Joints, come forth Flowers Severally, each jiandwg on a fhort Foot-jUlk, opening it felj into five Leaves, of a yellowijh color 5 at the bottom of which grows the

XII. *The Qualities.* They are all cold and moist in the second Degree: Aperitive, Diuretick, Stomachick, Alterative, and highly Antiforbuitick.

XIII. *The Specification.* It cures the Scurvy, and prevails against Heat of Urine.

XIV. *The Preparations.* You may have them from, 1. A liquid Juice of the Fruit. 2. An Essence of the same* 3. The green fruit 4. Pottage*. 5. A Lotion or Wash 6. A distilled Water 7. The Seed. 8. Pickled Cucumbers. 9. Pickled after the Mango fashion.

The Virtue.*

XV. *The liquid Juice.* It is expressed from the *Cucumber* 1 either ripe, or almost ripe, or unripe, as they are most fit to be eaten. It opens, is cool and cleansing, provokes Urine, and opens the Obstructions of the Breast, Lungs, Liver and Reins, and takes away Inflammations of those Parts. It helps Head, Sharpness and Scalding of Urine. Dose from 1 to 3 ounces twice a day. Outwardly applied, it makes the Skin smooth and fair: and being taken for some considerable time, it perfectly cures the Scurvy in a hot Habit of Body.

XVI. *The Essence.* It has all the Virtues of the former, but not full of cold, for which Reason this may be taken by it self, from 1 to 3 ounces or more, whereas the other ought to be taken mixed with Ale or White Port Wine. It is an excellent Stomachick, very much pleasing and gratifying the Viscera, if inflamed or over-heated.

XVII. *The green or unripe fruit.* It is first red, then sliced thin, after which it is seasoned with Pepper, Salt, Vinegar and Oil, an Onion or two being also thin sliced and freed, and put thereto. It is grateful to the Stomach above all other Sallets; it cools the Heat thereof, as also the Inflammation of the Lungs and other Viscera. It cures the Scurvy in a cold Habit of Body, nor is there a greater Antiforbuitick in the World, and may be freely eaten two or three times a day, and in large quantities too, without any danger or hurt to the Stomach and Bowels, though some ignorant People may affirm the contrary. God and Nature has Wlenished all the hot Regions and Countries of the world with them in a very ample manner, and it is my Opinion, that they are a great means of the Preservation of Life in all those sultry hot Parts of the Earth, and a singular Preventive of Diseases, especially of all such as proceed from Inflammation, violent Heat and Fevers, of what kind soever. It was not without some Reason that the Children of *Israel* lusted after them in the Wilderness: *Numb.* 11. 5. *We remember (said they) the Fish which we did eat in Egypt freely, the Cucumbers, and the Melons, and the Leeks, and the Onions, and the Garlic.* And by this it appears also, that *JEgypt* was very well stored with them.

XVIII. *The Pottage.* Take the Fruit, cut it in pieces, and chop it as Herbs to the Pot, and stew the same in a small Pipkin (or Stew-pan) with a piece of Mutton, (Beef, Veal, Lamb, or other Fleish,) adding in the stewing fine Flower of Oat-Meal, to give it the Consistence of Pottage: *Gerard.* This may be made savory with a little Salt, and if you please you may also add to it the Juice of an Orange, to make it grateful, of which you may eat from half a pint to a pint, or a good Porringer full every Morning to Breakfast, as much at Dinner, and the same again at Supper. Eaten in this manner for the space of three Weeks together, without Intermission, it will perfectly cure all manner of flat Puffles, and copper or red Faces, red and fiery (turning Noses, (though as red as red Roles;

though the Skin is filled with Pimples, Rubies, Scurf, Morphew, Herpes, Tetters, Ringworms, and other like Breakings out.

XIX. The Lotion or Wash. *Vijirong White Wine Vinegar a quart Juice of Cucumbers a pint, Or rice-Root in fine Jilvoer or ponder, Haters of Sulphur, or Sulphur in fine ponder; of each an ounce: Cdmphir in fine ponder half an ounce beaten with four blanched Almonds-, Juice of eight foytrehinwspghi Odk-apples cut thro' the middle: put all these into a strong double Glafs, shake them together very rough, and set it in the Sun or an equivalent Sand heat for 12 or 14 days**

This does not only help red and fiery Faces, but also takes away Pimples, Rubies, Freckles, Lentils, yellow Spots, Scurf, Morphew, Herpes, Tetters, Ringworms, Tanning, Sun-burning, and all other Deformities of the Face and Skin. The Face or Skin ought first to be washed pure and clean with fair warm Water, to open the Pores thereof, and then to be dried with a Cloth, and then as soon as that is done, this Wash is to be used and laid on, and so to be suffered to dry in of it self, without wiping away. It is to be used Morning and Night* and always during the whole time of eating the above prescribed Pottage.

XX. *The distilled Water.* It is good to cool the hot Distemper of the Liver and Blood, to quench thirst, cool the Heat of Fevers, and take away the Dryness and Roughness of the Tongue. It is good against the Heat of the Reins, as also the Sharpness; Scalding and Stoppage of Urine. Outwardly used, it cools Inflammations, helps Blood-heat and Redness of the Eyes, clears, cools and smooths the Skin, and is good against most Deformities thereof being often applied thereto.

XXI. *The Seed made into an Essence with the distilled Water.* It wonderfully cools the Heat of the Reins, and takes away the Scalding and Sharpness of Urine, and that Pain which is caused by the Application of *Cantharides* in *Epispasticks*, or Blistering-plasters, which sometimes, by their lying on too long, cause pitting of Blood, and almost the greatest Extremity of these ill Accidents this Medicine suddenly and easily cures, &c.

XXII. *Pickled Cucumbers.* There are various ways of pickling Cucumbers, which we have taught in our *Dor on Me die urn lib. 2. cap. 19. fell.* 14, 15, and other ways in some other of our Books: but this following is best. Take a thousand English Cucumbers, wipe them very clean with a dry Cloth, and lay them in a Stone Pot or Jar, with *Fennel* and *Dill*, and Cloves of *Garlic*, lay upon lay: upon which put boiling hot this Pickle. Take the best White Wine Vinegar four Gallons, and fait Brine (made of strong as it may bear an Egg) six quarts, choice Brandy or Sugar Spirits three quarts, white Pepper bruiled three ounces, Cloves flit, *Mace*, of each half an ounce: having flood a day, ltop them close up, and they will be fit to eat in about a Weeks time. After three Weeks or a Month draw off, and decant the Pickle, which boil, scum and put to the Cucumbers again, and so keep them for use. This is the usual Method. But Experience has told me, that there is no need of drawing off and boiling the Pickle at all, for the Brandy or Sugar Spirits are a sufficient Preservative of it. 2. That the first adding of the Brandy or Spirits ought to be after the boiling of the Pickle, when you are just going to put it upon the Cucumbers. These pickled Cucumbers excellently strengthen the Stomach, relieve the Scurvy, and cause a good Appetite.

XXIII. *Pickled Cucumbers after the Mango fashion.* Take Cucumbers which are pretty large, but such as are very hard and green; wipe them clean, slit them on one side, and take out all the Seeds and middle?

middle Pulp ; and put in, in the place theiof, three or tour or more Cloves of *Garlick*, a ilice of *Ginger*^ and half a dozen or more of *Pepper* Coins, only crackt into three or four pieces •, which done, tye them up with a Thread : then take the belt • *Whice Wine Vinegar* as much as will cover them, adding what Salt you think fit, with *Pepper*, *Ginger*, *Cloves* and *Mace* -, make this Pickle juit boil, and put it upon your *Cucumbers* boiling hot; repeat the boiling the next day, and pour it on hot as before. After this take a well glazed Stone Pot, into which put your *Cucumbers*, laying them fsmooth and well one by one, and then having put to every gallon of Pickle a pint of pure Lime Juice, not adulterated, put it upon \NzCucu??ibers, which cover, and let them Itand over a moderate Fire till the Liquor is fcaiding hot, taking care that it may not boil: when you fee the *Cucumbers* green enough, take them out and put them into a Stone Jar, placing them one by one very fsmooth and well: this done, when the Pickle is cold, you may add to it to every gallon thereof a quart of Brandy or Spirit of Wine, and half a pine of whole *Mujhird* Seed tyed up loofe in a Rag. Note, Some, in making of the Pickle, take pure White Wine Vinegar, to a gallon of which they add Lime Juice a quart, fait Brine frong enough to bear up an Egg three pints or better, not putting in any other Salt: with this they proceed as before is direfted -, and at the laft add the aforefaid proportion of Spirit of Wine, which makes an abfolut© and fingular Pickle, and fo good, as will keep your *Cucumbers* all the Year round. Thefe are more Stomatick than the former, more grateful to the Pallate, caulè a good Appetite, refill the Scurvj, and have all the good Properties of the former, with many other Advantages.

pointed, of an over-worn grey ifb green, fomehing whitijh underneath, little or nothing divided or parted at the edges. At the Joints bet tec en lie Bra rube s and the Leaves fpring jorth fmall pale yellow Flowers, opening into jive Leaves, at the end of Jf^L green Heads for the woji part, a* all other kinds of Cucumbers, Gourds, £N. do : but jitch j^* have Flowers only, without fuch Heads, quickly j^all jttvr, without Fruit» For that green Head, iu in all cthers, comes in time to be the Fruitt, which is finals rough, long and round, and fome thing of agrevijh green when they are ripe. The Fcot-jlalks upon which the Cucumbers grew, are fhort and rough, crooked withal, and bend the Fruit downwards, which when they are. thoroughly ripe, with a very little touchy will quickly open at the end next the Stalk, andfp^t out its Juice andfome of its Seed upon the Handset Faces, or other Parts of thofe who touched it* *^* Seed when ripe is blackijh and fomething rugged^ but other-wife white, lying in a green moiijiSubjUnce-, which is very bitter and loathfome to the Tafie. Tltf Fruit when it is pcrfetfij ripe, fquirts forth its Water with the Seeds, either of its own accord, or being touched, thø never fo gently . and many times it fir ikes fo hard, especially if it hits again)* the Face or Eyes, that it will/mart for a pretty while after •, but this Smarting arifes purely from the Acrimonious Quality of the Juice. And from this voluntary fpirting of the Seed came the Ka/qe <?/Noli me tangeie.

CHAP. CLXXIX.

Of CUCUMBER Wild.

I. H^p H E Names. It is called in Greeks *Σκῆ** • *£yti*@- • in Latin, *Cucumk* & *Cucumer agrejlis*, and in the Shops, *Ajininus* -, *Cucumk Sylveftris Matthioli*, *Tragi*, *Dodonai* •, allb by fome, *Noli me tangere*, (becaufe of the fpirting of them, if rudely handled, when ripe:) in Englilh, *Wild Cucumber*, *Spirting^ Cucumber*, and *Touch me not*.

II. The Kinds. It is a Species of *Cucumbers*, the Wild fort, but a fingular Plant of the kind.

III. The Infpijate Juice, is the Juice of the Fruit, or rather a *I'cccula* thereof, which being dried, is called almoft in all places throughout Europe, *Eheterium* : *Pliny*, lib. 20. cap. 1. The Greeks call it alib, *αἰτεκ* ab *αἰτι*to, *Impellere*, *jhmulare*, in *JYigare*, *pingere* -, which is as much as to fay, to impel, jYir up, or force violently, to purge vehemently, and therefore *Elaterium eji medicamentum vebementer purgans*. *Gaza* in his Translation of *Theophrastus* calls it, *Agitatorium*. Tis doubtlefs one of theitrongeftofallPurgers.

IV. The Defcription. It ha* a Root white and firm, thicker and Jhorter than any other fort of Gourd or Cucumber has, having withal some adjoining Fibres, very bitter, as are all the giher parts of the Plant. From this Root fpring forth many juicy, fat, hairy, rough trailing Branches, fpreading the mfelves over the Surface of the Earth, like to 0 ther Cucumbers or Gourds, on which grow very rugged, rough, hairy and ill-colcrd green Leaves^fbarp-

Y. The Juice. It is a Juice, Spirit and Juice but I cannot say it is round, being Rubb'd, Green, white and other Colours, when it is being in Seed, it is reddish like the Juice of the *Tragus*, and is very strong, opening, but in the late Seasons, the Juice is very weak, and is not so good as the Juice of the *Tragus*.

¶ The Root many times abides in the Ground all the Winter, if it Itands warm and the Ground u rich . but in cold Grounds and where it is not defended, it is apt to perih every Year: where the Root dies nor, it comes up in the Spring, and is k tiring^s from the Seed in April or May, it flowers in June and July, and the Fruit

is usually ripe in August[^] at which time the *Elatarium* is also made of it.

VII. *The Qualities.* The whole Plant is hot and dry in the third Degree; Aperitive, Absterfive, bitter in Taste, and wafting away. *Galen* will have the Juice to be hot but in the second Degree, cleansing, and of thin parts: it purges watry Humors, and is certainly the best Cathartick in the whole Republick of Medicine.

VIII. *The Specification.* *Elatarium* is a peculiar Medicament for the Cure of Dropfies.

IX. *The Preparations.* You may have herefrom, 1. A liquid Juice of the Leaves. 2. A liquid Juice of the Root. 3. An Errhine of the Juice of the Leaves or Root. 4. A liquid Juice of the Fruit. 5. A Syrup of the Juice of the Roots or Fruit. 6. An Infuswn of the Root. 7. A Vinegar of the Root. 8. A Decofion of the Root. 9. A Pouder of the Root. 10. An Eleatary of the Root. 11. An Oil of the Root. 12. A Cataplasim of the Root. 13. A Substitution of the Root. 14. A Cataplasim of the Leaves. 17. A Cataplasim of the Leaves with Goats-dung. 16. *Elatarium Viride, Green Elaterium, or the In-piffate Juice of the Fruit.* * 17. *Elatarium album vel optimum, White Elaterium, or the Fecula of the Juice of the Fruit.* 18. *The distilled Water.*

The Virtues.

X. *The Liquid Juice of the Leaves.* Dropped into the Ears, it eases them of the Pains and Noises therein, and very much prevails against Deafness: bathed upon the Skin, it takes away Freckles, Lentils, Discolorings, yellow Spots, Scurff, Morpew, Tettars, Ringworms, Herpes, and other Deformities thereof used Morning and Evening for some time.

XI. *The liquid Juice of the Root.* It is good against the Falling-sicknels and Kings-evil, put into the Noftrils, and taken inwardly also[^] and the Strumatick Swellings being daily Morning and Evening bathed therewith, it provokes the Terms, but is not to be given to Women with Child, because it is apt to destroy the Fruit in the Womb. It purges viscous and watry Humors, and that strongly[^] and therefore it is used in Clysters. It has also all the Virtues of the Juice of the Leaves, as to external piffations, if it is applied in like manner. Being taken from 2 to 4 drams in any convenient Vehicle, it prevails against the Dropfie and the yellow Jaundice, and opens all Obstructions of the Liver and Spleen, powerfully evacuating Water.

XII. *The Errhine made of the Juice of Leaves or Roots.* It is made by mixing 2 parts of the Juice with 1 part of Water in which Nitre is dissolved. Some make it by mixing the Juice 2 parts, with Milk 1 part. Snuff up the Noftrils it cures an Epikpiy, as also an inveterate Megrini or Head-ach^h, for it wonderfully purges the Head and Brain from Excrements, and cures a stinking Breath coming from the Noftrils, and is a prevalent Medicine against Lethargies, Carus, JSleepinefc and Apoplexies.

XIII. *The liquid Juice of the Fruit.* It has all the Virtues of the Juice of the Leaves and Roots, and is used in the same manner to all those Intentions, but it is much more powerful, as being more Acrimonious, and therefore is to be used in a smaller Dose. And an Errhine, may be also made of it, as of the Juice of the Leaves or Roots, very beneficial and potent to all the lame Purposes, being much stronger than is Juice of *Beets* or *Primrojes*.

XIV. *The Syrup of the Juice of the Roots or Fruit.* It is good against the Scurvy, Proppie, Tapndice and Gout, canying off all sorts of putrid Humors,

chiefly Flegm and Water, by which it gives a general Relief to the whole Body, and fo prevails against Head-achs, Apoplexies, Epilepsies, Carus, Lethargy, Vertigo and Madness. It is good against Surfeits and Agues, and kills Worms in the Body. The Dose is from a spoonful to 2, 3 or 4, in the Morning fasting, mixed with a Glass of warm Potet-drink or White-wine: if it is acuated with choice *Sena*[^] it will be much more powerful and efficacious to all the Intentions and Purposes before enumerated.

XV. *The Infuswn of the Root.* Take of the fresh or green Root well bruised a pound, put it into a pint and half of strong White Port Wine, in which let it infuse for 24 hours or more. Dose 3 ounces, for three or four days together, or until the Hydro-pick Swelling is plainly discerned to be very much wafted and fallen. This is *Dioscorides* his Medicine, for curing the Dropfy, which thing (*Jays* he) it doth, without any troubling of the Stomach.

XVI. *The Decofion of the Root.* It may be made in Wine or Water, or with a Mixture of both. This being drunk (*says Mefue*) helps the Dropfy, for it wonderfully evacuates watry Humors, and prevails against the Yellow Jaundice, and all Obstructions of both Liver and Spleen. This Decoction* on gargled in the Mouth, and held therein for some time, gives present Ease in the Tooth-ach,

XVII. *The Vinegar of the Root.* If the Root is infused or boiled in strong Vinegar, and that Vinegar is bathed upon the Skin two or three times a day, it is good to cure Tettars, Ringworms and a simple Herpe, as also to cure Scurff and Morpew, and to cleanse the Skin of all Discolorings, as Yellowness, Tawnefs, Freckles, Lentils, and other Spots of that kind.

XVIII. *The Pouder of the Root.* Snufft up the Noftrils, it is a good Errhine to purge and cleanse the Head and Brain of cold moist and viscous Humors, which cause the Head-ach, Megrin, Vertigo, Lethargy, Apoplexy, Epilepsy, Palfy, &c. *Dioscorides* says, that being applied to the Skin or Face, it cleanses it from all Scurff, and takes away the Discoloring of Scans. Inwardly taken, to a scruple or half a dram, mixt with Cream of Tartar, it kills Worms, purges the Bowels, and carries off slimy Humors.

XIX. *The Elettmary of the Root.* It is made of the Pouder mixt with Honey. Taken inwardly, from 3 dram to two drams, according to Age and Strength, in the Morning fasting, it purges Hegm, Choler and watry Humors, and abates the rebellious Ferment of the King's-evil: it cleanses and heals old Sores and Ulcers, being used Plaister-wise, cleansing them thoroughly, and wonderfully healing them. Applied upon a Herpes, Tettar or Ringworm, or other like Breakings out, or put upon any Deformity or Scar, does attenuate the Skin, attract forth the malign Juices, and heal those Breakings out, taking away also Marks, Spots, Blackness and Blewness coming upon the Skin and Flesh by Contusions and Blows.

XX. *The Oil of the Root.* It is made of the bruised Root or of its Juice, by Infolation, or boiling in Oil Olive, Anointed often upon the Temples, it is said to cure an inveterate Megrin, an Errhine of the Juice, being snufft alib up the Noftrils, Anointed well upon the Hip and Huckle-bone Morning and Evening, for half an hour together, it eases the Pain of the Sciatica, &c.

XXI. *The Cataplasim of the Root.* It may be made either of the Root bruited, &c, or of the Juice of the Root brought to a thickness, with Pouder of *Heacampane-roors*. Applied after anointing with the former Oil, it gives great ease in the *Gom* and *Sa-*

cinA-, difcufles Tumors arifftg from fimple Con-
tutions, abforbs acid Humors lurking in the Skin
and Scarf-skin, and takes away Deformities there-
of, as Scurff, Morpew, Leprofy, Yellowneis, and
other Diicolorings of the Skin.

XXII. *The Subftitut'wn of the Root.* Apotheca-
ries, lays *Farkinfon*, do mod ufually take the Root
of this *Wild Cucumber*, as a Subftitute for the Root
of *Coloquintida* or the *bitter Gourd*^ that not being
fo frequent, or fo eafy to be had as this is.

XXIII. *The Cataplafm of the Leaves.* It has all
the Virtues of the Cataplaim of the Root, but not
full out fo effectual, becaufe the Leaves have not the
fame Strength with the Root: yet, notwithstand-
ing, it is an excellent thing for the Purpofes intend-
ed, exceeding many other things of like kind. It
cleanfes the Skin from Difcolorings and many other
Deformities.

XXIV. *The Cataplafm of the Leaves with Goats-
Dung.* If it is laid upon any hard Tumors, Swel-
lings or Kernels, fuch as are thofe of the Kings-
Evil, it refolves them •, and alfo eafes Pains of the
Gout in what part of the Body foever h, and refits
the Putrefaftion of malign Ulcers.

XXV. *Green Elaterium, or the Infpiffate Juice
of the Cucumber.* Take *Wild Cucumbers* almoft ripe,
open them on one fide, and take or fqueeze out their
thinner Juice, and Seeds, which ftrain from the
^eeds, ferving the Juice: then beat the reft of the
Lucumber grofsly in a Marble Mortar, put all into
a Bag, and in a Prefe force forth all the Juice * put
this Juice to the former, which put into a Retort,
and in a gentle Sand-heat draw forth all the Water,
(which keep for a Cofmetick ^) continue the laid
gentle Heat till the Magma is perfectly dry'd h,
then break the Retort, take forth the Matter, and
keep it in a Jar-Glafs f red cloff ove* with a wet
Linnen Cloth, and Care to keep it from the Air.
If you have no Retort, and Care
to keep the Water, you may evaporate it to
Drynefs in a gentle Sand-heat in an open
Jar-Glafs, often ftirring it, (to break the
Bubbles) till it is quite dry. This
has the Virtues of the former, and
is more effectual, and is a more
convenienc Vehicle. 'Tis a more
weaker than the following, a moft
Medica-
ment.

XXVI. *The white Elaterium.* This is a
Elaterium, which is a kind of
It is thus made: Take
open them with a Knife, and
Juice gsnriy with a Sieve
a Sieve S^ h; ou r ^ J l " ? ^ M " ^ and
tyed clofe o ^ i t h a " S ^ 3 S, keep
See our *Pharmacopeia Londincnfr*, B.i.
cap.6. fecl. ii. If you may keep the
clear Water for V^JJuln Artnita. Some Au-
thors lay, that this *Elaterium* will keep, two hun-
dred Years, and yet be of wonderful Virtue, Vix
^ . . o t h e r s , z s P a r a c e f f w , fay it retains its Vir-
tues well fifty Years, at which Age it will be fo a-
bundant in Humidity that put to the Flame of a
Lamp or Candle, it will put it out: but *Diofcorides*
fays it is good from two Years old until ten, and
that that is the belt which being put to the Flame
of a Candle, will make it burn the more bright.
Ieophrastim his *Elaterium* is green, (which is, as
i, luppoie, the former Infpiffate Juice of the *Cucum-
ber*;) *Diofcorides* his *Elaterium* is white, which is
the *Ltcula* of the Juice, as is taught in this Section,
and this is that which *Mefue* fays is the belt. "The

green will continue moift many Years, after it is e-
vaporated and dried up hard, relenting or giving
with the Air, fo that it requires a long time to con-
fume its Humidity •, whereas the white fort being
once dried, will remain white, hard and dry for a
great number of Years, unlefs it is left open in a
moift Air, or ftand in a moift place- This white
Elaterium works very well, being given from i to
? grains, in ttrong Bodies h Authors fay it may be
given to 10 grains. *Farkinfon* fays, that half a
grain being put into a purging Medicine, to quicken
it, has oftentimes been feen to trouble the Stomach,
with very much difquiet, and vomiting; and working
alfo downwards with more Violence than it could be
thought that double the quantity could do. *Diof-
corides* fays the Dofe is from half an *Obolus* to a
whole *Obolus*. Now, the *Obolus* is 10 grains, or 12
at the molt, as fome take it •, which (hews the large
Dofes which the Ancients gave of this Medicine*
which we dare fcarcely follow. It purges Chofer
and Flegm from all parts of the Body, and drives
forth watry Humors to a Miracle^ being an extraor-
dinary thing to open the Pipes of fuch as are Purfy
and fhort Winded -5 and is indeed a Specifick for
the Cure of the Dropfy, epecially of that kind cal-
led *Sarcites* or *Anafarca*. When you give it for
Purging it may be given mixt with Milk, or rather
Cream becaufe the Unftuofity thereof will not fuf-
fer it to ftick to the Tunicles of the Stomach, but
caufe it to purge off the more fpeedily. If you
would have it to Vomit, *Dwfcondes* advifes to dif-
folve it in Water, and with a Father dipt therein,
to touch the lower part of the Tongue, as low as
you can; but in my Opinion, it is much better to
take the whole Dole down into the Stomach. It is
a prevalent thing againft the Megrim, Head-ach,
Carus, Lethargy, Vertigo, Apoplexy, Epilopfy,
ins ufed fometimes as an Errhine, dilloived in Wa-
ter or Milk, and fometimes taken inwardly, to both
And
It provokes

the Courfes in Women where they have been long
ftopt, and very much prevails againft the Green-
ficknefs in Virgins. It is fo ttrong and forcible, that
it is faid to kill the Child in the Womb, fo that a
Woman Impregnated muft by all means avoid it •,
but this is more epecially to be underftood, being
applied in a PelTary or Ointment to the Womb. It
cures the Gout in any Part, by its ftrong Cathartick
Faculty, carrying off the tartarous, vifcous or clam-
my Humors from the Joints, which breed it. The
common Dofe is a gr. lad v. and to very ftrong
perfon A gr.iii. adx. wdl correaw with Nutmeg,
picknardfAnifeeds, Lwgonce-pouder, &c. It curls
up the Skin, and is a good Remedy for
Uall and applied, it
helps the Quinfey and Gout, and clears the Skin of
Scurff, Morpew, Tettars, Ringworms, Mange, Itch,
Puffes, Scabs, and other like Deformities

XXVII. *The dialled Water from Roots or Fruit.*
If to every quart of it you add an ounce of fine Ni-
tre, diffoivng it & aer a gentle Heat h it becomes an
excellent Cofmetick to beautify and clear the Skin
of any Deformity, being two of three times a day,
or oftner laid on, and fuffered to dry in, after it is
flirt well cleaned with fair warm Water. This
Wafte is alfo aft excellent thing againft *mtryfipetis*
or *Anthonyh fire*^ the Parts affected being bathed
therewith, and ^lorhs wet therein being laid on,
and fo fuffered to dry upon Aie Part. It abates In-
flamations, and being given inwardly, (wellivyeet-
ne) with white Sugar it QOOIS and abates the rjolt
violent Heat of ^Fevers. Parts • affected with the
Gout, being well bathed therewith Morning and
Evening,

Evening, (after due and sufficient Purgings) are plentifully eased of their Pains after a singular manner. Given inwardly from i ounce to 4, well sweetned. With white Sugar, it purges well by Urine, carries off Water in Dropfies, prevails against the Scurvy in a hot Constitution, helps the Strangury, and expels Sand, Gravel, Slime, or any kind of Tartarous Matter*

from whence rise up one or three Stalks, Jet thick on all sides with long and narrow rchitijh or woolly Leaves, almoji from the bottom of the Stalk up to the top : with every Leaf Jiands a fmall lhve of a dun or brovonijh yellôw color, but not fo yellow a* in fome others ; in which He ads ^ after the flowers are fallen, come fmall Seed, ertclofed in the Down, and which, when perfetted^ is carried dvsuy with the Wind.

CHAR CLXXX.

Of CUDWEED Common,

CO TT ON WEED.

I. r-ir* HE Names. * It is called in Greek, TtA^dmv X in Latin, Gnapbaliu, Qentunculus, Centuncularis, Tome ntum fomentaria, Somentitia, Cottonaria, Bombdxhumilis, Albinum, Chamaxylon ?lini ixdliidgo: mEnglijf), Cudweed ox Cottonweed.

II. The Kinds. There are four principal forts of Cudweed, i. The Common, of which in this Chapter ^ Gnapbaliu Impium, Wicked Cudweed, of which in Chap. 181. 3. Gnapbaliu Marinum, Jive Cottonaria, Sea Cudweed or Cottonweed, of which in Chap. 182- 4* Gnapbaliu Americanum, American Cudweed, of which in Chap. 183.

^ III. Of the Common kind there are, 1. Gnapbaliu vulgare majjts Joñannis Thalii, Gnapbaliu Anglicum folio longiore Lobelii, Englifh Cudweed. 2. Gnapbaliu mimis, Yilago minor* Dodonti, Gnapbaliu wilgare minus, Gnapbaliu mediim Tabernontani, The Vulgar or Common lefler Cudweed.

IV. The Defections. The firft^ or Fig. 1. Cudweed, bat a Root which is fmall and thready, J

V. The fecond, or Lefler Cudweed, has a fib root Root, almoft like the former h from whence' fhoots forth fmall hoary Stalks, full of Branches almojt from the very Ground, with divers Jmaller, fhortet and narrower Leaves thereon, of a more dusky hoary color, like fine Cotton or Wooll -, fane JianHjng fingly, and fome more at a Space or Joint: the Flowers hereof ft and at the tops of the Stalks and Branches only, and not all along, a* in fome of the other kinds, one Branch above another, but all of them rifwg almoft to an even height, and tire of an overworn yellow coloY: it grows commenty about nine or ten inches high, feldom to a foot, unlefs in choice Ground. The Flowers are yellow, and grow hkt Buttons at the tops of the Stalks, and the Seed iff carried dway with the Wind.

VI. The Places. They both grow in barren, dry, fandy and gravelly Grounds in moft places of Eng- land : the firft has been found growing in Hamp* ſhead Wood, and in Woods near to Deptford, by London,

VII. The Times. They flower in June > July and duguft h and their Seed is ripe in a little time after.

VIII. The Vitalities, they are temperate in *e- feft of Heat or Cold, but dry in the third Degree: and therefore very Aftringent, Hepatick, and withal Anodyne.

IX. The Specification* They are peculiar dgtfinfl: Catarrhs, Fluxes of the Bowels, fxtulions 6t Biooi in any Part, and the Qpinfey.

X. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Decocti-

weeds, Wicked Cudweed the lesser. 2. Gnaphai- um majus generis minoris, tilago major\ Herba impia major, Gnaphalium inpium major, The greater fort of the lesser Cudweed, Wicked Cudweed the greater.

The Virtues.

XI. The liquid Juice. Taken inwardly to an ounce or more, mixed with a Glafe of Red Port Wine, or in some other proper Vehicle, it stops any inward Bleeding: it cleanses old and filthy Ulcers, and causes them quickly to heal. Taken in Wine, or in Milk, it is (as Pliny says) a sovereign Remedy against Heat and Swellings in the Throat, and that which is vulgarly called the Quinsey: and he farther says, That whosoever shall take it shall never be troubled with that Disease again. And for the same Reason Country People give it to their Swine, with this Observation, That whichsoever of them will not take it, will assuredly die.

XII. The Effence. It has the Virtues of the liquid Juice, but more powerful; and over and above in the curing of old running Sores and Ulcers, it is of admirable Excellency. It stops and cures all Huxes of the Bowels, tho' of long standing, and

restores their Tone again to Admiration. It cures Whites in Women, as all the overflowing of the Menstruum, and singularly the rebellious Catarrhs, and difficult simple Contusions; kills Worms in the Bowels, and heals Ruptures.

XIII. The Juice. It has the Virtues of the Juice and Effence, but in a lower degree, and may be given from 4 to 6 or 8 ounces, according to the Quantity. 1. In the Morning fasting. 2. Half an Ounce at Night going to Bed. Poffibly may be best for weak Stomachs.

XIV. The Pouder. It dries, binds and astringes, and therefore is profitable for Defluxions of Rheum from the Head upon the Lungs, as also to stop Huxes of Blood wheresoever. Taken from 1 to 2 drams in Red Port Wine, it prevails against the bloody-flux, and eases the Tortions of the Bowels coming thereby: it stops the overflowing of the Menstruum, and heals Wounds whether inward or outward, being made into an Electuary with the liquid Juice. This Pouder being either drunk

or used in the form of a Cataplasme, mixed with the Juice of the Turnep, cures the Disease called Tenasmus, which is a Convulsion of going to Stool and doing

nothing. It may be made either of the Juice of the Turnep, or of the Juice of the Turnep and the Pouder of the Herb made into a Cataplasme with the liquid Juice. It immediately stops the bleeding of it also afterwards cures this: Ulcers, dryes and heals all old and filthy

III. The Descriptions. The first of these has a fibrous Root, from whence shoots up a low or short Stalk, set with shorter Leaves than the former, but somewhat more white or hoary, and a little broader, at the top is a sheaf of a larger and more open Flower than in the two others, and of a paler yellow color; from the sides of this Stalk spring forth divers short Branches, set with such like, but smaller Leaves than those which grow below, with such a like yellow Flower as the other; which Branches, with their Flowers do always rise higher than the middle Stalk, and the Flower upon it: sometimes also the Branches, will have other small Branches spring from them, bearing Leaves on them, and Flowers on the top of each of these also rising above, the Branches, with their Flowers in the said manner, that the first Branches did unto the main Stem: the Seed follows the Flowers in a downy Bed, and is carried away with the Wind, as the rest are.

IV. The second, or Larger Wicked Cudweed, has a large Root with several pretty thick Branches, and many Herbs springing from the same, from which sometimes springs up but one Stalk, and sometimes two, three or more principal Stalks, very much in their Magnitude way of framing, Shape or Form of

the larger and for the most part from those Flowers which appear from the Mowers, which are always higher, as Children seeking to

1. The Name. It is called in Greek, γναφαλίον minus, in Latin, Gnaphalium minus, in French, Herbe Impie, in English, Wicked Herb, Cudweed the lesser. II. The Description. Of these there are two sorts, 1. Gnaphalium minus, Herba impia, Gnaphalium Fuschii, Matthwli, Lobelii, Lugdunensis, Aliorumque, Yilago (a Jolwrum inusitata superbia) and Cartafua-gou Angulana, The lesser bit of the lesser Cud-

Of CUDWEED Wicked.

I. THE Names. It is called in Greek, γναφαλίον minus, in Latin, Gnaphalium minus, in French, Herbe Impie, in English, Wicked Herb, Cudweed the lesser.

II. The Description. Of these there are two sorts, 1. Gnaphalium minus, Herba impia, Gnaphalium Fuschii, Matthwli, Lobelii, Lugdunensis, Aliorumque, Yilago (a Jolwrum inusitata superbia) and Cartafua-gou Angulana, The lesser bit of the lesser Cud-

VI. *The Times.* They both flower in July, and the Seed is ripe in Augufi.

VII. *The Qualities, Specification, Preparations, Virtues and Uses,* are the same with the *Common Cudweed* in Chap. 180. aforegoing, to which I refer you.

CHAP. CLXXXII
Of CUDWEED Sea.

I. *HE Names.* It is called in *Greek*, *ῥαβδωδία*. In *Uhcroylov*: in *Latin*, *Gnaphalium Marmum*, *Elichryfim Sy heft re jlore oblongo bauhini*: in *Englijh*, *Sea Cudweed*.

II. *The Kinds.* It is a fingular Plant of the Sea kind, and is called for the molt part, *Cottonaria*, or *Cottonseed*: also *Gnaphalium Maritimum tomentofum*.

III. *The Description.* It has a long and woody Root, which perijbes not yearly, as several of the other forts do. From this Root rise up several small and very hoary white Stalks, seldom growing above a handful or half a foot high, set thick with many short, flat, and very white, soft and hoary or woolly Leaves, so bary as tho' they were nothing but Cotton, bearing at the top small hoary or cottony Heads, with a yellow, Thymb breaking out in their middle, these are the tops of the Stalks, look like small round Buttons, of Color and fashjon like to the *Common Cudweeds*. Within these heads, in a downy Bed, the Seed is contained, which is somewhat longer than the Seed of the others.

IV. *The Places.* It is found upon the *Weflern Sea Coasts of England*, in divers places. It is found growing also at a place called *Merezey*, six Miles from *Colchefer*, near the Sea side. It has also been gathered upon the *Sea Coasts of Wales*.

V. *The Times.* It flowers from *June* to the end of *Augufi*, and the Seed is ripe in *September*.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with the *Englijh and Com?wH Cudweed* in Chap. 180. to which you are referred: yet it is thought by some, who have made Tryal of both, that this *Sea Cudweed* is the stronger and more effectual Medicament to all the Purposes for which the *Common* is intended.

CHAP. CLXXXIII
Of CUDWEED American.

I. *HE Names.* This Plant, as far as I can learn, was wholly unknown to the *Greeks*; yet modern Authors have given it this *Greek Name*, *ἄργυροκώμη*, *Argyrocome*, (i. e. *Silver-leav'd*) in *Latin* it is called, *Gnaphalium Americanum*; and in *Englijh*, *American Cudweed*, -also *Live-long*, and *Life-everlasting*.

II. *The Kinds.* It is a fingular Plant of the kind: and is accounted one of the *Species of Gnaphalium Carolas Cluflus*, from the Likeness of the *Umbles* or *Tuffs of Heads*, tho' they are greater and whiter than those of the other kinds of *Cudweed*: all of which are of kin to the *Golden Tufts*. This Plant has been called by some of our *Englijh*, *Live-long* and *Life-ever lasting*, because of the *Durability* or long *Duration* of their *Flowers* in their *Beauty*.

III. *The Description.* This *Silver Tuft* or *Indian Cottonweed*, has *Roots* which are long, and black on the out side, creeping very much under Ground: from whence spring up many white Heads of Leaves, covered with a hoary Woollyness, like *Cotton*, which rising into hard, thick, round Stalks, contain in the middle a yellow Thymb upon them, as also upon the long and narrow Leaves which grow thereon, more especially on the under side for the upper sides are of a dark shining green color. The Stalks are divided at the top into many small Branches, each of which have many fealy, tufted Heads set together, covered over with *Cotton* before their opening, and then parting one from another, abiding very white on the out side when they are fully grown, but with a small yellow Thymb in the middle of each Flower, which in time will turn into yellow Down, apt to be blown away with every Wind.

IV. *Gerard* says, that this *Indian* is of greater Beauty than the rest, and has upright Stalks, three feet high or more, covered with a soft and fine Wool, and in such a plentiful manner, that a Man may with his Hands take it from the Stalk in great quantity. This Stalk is beset with many long and narrow Leaves, green on the inner side, and hoary on the other side, somewhat like in form to *Rosemary Leaves*, but greater. The Flowers do grow at the tops of the Stalks in Bundles or Tufts, consisting of many small flowers of a white color, and very double or compact, or as it were consisting of little Silver Scales thrust close together, which do make the same very double. When the flower has long flourished, and is grown old, then Comes there, in the midst of the Stalk, a certain brown yellow Thymb, such as is in the midst of the *Daily*: which flowers being gathered when they are young, may be kept in such manner as they were gathered, for the space of a whole Year after, and that in & close Ojett or else where: from this long keeping of their Yrejmfs and Color, it was, that our *Englijh Gemletbomen* called it *Liv'skriff* &c. to which, on this occasion, I very aptly answers.

V. The

set for a great lengthy with many small, white and sweet flowers, comparing it round, and hanging down round about it.

XII. The fixth, or Lady-Traces of Liege, have triple bulb'd Root, and sometimes Quadruple round and a little long, not much unlike in Shape to some kinds of Pears, the sharper end tending downward into the Ground, of which two are for the most part large, one small, out of which several small fibres proceed. The leaves of this are somewhat more like unto those of a broad-leav'd Plantane, but yet smaller and narrower, three or four at the bottom of the Stalk, which otherwise is bare, and has none upon it, and the Flowers are yellowish, like the others, at the top, one growing above another.

XIII. The seventh, or Yellow Lady-Traces with smooth Leaves, which has a Root composed of three small Bulbs, almost perfectly round, the one full, the other lank; from which spring up longer and smoother Leaves than those of the Friezeland Orchis at Sect. 9 foregoing, but the Stalks and Flowers are very like them, yellow of color, and pleasantly sweet: the figure of this Plant Lobel has given us from Cornelius Gemma.

XIV. The eighth, or Small creeping Orchis, has a Root very unlike all the rest, being long and full of Strings, growing thick together, and interlacing themselves one among another, yet have they at the upper part thereof, next under the Leaves, (as Carnevains says) some shew of small Bulbs sometimes to be seen. from these Roots arise Leaves which are thick and somewhat broad, like Plantane, of a dark green color: the Stalk is slender, and set full at the top with feveral white blowers, hotted with Blood-red Spots, farinfnbn will have this to come nearer to an Helleborine than an Orchis,

XV. The Places. These all generally grow in dry Grounds, Heaths and waste untill'd Places, in many places of England, but are for the most part nurs'd up with us in Gardens.

XVI. The Times. They all flower late in the Year, scarcely before August or September.

XVII. The Qualities. They are all (except the last) hot and moist in the second Degree, some lay hot in the first Degree, and moist in the second. They attenuate, are Stomatick and Hyfterick, Alterative, Analeptick and Spermatogenetick.

XVIII. The Specification. They stir up Luft, and cure Barrenness in either Sex.

XIX. The Preparations. You may prepare therefrom, 1. A liquid Juice. 2. An Ejence. 3, Sanguis or Blood.

The Virtues.

XX. The liquid Juice. Taken to 2 spoonfulls or more in Canary, or rather Alicant 1. In the Morning fasting. 2. An hour before Dinner. 3. At Four in the Afternoon. 4. An hour and half after Supper, just at going to Bed, it breeds much Seed, Itirs up Luft, strengthens the Instruments of Generation, and cures a simple Gonorrhoea, or Gleet of the thinner parts of the Seed.

XXI. The Effence. It has all the Virtues of the former, and may be taken in the same Dose, and at the same times, but it is much more powerful to all the Intentions, and is effectual to cure even Ulcers of the Prostatae from a virulent Cause.

XXII. The Sanguis or Blood. The Pulp of the Roots made by well beating them in a Stone Mortar, 4 pounds: Crums of Rye and Wheat Bread, of each 1 pound: mix them well together, adding a little white Wine, to make them pretty moist: fix the Bolt-head, flopping it well with Cork and Spermith Wax, or Sealing Wax, so that nothing may

trifnfnfire, digest in a warm Balneo or Horfe-dung: till the Matter is changed into a Rubicund or Bloody Chyle, then force it strongly out with a Press, putting the expressed Blood into a Balneo Vaporis, that by this second Digestion it may acquire a greater Redness, and some iceces may settle; which continue till the Blood becomes absolutely clear, and of a most perfect Red, which then separate from the Fences by decanting it: put this into a Glass Alembick, and in Balneo Vaporis abstract some of the thin, clear and limpid Water or Spirit, leaving the Bloody Extratt at the bottom of a very red color. This admirably corroborates the Womb, and the Vessels and Instruments of Generatn both in Man and Woman: it is a Specifick to cause Conception in Women, to remove Barrenness and cause Fruitfulness. It also cures Impotency in Men, and restores them to their Priftin Vigor. Dose 1 Spoonful Morning, Noon and Night in Generous Wine.

CHAP. CLXXXV.

Of CUMIN Garden.

*-THE Names. It is called in Greek, ΚΥΜΙΝΟΝ: in Latin, Cuminum: in Arabick Camum and Kemum; and in English, Cumin.

II. The Kinds. It is twofold, viz. 1. ΚΥΜΙΝΟΝ ἡ ἡμετέριον Cuminum Hortense, Garden Cumin. 2. ΚΥΜΙΝΟΝ ἡ ἄγριον Cuminum agreste, Wild Cumin* of this we shall discourse in the next Chapter.

III. The Garden kind is threefold, 1. ΚΥΜΙΝΟΝ ἡ κοινὸν Cuminum vulgare, Our ordinary Cumin. 2. ΚΥΜΙΝΟΝ ἡ γλυκὺν Cuminum dulce Cuminum melitense dulce, Sweet Cumin, and Small Cumin. 3. ΚΥΜΙΝΟΝ ἡ ἄγριον Cuminum acre, Cuminum melitense acre, Sharp tatted Cumin, and Great Cumin.

IV. The

IV. The Descriptions. *The first of these has a Root which is long, small, white, and perfuming every Tear, from whence spring up several slender Stalks, a foot and half high or more, and some of them not so high, each branching themselves out gradually, and growing white at length, having fit ore of heaves, which are small and long, like unto those of Fennel. The Flowers are somewhat reddish, growing in Umbels at the tops of the Stalks, which turn into small, long and almost round whitish Seed, crested or fraked on the rounder side, and smelling strong.*

V. *The second, or Sweet small Cumin, has Roots, Stalks and Leaves like to the former, and like it in its manner of Growing, but its Seed is small, and like unto Anise Seed, and sweet as Sweet Fennel Seed: so that it seems to be nothing differing from the former, but in the Shape or form, Magnitude, and very sweet Taste of the Seed.*

VI. *'HK ri'd, or Sharp-tasted great Cumin, is like the Ordinary or Common Cumin in its Roots, Stalks, Leaves, Branches, flowers and manner of Growing, saving that it is every ways greater; but it principally differs in its Seeds, for they are not only greater than those of the first or Ordinary Cumin, but they are longer also, and pointed at both ends crested likewise on the rounder side, and of a finer duller color, smelling more unpleasantly, and being very sharp upon the Tongue, hot, quick and biting, like Cubebs or Pepper.*

VII. *The Places.* They grow all of them in England, in our Gardens, the Seed being sown, but they are Natives of other hotter Countries, as Spain, Italy and the Islands of the Mediterranean Sea, & also in Syria, Palestina, and other Eastern Countries, where they grow familiarly and plentifully. *The first* grows in Perfumery, and other parts of the East, where I saw it in Perfumery. *The second* grows besides in all the places aforementioned, very plentifully in the Isle of Malta, where they put it into their Bread and other Meats, and Trade with it to other Parts in exchange for other Commodities. *The third* (as well as the first) grows in several parts of Arabia, Ethiopia, Mgypt, AM where it more admirably obtains that acrid or (sharp Taste) however, they delight to grow in puffed and hot

VIII. *The Times.* They often to Perfection with us, in the middle of the Year, and sown in the middle of the Year, yet it they flower and seed early, it is late with us before the

and greater than any which comes the Spring: Ruellius says, that a Shower of Rain presently following its Sowing, hinders much the Growth thereof. Gerard, sowed it in the midst of May, and it sprung up in fix days after, and the Seed was ripe in the end of July.

IX. *The Qualities.* The Seed, which is principally used, is hot and dry in the third Degree, full of Sulphur and Mercury, it is Aperitive, Anodyne, Altringent, Attractive, Carminative, Digestive, Diffusive, Diuretic and Sudorific, Cephalic, Neurotic, Stomachic, Pettoral, Nephritic and Hyfteric, Emmenagogic, Lithontriptic, Alexipharmic, Analeptic and Spermatogenetic.

X. *The Specification.* It has been found, by Experience, to be a singular Cure for the Colick.

XI. *The Preparations.* You may have, i. A liquid Juice of the green Herb, 2. An Effence of the

green Herb. 3. A Cataplasme of the green Herb. 4. A Powder of the Seed. 5. A Spirituous Tincture of the same. 6. An Acid Tincture thereof. 7. An Oily Tincture of it. 8. A Saline Tincture. 9. A Spirit of the Seed. 10. An Oil from the same. 11. A Spirituous Water. 12. A Balsam made of the Oily Oil. 13. A Decoction of the Seed. 14. A Cataplasme thereof.

The Virtues.

XII. *The liquid Juice of the Leaves.* It expels Wind and Urine, provokes the Terms, and is good against the Bittings of Mad Dogs, Serpents, and other Venomous Creatures. Dose 2 Spoonfuls at a time Morning and Night, in a Glass of Wine or Ale.

XIII. *The Effence of the green Herb.* It has the former Virtues, besides which, it prevails against the Colick and Fluxes of the Bowels, is good against Vapors in Women, is a good Peccoral, opening Obstructions of the Breast and Lungs. Dose 1 or 2 Spoonfuls Morning and Night in Wine.

XIV. *The Cataplasme of the green Herb.* It diffuses Wind in the Bowels, strengthens the Joints, diffuses windy Humors in those or any other parts, repercusses Humors in simple and recent Contusions, diffuses Flatulencies in the Scrotum, and prevails against the Gout.

XV. *The Powder of the Seed.* Mixed with Honey, (a dram at a time) it is Peccoral, and very good against Coughs and Colds. Mixed with good Wine, and put in the Nostrils, it is good against Bleeding there. We use it up into a Quilt, sprinkled with good Wine-Vinegar, and made very hot upon a Warming-pan with Coals in it, and so applied to the Side, it takes away Pains and Stitches, and gives ease in the Pleurisy. Taken to 1 dram in a Glass of Generous Wine, it eases Pains of the Stomach and Womb, gives Relief in the Colick, and is good against the Gripings of the Guts. It makes such use it much inwardly to look very pale.

XVI. *The Spirituous Tincture of the Seed.* It is a true Anticolick, given to 1 Spoonful in Wine or Ale, strengthens the Stomach, and restores the Tone thereof, and is a singular good thing against the Bloody-flux, and all other Fluxes of the Bowels.

XVII. *The Acid Tincture.* It is a most admirable Stomachic, expels Wind, strengthens the Ventricle, causes a good Appetite and an excellent Digestion; and if a Loathing or Vomiting is present, it presently removes them, restoring the Stomach to its pristine State of Health. Dose so much at a time as to make the Liquor pleasantly sharp. It gives ease in the Gout and cures it, if the Parts affected be bathed therewith for some time

the Chock to a Miracle, being given from 20 to 40 or so drops at a time, in a Glass of Wine, or some other proper Vehicle: it opens Obstructions of the Womb, provokes the Terms, and removes Sand, Gravel and Tartarous Matter from the Reins, Ureters and Bladder, and gives ease in a very short time. Anointed outwardly upon the Joints affected with the Gout, it gives ease and in a short time after cures it. It cures Cramps and Convulsions to a Miracle, by anointing it on the Part affected.

XIX. *The Saline Tincture.* Given from 20 to 40 drops, or more, in 3 Glasses of White Port Wine, it opens Obstructions of the Reins and Ureters, cleanses those Parts of Sand, Gravel or Tartarous Matter, and causes the Patient to Pass freely. Outwardly bathed upon places affected with the Gout,

it gives Ease and Relief. It attenuates, digests and diffuses Humors.

XX. *The Oil of the Seed.* It is a Specifick against Pains of the Stomach and Bowels, gives preference in the Cholick, as also in the Stone, provokes the Terms in Women, and has all the Virtues of the Spirituous and Oily Tinctures; Given ad gut, 12 or 20 in a Glass of Wine to a Woman in Travel, it facilitates the Delivery. It is good against Coughs, Colds, Asthma's, Shortness of Breath, Difficulty of Breathing, Wheezings, Hoarseness and other like Distempers of the Breast and Lungs. It increases Seed, provokes Lust, strengthens the Instruments of Generation, restores in Consumptions, breeds Milk in Nurses, and refills Poyson: it is also prevalent against the Bittings of Vipers and other Serpents; also the Bittings of Mad Dogs, and other Venomous Beasts, being inwardly taken, and outwardly applied to the place.

XXI. *The Spirituous Water.* It may be used as a Vehicle for any of the former internal Preparations, and has in some measure all their Virtues: it is a very good thing for Nurses to take, because it very much promotes the breeding of Milk.

XXII. *The balsam.* It is made of the Chymical Oil, mixt with six times its quantity of pure Oil of Nutmegs by Expression. It is of wonderful life to anoint the Genitals of a Man, who is grown Impotent either by Age, Accident, or a long Diffusion of the A& ^ the Oil of the Seed being in the mean Season taken inwardly. Anointed upon Parts affected with Cramps and convulsions, it generally cures them and strengthens any Part which is much weakened, either by the Gout or other Accidents. Anointed on the Stomach and Side, it comforts them, and eases the Pains of the Pleurisy.

XXIII. *The Decoction of the Seed in Wine.* If Figs are added in the Boiling, it will be the more Peccoral, and so be good for such as are Short-winded, or are otherwise troubled with an old Cough, Hoarseness or Wheezing, Difficulty of Breathing, and other Diseases of those Parts, and withal it expels Wind from the Stomach and Bowels: and if it is constantly drunk for a whole Year together, it obliterates the very Roots and Foundation of the Gout, and by keeping of the Body soluble, and sweetning all the Juices, it carries off the Tartarous Matter which breeds that Disease, and that without either Purging or any other Medicine. But when it is thus generally used, the Decoction must be made sometimes in Water and sometimes in Wine, for the Stomach sake, and it must be used as the Patients common Drink. I say all this from manifold Experience.

XXIV. *The Cataplasin of the Seed.* If it is bruised and jryed with Yolks of Eggs till they are hard, and then beaten up with a little Oil of Nutmegs by Expression^ or with some of the former Balsam* and applied to the Head, (the Hair being first shaved off) it gives wonderful and speedy Relief in an old Head-ach, tho' it be vehement, more especially if it comes from a cold and moist Cause, and applied to the sack part of the Head, it flops the Rheum which falls into the Eyes, and helps such as are Blood-thotten^, more especially if withal it is made with Wax into the Form of an Emplaster, and applied warm over the Eye-lids. The Cataplasin made only with the Seed and Yolks of Eggs, and applied to a simple Contusion, diffuses it: but with the Oil of Nutmegs* being applied to the Scrotum, it is excellent to discuss a windy Tumor of that Part.

CHAP. CLXXXVL

Of CUMIN Wild.

THE Names. It is called in Greeks *K^xmv* T&hvw \$ £-> *exov*: ill Latin, *Curmnum Syhdjire*: in English, *Wild Cumin*.

II. *The Kinds.* Authors make three kinds here* 0^ viz. 1. *Kiljuvov el yaw-* *Cuminum Sylvestre*, *Cuminum primum Dioscoridis*, (according to *Matthiolus*) *Cuminum globosum Camerarii*, *Cumin x^n Capitulis globosis Bauhini*, also *Leporum Cubile^ Sialimene^* as it is called in the Isle of *Lem^ios*, Wild Cumin. 2. *CmKoovy^ V7ri<piovy Hypocoum* and *Hypopheum^ Hypocoum verum Dioscoridis*, (according to *Dodon. vus* and *Clusius*) *Cuminum Sylvestre alterum vel Siliquosum Camerarii^ Lugdunensis, Tabernmontani £? Lobelii^*, *Cuminum Sylvestre Corniculatum Gerardi^ Hypocoum Legitimum Bauhini^* The second or Horned Wild Cumin. 5. *Cuminum Siliquosum alterum Dioscoridis, Lobelii, Pen<e, Lugdunensis, Cuminum Sylvestre tertium, & Siliquosum minus Tabernmontani, Hypocoum alterum Bauhini^* The second Horned or small Coded Wild Cumin.

III. As for these two latter, the? *Camerarius, Dodonaus, Lobel* and *Gerard^* with some others, do account them as Species of *Cumin^* or kinds of *Wild Cumin*, yet they are scarcely so to be accounted, for that they have neither the Appearance or outward Resemblance of them, neither yet the Medical Qualities or Virtues answerable to them, but rather have the Qualities and Properties of *Poppies*: however, because Custom has given them the Name of *Wild Cumin*, we submit, and rank them in the same Order.

IV. *The Descriptions.* the first, or Wild Cumin, has* a Root which is small and white, with some fibres adjoining to it, and quickly perishes with the least Moisture or Dew of cold Nights, and therefore

comes not often to Maturity in our Country : from this Root froot forth feveral long, rough andfome-what hard winged Leaves, confining of many lejj'er Leaves, each of which are finely dented about the edges, which are in tajhion almoji like the fmalleft Leaves of Wild Parsnep : from among which Leaves jprings up a slender, weak, bending Stalk, about a foot high, much like to Peften Veneris, divided at the top into many parts, each of which has a round vohitih Jeft and woolly or downy head or Ball, flanding upon a fmall i'oot-Jlalk, viz. round and hairy Buttons or Knobs, like Arçlion Montanum, or Bardana minor Montana, a* Diofcorides has obferved, or like to the Plane-tree Heads or Balls : within which Heads is contained a downy Suhfiance, among(t which is the Seed, like the Seed pf Dens Leonis, but much lejj'er.

V. The feconi, or Horned Wild Cumin, which is the Hypecoum Legitimum, has a fingle, long and thick Root, with fome Fibres appendent to it, which dies every Tear, at the Jirfl approach of Winter, and is with us very hardly made to fpring again, but by an Autumn Sowing : from this Root fpr ing forth feveral long winged Leaves lying on the Ground, very much divided, and cut into many parts, not much unlike to the Leaves of Sefeli or Maflilia, of a pale or whit ifh green color, fo like unto Fumiterry in the color of the Leaves, as alfo fomewhat near to it in the many Divifions and Parts thereof, that it may eafily deceive one who does but flightly look upon it, but the Leaves are fmaller and thinner, and, more gentle in handling (itW growing larger in Spain, as Clufius has obferved.) In the midji ofthele Leaves rifes up a Stalk (or two) a Cubit high or more, very fmooth and zvhitijh, with fome fine jagged Leaves thereon, which is divided towards the top into feveral Branches, at the tops of which come forth fine fmall yellow flowers, confifting of fix Leaves apiece, two of which are larger than the rejf, and edged with green on the out fide, and ft and one oppofite to anothe the rejf being fmall, and Scarcely to be difcerned but when the Flower is blown open -, the flowers being pafs'daway, there fucceed long, crooked, fiat Horns, Husks or Cods, crooked, large and full of Knots* Joints or Divifions, fomewhat like unto the Husks or Horns of the Scorpioides Matthlioli, but greater and longer ^ in the feveral Joints whereof lye feveral fquare yellowifh Seeds, fmall and flat, and almoji like to thofe of Galega or Goats-Rue, which are very difficultly to be taken out and feperated from the Husks or Skins. TJ)e Tajfe of the whole Plant is unpleafant.

VI. The third, or Small Codded Wild Cumin, has a Root much like the former; the Leaves are alfo fomewhat like, not fo broad and long as thofe, but more cut in, and finely dented and divided, fomewhat like unto Sefeli or Hartwort of Marfelles, or Wild Chervil. The Stalks are fmooth, fmall and tender, full of Branches and Leaves, much like unto the fmall Leaves of Caraway or Pe&en Veneris. At the tops of the Stalks and Branches come forth pretty yellow flowers, made of five pointed Leaves, and much like to thofe of Great Celandine or Rocket, faving that they are fomewhat lefs. Thefe being pafs'd away,, long Pods fucceed them, zvhich hang down, and ft and not upright, nor are crooked, like the former; but the Seeds within the Cods are feverally diftintf, and feperated one from another by equal Partitions, in fmall Croffes, yellow of color and fomewhat long, larger than the other afongoing, and not much unlike to Galega or thofe O/Goats-Rue.

VII. The Places. They are found Natives of Gallia, Lycia, feveral places of Afia, Italy, Spain and trance, and grow in our Gardens here in England only by lowing the Seed.

VIII. The Times. They flower not with us till the middle of Summer, viz. July and Augufi, and give their Seed late, viz. in September \$ but the firft feeds very late, and is feldom good. Gerard fays, that the fecond did ilourifh and flower in his Garden.

IX. The Qualities, Specification and Virtues of the firft, are the fame with thofe of the Garden Cumin in the former Chapter, to which you are referred. But as for the two latter, tho' they feem to be of the Nature of Poppies, yet fince no Author has laid any thing of them, we fhall be filent concerning the fame.

Sukutemay be admittet V^ or X^ iz.

a quid pro quo, is to be allowed of when the true Ingredient is, to be had, forafmuch as no Subfrikute can be jo eftetual to every Intention as the Genuine is: this Abuse ought indeed to be reified for the future.

V. The Defcriptions. The firft, or Common fweet round kind, has a Root which is compofed of many long and round blackijh brown fmall Root, of the bignefs of fmall Olives, or Roots of the dearer Filipendula, which are fanned together by long Strings, and are of a fweet Smell, even whilji they are green, but more when they are dry. which then

are of a bitter Ta^{ie}, fomewhat like unto Galanga : from this Root jhoot forth many Heads of long and narrow Leaves, fomewhat ridg'd in the middle, eijery Leaf feemirtg thereby to be three fquare, and fomething hard and rough in handling *, fzOeet alfo in Scent: from among thefe Leaves rife up manyfmooth fquare Stalks, about a yard high, fluffed with a white Pith, and not hollow,* without any Knöt or Joint therein, unto the very tops, where there ft and a few jhort Leaves, and many fmall Panicles or chaffy green Spikes, or Ears of Jmall Leaves above them, which afterwards contain the Seed within them.*

VI. The fecond, or Long-rooted fweet Cyperus, has Roots which are of a moderate bigneſs, long and round, and of a black or blackijh brown color on the out fide, but whitijh within, full and firm, and creeping hither and thither, taking up much Ground, by reaſon of their ſpreading ^ it creeps under the Superficies of the Earth, round about, by which it it quickly much increafed* and is of a moſt pleaſing fweet Smell when it is broken, tW it be green and frejh, dnd yet more pleaſant when it is dry. From this Root Jpnng forth long Leaves, which are a* it were three fquare, like the former, and a* rough and hard in handling alfo, almoſt like unto the Common Reed, but that they are lejfer and Jhorter. The Stalk Ufmooth and three fgmre, fluffed with a white Pith, lke the former, and riling three feet high or more, arid having alfo fome Jhort narrow Leaves at the tops thereof*, and fmall long Panicles, like unto the othdr in all things, fo that they are ſcarcely to be difcerned afunder above Ground, the only or chief Difference confiſting in the Root.

VII. The third, or Marfli kind, has Roots which are tuberous and almoſt round, hard and black, and without Smell, many Tubers hanging fometime upon one String ^ they are not large, but grow almoſt after the manner of Virginea Potatoes, white and firm within. The Stalk and Leaves are much like to the firſt kind, but the Heads are unlike, for theſe are rough and blackijh, about the bigneſs of a Filbert,

hanging about fix or feven in number, at top of the Stalk.

VIII. The Places. The firſt and fecond of theſe grow naturally in Fenny Grounds, yet they thrive very well in Gardens, as we daily fee by Experience, The firſt grows naturally in Italy and Spain, as alfo in Mgypt by the River Nilus, as Alpinm fays, but is only to be found with us in our Gardens, where, unleſs much Care be taken, it difficultly endures the Hardſhip of the Winter. The fecond grows in Syria and Candy, but with us only in Gardens. The third and laſt grows about Ditches and the Banks of Rivers, where Salt or Sea Water comes : it is found plentifully in the Marhes below Graveſend, in ShiPey, Tenet and other like places.

IX. The Times. The firſt flowers or bears its buſhy Tops in Auguſt, with us here in England: The fecond produces its tuſſed Head in July, or towards the end of that Month, for the moſt part: and the third Flowers always in July and Auguſt.

X. The Qualities. The Roots are only of life, and are accounted hot and dry in the fecond Degree • they Attenuate, are Aperitive, Abfterfive, Afringent, Carminative, Digeſtive and Diuretick ^ Cephalick, Stomatick, Nephritick arid Hyfterick ^ Lithontrip-tick and Alexipharmick.

XI. The Specification. They are peculiar againſt the Stone, Gravel and Obſtruition of Urine.

XII. The Preparations. You may have there* from, 1. A He coition in Wine or Waterm 2. A Pou* der: 3. A Cdtaplafm. 4. Afhes. 5. 'A Spirituous Tinfſſure. 6. Art Acid Tint'ure. 7. An Oily Tin* Sure. 8. A Saline TmSure.

The Tirtuei.

XIII. The Vecobion iri Wine or Water. If it is made in Wine, it ought to be White Port Wine : it cleanſes, fweetens and purifies the Blood and Juices of the Body, provokes Urine, and helps to break the Stone in the Bladder, and to abate the Water in a Dropfy, to wit, in an Anafarca, being drank Morning, Noon and Night, oroftner, half a pint at a time. It provokes the Terms, and is good againſt Pains of the Mother or Womb, more eſpecially, if, beſides taking it inwardly, it be injected up, and the Region of the Womb be alfo bathed therewith warm. It is good alfo to waſh all forts of foul and naſty Ulcers of the Gums, Mouth and Throat, as alfo eating Cankers, for that it cleanſes, dries and heals them. It opens Obſtructions, and provokes the Terms in Women : it alfo helps i itinking Breath, being drunk for ſome time.

XIV. The Pouder. It is an excellent Remedy for all running Sores, old Ulcers, Cankers, tha* ſpreading and eating, in any part of the Body h it flops Putridity, cleanſes, dries and heals, doing whas it does without any thing of Heat or Sharpneſs. It dries up the over much Moifture of Ulcers, and by its Afringent Quality, helps all forts of fore Mouths, and Ulcers in the ſecret Parts. It is of an inciding or cutting Quality, and therefore given to one dram Morning and Night in a Glaſs of iWhite Port Wine, it provokes Urine and the Terms, and helps ſuch as are troubled with the Stone, the De* coction in Wiſe being drunk inwardly alfo at the iame time.

XV. The Cataplafm. It is made of the Ponders of the Roots, and B'y-berries, mixed in equal quan* tities, and made up with Boys Urine. This being laid upon the Belly of one that has the Dropfy, is ſaid to help them very much, ^ taking at the iame time the Decoction inwardly oftentimes.

XVI. The Afhes. They have the Virtues of the Pouder, but are more flaarp, by xeaalbn of the Salt contained

contained in them. *Alpinus* fays, that the *Mgyptians* did much vse both the Pouder of the Roots, and alib the *Athes* of the fame, to cure *Ulcers* both of the "Mouth and fecret Parts.

XVII. *The Spirituous Tinware.* Taken in the Morning failing, as also an hour before Dinner, at Four in the Afternoon, and at Bed-time, to the quantity of 2 drams, in Canary or other Wine, or some other convenient Vehicle, it comforts and warms the Stomach, Brain, Nerves, Lungs, Womb and Blood : and if it is taken for some time together, it warms a cold Habit of Body, strengthens the natural Faculties, fortifies the Heart and invigorates the Spirits.

XVIII. *The Acid Tincture.* It is a most admirable Stomack, incides, opens, cleanses, strengthens, warms, comforts and restores the Tone of the Stomach and the other Viscera. It provokes Urine and the Courfe, is good against the Stone, as also Vomiting, Sicknefs at Stomach, want of Appetite and Indigeition, and is good against Catarrhs proceeding from a cold and moist Cause. Dose 30 or 40 drops, more or less, to a pleasing Acidity. It gives comfort to such, who, by long Sicknefs, are much spent, the whole Body being weak, the Stomach profligated, the Heart dejected, and the Spirits fainting.

XIX. *The Oily Tincture.* It comforts the Nerves, and being outwardly bathed upon Parts affected with Cramps, Convulsions, Numbnefs, Trembling, Palsy, extream Coldnefs of any Part, Pains or Aches, Gout or Sciatica from a cold Cause, it cures them, being constantly used Morning and Night for some considerable time. It is good also to prevent Gangrens, and cure the Contusions or Punures of the Nerves, immediately following the Pain. Anointed on the Head, it cures a Head-ach from a cold Cause. Given inwardly Morning and Night from 15 to 30 or 40 drops, in White Port Wine or some other specific Vehicle, it helps Crudities, warms and comforts the Brain, Nerves, Stomach and Womb, expels Wind from the Bowels, is good against Barrennefs from a cold and moist Cause, prevails against cold Catarrhs, fortifies the Senfes, helps against Coughs, Colds, shortnefs of Breath and difficulty of Breathing. It provokes Urine and the Terms, is good against Dropfies, and expels Sand, Gravel and other Tartarous Matter out from the Reins, Ureters and Bladder.

XX. *The Saline Tincture.* It gives ease by bathing therewith, in the Gout proceeding from a cold Cause. Inwardly taken, from 1 to 2 drams in some proper Vehicle, it is very Diuretick, provoking Urine, and expelling the Recrements of the Urinary Passages, as also Water in Dropfies.

CHAP. CLXXXVIII

Of CYPRESS Moss or Heath.

I. Names. It is called in *Greeks* *X&y.atw*. * *TM&* : in *Lat* in, *ChamacypariJJus*, *Cupressifl/s*, vel *Cyprejjus pumila*, (*herba nomen*) *Cupressiflm* vel *Cyprejjus -mufcofm* : in *Englilh*, *Moss Cypress*, or *Heath Cypress*.

II. *The Kinds.* It is without doubt one of the kinds of *Moss*, and *Singular* is *fui generis* for which Reason Authors have called it also, *Aufcus claoatm* and *upreffiformis*, *Mufcus clavatum foliis*, *CupressiflHhiqui Sclo?linii* Kb. r[^] cap. 11. *Savinia byljejins* *Iragt*, *Chamxycpariflm*, *Tabernmontani* E?

Turneri ^ and in *Englilh* it is not unfitly called. *Heath Cypress*.

III. *The Description.* It has a small fibres or flimy Root, from whence spring several Stalks some rough and others naked, being Lid and branched, with very short and thick Leaves grow on them, something resembling a Branch of the Cypress-tree and of a dark green color, bitter in Taste without Smell from the tops whereof sometimes spring forth small and soft spiked Heads, viz. such bars or Catkins as are those of the Club or Woolf-BawMois, which are of a yellowish color and growing on small Foot-stalks. This Herb is a low Plant, and abides always green, both Winter and Summer.

IV. *The Places.* It grows in Woody and Mountainous places, where they call it *Wild Savin*.

V. *The Times* It flourishes and is in its chief Verdure in the Summer Months.

VI. *The Qualities.* It is temperate in its Nature, and is good for the Cure of the following Diseases.

VII. *The Specification.* It is good for the Handling of Blood, and for the Cure of the following Diseases.

VIII. *The Preparations.* You may use it in the following manner. 1. A Decodion in Red Wine. 2. A Tincture. 3. A Pouder.

The Virtues.

IX. *The Decodion in Red Wine.* It is good for the Cure of the following Diseases, and cures the following Diseases, if it is recent. It also follows the Terms in Women, and is good against the following Diseases: Wounds and Illnesses waisted therewith, it dries and heals them.

X. *The Spirituous Tincture.* It strengthens the Stomach, stops Vomiting and Fluxes of the Belly, and gives ease in griping Pains of the Bowels and stops the Loches in Women in Child-bed. Dose from 2 to 4 drams, Morning and Night, in Canary or other fit Vehicle, as the Occasion requires.

XI. *The Pouder.* Inwardly given to one dram,

it flops Fluxes and pfitting of Blood : outwardly applied, it flops Bleeding in Wounds •, and ftrewed upon moift and running Ulcers, it cleanfes them, dries up the Humidities, ftrengthens the Part and induces the healing.

CHAP. CLXXXIX.

Of D A F F O D I L Broad-leav'd fingle, one flowered.

L. >~w-* H E Names. It is called in *Greek* $\alpha\lambda\lambda\alpha\delta\epsilon\iota\sigma$: ' X in *Latin* * *Narciffus* h and in *Engliffh*, *Daffodil*.

II. *The Kinds*. It is divided into two principal kinds, 1. N*?Jk©- *A»9^ *Narciffus verus*, The true or right *Narciffus* or *Daffodil*. 2. N<*,*UC- yf©, *Narciffus nothus*, *Baftard Daffodil*.

III. *The true kind* is genus to four other fubordinate Species, viz. 1. N*?xf©- vr*a.Tv<pv\&, *NarciJJus latifolius*, *Broad-leav'd*. 2. swfyt/A*©-, *Anguftifolius*, *Narrow-leav'd*. 3. '2%n*iri<'> *Junceus*, *Rufh Daffodil*. 4. 'ExJJW £ 8**<fej©-, -^>^7- ^//J, *Sea Daffodil*. And thefe four forts divide themfelves again into eight other inferior Species, viz. 1. *Narciffus latifolius monanthos, fimplici fiore*, *Broad-leav'd Daffodil*, with one fingle Flower, of which in this Chapter. 2. *Narciffus latifolius polyanthos fimplici fiore*, *Daffodil broad-leav'd*, with many Flowers, fingle-flowered, of which in Chap. 190. 3. *Narciffus latifolius multiplici fiore, vel fiore pleno*, *Broad-leav'd Daffodil*, with a double Flower, of which in Chap. 191. 4. *Narciffus anguftifolius fiore fimplici*, *Daffodil narrow-leav'd*, with a fingle Flower, of which in Chap. 192. 5. *Narciffus anguftifolius fiore pleno*, *Daffodil narrow-leav'd*, with a double Flower, of which in Chap. 192. 6. *Narciffus junceus fiore fimplici*, *Rufh Daffodil fingle-flowered*, of which in Chap. 194. 7. *Narciffus junceus fiore multiplici*, *Rufh Daffodil double-flowered*, of which in Chap. 195. 8. *Narciffus marinus, vel litoralis*, *Sea Daffodil*, of which in Chap. 196. following.

IV. *The Bajiard kind* is genus to four other fubordinate Species, viz. 1. VwJbvitMa*©- WK&TVWAA©, *Pfeudonarciffus latifolius*, *Baftard Narciffus broad-leav'd*. 2. YevJWf*flj©- riVQ<pvK\&, *Pfeudonarciffus anguftifolius*, *Baftard Daffodil narrow-leav'd*. 3. SajW/w, *Junceus*, *Baftard Rufh Daffodil*. 4. &a- Actj©-, *Marinus*, *Baftard Sea Daffodil*. And thefe four forts divide themfelves again into fix other inferior Species, viz. 1. *Pfeudonarciffus latifolius fimplici fiore*, *Baftard Daffodil broad-leav'd fingle-flowered*, of which in Chap. 197. 2. *Pfeudonarciffus latifolius fiore pleno*, *Baftard Daffodil broad-leav'd double-flowered*, of which, in Chap. 198. 3- Pf*"- donarciffus anguftifolius fiore fimplici, *Baftard Daffodil narrow-leav'd fingle-flowered*, of which in Chap. 199. 4. *Pfeudonarciffus anguftifolius fiore multiplici* *Baftard Daffodil narrow-leav'd double-flowered*, of which in Chap. 200. 5. *Pfeudonarciffus junceus*, *Baftard Rufh Daffodil*, of which in Chap. 201. 6. *Pfeudonarciffus marinus*, *Baftard Sea Daffodil*, of which in Chap. 202. following.

V. *Thefe are the moft general Heads of Daffodils*; the particular Species of each are manifold, all which we will not promife to treat of in this Work -, but the moft noted fingulars under each Head, we fhall difcourfe of, with what Brevity is poffible, to the fakes of fuch as are *Florifts*, or *Lovers of a*

Flower-Garden. Thole then which we are to treat of in this Chapter, are the firft of the aforementioned fub-fubordinate Species, viz. *Narciffus latifolius monanthos fimplici fiore*, *Daffodil broad-lea v'd fingle-flowered*, having but one Flower upon a Stalk, and fometimes by Accident but two Flowers at moft.

VI. Authors make about twenty four fingular kinds of this; we (hall only defcribe twenty of the moft ufual, viz. i. *Narciffus latifolius omnium maximus, amplo calice flavo, five incomparabilis vel nonpareille*, The incomparable or great none-fuch *Daffodil*. 2. *Narciffus omniu?n maximus fiore iff Calice flavo*, The incomparable great yellow *Daffodil*. 3. *Narciffus grifeus maximus calice flavo*, The gray peerlefs *Daffodil*. 4. *Narciffus latifolius fiore flavo, amplo calice*, The letter yellow nonpariil, with a large Cup. 5. *Narciffus Indieus fiore rubro, diffus Jacobtus*, The Weft Indian *Daffodil*, with a red Flower. 6. *Narciffus Trapezunticus fiore luteo pr<ecociffimus*, The early *Daffodil* of *Trebizond*. 7. *Narciffus albus pracox minor oblongo calice luteo*, The fmall early white *Daffodil*, with a long Cup. 8. *Narciffus pallidus pr<zcox oblongo calice flavo*, The early Straw-color'd *Daffodil*, with a long yellow Cup. 9. *Narciffus albus ferotinus major oblongo calice luteo*, The great late-flowering white *Daffodil*, with a long yellow Cup. 10. *Narciffus pallidus ferotinus oblongo calice flavo*, The late Straw-color'd *Daffodil*, with a long yellow Cup. 11. *Narciffus albus ferotinus oblongo calice flavo, duvbus floribus in caule*, The late white *Daffodil*, with a long Cup, and two Flowers on a Stalk. 12. *Narciffus medio-luteus vulgaris*, The common Engliffh white *Daffodil*. 13. *Narciffus ?iediocroceusjerotinus*, The late-flowering white *Daffodil*. 14. *Narciffus medio purpureuspracox*, The early purple-ringed *Daffodil*. 15. *Narciffus medio pur pure usferotinus*, The late purple-ringed *Daffodil*. 16. *Narciffus medio purpureus maximus*, The great white purple-ringed *Daffodil*. 17. *Narciffus medio purpureus fellaris*, The ftarry purple-ringed *Daffodil*. 18. *Narciffus Perficus*, The *Perfian Daffodil*. 19. *Narciffus ~Autumnalis major*, The greater *Autumn* or *Winter Daffodil*. 20. *Narciffus Autumnalis minor*, The letter *Autumn* or *Winter Daffodil*.

VII. The Decriptions. *The fir ft.* Incomparable Nompaille, or None-fuch Daffodil, ha* a greccr bulbous Root, as large ax other Daffodils, which bear large blowers, which is covered over with a browlujh-Coat or Skin •> from whence comes three or four long and broad Leaves, of a greyijh green color •, amonp which rifes up a Stalk two feet or more high, at top whereof, out of a thin skinny Husk, which all Daffodils have, comes forth one large fingle Flower, (commonly no more) confifing of fix very pale, yellow, large heaves, the bottom whereof, next unto the Stalk, is narrow and round, rifing wider to the Mouth, which is very large and open, and unevenly cut in or dented about the edges. The Calice or C, much refembles one of our old Silver Beakers, with a narrow bottom, and a wide Mouth. The Flower being paf, there comes fometimes (tho not often) a round green Head, and a black round Seed therein

VIII. *The fecond.* A Daffodil of a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

IX. *The third.* A Daffodil of a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

X. *The fourth.* A Daffodil of a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

XI. *The fifth.* or Weft Indian Daffodil, bat a round large bulbed Root, of a brownifh color on the outfide and white within, which fends forth feveral broad Leaves, fomewhat like to the Common white

XII. *The fixth.* or Early Daffodil of bus abu/hwRoot, but not very great,

the outfide, and yellow under that blackifh or outwdrmoji Coat, fo very like to the Autumn Daffodil, (excepting for that Tellovbnefs) that they may eafily be mifiaken one for another : it has three or four very fhort green heaves, very like to the heaves of the Autumn Daffodil, excepting that thefe are not fo broad or fo long, nor fpring tip in Autumn. In the midjl of thefe heaves rifes up a fhort green Stalk, four, five or fix inches high, bearing at the top, out of a whit iff) thin Skin, ftripedwith green, one flower a little bending downwards, confifing of fix heaves, laid open abnoft in the fame nanner with the former

XIII. *The feventh.* or Small early white Daffodil, has a bulbous Root of a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

XIV. *The eighth.* or Early Straw-color'd Daffodil from a bulbous Root has green heaves, as the former, but much narrower -, the heaves of the Flowers are more enclining to yellow, but yet very pale, as if of a light Straw color, feeming to be a little more narrow, and pointed, as the former: the Cup is long and yellow, and the Smellfweet, like the loft.

XV. *The ninth.* or Great late-flouring white Daffodil, has a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

XVI. *The tenth.* or Small late-flouring white Daffodil, has a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

XVII. *The eleventh.* or ill Daffodil, has a moderate largenefs, yet leffer than the Roots of the later kinds ^ from whence fpring heaves broad, very green, and not whitifh, three or four

XVIII. *The twelfth.* or Small white Daffodil, (feilfo Primroie Peerlefs) has a moderate large bulbed Root, increafing more than a better Plant, from whence fpring long limber broad Leaves, of a greyijb green color, among winch rifes up a Stalk bearing at its top, out of a skinny husk, fometimes but one Flower, but moji commonly im-

/eldom three', (but larger for the most part than any which bear many Flowers upon a Stalk) of a pale whitish Cream color, near to that of a pale Primrose, with a J^omall round flat Crown, rather than a Cup, in the middle, of a pale yellow color, with some pale Chives standing therein, and of a pretty sweet Smell.

XIX. The thirteenth, or Late-flowering white Daffodil, has a bulbous Root, like the former, but the Leaves are shorter, and the Stalk rises not J^o high by ??iuch, and bears but one Flower, of a pure white color, made of six Jhall Leaves, and something narrow, standing severally one from another, and not Jo clofe together as the former, but appearing like a Star -, the Cup is /mall and round, of a pale yellow color, but Saffron like about the brims, having six /mall pale Chives in the middle, the Smell of which is much fleetier than the former.

XX. The fourteenth, or Early purple-ringed Daffodil, from a bulbous Root, has many long greyish green Leaves, somewhat narrower and stiffer than the former Common white Daffodil, among which rises up a long naked hollow Stalk, (as all other Daffodils have) bearing at the top one Flower, (/eldom two) consisting of six long white Leaves, standing do/* together about the Stalk: the Cup is yellow, and /o flat, that it might rather be called a Crown, for it stands very clofe to the middle, and very open at the brims, circled with a reddish or purple colored Ringi having also several Chives in the middle of it, whose Smell is very sweet, exceeding /everal other kinds.

XXI. The fifteenth, or Late purple-ringed Daffodil, from a bulbous Root, greater than the last, ha* Leaves broader than it, some being near twice a* broad. The Flower is like the former being large, and its JLiavcs standing clo/e, one to the sides of another. The Ring also, which compasses the yellow Coronet, is sometimes of a paler reddish purple, and /ome times of as deep a red of the former, from which it differs not any thing else, but in the time of Flowering, which is not until the other is paji and gone: the Smell is sweet, like the former.

XXII. The sixteenth, or Great white purple-ringed Daffodil, has a bulbous Root, greater than the former, as also its Leaves and Flowers, the largenejs of which makes it only to differ from the last, and to be a diftint kind, it flowering with the later of the Purple-ringed Daffodils.

XXIII. The seventeenth, or Starry purple-ringed Daffodil, from a bulbous Root has a little narrower and greener Leaves than the former kinds: the Flower has six white Leaves, not Jo broad, but narrower, and /eeming longer than they, not clofing together, but standing apart one from another, making it /eem like a white Star: it has also a yellow Coronet in the middle, circled about with purple, like the former, /melling /weet, but nothing Jo /weet as the Early purple-ringed Daffodil.

XXIV. The eighteenth, or Perlian Daffodil, has a bulbous Root, a little blackish on the out side, somewhat like the Root of the Autumn Daffodil following, From this Root rises up a naked Stalk about a foot high, bearing one pale yellow Flower, breaking thro a thin Skin, which first enclod it, composed of six Leaves, the three outermost being a little larger than the rest, and having in its middle six /mall Chives and a larger Point el, of an unplea/ant Smell. After the Flower is past -> the Leaves come up, somctvnc before Winter, but most usually after the deep of Winter is past, in the beginning of the Tear, which are broad, long, and of a pale green color, like the Leaves of other Daffodils, but not green, as the Autumn Daffodil is; they also twine them/elves a little as /ome of the Pancratium or Baftard Sea Dar

bdils do. This differs from all other kinds of Daffodils in its manner of Growing, for it has never Leaves und Flowers at one time together, wherein it is like unto a Colchicum, but in Root and Leaf it is a Daffodil.

XXV. The nineteenth, or Greater Autumn Daffodil, has a Root great and round, covered over with a blackish Skin, from whence rise up three or four fair broad and Jhort Leaves at first, but afterwards they grow longer, and of a very deep green color; in the middle of which rises up a Jhort /tiff round Foot* /alk, bearing one fair yellow Flower, enclod at first in a thin Skin or Husk, and composed of six Leaves, as the former, with /everal Chives in the middle, as most other Daffodils have, which pass away without any appearance of Seed, or Head for Seed, tho under the Head there is a little green Knot, which possibly might contain and bear Seed, if the Clime teas warm and friendly-enough, or our /harp Winters did not hinder it.

XXVI. The twentieth, or Lesser Autumn Daffodil, has a Root like the former, but lesser, and covered with a like blackish Skin; from whence spring forth deep green-color*d Leaves, as in the last, but smaller and narrower, a little hollow in the middle y and after them the Stalk and Flower, which is lesser than the other, and a little paler, consisting in fiti fuch like Leaves, narrow and Jharp-po'wted. Clufius /ays, that the flowering of this Daffodil is more like to the Perlian Daffodil at fe. 23. above, than to the former Great Autumn kind, tho with us it seems to imitate the latter or Great Autumn moli, in sending forth its Leaves first, then its Stalk and Flowers.

XXVII. The Places. Whence the first, /cond, third and fourth first came, is now unknown: the fifth the Title shews came out of the West Indies and was first brought into Spain, and from thence it was sent to us, and into several other parts of Europe: the sixth came from Conjhmtinople or T/epuzuntia: the seventh, eighth, ninth, tenth and eleventh are Natives of the Pyren&an Mountains, from whence they have been brought to us: the twelfth is said to grow naturally in England, and is plentiful enough in all Country Gardens: the Original of the thirteenth is unknown: the fourteenth, Sixteenth and Jeventeenth are Turkish Plants, and came to us from Constantinople: the fifteenth grows in many places of Europe, as in France, Germany and Italy, as Clufius has said: the eighteenth grows in Pcrjid and Turkey, and came to us from Con ft ani nople: the nineteenth, twentieth and twenty-first are also Turkish Plants and were lent to us from that Metropolis. Now, by Transplanting and great Care, they are made Denizons, if not Natives, with us, and are to be found in most Gardens of our Great and Excellent Florists.

XXVIII. The Times. The first, /cond, third and fourth flower in March, but most in April: the fifth flowers in June and July: the sixth flowers in December, if the former part of the Winter has been mild, but most usually in the end of January, or in the beginning, middle or end of February: the seventh, eighth, ninth, tenth and eleventh flower in the latter end of March and thro the Month of April: the twelfth ilowets about the middle or end of April: the thirteenth flowers in May: the fourteenth flowers early in March: the fifteenth, sixteenth and /eventeenth flower about the middle or end of April: the eighteenth, nineteenth and twentieth flower about the end of September and in October.

XXIX. The Qualities. They are hot and dry in the first Degree, Attractive, Glutinative, Vulnerary, Emetic and Anthelmintic.

XXX. V*

XXX. *The Specification.* They have been found by Experience to be good againft Coughs, Afthma's and Colicks.

XXXI. *The reparations.* The Root is only in life, and therefrom you may have, 1. A liquid Juice. 2. A Lohoch. 3. An EJfenee. 4. An Ointment or half am. 5. A Cataplafm. 6. A Mixture.

The Virtues.

XXXII. *The liquid Juice.* Taken to 2, 3 or 4 ounces, or more, according to Age and Strength, it caufes Vomiting, and very much cleanfes the Stomach by that means, caufing a good Appetite and Digeltion. It may be mixed with White Wine, and taken in the Morning fasting, and fo it is good againft the Colick.

XXXIII. *The Lohoch.* It is made of the Juice, mixt with half its weight of Honey. It is good againft Coughs, Colds, Hoarfenefs, Wheezings, fliortnefs of Breath and difficulty of Breathing. Dofe 1 spoonful at a time, twice or thrice a day : or it may be often taken with a Liquorice Stick.

XXXIV. *The EJfenee.* It wonderfully cleanfes, dries and heals : it conglutinates or glews the Mouths of great Wounds together, yea, Incifions of the Veins, Arteries, Nerves and Tendons, the Wound being wafhed therewith, and Lint dipt therein, being bound thereon.

XXXV. *The half am or Ointmt.* It is fingular againft Burnings or Scaldings, whether with Fire, Water, Oil, Gun-powder, Pitch, &c. It cleanfes old Ulcers, dries and heals them : and being applied to green Wounds, it confolidates or joins their Lips together, and quickly heals them. It alfo draws forth Pricks, Thorns, Splinters or other like things gotten into the Flefh.

XXXVI. *The Cataplafm.* If it is beaten and niade up with Honey, and applied Emplaiter-wife, it is cleanfing and attractive, cures Burnings and oaidings, and conglutinates Sinews which are cut aiunder: and fo applied to Strains or Wrenches of the Wrifts or Ankles, or Joints pained with the Gout, it gives Relief. If to the Cataplafm Meal or Flower of Darnel is added, it becomes very attractive, and draws forth Thorns, Splinters, &c out of the Flefh * and applied upon Sun-burnings and Morphew, it takes them away. The Root made into a Cataplafm with Hogs-Lard and Rye-Bread haften the Suppuration of Apoftems, even of thofe which are not eafily ripenned.

XXXVII. *The Mixture.* It is mixt with an equal quantity of White Wine gar, and an eighth part of fettle Seed in ponder. It is good to remove Defections of the Skin, as Scurft, Morphew, Tanning, Yellownefs, Brownnefs, Pimples, Freckles, Lentils, Tettis, Ringworms, and other like AffeSs molefting the fame.

C H A P. CXC.

Of D A F F O D I L broad-leav'd fingle,
many-flowered.

I. -p H E Names. It is called in Greek, Νίσιανθος, *Niffits latifolius Polyanthus fiore fitnphi:* in English Daffodil broad-leav'd many-flowered fingle.

II. *The Kinds.* There are about fifteen kinds of

thefe many-flowered fingle, viz. 1. *Narciffus Ajricanus aureus major,* Daffodil the greater yellow African. 2. *Narciffus Ajricanus aureus minor,* Daffodil the leffer yellow African. 3. *Narciffus Bfzantinus totus luteus,* The yellow Turkey Daffodil. 4. *Narciffus Ju/phureus major,* The greater Limon-color'd Daffodil. 5. *Narciffus fulphureus minor,* The leffer Limon-color'd Daffodil. 6. *Narciffus totus albus polyanthos,* The many-flowered Milk-white Daffodil. 7. *Narciffus latifolius totus albus, mediocri calice reflexus,* The Milk-white Daffodil with the great Cup. 8. *Narciffus Narbonenjis medio luteus prtcox,* The early Narbone Daffodil. 9. *Narciffus Narbonenjis vulgaris,* The common French Daffodil. 10. *Narciffus Narbonenjis major flore amplo* The Narbone Daffodil with great Flowers. 11. *Narciffus Pifanus,* The Italian Daffodil. 12. *Narciffus medw croceus polyanthos* The French Daffodil with Saffron-color'd Cups. 13. *Narciffus media croceus alter,* The other Saffron-color'd Daffodil. 14. *Narciffus Anglicus polyanthos,* The great Englifh Daffodil. 15. *Narciffus Narbonenjis medw luteus fertinus major isf minor,* The late-flowering Narbone Daffodil, greater and leffer.

III. *The Descriptions.* The fingle or low African, (a noble and diately i lower) is a ere at bulbous Root, covered with a blackish Skin, from whence Spring many very Jong and broad helves of a better green thin many others, in the midji of which comes up a Stalk, not rning fo high as bearing at the top out of a skinny Husk, many fair, goodly and large flowers, tenor tielve in nu/r, if the Root is well grown, and it grows in a wari place, each flower being larger than any of the French, Spanifli or Turkey Daffodils, which bear many fingle flowers on a Stalk, (this coming near to the late-nejs of our Englifh Daffodil f/Zchap. 189. fe& &) before dejenbej, or the French deferibed at feft 12. Jollowmg, which indeed is alfo a kind of our Englifh It's phlscAV. bul bearir >? > re flowers. Thefe flozm-s are of a fair fhimng color, having large, round and open Cups or Bowls, yellower than the

the outward Leaves, and of Jo exceeding jweet < Smell, that it is dmoji ready to overcome, at leafh fatiate the Scryes.

IV. Thejsecond, or Leffer yellow African, is almoft the fame with the former, but wants Jomewha^l of its ftately Height, Largenejs of its flowers am- Cup, and Beauty of Color, it being of a paler yellow, and is in all thofe rejpellis inferior to it j nor is its Jweet S[?]nell altogether fojirong.

V. The third, or Yellow Turkey Daffodil, altho from its bulbom Root it bos very long heaves, and a high Stalk, yet it comes Jhort of the Beauty of that which was laji deferibed^h, for in this the flowers are not fo many, not being above four or five, nor Jo large, being not much greater than the Common French Daffodil at left. 11. following, nor of Jo fair a color, but much paler^h, nor having a Cup fo large, this being manifefly Jmaller •, nor of fo frong or jweet a Smell, this being alfo weaker.

VI. The fourth, or Greater Limon-color'd, from an indifferent large bulbous Root, has three or four very long and green Leaves, half a yard long at leafh, among which rijes up a round, yet creft ed Stalk, noi Jo high at the Leaves, bearing five or fix fingh flowers thereon, every one of them being greater than the Common French Daffodil at left. 11. following, or the Italian at left. 13. they are of a faint, yet pleajant yellow color at firft, but when they have been in flower a fortnight, or thereabouts, change into a deeper yellow. The Cup in the middle is alfo larger than in thofe aforegoing, and of a deeper yellow color than the other Leaves, having only three Chives within it *, and is of a very pleafant Smell.

VII. The fifth, or Leffer Limon-color'd, from its bulbous Root has broader and Jhorter Leaves than the former, not green like them, but of the color of other Daffodils. The Stalk rijes up higher than the Leaves, bearing four or five flowers upon Jhorter foot-ftalks, and no bigger than the Common French Daffodil, of a pale yellow, which Jome call a Brim-Jione color: the Cup, or rather Crown in the middle, is Jmall, and broad open, of a little deeper yellow, having many Chives within it, and a* it were, Jprinkled with a kind of Mealnejs. It is not Jull ~~of~~ of fo jweet a Smell as the former.

viii. The fixth, or Many-tiowed Milk-white, frai its bulbous Root covered over with a blackifh Skin-, from whence fpring Leaves of a mean fize, both for length and breadth, greener than the ordinary Jorts, which have Jome Whitenejs in them. The flowers are many upon the Stalk, a* Jmall for the moft part as any of theje kinds which bear many together^ being zholly of a Milk, or rather of a Snow white color, a* well the Cup, which is Jmall, as the outward Leaves, which encompajs it: after which come Jmall Heads, in which is contained round black Seed, as all other Daffodils have, but Jome greater, Jome leffer, according to the Magnitude of the Plants, The Smell of this is very Jweet.

IX- Thejeventh, or Milk-white with the great Cup, is threefold, 1. One which has its Leaves Jomewhat broader^ and the flowers greater than the former. 2. Another which has its Leaves Jmaller, and its flowers alfo, whoje Cups are likewije Jmall, and are never Je en fully open, but as it were half clofed at the brims. ?. Another fort, whoje Leaves are as broad as any of the leffer Jorts, and whoje Cup in the middle of the flower is Jomething larger than in any of the leffer kinds, but leffer than in the greater kinds • the Leaves of whoje flowers do a little turn themjelves upwards, from whence it is called Reflexus. Thefe are ujjally called Narciflus torus albus polyanthos, major, medius, minor, according as the differences are.

X. The eighth, or Early Narbone, has from its

bulbom Root, which is great, Leaves Jp ringing up a Month or two before the following kind, being alfo Jhorter and narrower. The Stalk is not very high, bearing fever al flowers at the top, breaking thro³ a thin Skin, as is common with the Daffodils, every one of which is Jmall, confining of fix white Leave s^o and a Jmall yellow Cup in the middle, of a pleajant jweet Smell, but nothing Jo Jirong as many others.. The Root of this feldom parts into off Jets, as all the following do, which bear many Jingle flowers.

XL The n'mth, or Common French Daffodil, has its bulbous Root covered with a blackilh Skin, front which Jpr ing long and broad green Leaves, a little hollowfth in the middle, and edged on both fides: the Stalk is abvut half a yard high, bearing on its topje* veral flowers, fomewhat larger than the former, confifting of fix white Leaves, Jomething round. The Cup is yellow in the middle, Jmall and round, like unto an Acom Cup, or a little fuller in the midfi. This is the Defcription of thofe which came to us firfi out of France ^ but with us I think they either degenerate or alter in form, making infome the Cup Jhorter, in others flatter, and Jome longer than the refi l Jome of a paler and Jome of a deeper yellow color.

XII. The tenth, or Narbone with great Flowers, has a Root not Jo great or found as the former, buf is more plentiful in Off Jets than any other of the French or Italian kinds. The Leaves are almoft like the lafi, not full out fo broad, but full out at long, fpring Jooner out of the Ground, yet not Jo early as the eighth at left. 10. aforegoing. The Stalk is flatter and rijes higher, bearing four or five t/ovoerf, much larger than any of this kind, every one equaling the Unglifti Daffodil (in cap. 189. left. 17.) but whiter than it, and the yelldw Cup larger and more open than in any of the refi.

XIII. The eleventh, or Italian Daffbdil, from in bulbous Root has Leaves as large or larger than the Common French at left. 11. above^h, but its Stalk is fomewhat higher, bearing many white flowers, very like to the Jaid Common French, but a little larger, as is alfo the yellow Cup in the middle, and rounder than is commonly Jeen in any of the French kinds, except the Narbone with great Flowers at left. 12; above*

XIV. The twelfth, or Vrench many-flowed, with Saffron-colored Cups, has a bulbous Root, Leaves of a greyifh green color, not Jo broad or Jo long as the Italian, but coming nearer to the Common French; The flowers are white, and many upon a Stalk: the yellow Cup is Jomewhat large, and circled with a Saffron like brim or edge, which indeed makes the chief difference.

XV. The thirteenth, or Other Saffron-colored, has alfo a bulbous Roof, from whence fpring Leaves large and long; in the midft of which grozvs up a Stalk, bearing at its topjeveral white flowers, which are larger than any of the other French, except the Narbone-with great Flowers at left. 12. above*, but the Cup is Jmall and Jhort, rather Jeeming a Coronet than a Cup, of a deep Saffron color all about the brims or edges.

XVI. The fourteenth, or Great Englifh Daffodil, has a bulbous Root, from whence fpring Leaves not much broader or longer than the Narbone with great Flowers at left. 12 above. The Stalk ivith the blow* ernsfes not fully Jo high as it, bearing many Flowers Jher eon, not altogether fo white, yet whiter than the Common Englifh (in cap. 189. left. 17.) but nothing fo large, and* with Jhort, broad, and almoft round Leaves, Jhwding clofe one unto another. The yel-^o Cup in the middle is Bowl-fajhcn, Jomewhat deeper than in dny of the former, but not much Jreater: and the Smell thereof is very Jweet and pleajant.

XVII. The fifteenth, or Narbone late-flowering, greater and leffer. The greater has its Root, as well as its Leaves, greater, larger, broader and longer than any off the other former French, Narbone ^Italian kinds. The Stalk is as high as any of them, bearing at top five or fix white Mowers, (landing open Jspread, likè a Star, and not clofe together, every one whereof is large, and round-pointed. The Cup is yellow, fmall andfhort, yet not lying flat to the Slower, but a hale ji an ding out, with fome Threads in the middle, as all the former Daffodils have. This is not Jo fweet Jcented as the earlier kinds be. The leffer differs not from the former, but only that it is every way leffer, and the Cup in the middle of the blower is yet fhorter than it.

XVIII. The Places. The firft zxAfecond grow in Barbary, about Algier and Fez, as fome, who have been in thole Parts, relate: the third grows in Turkey, about Conftantinople: the fourth and fifth have been brought to us from the Pyren<ean Mountains, as alfo out oi Italy: xhzfixth andfeventh grow in Spain, in the Southern Parts of France, as alfo at Conjlantinople: the eighth, ninths tenth, twelfth, thirteenth and fifteenth grow in France, as about Mompelier: the eighth and ninth grow alfo naturally in many places in Spain, which are open to the Sea h as alfo in Turkey: the tenth is a Native of Italy, growing about Pi/a in Tu/cany: the four* tee nth is accounted in Foreign Nations, as a Native of England. However, being brought to us from their native Places, they are nurs'd up here by the curious Florift only in Gardens^ where they flourish well.

XIX. The Times. The firft, /econd and thirl after they have been accustomed to our Climate, flower very early, even with the firft fort of Daffodils -, but many times upon their firft bringing over, they flower in January or February, if the Seafon is mild and warm, becaufe they are tender Plants, and ibon perih by being left abroad: the fourth and fifth flower in April: the fixth and feventh flower earlier in Turkey than the others h fo alfo after accustomed to our Air, where they flower in the epd of AUnh, or in April: the eighth flowers earlier than the reft by a Month, viz. in the beginning of March, or earlier, if the Weather is mild: the ninth, tenth, eleventh, twelfth and thirteenth flower in April, fome of them a little one before another thefourteenth and fifteenth flower not till May.

XX. The dualities, Specification. Preparations and Virtues, are much the fame with thofe mCchap. 189. foregoing, to which I referryou.

C H A P . CXCI.

Of D A F F O D I L broad-leav'd: double flowrecl

I. Tp HE Names. It is called in Greek, N i u X T A r i t + f A A A @ - T o A A d f T A o @ ' in Latin, Narciffus, latifoUus multiplici Jiore, vel fiore pie no: in Englifh, Daffodil broad-leav'd, double-flowered.

II. The Kinds. There are fix feveral forts o, this, viz. 1. Narciffus albus multiplex, The double white Daffodil. 2. Narciffus medio ptrpureus multiplex, The double purple-ring'd Daffodil. 3. Nardiffus medio licteus corona duplici, The double Crown'd Turkey Daffodil. 4. Narciffus Chalcedonicus fiore pleno albo poiyanthos^ The double whit Daffodil, with many Flowers. 5. Narciffus CIm

edonicus fimbntus multiplex poiyanthos^ The great double many-flowered purple-ring d Daffodil of Coi-ftantinople. 6. Narciffus Cypnus fiore pleno luteo poiyanthos^ The many-flowered double yellow Daf-fodil of Cyprus.

III. The Defcriptions. The firft, ^Double purple-ring'd, from a bulbous Root has Leaves not very broad, but of a mean/ize, of the/lame Largenefs of the Purple-ring'd Daffodil following. The Stalk r/ies up to half a yard high, bearing at top thereof one Flower, and no more, confining of many Leaves, if a fair white color: The Flower PS larger than of any other Double white Daffodil, having every Leaf, e/pecially the outermost, as large almoft a* any Leaf of the Single Daffodil with the ydlow Cup, or purple Ring. Sometimes the Flower is very little double, and almoft Jingle, but then it is either in d bad Ground, or it ha*flood long in the place without removing h for then it hat/uch a great encreafe of Roots, that they draw away the Nourijhment, to the [pollingof the Flower: but if you tr an/plant it, taking azffay the Off/ets, and /et the Root Jingle, it will thrive, and bear a goodly double Flower^ and of a very/sweet Smell.

^ The /econd, or Double purple-ring'd, from a bulbed Root has broad Leaves /pring up, little dip fering from the Leaves of the Single purple-ring'd, it being probably of the /ame Species. The Flower (being /ornetimes but one on a Stalk, a/id /ometimes two) confifts of fix white outer Leaves, <u large & the Leaves of the Single kind, having many /mall yellow pieces, edged with purple Circles round about them inftead of a Cup: and in the midft of the/ piece's ft and fix other v/hte Leaves, leffer than the former, and a yellow Cup, edged al/o with a purple Circle, parted into pieces, and they comprehending a few other white Leaves, /mailer tba:: any of the. o- ther, having among them /ome broken pieces of the Cup, with a few Chives in the middle of the Flower^ which is of a very/sweet Smell.

V. The third, or Double-crown'd Turkey, hoi a Root like unto the laft, or /omewhat larger, front whence /pring forth three or four Leaves, as large and long almoft as the Great double white next following; the Stalk is al/o near as great, and full as high, bearing at the top four or five Flowers, who/e Leaves are as large as the Early Narbone or Common French, (in cap. 190. fe&. 10, 11.) but not full out of Jo pure a white color: they are fix in number, and ft and like the former French Daffodils now named, but that the yellow Cup in*the middle of this is thick and double, or as it were crumpled together, not ftanding very high to be feen, but keeping low andfhort h Jo that it is not prejent/y taken notice of, unle/s prearely lookt upon. This Flower is of <* exceeding fweet omell

h VL P/Z fZ/11" oA Double white many-flowered Skin. ffeL ffeL ffeL c^ed with black? which lends forth many very broad long Leaves, more green than grey: a mo m fnesup afrongroicidStalk. hfiJr fiat and rked bearing fur I s fme n ses or more Vowersq: the top, every one being veryZ largr f Uveob n «i confyedlyset together. Uvvg little pieces of a yellow Cup ruining among them, xmboutanyfhew of that purple King which* in the jormer h thefe fall away without bearing Seed, even as all or mofi other double Homers do. % is a beautiful and goodly tlower, defirable for its Beauty and Duplicity, as alfo for its exceeding fweet and frong Smelly one Stalk of blowers being mfead of a hofegay. *

VII. The fifth, or Great double purple-ring'd, differs htte or nothing in Root or Leaf from the former: the only difference M in the Flower^ which, thd"

tho* they are double, and bear many upon a Stalk like unto the former, yet this has the pieces of the yellow Cups tipped with purple, as if they were shred or scattered among the white Leaves, whereas the other has only the yellow, without any appearance of purple Tips upon them: the Smell of this is asjirong andsweet as any of the other.

VIII. The sixth, or Many-flowred double yellow of Cyprus, has a bulbed Root, like to the former, and its Leaves are almost as long and as broad as the other. The Stalk is afoot high and more, bearing on its top four or five Flowers, every one very double, of a fine pale yellow color, and of a strong sweet Smell.

IX. The Places. The first was brought into England out of Cambray, where it grows Wild. All the rest came from Constantinople at several times: the first also grows in Cyprus, and some also in Barbary, about Argiers and Fez, and some of them grow in Candia, as also about Aleppo, and some other Places in the Turks Dominions. Now they are made Denizens of our Kingdom, and grow frequently in our Gardens.

X. The Times. The first flowers about the middle of end of April: all the other Turkey kinds flower very early, in the middle or end of March, or beginning of April at farthest.

XI. The Qualities, Specification, Preparations and Virtues, are the same with those in Chap. 189. foregoing, to which you are referred.

C H A P . C X C I L

Of D A F F O D I L narrow-leav'd, liogle-flowred.

I. THE Names. It is called in Greek, Νάρκισσος.

X. Narcissus angustifolius in Latin, Narcissus angustifolius in English, Single-flowred, narrow-leav'd Daffodil.

II. The Kinds. The most observed are about nine in number, viz. 1. Narcissus angustifolius albidus proterox oblongo calice, The early white narrow-leav'd Daffodil, with a long Cup. 2. Narcissus medio croceus tenuifolius, The Saffron-crown'd narrow-leav'd small Daffodil. 3. Narcissus minimus medio purpureus, The least purple-ringed Daffodil. 4. Narcissus minimus flore juncifolii, The least Daiiodil of all. 5. Narcissus Autumnalis minor albus, The little white Autumn Daffodil. 6. Narcissus Autumnalis albus medio obfoletus, The white Autumn Daffodil with a decayed Crown. 7. Narcissus angustifolius luteus semper florens, The yellow Italian Daffodil, always flowering. 8. Narcissus angustifolius, vel juncifolius maxbnus amplo Calice, The Great Junquilia with a large Flower or Cup. 9. Narcissus Virginicus, vel Virginianus, seu Lilionarcissus Virginianus, The Virginia Daffodil.

III. The Descriptions. The first of these, orally white narrow-leav'd Daffodil, from a bulbous Root, has three or four narrow, long and very green leaves, a foot long generally. The Stalk rises not so high as the Leaves, on which grows one Flower, (not full out so large as the Late-flowering Daffodil with a long Cup, among the Broad-leav'd kinds) which consists of six pale-color'd Leaves, not of a pure white, but with a mixture of a light yellow among the white. The Cup in the middle is round and long, (yet not so long as to be accounted a Baftard Daffo-

dil) within which is a middle Point, accompanied with six Chives, having yellow mealy Pendants.

IV. The fecojid, or Saffron-crown'd narrow-leav'd small Daffodil, has a Root small, round and a little long withal, covered with a blackish Skin, which sends forth four or five ac-ryw Leaves, about an inch long, among which rises up a Jvtik eight, nine or ten inches high, bearing at top one small white Flower, consisting of six Leaves, with a small yellow Cup in the middle, shadowed over at the br'wis with a Saffron color.

V. The third, or Least purple-ring'd, has a bulbous Root, small narrow Leaves, shorter by much than any of the Purple-ring'd Daffodils before described. The Stalk and Flower keep an equal proportion to the rest of the Plant, being in Form and Color of the Flower like unto the Star Daffodil before described, but unlike in Magnitude. The purple color which encircles the brims of the Cup, is so faint, that sometimes it is not easily perceived.

VI. The fourth, or Least of all, has a Root small, even the smallest of any Daffodil, and covered with a black Skin; from whence spring two or three whitish green Leaves, narrower than the two last foregoing and shorter by half, being not above two or three inches long; nor is the Stalk above three or four inches high, bearing one single Flower at top, something larger than the proportion of the Plant should seem to admit, and not much unlike to the Least Ruth Daffodil, and of the same bigness, or rather somewhat bigger, being of a faint yellow color, both Leaves and Cup or Crown, for the middle part is spread very much, even to the middle of the Leaves almost, and lies flat open upon the Flower.

VII. The fifth, or Little white Autumn, has a bulbous small Root, and blackish on the outside, which rises with its Flowers first out of the Ground, without any Leaves at all. It first springs up with one or two Stalks three or four inches long, every one bearing, out of a small Husk, one small white Flower, laid open abroad, like unto the Star white Daffodil before described. In the middle of the Flower is a small yellow Cup, of a middle size. After the Flower is past, there comes in the same place a small Head, containing small, round, black Seed, like unto the Autumn Hyacinth. After the Seed is ripe and gone, then spring up the Leaves, which are small and narrow, not much bigger than those of the Autumn Hyacinth afore-named.

VIII. The sixth, or White Autumn with a decayed Crown, from its bulbous Root has two or three Leaves at most, and very narrow, (so that scarce account it among the Ruth Daffodils) some what broad at bottom, and more pointed at top, between which Leaves comes up the Stalk, bearing usually two Flowers, and no more, made of six white Leaves apiece, pointed, and not round. The Cup is small and round, like unto the Cup or Crown of the Least Ruth Daffodil, of a yellow color at bottom, but of a dun color towards the edge.

IX. The seventh, or Yellow Italian always flowering, has a bulbous Root, from whence spring a number of small, long narrow, and very green Leaves broader, than the Leaves of any Ruth Daffodil, among which rise up divers Stalks, bearing at their Heads two or three Flowers apiece, each of them being small and yellow, with a small Crown, of a deeper yellow than the former. It is said never to cease bearing Flowers, but that after one or more Stalks have been in flower together, and are past, others succeed in their places.

X. The eighth, or Great Junquilia with a large Flower, has a Root which is greater and lower than the Ruth Daffodils, covered with a blackish Skin, from whence spring up several long green Leaves, like

like unto ibeiulh Daffodils, l/ll thicker and broader, fo that it may very well be accounted among the Narrow-leav'd Daffodils. Every Stalk bears at its top two or three very fair large Flowers, with a large an l more open Cup than in any of the Jaid Ruff Daf-fodils •, both of them of; a fair yellow color, but the Cup a little deeper than the blower, and a little crumpled about the eefges^ fyaving a pretty jfrong or Jbarp pleafant Smell. This Plant, by its frame, jould feem to be of the Ruff kind, which Name it obtained by reafon of the Ukenefs of its Leaf to them : but in Confi- dence rat ion its Leaf is broader and larger than any of the Ruff Daffodils, Authors have placed it among the Narrow-leavM, ih<? it might have in- differently been placed in the Rank of either Spe- cies.

XL The ninth, or Single white Virginian, has a Root f?nuil long and round., black'ijh on the out fide, and white within *, front whence rife up two or three long, and very narrow, green, fhining Leaves, growing Jometiwc reddijh about the edges : between thefe Leaves rife up the Stalk, about jive or fix inches high, or more, bearing on the Head thereof one flow- er, and no more, frm dng upright, like a little Lilly or Tulip, made of fix ^Leaves, wholly white, both within and without, except that at the bottom next to the Stalk ; and a little on the backfide of the three outer Leaves, it has a fm all dafh of a reddijh purple color. It has alfo in the middle a few Chives, Jland- ing about a fm all pointed Head, which Head grows to be fm all and long, containing fm all, blackijh, flat Seed.

XII. The ?laces. The firft and fecond of thefe grows with the Broad-leav'd ones on the Pyreanan Mountains, from whence they were brought into our Gardens: the native places of the third and fourth are unknown : the fifth Clufius law growing in Spain : the Jixth is alfo a Native of the fame Coun- try : the Original of the feventh is unknown : the eighth we only know to grow in our Gardens: the ninth was brought to us from Virginia, where they grow in great abundance. AH thefe, by Tranfplan- tation and Care, are now found to grow in Englifh Gardens.

XIII. The Times. The firft flowers early, a Month before the other Narrow-leatfd kinds, viz. in the very beginning of March, if the Weather is mild : the fecond, third and fourth flower in April : the fifth flower? in the beginning of Autwnn, and the Seed is ripe in the end of Oltober, in hot Coun- tries •, but in ours, it feldom comes to more than Flowering : the fifth flowers in Autumn : the fe- venth flowers all the Summer long, whence came the Addition to its Name of Semper florens : the eighth flowers in April •, and the ninth in the end of April, and beginning or fore part of the Month of May.

XIV. The Qualities Specification, Preparations and Virtues, are accounted the fame with the Daf- fodils in Chap. 189. aforegoing, fo that no more need • be faid thereof .

CHAPTER CXCIIL

Of D A F F O D I L narrow-Wd, double-flowered.

THE Names. It is called in Greek, Η^α^α^••. \ reryuAA© 7n:*\\$4TA©©: in Latin, Narciffus anguifoliuts fore pleno : in Englifc Daffodil nar- row-leav & double-fc^wreL

II. The Kinds. It is twofold, viz. I. Narciffus anguifolius flore ulbo pleno, Narrow-leav'd white double-flower'd Daffodil. 2. Narciffus anguifolius flore aureo pleno, The narrow-leav'd double Golden- tiower'd Daffodil.

III. The Defcriptions. The firft, or Double- flowered narrow-leav'd Daffodil, has a Root very like unto the forme* Singh Virginian Daffodil (trt cap. 192. left ii-) &^* ** IS a tittte l^r &^er^m £ rounder, l little long withal, and blackijh on the outfide, as ^hat is -, from whence rife up two Leaves, fomewhat wader than that, but of a like Greenefs. The Stalk rife up between thefe heaves about a fpan high, or not ?nuch higher, bearing one fair double Snow-white flower, very like in the Form or Shape to the Leffer French double Baftard Daffodil hereaf- to be defcribed -, for it is in like manner laid O- fen flat, and compofed offix Rows of Leaves, every Rota lying in order juft oppofite, or one before ano- her, whereof thofe fix Leaves, which make the firft r outwardmoft Courfe, are the great eft, and all the reft lying one upon or before another, every Row be- ing mailer than the others : in the middle there com- es forth a fm all, long, pointed Fork or Horn, white infomefort, like to the Flower it felf

IV. The fecond, or Double Golden narrow-leav'd, has a Root almoft like the Common Junquilia, or Ruff Daffodil, from which Spring up very narrow Leaves, four or five inches long, of a whitijh green color ; from among which rife up a Stalk, about a foot high, bearing at the top a Flower, confifting of Come outward Leaves, which are of a yellow color and of many other Leaves in the middle, being fmail- ler, and Jet thick and round together, of a more yel- low Gold color, but withfome whiter Leaves among them, the middle part a little pointing forth : the Flower ^ftands long before it does perfect its color^ and abides long in Flower before its color decays.

V. The Places. It has been found growing in feveral places of Virginia, from whence it has been brought to us : it has alfo* been found growing in the Lawns of Carolina.

VI. The Times. It flowers in Virginia towards the latter end of March, or beginning of April: but with us here in England in the end of April

VII. The Qualities, Specification, Preparations and Virtues, are laid to be the lame with the Daf- fodils in Chap. 189. to which I refer you.

VIII. An Obfervation. I have been told by Ibme of the Indians, that if the Juice of the Root be gi- ven for fome confiderable time, inwardly in the Spring of the Year «, and that the Root it felf by- being beaten and made into a Cataplafm, be alfo at the fame time applied to Tumors in the Neck and Throat, it will cure them. I fuppo^e ~~the~~ Tumors here meant, are Strumous.

CHAPTER CXCIV.

Of D A F F O D I L Ruff; fmgle- flowered.

THE Names. It is called in Greek* N«^xj«0. Sxrrrtottoxt : in Uin Narciffus Junci* Vomitorlus Btoforidih : in Enghjb, Dafodil Rujh-kav'd fwgle-flowered, or,

II. The Kinds. There are about twelve feveral Kinds, viz. I. Narciffus Juncifolius albus jimplex^ Th5w^ \te Junquilia 2. Niffu

Juncifolius albus magno Calice, The white Junquilia with a great Cup. 3. *Narciffus Juncifolius albo reflexo*, The white turning Junquilia, or Ruff Daffodil. 4. *Narciffus Juncifolius flore luteo reflexo*, The yellow turning Junquilia, or Ruff Daffodil. 5. *Narciffus Juncifolius albo foliis reflexis luteis*, The yellow turning Junquilia with a white Cup*. 6. *Narciffus Juncifolius luteo foliis reflexis albidis*, The white turning Junquilia with a yellow Cup. 7. *Narciffus Juncifolius luteus magno Calice*, The Junquilia, or Ruff Daffodil with a great Cup. 8. *Narciffus Juncifolius luteus vulgaris major*, The common or ordinary Junquilia, or Ruff Daffodil. 9. *Narciffus Juncifolius luteus medius*, The middle-fiz'd Junquilia, or Ruff Daffodil. 10. *Narciffus Juncifolius luteus minor*, The Idle Junquilia, or Ruff Daffodil. 11. *Narciffus Juncifolius luteus lineis albicantibus distans*, The yellow Junquilia, or Ruff Daffodil with white Lines. 12. *Narciffus Juncifolius Autumnalis flore viridi*, The Autumn Ruff Daffodil, or Junquilia, with a green Flower.

III. The Descriptions. *The first, or White Junquilia, has a small bulbous Root, covered with a blackish Skirt*, from whence spring forth small long Leaves, a little broader, and of a whiter green color than the Ordinary yellow Junquilia, or Ruff Daffodil. The Stalk rises up half a foot high or more, bearing two or three small white flowers upon a Stalk, yet somewhat larger than the Common yellow Junquilia, having a small round Cup in the middle, white also as the Leaves are. The Seeds small, black and round, as the Seeds of Ruff Daffodils are.*

IV. *The second, or White with a great Cup, has a Root, Leaves and Stalk in all respects like the former; the flower and Seed is also like, but in this it differs, that the Cup in the middle of the Flower is a little larger than the former.*

V. *The third, or White turning, has a bulbous or round Root, small, and a little long upright, covered with a blackish brown Skin -, from whence spring up four or five long green Leaves, yet shorter and broader than the Common yellow Junquilia, and fully as green -, from among which rises up a slender green Stalk, a foot high, bearing at its top, out of a skinny Husk, three or four, or more Snow-white flowers, standing upon long green foot-stalks, every lower hanging down its Head, and turning up its six narrow and long Leaves, even to a very foot-stalk again: from the middle of the flower hangs down a long round Cup, as white as the Leaves, within which are contained three small white Chives, tipped with yellow, and a small long Point, thrusting out beyond the brims of the Cup: after the flowers are past, there comes up in their places small three-square Heads, in which is contained very small, round and black shining Seed. The flower is white, without any good Smell, or indeed rather none at all.*

VI. *The fourth, or Yellow turning up, has a bulbous Root, from whence rise up long Ruff-like Leaves, but they are greater and longer than the former, and of a paler green color: the Stalk rises somewhat higher, bearing two or three flowers thereon, wholly of a Golden yellow color, both the Cup and the Leaves, which turn up again.*

VII. *The fifth, or Yellow turning up with a white Cup, has from a round Root several long Ruff-like leaves rising up, and standing upright, like the former, between which rises up a green Stalk, about a foot or more high, bearing two or three flowers thereon, whose turning up Leaves are of a fair pale yellow, and the Cup of a pale white, but not so delicate or pure a white as the former.*

VIII. *The sixth, or White turning up Junquilia with a yellow Cup, differs not much either in its*

Roots, Leaves, Stalk or flowers, save, that as the Lift had the Leaves of the flower, which turns up again, the How, and the Cup whitish -, so this has contrariwise, the turning up Leaves of a whitish yellow, and the long Cup yellow; otherwise the difference is inconsiderable.

IX. *The seventh, or Junquilia with a great Cup, has a round or bulbous Root, from which spring larger Leaves, and longer than the Ordinary or Common yellow Junquilia, being a little flat on one side, and round on the other, but of the same Greenness with all the rest: the Stalk rises up two feet high, bearing two, and sometimes three flowers thereon, being of a fair yellow color, with a large open Cup in the middle, of a little deeper yellow color, like unto the Great Junquilia with the great Flower before described, of which this doubtless is a kind, but that this is fatter and leffer than that, both in Leaf and Stalk, and Cup, &c. being somewhat leffer in all its other parts.*

X. *The eighth, or Common or Ordinary Junquilia, has a round or bulbous Root, which is blackish on the outside, from which spring four or five long, round, green Leaves, like unto Ruffles, from whence came the Name; from among which Leaves rises up a Stalk, round and green, a foot and half or more high, bearing at the top three or four flowers, all yellow, but much fatter than the last, and of a little Cup also. The Seed is small and black, enclosed in small cornered Heads. The Smell of the slower is very sweet in all these sorts of Junquilia, or Ruff Daffodils.*

XI. *The ninth, or Middle-fiz'd Junquilia, is like unto the former in its bulbous Root, Ruff-like Leaves, Stalks and flowers, five, that the Leaves are smaller and rounder, the Stalk rises up not so high, nor are the flowers so great, but the Leaves of the taller are a little rounder, and not so pointed as in the former, but in all things else they are alike, this being only the leffer.*

XII. *The tenth, or Small Junquilia, has a Root round, small and black, very like unto the last, from whence spring up five or six small green Leaves, a little broader, but not so long as the Lift, from among which rises up a Stalk almost a foot high, bearing one or two small flowers at the top, of a paler yellow color than the former, with a yellow open Cup (or Crown rather) in the middle, bigger than in either of the two last.*

XIII. *The eleventh, or Yellow Junquilia with white Lines, has a Root not differing from the former, from which spring forth round, long, green Leaves, like to the Ordinary or Common Ruff Daffodil, with a Stalk bearing two or three yellow flowers, having Leaves somewhat round at the point or end, with a Line or Strake of white in the middle of every one of them: the Cup is short and Crown-fashion, and a little crumpled about the edges or brims. The Seed is like to the other kinds.*

XIV. *The twelfth, or Autumn Ruff with a green Flower, sends forth from its Root but one only Leaf, very long, round and green, which while this green Leaf is fresh and to be seen, bears no flower -, but that being faded away, a Stalk afterwards rises up, very much like to the former green Leaf, round, naked and green up to the top, where two or three flowers break forth out of a small thin Skin, every one consisting of six small and narrow green Leaves, very sharp-pointed at the end, and as it were ending in a small Prick or Thorn -, in the middle of which is a small round Cup, (or rather Crown) of the same color with the Leaves and Stalk; which Flower smells very sweet, like unto the rest of the Ruff Daffodils or Junquilia.*

XV. *The Places** The original or native places
iron*

ironi whence chelc have been brought to us, were ha/Spain^ \w^ Pyre/2jsa/7 Mountains^ and Southern parts of Vrance : tie twelfth is a Native of barbari, and was brought to us frOm France. Now, by Indultry and careful Cultivation, they are all become hee Denizons, if not Natives of our Country, where, in the Gardens of our Horiits, they thrive very well.

XVI. The Times. They molt of them flower in the Spring, in March, (if it is mild) and April and illA), die Seed ripening in some reasonable time after : but the lait or twelfth flowers not till Olio-be>\ and the Frolts coming ibon after, caufes it suddenly to perilh.

XVII. The ^jialities^ Specification, Preparations anl Virtues, are much one and the fame with tholē of the Common Daffodils in Chap. 189. to which I refer you.

CHAP. exev.

Of D A F F O D I L Ruffl., double-flowered.

i' p i / £ Names. It is called in Greek, N«x,«©- Ntraffus Junajoltusfiore m u l t i ^ l & A j ceusfiore_ple_no, Bulbus Vomitonu-sDiofo.

thU ... 2 fbre ... double ... iia, or. Rulh Daffodil. ... luteits jlore pie no ... or Ruffl Daffodil.

insbefncptions. The fir ft of theje ha* a TM which is bulbous or round, and blackijh brotvn on.the outside,Jo like unto ihe Common Rulh Daffodil.that it is almojl impoffible to know the one from the other .,from which fpring forth long, round, green Leaves, like the Leaves of the Common or Ordinary Junquilia, or Ruffl Daffodil, and of the fame bignejs, among which rijes up a long, (lender, green Stalk, bearing two or three, feldom more, fmall flowers, yellow and double viz. with fever al Rows of Leaves, having the yellow Cup fuch a* is i* the Jingle Floater, broken into fmall fhreds or pieces, running among the Leaves of the Flowers -, which pieces in fome flowers are not fo cajilyfecn, being/mailer than in others. This bears no Button or Head under the htoTM, for Seed.

V. The fecond, or Lefter kind, is in its Root; Leaves, Stalk and flowers very like .to the former, h*ve that its blowers are J'mailer, and not fo double, being one, two or three at mofl upon a Stalk; and dfo of much left Beauty.

V. The Places. They are Natives of Italy, Tur-O\ Spain, the Pyrenmn Mountains, and fome Southern parts of trance : but jftourifh very well with us in our Gardens.

:: VI- The Times. Their chief times of flowering are in Murc)^ April and May.

•. .h. jhe Qualities, Specification^ Preparations aud Virtues, are much the fame with thofe of the Common Daffodil in Chap. 189. aforegoing.

Obfervation. The Juice of the Root, ... iagle or double Junquilds. It may be ... Vomit and cleane the Sumach. from f ipooniul to 2 or more, mixed with a Glas

of White Wine or warm Water, , in the Morning falling ? it carries off thick and vifcous Humors, and the Matter which cauiēs the King's-evil: Some mix it with Vinegar for the fame purpofe. It alfo purges downwards afterwards, the reit of thofe thick tough Recrements.

IX. Obferv. 2. The Decoftion in Wine. It does alib the lame thing with the Juice, but it is pleafanter, and works more gently, and moltly by Stool, if it is corrected with An/feed, Ginger and other Spices, to abate the Churlilhnēfs of the Working. I have found it by Experience to be good againft a Faralyfis, if it was recent, and the Patients had Strength and Youth on their fides.

X. Obferv. 3. The Root made into a Cataplafm, and applied, or into an Ointment, as you doJPi/f-wort Roots, is an excellent thing to be applied to Strumous Tumors or Swellings in the Throat or other Parts, whether they be whole, or broken and ulcerated.

CHAP. CXCVI.

Of P A F F O D I L Sea.

i' Names. It is called in Greek, N«x,«©- iKif & 8«t «/©- in Latin, NarciJus Ma* Zinus vel Litoralis ; and in Englifh, Sea Daffodil.

II. The Kinds. There are four kinds thereof: the fir ft is commonly called, Narciffus Marinus magnus, five Tertius Matthwli, The great white Sea Daffodil, or Matthwlus his third Daffodil. Clufius called it Lihonarciffus Hemerocallis and Eemerocal-lidis fiae.; and yet this seems not to be a proper Name, ior that his Hemerocallis is a plain Pam- tion, or Sea Bajiard Daffodil, whose middle Cup is hS V^H S^ ^giny true Dd mod! -> which is i^ ^ S Dlfoc <Ke between a True and iBallard Daffodil. It may moft fitly be called, Aaraffus Marinus maximus, Thegreateft Sea Daffodil, becaule it is a true Daffodil, and thegreateft of i' j . d'UP \ aS allb becaufe k has been found chiefly in Iflands, or Places near the Sea. 2. Nor-ciffus Indicus Autumnalis quorundam Lobe hi, Pan-cratium Indicum, The Indian Autumn Sea Daffodil of Lobe I. 3. NarciJus Marinus African us five txoticus Lobeln.; The African Sea Daffodil * NarciJus Marinus Exoticus, The ftrangSD .i: f bdil: of all which in order.

III. The Deitiiptions. The fir ft <V Sea Daffodil, has a Root which %%? imcance, ftanding in one place without ved, grows to be much greater *r>A i other Lftodil * <> i. fLait j", «ny Ordinary Sq'ii orU^Z, £^ the outside, and having many lom Vhrh I tibres or long Roots, LiOH% 7 I- t z F

for which Reafon this Plant mll not thrw^d bear blowers, if it is often tranfplami but delights to continue in one place without removing, and when it may not be overfhadowed with other Herbs jUnd- ing too near it, which then mll Jiourifh, and bear many fine Mowers. from thfS Root arife fix or feven, or more Leaves, twice fo broad almoft as any of the former Daffodils, but not Jo long By half ds mTM, of them, being rather fhort in Qo^arifon of the breadth, and of a white green cobr : frort the midj

midft of thefe Leaves, as alfo fro?n the fides, fprints up one Stalk, and fometimes two, of more, thick and round/h, and fometimes a little fiat and cornered, a foot or more high, bearing at the top (out of a skinny Husk) eight, ten or twelve, or more very large Flowers, confifling of fix white Leaves apiece, fspread or laid open, with a white or fhort Cup or Crown in the middle, lying fiat upon the Leaves, cut or divided into fix Corners, (and not whole, as the Cup or Crown of ttany other Single Daffodil ^) from every of which Edges or Corners of this Cup or Crown proceeds one white long lspread, a little crooked or turning up at the end, tipt with a yellow Pendent, and fome other white Threads, tipt with yellow Pendants, fianding alfo. in the ?middle. After the Fiomer is paf, great three fquare Heads come forth, in which the Seed is contained, which is great, black and round, like unto the Seed of other Daffodils, but greater. The Flower has a pretty good Smelly but not very Jirong.

IV. The fecond, or Indian Autumn Sea, has a Root, as Lobel fays, a fpan long, and of the thicknefs of a Man's Arm, covered with many white Shells, of which the outwardmoji are of a dark red, or Cheft-nut color. The Flowers are eight or ten in number, every one by its felf upon a fhort Foot-jlalk, made of fix Leaves apiece, fome what long, narrow and pointed, like unto the Flowers of we Englifh Colchicum, O* Meadow Saffron, of a whitifh yellow dun color, with fix long Threads in the middle. The green Leaves are long and broad, and broad-pointed. Some are of Opinion, that this Plant comes nearer to the Refemblance of an Hyacinth than of a Daffodil •, but Lobel has numbered it among the Daffodils, whom we here follow, yet leave it to others Judgments to determine of which kind it is.

V. The? third, or African Sea, has a Root very great, made as it were of many fealy Cloves, from whence rifes up afmall fhort Stalk, bearing, a little above the Ground, two fair, broad, green, pointed Leaves, longer than they are broad, fo encompassing the Stalk at the bottom, that it feems to run through them: the Stalk is spotted with divers difcolored Spots, and is bare or naked from thefe two Leaves unto the top, where it bears one fair double flower, like unto a Double Anemone, of a diluted reddifh color, tending to a blujh, with many Threads fet about the middle Head.

VI. The fourth, or Strange Sea Daffodil, has a Root which is very great, yet like unto other Great Daffodils •, the outward Skins of which are of a dark brown color. From this Root rife up five or fix large and long Leaves, of a pale green color; from among which arifes up a ftrong and large Stalk, bearing at top, out of a thin Husk or Skin, many very large Flowers, made of fix long and pointed Leaves apiece, of a blewifh purple color, with a large round open Q^> in the middle, of a fadder color than the

VII. The Places. The firft was found by the Sea fide in the Ifle of Sardinia, and on the high Mountains alfo of the fame Ifle, where it has, born (by Report) thirty five Flowers upon a Stalk: it grows alfo about Illyricum, and other Maritne places of the Mediterranean. The fecond grows in the upper part of Hifpaniola in the Weft Indites. The third grows near the Cape of Good Hope, from whence it was brought into Holland. The lafi, the place of its Origin is unknown, but now they are all nourifh'd up in Gardens.

VIII. The Times. The III? fprints later out of the Ground than any other daffodil, viz. about the latter end of March or beginning of April? and flowers in the end of May or beginning of June; and the Seed is ripe in the end of July or beginning

of Auguft. The fecond flowers in Autumn, viz. in September and Otober. The third and fourth flower in the Summer Months, earlier or later, as the Seafon is in Warmth.

IX. The Qualities, Specification, Preparations and Virtues, are the fame with thofe of the Commo?i Daffodil in Chap. 189. aforegoing, which fee in their places.

C H A P." CXC VII

Of D A F F O D I L Baftard, broad-leav'd fingle-flowrcd.

THE Names. It is called in Greek, Πικραλίς, xJaj & WCLTV\$CM@ - «VA2V: in Latin, Pseudonarcijus latifolius flore-fimplici: in Englifh, Bajard Daffodil broad-leaved, with fingle Flowers.

II. The Kinds. There are nine feveral kinds commonly taken notice of, viz. 1. Pseudonarciffus Anglus vulgaris, Our common Englifh Baftard Daffodil. 2. Pseudonarciffus Anglian vulgaris alter, Another common Englifh white Baftard Daffodil: 3. Pseudonarciffus tubo fexangular, The fix-cornered Baftard Daffodil. 4. Pseudonarciffus aureus Hiffamicus maximus, The great yellow Spanifh Baftard Daffodil. 5. Pseudonarciffus Pyrentus Hifpanico cV Anglico fimilis, The Mountain Baftard Daffodil of divers kinds. 6. Pseudonarciffus Pallidus prj?cex> The early Straw-colored Baftard Daffodil. 7. Pseudonarciffus Hifpanicus Jiore albo major, The greater white Spanifh Baftard Daffodil. 8. Pseudonarciffus Hifpanicus maximus albidus, The greateft Spanifh white Baftard Daffodil. 9. Pseudonarciffus Iifpanicus m flpre albo medius & minor, The lefler and næaff white Spanifh Baftard Daffodils:

III. The Descriptions. The first, or Common English, ha* a Root which is bulbous and somewhat blackish -on tj?e outside ; from whence spring forth three or four greyish green Leaves, long and somewhat narrow •, among which rises up the Stalk, about 4 spun or somewhat more high, bearing at the top, out of a skinny Husk, (a* all other Daffodils have) one Flower, and sometimes two, something large, having the six Leaves which fit and like Wings of a pale yellow color, and the long Trunk in the middle of a fair yellow, with the edges or brims a little crumpled or uneven. After the Flower is past, it bears a round Head[^] seeming threc-square, containing round black Seed.

IV. The second, or Our common English white, is in Root, Leaves and Stalk, like to the other in almost all respects : but the Wings of its, flower are much more white than the former, and in a manner of a Milk-white color, the Trunk remaining almost a* yellow at that in the foregoing, but not differing in any thing else.

V. The third, or Six-cornered, has a Root like to the others, from whence spring two or three long and somewhat broader Leaves than in the two foregoing between which comes forth a Stalk, bearing a flower, somewhat large, having the six outward of a pale yellow color, and the long Trunk

prelfing dee down, the/eit

fa v f jmet S crumpled When
past, there comes in the place a three-Square
reuni black \$" > like to

or Mountain Baftard, of divers
ave all of them a bulbous Root, which is
on the outside: but of this there are several
softs, a, i. One which has very broad and whitish
green Leaves, something short in Companion with others
of that breadth : the flower is wholly yellow,
ut a little paler than the former Spanish kind, having
the Leaves of its Mower long and a little narrower
*, standing like Wings about the middle of the
trunk, icjy is as long as k, Leaves, and mailer
Man in many others of this kind, but a little yellower
than the Wings, z. One which has narrower green
leaves than the former, and longer; the flower is
yellow, but the Trunk is larger, wider and more
open at the Mouth than the other, and almost as large
a* the former Spanish, but not so high as the last.

3- One which has the Wings of the Blower, of a Straw
color, but its Trunk is long and narrow, of a fair
yellow. 4. One which has Such like Flowers, but
that n, Jhorter er, both in the Wings and the Trunk.
5- Another which has the Wings of the Flower longer
Man the long Trunk, and sometimes Jhwrtter. 6. Another
which has its Wings a/llyelow, or only a little
more pale or white, like to the English kind. 7. Others
which have their Trunks long and narrow, or
brims*

h,i,w, l, A j-Lf*TM* rising up, of a meanfize[^]
ktu.ee, i.e broadest and narrower*ktnds, of a greyish

green color and not very long: the Stalk rises up a
foot high or more on the top of which grows one large
fair Flower, equalling the large Spanish Baftard
Daffodil, before described, in the Lafgenefs of its
Trunks and having the brims turned up a little
which makes it seem the larger. The Wings or out-
ward heaves are in a manner as fiort as they are in
the greatest Spanish kind, (and not long flagging,
down like unto Mountain kinds) and fit and
straight outright. All the whole flower is of one
even color viz. of a fine pale yellow, not much unlike
to the color of a fresh Limon Peel, but a little whiter
which we commonly call a Strob-color. It is a large
Flower, and early in the Spring.

IX* The seventh or Greater white Spanish, has
a Root greater and thicker than the first Spanish at
feet 6. above, but does not encrease much, nor is
covered with a black, but rather with a whitish Skin.
From this Root divers Leaves rise up together, long
and broad, somewhat like to the first Spanish kind at
fea. 6. but a little broader, and of a whiter green
color, yet not so white as in the Lesser Spanish white
kinds, after described. From among these Leaves
rises up a round strong Stalk, about two feet mgv >>
bearing at its top one white Flower, bending down
the Head, as all these White kinds do, but is not so
pure white as the Lesser kinds which follow, ye*
whiter than the Greatest white Spanish kind, *** to
be described in fe& 10. The whole flower, as well
Trunk as Wings, is much larger than the Lesser
white kinds, and almost equalling the first Spanish
flower, but a little longer and more
crumpled, and turning up at the brims after which,
there follows a Head and Seed, like to the first.

X. The eighth, or Greatest Spanish white, has a
Root like to the former, but greater, being white on
the outside, and not black. In the manner of its
Growing, it is very like to the last both in its Leaves
and Flowers, but larger in both. The Flower of this
is not full out of white, but has some (hew of Pale-
ness therein, and more upon the first opening of the
Flower than afterwards, and is as great altogether as
the Spanish yellow, at the leaf with a longer and
somewhat narrower Trunk, after which come Heads
of Seed, like the former.

XI The ninth, or Lesser and mean white Spanish,
are two other one lesser than another, and both less
than the two former White Spanish Daffodils.
The Roots of both are like one another, but do differ
in Greatness. The Leaves of both are of a whitish
green color, one a little broader than the other. The
Flower of both are pure white, and bending down
their Heads, that they almost touch the Stalk again
the greater Flower has the longer and narrower
Trunk and the lesser Flower the Jitter and wider
open yet both a little crumpled at the Priop* I A

XII. The Places. The first is in
England in Copies, in j j S S S H S S
that by its growing Wild, it is of the lesser Se
in our Gardens. The second is also found
growing on the Pyrentan Mountains. The
third grows in Gardens. The Wri-, IXnmeht
out of W. I ^ f i ^ f ^ * \$ ^ £ ^
ninth came from the Pyren Mountains and are
also found in some parts of Spain : but with us
they all grow in Gardens only.

Ydll. The Times. The first, second and sixth are
the most early ; the rest flower in April and
the greatest yellow, somewhat earlier than the other
greater or lesser white.

XIV. The natalities, Specification, Preparations
and Virtues, are much the same with the Common

or *Vulgar Daffodils* in Chap. 189. foregoing, to which you are referred.

C H A P . C X C V I I I

O / D A F F O D I L Baftard, broad-leav'd double-flowred.

I. THE Names. It is called in Greek, *Κίονος*, *Τακτ'ΑΑ* *©* *ΤWAAGVAVO* *^* *VI*. *Λίνον*, *Pfeudonarciffus latijolius flore multiphci*, and in English, *Baftard Daffodil broad-leav'd*, with double flowers.

II. The Kinds. Of this fort there are five kinds, viz! 1. *Pfeudonarciffus Anglicus flore pleno*, The English double Baftard Daffodil, or *Gerard's* double Daffodil. 2. *Pfeudonarciffus aureus maximus Anglicus flore pie no*, five *Roseus Tradescanti*, The greatest English yellow double Baftard Daffodil, or *Trade/cant* his great *Rofe* Daffodil. 3. *Pfeudonarciffus aureus major Anglicus*, The English great yellow double Baftard Daffodil, *oxWilmer's* great yellow double Baftard Daffodil. 4. *Pfeudonarciffus aureus Hispanicus flore pleno*, The great double yellow Spanish Baftard Daffodil, or *Parkinforts* Baftard Daffodil. 5. *Pfeudonarciffus Gallic us major flore pie no*. The greater double French Baftard Daffodil

III The Defcriptions. *The fir ft*, or English double Baftard, has a Root which is small, very like unto the French double kinds, especially the *Leffer*, to which it is fo like, that it is hard to know the one from the other, from this Root arise Leaves very like unto the Single kinds, being of a whitish green color, and something broad, a little shorter and narrower, yet stiffer than the following French kind. The Stalk ryes up about a foot high, bearing at top one very double Flower, the outermost Leaves being of the same pale color which is to be seen in the Wings of the Single kind; those which stand next them are some oja* deep a yellow as the Trunk of the Single, and other some of the same pale color, with some green Stripes on the back of divers of the Leaves. Thus is the whole Flower variably mixt with pale and deep yellow, and some green Stripes among them, when it is fully open, and the Leaves dispersed and broken. Sometimes the flower Jhews a clofe and round yellow Trunk in the middle, separate from the pale outward Wings *, which Trunk is very double, Jhewing some pale Leaves within it, dispersed among the yellow: and sometimes the Trunk is more open, or in part broken, Jhewing forth the same colors intermixt within it. At length the *Plowipaffe's* way, and without giving any Seed, ax d'orfer' bulbous Roots do, which bear double Flowers.

IV. The second, or Greatest English yellow double, (called by *Parkinon*, The Prince of Daffodils) has a great round Root, like unto other Daffodils, covered with a brownish Skin -, from whence rise up four or five somewhat large and broad Leaves, of a greyish green color, yet not fully fo long and large as the next following: from the middle of which rises up a Stalk, almost as high and as great as it, bearing at its top out of a skinny Husk, one fair, large, double Flower, (the Bud, before it breaks open, being shorter and thicker in the middle, and ending in a longer and sharper Point than any of the other Daffodils) very much spread open, consisting of smaller and shorter Leaves than the next following, but more

in number, and thicker and rounder set together, making it to seem as great and double as any Province *Rofe*, and intermixt with divers yellow and pale Leaves, as it were in Rows, one under another. It continues long in Flower, and for cads by standing long, to be the broadest in Company of any of the Daffodils ^ but it fades away at last without giving any Seed, as all double Daffodils do*

V. The third, or English great yellow double Baftard, has a thick great bulbous Root, which encreases as well as any other Daffodil *, from which rise up three or four large, long and broad Leaves, somewhat longer and broader than the former, and of a whitish green color. The Stalk rises to be about two feet high, if it grows in a fat and fruitful Soil, and is strong and something round, bearing at the top, out of a thin Husk or Skin, one large and fair double Flower, each Leaf of which is twice as large and broad as the last described, variously intermixt with a Row of paler, and a Row of deeper yellow Leaves, wholly dispersed throughout the Flower, the pale color as well as the deeper yellow, in this as well as in the Small English kind, growing deeper by standing: sometimes the Leaves thereof are scattered and spread wholly making it Jhew a fair, broad, open Flower ^ and sometimes the outer Leaves fit and separate from the middle Trunk, which is whole and unbroken, and very thick of Leaves -, and sometimes the middle Trunk will be half broken, neither expressing a full open double Flower, nor a clofe double Trunk, as it is also seen in the Small English kind; at length the Flower passes off without bearing any Seed. This Great double Baftard Daffodil does Jo near resemble our Common double English kind, that there is little other Difference found between them, but in the Largeness of the Leaves and Flowers, and in its Stateliness, and magnificent way of Growing.

VI. The fourth, or Great double yellow Spanish, has a great bulbous Root, covered with a dark-colored Skin, and whitish on the inside: from this Root divers Leaves rise up, stiffer, narrower, and not of so whitish a green color as the former, but more dull or greyish, plainly resembling the Leaves of the Single great kind *, from whence 'tis said this took its Original: The Stalk hereof also rises almost as high as it, and near the height of the last described, bearing one double Flower at top, always spread open, and never forming a double Trunk, like the former, yet not so fair and large as it; the outermost Leaves whereof, being of agreeable color at first, are afterwards more yellow, and do a little turn themselves back again to the Stalk: the other Leaves are some of a pale yellow, others of a more Gold yellow color: those which stand in the middle are smaller, and some of them Jhew as if they were hollow-trunked *, so that they seem to be greenish, whitish, yellow and Gold" yellow, all mixed one among another. *Parkinon* thinks himself to be the first that ever had this Flower in England, his being of his own raising, and flowering first in his Garden.

VII The fifth, or Greater double French, has a Root very like unto the *Leffer* kind, but a little bigger and longer; from which spring whitish green Leaves, longer and broader than the Smaller trench kind, hereafter to be described, and broader and longer, and more limber than the Double English kind at first 3. above. The Stalk rises up not much higher than the Smaller French kind, but a little bigger, bearing at its top one great double Flower, which when it is perfectly blown open, (which is but seldom, by reason of the Leaves cleaving very Jaji one to another) becomes a fair and goodly Flower, larger by half than the Smaller kind, and fuller of Leaves, of the same pale whitish yellow or Limon color with

the Leifer, or rather a little whiter, and not Jet in the fame Order of Rows, as that is, but more confuted together, and turning back the ends of the outer moft heaves to the Stalk again, neither of which is found in the Leffer kind.

VIII. The Places. The firft is natural of our own Country, for Gerard found it in an old Womans Garden in the Weft of England, where it-grew before the Woman came to dwell there: and Parkinjon fays, That he heard that it was a Native of the Ifle of Wight. The fecond is unknown as to its Original, but it feems to be a Native in John Tradescant his Garden. The third, as far as we can learn, is an English Plant, growing in the Garden of Vincent SwinA (a Fleming) dwelling on the Bank fide of the River Thames, from whom Mr. Wilmer a Stratford Bow had it; after which it went by W Timers Name. The fourth, Parkinjon fays, was of his own railing: he fays it was alfo raised from the Seed of the Great Spanifh Jingle kind, which he fowed in his own Garden, and cherifhed it, till it gave fuch a Flower as is defcribed. The lait, its Origin is not certainly known; fome think it came from France, others from Germany.

IX. The Times. They all flower much about onetime, viz. from the middle of March, as the *ear is in forwardnefs, unto the middle of April.

X. The Vitalities, Specification, Preparations and Virtues. They are much the fame with thole of Common Urticaria in Chap. 189. aforegoing, which fee in the place cited.

among which comes forth a Jhort Stalk, not above an Hand Breadth or half a foot high, bearing one Jingle Flower, not fully ftanding out right, but a little bending down, confifting of Jixsmall Leaves, ftanding as Wings about ajmall but long Trunk, a little crumpled at the brims. The whole Flower, as well Leaves a* Trunk, are of one deep yellow color, like unto the Great Spanifh kind.

V. The third, or Leaf Spanifh yellow baftard, has a Root fmaller than either* of the former -, the Leaves of this Small kind HZ? Jrailer and Jhorter than the laft, Jeldom exceeding the length of three inches, and very narrow withal, but of the Jame greyifh green color with the former *, every Flower ftands upon a fmall and Jhort footstalk, fcarce rifing above the Ground, Jo that its No/e, for the moft part, does lye on or touch the Earth, and is formed after the fame Fcthion, and of the Jame color with thole immediately going before, but much leffer.

VI. The Places. The firft is a Native of the Pyreanan Mountains. The fecond are Natives of Spain: and the third was alfo brought from thence to us: and are all now nurs'd up in our Gardens.

VII. The Times. The firft flowers at the end of March. The fecond and thiid about the beginning of March: but with us they flower fomewhat before, becaufe of the Coldnefs of our Clime.

VIII. The Qualities, Specification, Preparations and Virtues, differ not much from the Common Daffodils in Chap. 189. aforegoing, but thefe are fuppofed to be fomewhat weaken

C H A P . CXCIX.

^ / D A F F O D I L Baftard, narrow-leav'd fingle-flowred.

THE frames. It is called in Greek, in Latin, Pseudonarcissus angustifolius, in English, Baftard Daffodil narrow-leaved with fingle Bowers.

W. H. In this there are three feveral Pseudonarcissus angustifolius fibre flavo-vejcente Tibq quajibciffjo, Baftard Daffodil narrow-leav'd, with a dipt Trunk. 2. Pseudonarcissus Hispanicus wedius & minor lute us, Spanifh yellow baftard Daffodils, the two leffer kinds. 3. Pseudonarcissus Hijpanicus lute us minimus, The laft apanifli yellow Baftard Daffodil.

HI/The Defections. The firft, or Narrow-leav'd Baftard, with a dipt Trunk, has a bulbous Root, from which Jpring long and narrow greyifh green Leaves, bearing one Jingle flower at the top of its Stalk, like unto the former Single Baftard kinds, having its outer Leaves of a pale yellow qplor, and its Trunk of a deeper yellow. The chief differences of this from the English double Baftard in the former Chapter, is in the Leaves, being narrow, and then in the Trunk of the flower, which is not crimp led or turned up, as moft of the others are, and that the brims or edges of the flower, are as if they had been off or cut even.

II. The fecond, or Spanifh yellow Baftard leffer Kinds, have a Root which is but Jmall, and Covered with a darkifh Skin. Thefe two Leffer kinds do differ but in Greatnefs the one from the other in any thing elfe. Jo that in defcribing the one you may understand the other. The leffer then has three or four narrow, Jhort, whitifh green Leaves, J,

C H A P . CC.

Of D A F F O D I L Baftard, narrow-leav'd double-flowred.

I. The Names. It is called in Greek, in Latin, Pseudonarcissus angustifolius Jiore multiplici, vel a double blower.

II. The Kinds. It is Jingularis Jui generis, out any fub-ordinate Species and is vulgarly called, Pseudonarcissus Gallicus minor flore pie no, The leffer French double Baftard Daffodil.

III. The Defcription. The Roots of this Leffer French kind, are like unto the Double English kind, a* aljo to the former Double greater French kind; and the Leaves are of the fame whitifh green color alfo, but narrower, and not longer: the Stalk rifes a little higher than the English, and not fully Jo high as the Greater French, bearing one fair double flower on its top, of a pale yellow or Liraon color, confifting of fix Rows of Leaves, every Row far & Z Jmaller than other unto the middle, and Jo Jet a placed, that every Leaf of the flower does Jiand i retly almojl in all, one upon or before another, the middle, where the Leaves are fmallest the outer* maji being the greateji, which makes the flower the more beautifull. This and the Greater kind has no Trunk, or Jhew of any other thing in the middle, as all or nwl of the other former Double Baftard Daffodils have, but are flowers wholly compofed of Leaves, ftanding double even to the middle. Parkinjon doubts whether this or the Greater French Baftard, ought to be called Baftard Daffodils or not, becaufe the flower in neither of them is made after the fafhion of other Baftard Daffodils, but rather refembles the form of the Double white Daffodil.

IV. *The Places.* This French double kind grows about Orleanse in France, where it plentifully abounds; but with us in England, it is only nurs'd up in Gardens.

V. *Tfo T/v/r.* It flowers from the middle of March to the middle of April.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Daffodil, all which are discour'd in Chap. 189. foregoing.

CHAP. CCI.

Of DAFFODIL Baftard > Ruff-leav'd.

Lnr^HE Names. It is called in Greek, *Κοιλο-κρινθός*: in Latin, *Pseudonarcissus Juncifolius*, vel *Juncus*: in English, *Bajiard Ruff Daffodil*.

II. *Tfo JFC//A.* Authors make four several sorts of this Plant: 1. *Sseudonarcissus Juncifolius albus*, The white Baftard Junquilia, or Ruff Daffodil. 2. *Pseudonarcissus Juncifolius hit ens major*, The greater yellow Baftard Junquilia, or Baftard Rudi Daffodil. 3. *Pseudonarcissus Juncifolius lute us minor*, The letter yellow Baftard Junquilia, or Ruff Daffodil. 4. *Pseudonarcissus Juncifolius luteus ferotinus*, The late yellow Baftard Junquilia, or Ruff Daffodil.

III. *The Defections.* The fir ft, or White Baftard Junquilia, has a bulbous Root, from which rise two or three long and very green Leaves^ very like unto the Small yellow Junquilia, or Ruff Daffodil before ibed, bin not altogether so round: from MMong which rises up a short Stalk, about six inch&Efigh, bearing at top, out of a skinny Husk, one small white blower, sometimes declining to a pale cftw, having six small and short Leaves standing about the middle of the Trunk, which is long, and much wider open at the mouth than at the bottom. The small outward Leaves or Wings are a little tending to green, and the Trunk, as I said, is either white or whitish, having the brims or edges a little uneven, The Seed is small, black and round, like unto other Junquilia, or Ruff Daffodils, but smaller.

IV. *The second, or Greater yellow Baftard Junquilia, has a bulbous Root, bigger than the former; and the Leaves of this Greater kind are longer, greater and a little broader than the last before ibed. The Stalk also is higher, and the Flower larger, more open at the Mouth, and more crumpled than the White, but wholly of a yellow color. The Seed is also larger, according to the Proportion of the*

JSS The third, or Lesser yellow Baftard Junquilia, is in Root, Leaves, Stalk and Flower, and manner of Growing, yea, in all things like unto the last, it is needless to trouble you with any farther Description thereof; the only Difference is in the Magnitude of the Plants, this being smaller in all its Parts.

VI. *The fourth, or Late yellow Baftard Junquilia, is in Root, Leaves, Stalk and Flower, also in manner of Growing^ very like unto the former Greater yellow Baftard Junquilia, but with this Difference; that this is rather the larger Plant, and bears the fairer Flower, and flowers also some thing later than that does.*

VII. *The Places.* These all came to us from the Vyreman Mountains, and being tender Plants, require With much Care, nurs'd up in our Gardens.

VIII. *The Times.* The three first flower in April: the last flowers a Month later, viz. in May.

IX. *The Qualities, Specification, Preparations and Virtues,* are much the same with the Common Daffodil, of which we have spoken in Chap. 189. foregoing.

CHAP. CCIL

Of DAFFODIL Baftard, Sea

I^T^HE Nantes. It is called in Greek, *Κοιλο-κρινθός*: in Latin, *Pseudonarcissus Marinus*; and in English, *Sea Bajiard Daffodil*.

II. *The Kinds.* So far as we know, it is a singular Plant of the kind^ tho' Authors Report, that there are other sorts of it, some of which bear yellow Flowers, and others which bear red; but of those we can say nothing in this place.

III. *An Observation.* Some have called this Plant *Pancretium flore Li Hi* \$ but this was a Mistake. Others thought it to be a kind of *Scylla* \$ and used it instead of *Squills* in *Theriaca* *, but this was a dangerous Error. Others, as *Clufius* faith* call'd it *Hemerocallis*, thinking it to be a Lilly *, and *Clufius* does thereupon call it *tiemerocallis Valentiniana*, but was wholly in the wrong: for it is neither *Pancretium*^ nor *Scylla*, nor *Lillinn* \$ but it is essentially a kind of *Daffodil*, as the Form of Root^ Leaf, Stalk and Flower demonstrate.

IV. *Observat.* 2. 'Tis true, *Dioscorides* will have *Pancretium* to be a kind of *Scylla* 5 and (b) it was called in his time, viz. *Scylla radice rubra*, which had a Leaf like a Lilly, but longer, and was used both with the same Preparation and Quantity, and for the same Diseases that *Scylla* was used for; only that it was said to be weaker. But beware of using of this *Sea Bajiard Daffodil* by such a Mistake, because of its dangerous Effects, which are said to be deadly: for it is reported, that one, out of Malice* did before hand cut the Root of this Plant with the Knife which another was presently after to cut his Meat withal, and that with an Intention to kill him by the Poison thereof, with which the Knife was poisoned.

V. *The Description.* It has a large white bulbous Root, from which spring several broad whitish green Leaves, but not very long, among which rise up a few round Stalk, at the top whereof break out of a great round skinny Husk, five or six blowers^ every one made somewhat of the Fashion of the Great > Baftard Ruff Daffodil, but greater^ and wholly white; the six Leaves being larger and longer than in the Junquilia or Ruff kind, and extending beyond the Trunk, each tipped with green at the point of each Leaf, and down the middle likewise, on the backside*. The Trunk is longer, larger and wider open at the Mouth, cut in or indented at the brims or edges^ and small at the bottom, with divers white Threads in the middle, and is very fewcet. Under the Flower is found green Head, which grows very great, having within it, when it is ripe, fiat and black Seed.

VI. *The Places.* It grows near the Sea side in Italy, Spain and France, within the Straights, and is the most part upon all the Levant Shore, and Islands of the Mediterranean, but does not often flower in our colder Climates, but it prospers^ and I saw it grow admirably well in some part of Southern Carolina, and other parts of bloridd*.

VII. *The Times.* It flowers towards the latter end of Summer, viz. in August and September.

Stfi. As to the *Qualities and Medicinal Virtues* hereof, Authors have said nothing about it, but do account it a virulent Poifon, rather than any thing else: and yet it is possible it may be prepared for external Applications, with fingular Advantage against many stubbdm and rebellious Difeases, such as are Struma's, Oedema's, and other Infirmities of like kind.

CCIII A.P. CCIII

Of D A F F O D I L Chequer &

The *Names*. This Plant was unknown to the *Greeks*, as far as we can learn, and fo has no proper *Greek Name* belonging to it; but it is called in *L</>*, by Authors, *Fritillaria*, by *Dodontus*, *Flos Meleagridis*, (*The Ginny Hen-Flower*, because of the Variety of the Colors in the Flower, agreeing with the Colors of the Feathers of a *Ginny Heu*;) by *Lobel*, *Lilio-narcijus*, *Vanegatus*, & *Purpureus Vanegatus*, of *Tejfulatus*, (making it a kind of *lahp*;) others, *Lilium variegatum*: in *Englijh*, *The Chequer'd Daffodil*, *The Chequer'd hilly*, *The Ginny Hen-Flower*, and *Fritillary*, by which last Name it is molt known.

II. *The Kinds*. Some Authors will have it to be of the kind of the *Daffodil*, some of the *Tulip*, some of the *Lilly*, and others as partaking of something of all of them, and therefore have placed it between them: but because it is now molt commonly called, *A Chequer'd Daffodil*, we have placed it immediately after the *Daffodils*. Hereof there are many Species found out of late, as *White*, *Red*, *Purple*, *Telbw*, *Black*, of each of which there are alio severai forts, but the *Purple kind* was that which was first known.

III. Authors make several Species hereof, some more, some less: those which we (shall take notice of in this Chapter, are the thirteen following, viz. 1. *Niljaria vulgaris*, The common Chequer'd Daffodil. 2. *Fritillaria vulgaris pallidior*, *pr&cox* & *Scrotina*, The early and late common Chequer'd Daffodil. 3. *Fritillaria flore atro rubente*, The Blood-red Fritillary. 4. *Fritillaria maxima purpurea*, *five rubra*, The great purple or red Fritillary. 5. *Fritillana alba*, The white Chequer'd Daffodil. 6. *Fritillaria flore duplici albicante*, The double bluish Fritillary. 7. *Fritillary flore luteo puro*, The abfolute yellow Fritillary. 8. *Fritillaria flore luteo varia five punttato*, The variegated yellow Fritillary. 9. *Fritillaria lutea maxima halica*, The great yellow Italian Fritillary. 10. *Fritillaria polyanthos flore pitirvo Italarum*, The small Italian Fritillary. 11. *trit Maria lutea Juncifolia Lusitanica*, The Portugallish yellow Fritillary. 12. *Fritillana Pyrennia*, *jive Apennines* The Pyrensean black Fritillary. 13. *Fritillaria UmbeUijera Hi/panica*, The Spanifh Umbelliferous black Fritillary. Some think, that the Name *Fritillaria* was given to it from *Fritillus*, the *Chequer'd Board*, upon which Gamesters play at Dice, this delightful Flower being Chequer'd in like manner on its Leaves.

IV. *The Defcriptions*. *The first*, or *Common Chequer'd Daffodil*, has a small white bulbous Root, but somewhat flatish, made as it were of two Cloves, and divide din a manner into two parts, yet joining together at the bottom or feat of the Root, which holds them both together. from between this Cleft or Division, the Bud for tpe Stalk appears, which in time

rises up to be a foot or foot and half high, being round and of a brownish green color, 7)iore especially near unto the Ground, whereon there jlands difperfedly four or five narrow, long and green Leaves, being a little hollow. At the top of the Stalk, between the upper heaves, (which are fmaller than the lowest) the Flower Jhews it self, hanging or turning down the Head, but not turning up again any of its Leaves as some Lillies do. Sometimes this Stalk bears two Flowers, and sometimes, yet but very seldom, three, confining of six Leaves apiece, of a reddish purple color, spotted with great Spots, appearing like unto square Chequers, of a deeper color. The inside of the Flower is of a brighter color than the outside, which has some Greenness at the bottom of every Leaf. Within the Flower do appear six Chives, tipped with yellow Pendants, and a threeforked Stalk, pointing, compassing a green Head, which when the Flower is past, rises upright again, and becomes the Seed-VeJJeL being something long and round, yet having a small bevo of Edges, flat at the Head, like the Head of a Lilly, and without any Crown, the Tulip has, in which is contained pale-colored flat Seed-like unto those of the Lilly, but smaller.

V. *The fecpni*, or *Early and late coitmc*, *chequer'd Daffodil*, of the same kind with the former, but with the following Differences, viz. 1. That some of them do flower early, with or before the Early-flowering Tulips; and some of them flower later, to wit, a Month or more after the former. 2. That in some the Color is paler, and in some of a very high or deep color. 3. That some have eight Leaves, and sometimes ten or eleven heaves, as if two Flowers were made one, some call a Double Fritillary. The Flowers at top of the Stalk are Chequer'd mejj admirably, and yet in the same Mature has kept a wonderful Order, surpassing the most curious Fainting Art can perform: one square is of a greenish yellow color, the other purple, keeping the same Order, as well on the backside of the blovser as on the inside; sometimes they are blackish in one Square, and of a Violet-color in another, so that Nature seems in a simple flower to hing forth Variety in Herfettion.

VI. The

- VI. The thirds or Blood-red Fritill^{ary} has a Root fomewhat rounder and clojer than the fir ft >, from whence the Stalk rife sup. being Jhorter ant lower than in any other of thefe kinds, having one or two Leaves thereon, and at the top thereof two or three more fet c/ofer together, which are bkoadf[^] Shorter and whiter than any of them before, almoft like unto the heaves of the Yellow Fritillary; from among which top Leaves cromes forth the flower, fomewhat bending down, or rather ftanding forth, being larger than any of the former, and almoft equal in Largenefs to the Yellow Fritillary, of a dusky grey color en the outfide, and of a very dark red- color on the infide, diverfly spotted or ftraked: this very hardly increafes by the Root, and as feldom gives ripe Seed, but flowers with the other firft or early forte, and 'before the black kind, and abides a[^]lefs time in How- er than any.*

VII. The fourth, or Great purple or red Fritilla- ry, has a Root equal to the Largenefs of the reft of its parts; from whence rifes up one, andfometimes two Stalks, having one, two or three flowers apiece on them, as Nature and the Seafonferves: each one of thefe flowers are larger and greater than any of thofe before deferibed, and pendulous in like manner as they are, of a fad red or purplifh color, with many thwart or "crofs Lines on them, andf mallong Marks, which fcarcely appear Chequerwife, nor are fo eminent or confpicious as in the former. The Stalk is ftrong and high, whereon are fet feveral long zwhitifh green Leaves, larger and broader than thofe of the former. \ . • .

VIII. The fifth, -or White Fritillary, has a Root fa like unto the former', as not to be diftingmfl)ed, and the whole Plant is fo very like unto the fir ft, that it is needlefs to make any Defcription[^] but only fhevo the*chief Differences. In this the Stalk and Leaves are zoholly green, by which this is, diftin- guijbedfrom that, which is brownijh at bottom* The Flower in this is white, without almoft any fhew of Spot br Mark in it, tht in fo?ne they are more plain- ly to be fecn[^] and in fome there ts again a kind of faint blujh color to be feen in the Flower, efpecially on the infide, the bottoms of the leaves of every one of which are greenifh, having atfq a fmall Lift of green coming down towards the middle of each Leaf: MS for the Head or Seed-Veflel and Seed, they are fo like to the jirft, as not to be differenced from them.

IX. The fixth, or Double blujh Fritillary, has a white round flattifh Root, like unto the laft, bearing a Stalk with long green Leaves thereon, little differ- ing from it, or the firft defer ibed kind. The Flower is constantly the fame, compofedcf many Leaves, be- ing ten at the laft, but moft ufually twelve, of a pale znhitifh purple color, fpotted like unto the Paler ordi- nary early Fritillary, fo that one would think it to begin accidental kind thereof; whereas it is (as is &efaid) conflant in its Appearance and manner of rering.

X. The feventh, or Abfolute yellow Fritillary, has a whitijh Root, more round and not fo flat as the former kinds, and of a mean Largenefs. From the middle rifes up a Stalk a foot and half high, and fo?netimes higher, on which grow, without any Order, fever al long and broadijh Leaves, of a whitip green color, like unto the Leaves of the Black Fritillary, but not above half fa broad: the Flower is fomewhat fmall and long, not much unlike to the Black for Shape or form, but that the Leaves arc fmailer and rounder pointed, of a faint yellowijlo color, without any fhew of Spots or Chequers at all, either within or withAt the Flower, having fome Chives and yellow Pendants in the ?middle, as are to be feen in them all. The Seed is like to that of the firft kind.

XI. The eighth, or Variegated yellow Fritillary[^] has a Root like to the other, but not fo flat. It grows not much lower than the former, and bvivnijl) at, the rifting up, having its Leaves whiter, broader andfhorter than it, and almoft round-pointed. The Flower is greater and larger fpread than any of the afore-defer ibed, and of a fur pale yellow color, spot- ted in very good order with fine, fnall, yitlow Che- quers, zvhich give it a wonderful plcajrltg Beauty. It has alfo fome Lifts of green running down the back of every Leaf-, and feldom yields any Seed*

XII. The ninth, or Great yellow Italian Fritilla- ry, from a Root fomewhat like to the others before, it fends up a round and brown green Stalk, on which grow feveral Leaves, fomewhat broad and fhort, which encompafs the Stalk at their bottom, of d dark green color h at the top of which Stalk, which bends a little downwards, do moft ufually grow three or four Leaves, between which comes forth moft commonly but one Flower, which is longer than de laft, hang- ing down the Head, a all the others do[^]. confifting of fix Leaves, of a dark yellowifh purple color, fpotted with fome fmall red Chequers > This flowers late, or not till all the other are pdfti

XIII. The tenth, or Small Italian Fritillary, has much alike Root and Stalk, but fmailer: the Stalk has fever al fmall, Jhort, green Leaves thereon to the very top, but it bears a greater ft ore. of Flowers than the former, but they are much f?naller, and of ayel- lowifh green color, fpotted with long and fmall dark red Marks or Chequers.

XIV. The eleventh, or Portugal fmall yellow Fritillary, has a Root much like the others be for ego* ing; the Leaves are fo fmall, narrow and long, that it has cdufzd it to: obtain the Name of Ruihes[^] or Fritillaria Juncifolia[^] Ruff Fritillary, which grotv up* on a long, weak, round Stalk, fet without Orden The Flower is fmall and 'yellow, but thicker Che- quered with red Spots than any of the other Yellow Fritillaries ^ the Stalk of the Flower at Head thereof b/ing alfo of a yellowifh color.

V. The twelfth, or Pyrenfan black Fritillary has a Root which does often grow fo great, that it feems like unto the Root of a Small Crown imperial TheStal/t is ftrcng, roundandhigh[^] fet without Or* dfr, with broader and whiter green Leaves than a- ny of the former, bearing one, two or three Flowers, not being fo large as thofe of the Common purple Fritillary[^] but fmailer, longer and rounder\ fome- times turning u\$ the brims or edges of the Leaves a* gain, and are of a yellowifh fhining green color on the infide, fome times fpotted with red Spots, almoft thro* the whole infide of the Flower, mi to the very edge, which, abides of a pale yellow color >, and fome tmes again there are very few Spots to be feen, and theft from the middle only on the infide, (for on the out- fide; of this fort there never appears any Spots at all) andfomctwies without any fhew of Spots <5, fome times alfo of a more pale green, and Some times of a more yellow color. The outfide of the Flowers do likewife vary; for in fome the outfide of the Leaves are of a dark dull yellow, fometimes of a more pale yellon\ and other times of a dark purplifh) yellow, which in fome is fo deep andfo much, that it rather fecms black than purple or yellow, and this chiefly about the bottom of the Flower, next to the Stalk, bat the edges are Jfill of a yellowifh green. The fie ad and Seed are like unto the former, but larger in all rejpetts.

XVI. The thirteenth, or Spanilh Umbelleroijs black Fritillary, is no doubt of kin to the laft de* fcribed; but is in its Root, Stalk, LcLives and Flow- ers greater than it, andfo greater in the whole, as if growing in a fatter or richer Soil, it were the jlronger, andfo more proliferous and able to bear a greater jlore of F\owers, The Flowers grovs four OJ* jiOc

fi- ffirm the Head together, b.uyng dozen, round jboist the Sulk, like tattoaci tvn Imperial, and arc v(k green color on the mfidc, spotted i few rei. Spots, the out fide bang blackijh as the (firmer.

XVII. The Places. TIK firft of theft came from Ynuice, where, about Qrleance, it grows plentifully : die odier forts grow in tiiofe Countries which their Titles hidigiEite, but arc all or them nurs'd Op wrth us in C'.trdens of thrifts, and are moft of them become Natives of this Kingdam.

XVIII. The limes. The early kinds do flower in the beginning of -April, according to the Mildneii or Hardncls of the aforegoing Winter: the others flower after the firft arc pait tor a Months fpace, one after another ; and the Great ye/IJzo is very lute, not flowering till about the middle or the end of May.

XIX. As to the Qtdfyies, Specification, Preparations and Virtues of their Wants, or any of them, Anchors have iiiid nothing ac all, whether inwardly to be taken or outwardly to be applied \ nor have I hid any Kverpience of their Effeits in my fburty Years fjiftice : they are a glorious and admirable Hovrer, of an extraordinary Beauty, and their chief Uie v;irh us, is to be an Ornament for Gardens, which they nobly beautify, and therefore deierve our Cultivation, Entertainment and Obfervatk>n, efpcially of F/orifts, and other Lovers of Curiofities of this kind.

CHAP. CCIV.

Of DAISIE Garden.

J-'TP-tf-E Niimet. The Daifie is called in Greek, J- (as lome fuppose, irom Theophrasim lib. 7. cap.a.) '&&£. but this I judge to be a Miftake, tot 11 docs not plainly appear in any Greek Author, that the Grecians had the Knowledge thereof: in Latin, Bellis, Pliny lib. 26. crtp.; and m Englijb, Garden biiijie. The Ltfijji aUb call it, /frria ..Wj.

II. The Kindt. The chief kinds arc, 1. Bellis hortnfs The Garden Daifie, of which in this Chapter. 1. *&ll> "grejlis, The Field Daifie, ofwhich inChap.2Cf. 3. Bellismajorvulgans, Thegreater common Daifie, of which in Chap. 206. 4. Betti fpih/fa, The Thorney Daifie, of which in Chap. 207. V Belfis Americana, The Well India or American Daiiie, of which in Chap. 2e8. following.

III. Bellis hnenfis, or the Garden Daifie is manifold, viz. 1. Bellis minor jlore rubro fwplici, Single red trifles. 2. Bellis major Jlore albo plcno^The great double white Daifie. 3. jBt/hx minor Jlore pjfi:o variorum colorum, The lefter double Dailies of divers colors. 4. B^/w minor profifera, Double double Daiiiss. T- BellitGlobularia cerulea, Blew Globe D>aifius. 6. Bellit Globularia lutea, Yellow GloVie Dai It us.

iV. The Defoitions. The jtrjt or Single red Dailie, has Roets uh/ch arejmall, white ond fibrous cr thready • frgm whence rife mnyfmoot^ green nd-j ointTA Laves, lying on the Ground, a Hitle fnipt about the edges: from among which rife up ma_ /ender round Yoot-flalkr, rather than Stalks or SfeM, about unhand breadth high at moji, andfome-tites not Jo high, bearing one Flower apiece, conji-fing. cf nunyfmall Lewes, as a Vale or Border, fit about a miSdlt Thrum .- the Leaves are almoft wholly rcl wfareit in the middle they are while or aihitijh,

nchmg to red en the edges, the middle being •ellm.

V. TheTfiml or Great douUe white Da^ fe, a white don 7 firingy &* • *** f^i* vkn f jo tee to the Great lingle **&, which grows bj, highways^ and in Meadows and heldt, that there pa no difference between them, but in the llouier, which in this is double. It has many long ani-ifomevhat broad Leaves, lying upon the Ground, deeply cut in on both fides, fmevma? like unto an Oaken Leaf: but thojc which are on the Stalks^ me fycrter, narrower, and not fo deeply cut in, but only notched on the edges. The flowers at the top are white and double, confifing of feveral Rows of Leaves, being greater mCmfafs than any of tlx Double Dailies wbtcbfcf* OTV, but nothing fo double oj"Leaves.

VI. *The third, or Lesser double Daifie, ha* a white fibrous Root, from whence rise Leaves, lying upon the Ground, in Form like to the Common fingle ones, from which they differ little or nothing, but that they are [mailer, and little or nothing frupt about the edges. The Stalks likewise are fmailer and lower, but bearing as double Flowers ay any, being composed of many fmallLeaves, thick thruji together, of various colors ; for some are wholly of a pure white, others have a little red, either difperfed upon the white Leaves, or on the edges, and some times on the 'backs of the Leaves : some again seem to be of a whitijb red, more red than white, when indeed they are white Leaves, difperfed among the red: others are of a deep or dark red color, and some are fpeckled or ftriped with white and red through the whole Flower : and in some the Leaves will be red on the upper fide', and white underneath: and some (the? but very rare) are of a greenifh color. Of this kind some have Stalks and Heads which are round ^ and some again which are flat : which laji I have known to degenerate into round, and fo to continue.*

VII. *The fourth, or Double double Daifie, has no difference in Root, Leaf or Stalk from the former kind, but only in the Flower ; which in this bears many fmall double Flowers, fit an ding upon very fhort Stalks round about the middle Flower, which is ufually as great and double as any of the other double kinds, and is either wholly of a deep red or fpeckled with white and red., as in some of the former kinds, or elfe greenijl), all the fmall Flowers about it being of the fame color with the mid die/noft.*

VIII. *The fifth, or Blew Globe'Dai fie, has a hard and fibrous Root, and a great Affinity with the Plant laft defcribed, fath in Form of its Leaf and Flower. It has many narrower, fhrcter. and bicker green Leaves than the former, lying, round about upon the Ground*, among which rise up flender, but fit iff and hard Stalks, fix inches or more high, fet here, and there with fmall Leaves, and at the top a fmall round Head, composed of many fmall blew Leaves, fomevohat like unto a Scabious Head ^ anifometimes it is alfo found with white Heads of Flowers. The whole Plant is of a bitter Tafte.*

IX. *The sixth, or Yellow Globe Daifie, has a Root of a Fingers length, round and hard, with a thick Rind, and a woody Pith in the middle, of ajharp drying Tafte and a ftrong Smell : from whence rise up many thick, fmooth, round, pointed Leaves, fspread upon the Ground like the former: among which fpring tip feveral fmall round rufhy Stalks, a foot high, bearing about their middle two fmall Leaves at the Joints, and at the tops round Heads of Flowers thruft thick together, ftan-ding in purplifh Husks, every one of which Flowers do blow or fspread into five Leaves Star-fashion, and of a fair yellow color, fmelling not much unlike to Broom Flowers, with many fthreads in the middle, encompassing a flat Pointed, Jhorned or bended two ways. After the Flowers are faded, rise up Seed-Vejfets, which are round, fwelling out in the middle', and divided into four parts at the tops, containing within them round, flat, black Seed, with a fmall Cut or Notchjn them. The Leaves of this Plant are of ajharp and bitter Tafte.*

X. *The Places.* The first four are planted and found only in Gardens, and require to be often replanted, otherwise they degenerate into fingle Flowers, or at lead into lefs double. The two last are alfo Garden-Flowers, but more rarely to be met with than the others, the *Blew Daifie* is a Native of *Mompelie* in *Frahee*, and of the Mountains in many places of *Italy*; the *Tellow kind* is *Italian*, and found up and down in the Kingdom of *Naples*.

\$1 *The Times.* All sorts of *Daifles* almost flow

er betimes in the Spring, during *April* and *May*, and some of them in *June*, but the former *Blew* and *Telloiv* flower not unril *Auguft* or *September*.

XII. *The Vitalities.* They are cold and dry in the first Degree, and are Abiterfive, Afringent, Incarnative and Vulnerary \$ Hepatick, Arthritick and Analeptick.

XIII. *The Specification.* They are dedicated to the Curing of Wounds ^ for which Reason Authors have accounted them among the *QonfoluU*, ur Wound-Herbs.

XIV. *The Preparations.* You may prepare therefrom, 1. A liquid Juice. 2. An Effe/ur. 3. A Decoffion. 4. A compound Decoition in Wine. 5. An Ointment. 6. A Balsam. 7. A Cataplafm. 8. A diftilled Water. 9. An Acid TinSure. 10. An Oily Tintture*

The Virtues.

XV. *The liquid Juice.* It is good to heal Wounds, whether inward or outward : it unites with and ftrenghens the Balsam of the Blood, and fo induces the Healing, by drying, ftrenghning and conglutinating. It abates Heat, and alleviates the Boiling of Cholera, refreshing the Liver and other inward Parts. It is good to cure the Wounds made in the Cavity of the Thorax or Brest, being taken two or three ounces at a time, three or lout times a day, either alone or mixed with a little Wine ; dropped into running Eyes, it much helps them.

XVI. *The Effence.* It has all the former Virtues to a great Advantage, excepting that it heals more, but it much more powerfully confolidates Wounds. It may be given alone, from one ounce to two or three ounces, or it may be mixed with a Syrup made of the Juice of the fame Herb.

XVII. *The becotion.* It cures inward Wounds of the Brest as the former Preparations do -, but it is not altogether fo powerful. If it is made with Wine, it cleanses, incarnates and cures all Ulcers and Pulfes in the Mouth or Tongue, or in the Secret Parts.

XVIII. *The compound Decoffion.* Take *Daifle* Leaves and Roots five liandf ills: *Agnmony, Hvoar' Elder*, of each three haadfuls ; being bried, bdi all in three quarts of Wkie till a quart or more is consumed : then ftyato but for life. It is good againft B'lfie, Gout and Sciatica, to foment the parts therewith two or three times a day, fo hot as the Patient can endure it comforts the Nerves, and eases the Pains of the Parts afflicted.

XIX. *The Ointment,* It cleanses, dries and heals old Ulcers, and difflves or difperles Tumors, Knots or Kernels in the feihy Parts of the Body : it difcuffes fimpk Contyions, which come thro' Falls or Blows 5 and abates Tumors or Swellings in the *Scrotum*, being duly applied : it is laid to cure wonderfully all sorts of fimple Wounds accompanied with Inflammation, and such as are kept long from healing by reason of the Atflux. of Humors to them, whether in the Joints, Arms or Legs.

XX. *The Balsam.* It has all the virtues of the Ointment, but it cleanses putrid and corrupt Sores, and foul Ulcers, much better than that: and sometimes it cures fimple green Waunds at one Dressing. It gives ease in the Gout and Sciatica, and strengthens the Nerves and weak Joints, being applied.

XXI. *The Cataplafm* It difcuffes recut Tumors and fimple Contufions^ and is effectual, being applied, to Swellings of the *Scrotum* : applied to a fimple recent Wound, after it has been washed with Spirit of Wirier it many times conglutinates the Lips thereof at the first Application.

XXIIv The

XXII. *The difilled Water.* It is cooling, and has the Virtues of the liquid Juice, but very much weaker * however, it may be ufed as a Vehicle to convey refrigerating or cooling things in : it abates the Heat of Fevers, abates inward Inflammations, and allays the Turgency of Choller.

XXIII. *The And Tintfire.* It is fingular good to cure Fevers, efpecially fuch- as are burning, malignant or peffilential: it cools powerfully, quenches Thirit and compoies the Spirits. Dofe 30, 40 or 60 drops or more in fome convenient Vehicle, or in any thing the Patient drinks, and to be as often repeated as they call for any thing to quench their Thirt with.

XXIV. *The Oily TinSure.* It is a fingular thing againft all Wounds and Pun&cures of the Nerves: it alfo cures Convulfions in what part of the Body ioever[^] and is a famous thing againft Palfies, if the Back-bone, as alfo all the Parts affe&ced, be well appointed therewith by a cheerful Fire, and it is well rubbed in for half an hour at a time, and this twice a day, viz. Morning and Evening.

CHAP. GCV.

Of DAISIE Field.

¹HP^{H^E} Names. Ft is called in Latin, *Bellis a-*
gre. It is, *Herb a margarita*, and by fome, *Cou-*
lor: and in Engl. *Jh*, *Diiffie*, and *FieM*

. II. *The Kinds.* There are two principal kinds mereor, which are very common, viz. 1. *Bellis*
mnor syheftris. The leffer Wild Daifie. 2. *Bellis*
W^{XA} ve^{Vnedhi} fyveftris, The greater or middle
Wild or held DaiGe.

III. *The Defcriptions.* *The fir ft, or Small com-*
mon fingle Field Daifie, has a Root which is fmall,
white and fibrous ; from the Head of which fprings
forth many thick and fomewhat long green Leaves,
lying upon the Ground, fmall at the bottom, but
broad, and almoji round towards the point or end,
*and a little dented about the edges. From among this**
heap or tuft of Leaves rife up many very /ender,
weak and naked Stalks, or rather loot-Jialks, of three,
four or five, or more inches high, bearing every one
of them a fmall green Head, from whence rife many
fmall white Leaves, encmpaffing a yellow Thrum,
which is in the middle. Sometimes the green Leaves
will be found much larger in one place than in M^z
ther j and the Flower likewife will in fome be red-
dift at the ends, andfometimes under ftained; am
yet notwithstanding all this difference, they are out
one kind or fort, and not divers, as fome main-
tain.

IV. *The fecond, or Greater or middle Field Dai-*
fie, tW it is another Species, yet it agrees with the
former in moft refpeSs, faving that its main Root is
thicker and longer, with many fmall white Fibres
proceeding therefrom : the Leaves are larger and
dented in almoft in like manner on the edges : the
Stalks are thicker, but round andfomewhat higher;
and the Flowers, like the other, white, andfometi'ts
on the tips of their Leaves withablufh ofred^z;
they are larger every way: the Thrum in the middle
is alfo bigger, but of the fame yellow color with the
before defcribed.

V. *The Places.* They grow wild almoft every where, in molt Meadows and Pafure-Grounds of this Kingdom.

VI. *The Times.* They flower in moft of the Summer Months, viz. in April, May, June and July.

VII. *Tta Qualities, Specification, Preparations and Virtues,* are the fame with *Garden Daifies*, only they are with this Advantage, that the *Field Daifie* is more effe&toal for all the Purpofes defigned: fee Chap. 204. fett. 12. ad 24. foregoing.

CHAP. CCVI.

Of DAISIE Great

O R,

MAUDLIN-WORT.

L^h-r[^]HE Names. It is called in *Latin*, *Bellidifloria magna*, *Maxima* iff *Major* •, and in *Englijh*, *The great Daifie*, (but it is the greatelt of all the sorts of *Daifies*) and *Maudlin-wort*.

II. *The Kinds.* It is *Singularis sui generis* •, and is called by some Authors, *Confolida media*, The middle Confound ; but the true middle Confound is *Bugula* -, others, to make a Difference in the Name between *Bugle* and this, call it *Qonfolia media Vulnerarwrum* : however, it is taken by all to be *Confolida media dii generis*, or a kind of middle Confound, from the Virtues it is endowed with.

17. *The Description.* It has a Root which is a half white Fibres or Strings, which abide many winters with the Leaves, Jhoot ing forth every Spring fewen : from the Head of a Root spring forth many long, narrow and narrow-pointed Leaves, lying next the Ground, but cut in on both sides, making it seem almost like the Divisions of some sorts of Oaken Leaves, or rather like the Leaves of Groundfel: the Stalks grow to somewhat tall, viz. about a foot and half in height, with divers Leaves thereon, much in Shape like the other, but smaller and lesser divided than the lower •, and growing yet smaller and lesser divided, the nearer they grow to the top. At the tops of the Stalks grow pretty large Flowers, with white Leaves, and a yellow Thrum in the middle, like the Flower of the Single Field Daifie, or those of May-weed, but something lesser than this last named ± each Flower grows upon a several loot-

*stalk, and the white and narrow Leaves are as < * Pale or Border round about the middle yellow Thru?n and are of no Smell at all: after the Flowers are past, then comes the Seed, which is some what long, and is blown away with the Wind.*

IV. *The Places.* It grows almost every where, by Hedge-fides, in Meadows, the Borders of Fields, and other walte Grounds.

V. *The Times.* It flourishes and flowers in the Months of *May* and *June*.

VI. *The Qualities.* It is cold in the first Degree, and temperate in respect to Dryness and Moisture, but in some Authors Opinions it inclines to Dryness. It is Afringent, Conglutinative and Vulnerary, appropriated to the Liver and Joints, and is Analeptick. *

VII. *The Specification* ^ It consolidates and conglutinates the Lips of Wounds to a Miracle.

VIII. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Ejjence. 3. A Decotion. 4. A distilled Water. 5. A Wound Drink. 6. An Ointment or Balfam. 7. A Cataplasm. 8. A Clyster.

The Virtues.

IX. *The liquid Juice.* It is given to very good Purpose to heal any inward Wound, consolidate the Rupture of any Vessel in the Thorax, cure Spitting or Pissing of Blood, and helps Ruptures of the Intestines. Dose two or three ounces Morning and Evening in a Glass of old Malaga or Red Port Wine.

X. *The Ejjence.* It has all the former Virtues, besides which, it is excellent against Bloody-fluxes, and all other Fluxes of the Bowels : and has sometimes been found of good Use in overflowing of the Loches, or of the Terms in Women. Dose two, three or four spoonfuls Morning and Night, in a Glass of Generous Wine.

XI. *The distilled Water.* It is good to be good against Ruptures of the Bowels •, and may be used as a Vehicle to convey other Medicines in : sweetned with Sugar Candy, it is very good against a Cough.

XII. *The Wound Drink.* # of this Daifie Leaves six handfuls : Sanicle, Allieal, of each three handfuls : Bugle two handfuls : Angelica one handful: boil all in Water six quarts to three : let rain out and add thereto an equal part of white Port Wine, which sweeten a little with white Sugar a* it is taken. Dose eight ounces Morning, Noon and Night: it is of great Efficacy in the Cure of all sorts of old and malign Ulcers, Fistula, and the like.

XIII. *The Ointment or Balfam.* It is made with Oil, Turpentine and Wax, and is excellent for Wounds, especially those in which there is any thing of Inflammation, and will not come to Digestion or Maturation, as are those *Sinovi* or weeping Wounds made in the Knees, Elbows and other Joints.

XIV. *The Cataplasm.* It is good against all burning Apoplems and Ulcers, as also an Inflammation and Running of the Eyes, being applied thereto: it likewise eases the extreme Pain of the Gout, being applied, and renewed as often as need requires.

XV. *The Clyster.* It gives ease in the vehement Torments of the Guts, Gripings of the Bowels, and is profitable in the violent Heat of Agues * and alters the Habit of the Belly where there is a great Stipticity or Binding : and in a Bloody-tiux, Diarrhea or Lienteria, it does much good.

C H A P . CCVII

Of D A I S I E Thorney.

THE Names. It is called in Latin, *Bellis* /pin of a fiore luteo nudo, also *Bellis major* /pi no/a : in English, *The Thorney Daifie*, or *The naked-flowered yellow Daifie*, with prickly Leaves.

II. *The Kinds*. It is a fingular Plant of its kind, and noted becaufe of its naked Flower.

III. *The Description*. It has a Root confining of a great Tuft or Bufh of long blackifh Strings, or long fibres, whose Tafte is bitter and unplea/ant, and its Smell fomething ftrong *, from the Head of which Jiringy Root, /pring up divers Heads of very fmall green Leaves, dented about the edges, and every dent Jharp at the point, which fhooting up into Stalks, with the like, but leffer Leaves on them, become hard and woody up to the tops, /ometimes branched and /ometimes not, but bearing on their various tops feveral fmall round flowers on feveral /mall /bot-Jialks, which Flowers have no Border of Leaves^ either white or yellow, to encompafs them, but are like to thofe of the Naked Cammomil or Fetherfew, yet fomewhat leffer, being a yellow round Knob, fomething hollow in the middle. When the flower is paf, there come in their places fmall He ads with Seed, each of which is fmall, long and. whitifh, which muj be quickly gathred when it is ripe, or otherwife it quickly jalls, or is blown away with the Wind.

IV. *The Places*. It was firft brought out of Italy by Dr. Flud, from the Garden of Pi/a, in the Duke of Florence his Dominions *, but is only nurs'd up with us in Gardens.

V. *The Times*. It is in its Vigor in June, and flowers in June, July and Augufi h, and feeds in fome little time after.

VI. As to its Qualities, Specification, Preparations and Virtues, Authors have faid nothing, and therefore we fliall be filent concerning the fame.^ It is a Curiofity value4 by Flonjh, and ferves chiefly as an Ornament for the Garden.

C H A P . CCVIII

Of D A I S I E American.

THE Names. It is called in Latin, *Bellis Americana*, *Bellis Americana Umbellifera*, and *Bellis major Ramofa Americana* : in English, *The great white*, or *American Daifie*.

II. *The Kinds*. This is alfo fingularis/ui generis, and therefore admits but of a fingle Deicription.

III. *The Description*. It has a fibrom or firingy Root, from which /pring up one, two or more Stalks^ which grow higher and greater than the Great Daifie in Chap. 206. aforegoing : the Leaves are al/o larger, and broadeji towards the ends, but longer and /Mai" /ler at the bottoms, dented likewi/e about the edges, fhooting forth fever al Branches, and all of them bearing many white flowers at their tops, as it were in an Vmble, yet not/o great, nor the white Leaves fo large as it, but /mailer, and more in number, with a gree'nijh yellow Thrum in the middle, /ome of which are a little larger than others: the Seed is al/o /mailer than that in Maudlin-wort.

IV. *The Places*. It was firft brought to us from Virginia, and grows well enough in our Gardens, being looked after with a little Care : I alfo found it growing in feveral places in the Southern parts of Carolina, and other parts adjacent thereto.

V. *The Times*. It flowers in May zx June, and the Seed is ripe in fome fhort time after.

VI. *The Qualities, Specification, Preparations and Virtues*, are the fame with thofe of the Great Daifie in Chap. 206. aforementioned. It is indeed a fingular Wound-Herb, and ought to be commended for the fpeedy curing of fimple green Wounds, being made into proper Ointments or Bal/ams, or applied in the Form of a Catapla/m.

C H A P . CCIX.

Of DANDELION,

O R,

"PISS-A-EED Common.

THE Names. This Plant feems to be unknown to the G w ^ and therefore can have no Greek Denomination, tho' fome Authors will have it to be the ^CHJV w /©- P mii M > - 2a ^{ca}P. 8, and others, that it is the VW*, Theophradj, which is *Ambubeia*, a kind of Cic^ory, or Pnejh Crown: but in Latin it is called, *Dens Leonis*, *Rojirum Porcinum*, and *Corona vel Caput Monachi* 3 and in English, *Dandelion*, *OPifs-a-bed*.

II. *The Kinds*. It is doubtlefs one of the kinds of Wild Succory h, of which there are feveral Species, viz, i, *Dens Leonis vulgaris*, Our common

Dandelion,

Dandelion, of which in this Chapter. 2. *Dens Peregrine*, Outlandish Dandelion, of which in the next Chapter.

III. This our Common Dandelion is also two-Fold, viz. 1. *Dens Leonis latifolius vulgaris*, *Urnaria*, *Hieracium majus Tragi*, *Hieracium parvum Cordi*, (in *Historia*) *Hieracium minus Gefneri*, (in *Hortis*) *Chondrilla alba Thalii*, *Dodonæi*, *Gefalpini*, *Hedynois major Fuchii*, *Hedynois Dalechampii* & *Lugdunensis*, *Taraxicon minus Loniceri*, *Taraxicon verum of Serapio* & *Avicenna*: and for it is used with us in all Compositions wherein *Taraxicon* is named, Our Common broad-leav'd Dandelion. 2. *Dens Leonis arigustioribus foliis: Aphaca angustioris folii Ofalpini* The narrow-leav'd Dandelion,

IV, The Descriptions. The first, or Broad-leav'd kind, has a Root which grows downwards very deep, which being broken off within the Ground, will nevertheles shoot forth again anew, and with difficulty be destroyed when it has once taken deep Rooting: from the Head of this Root Spring forth several long and deeply gashed Leaves, lying roundabout it on the ground; the ends of each Gash or Jag on both sides looking downwards to the Root again, the middle Rib being white, which being broken, yields much bitter Juice, of a Milk-white Color and Substance, but the Root much more, from among these Leaves (which always abide green) arise many slender, weak, naked Foot-stalks, (rather than Stalks) of about six, eight or ten inches high, very rarely a foot long, every one of them bearing at the top one large yellow flower, consisting of many Rows of yellow Leaves, broad at the Points, and notched in, with a deep Spot of ye lloze in the middle, which growing ripe, the green Husk, in which the flower flood, turns it self down to the Stalk, and the Head of Down becomes as round as a Ball, with long reddish Seed underneath, each Seed bearing a part of the Down on its Head; which Seed, together with the Down, is blown away with

the Wind, and when perfectly ripe, may with a Blast of ones Mouth be blown perfectly away.

V. The second, or Narrow kind, as to its Root, Stalks, Flowers, Down, Seed and manner of Growing is wholly like the before described: the Leaves in springing forth, growing round the Root, the Number and Deepness of the Gashes or Divisions on the edges, are much like the former also; but in this the Difference is, that the Leaves of this latter Plant are narrower and by this one Note it may be distinguished.

VI. The Places. They grow almost every where, in all Meadows and Pasture-Grounds, in Closets near to Water-Ditches, as also in Gardens and Highways. The first is common almost every where, but the second is somewhat rarer, yet often to be met with.

VII. The Times. They flower thro' all the Summer Months; and the first is found in some place or other in flower every Month of the Year, especially if the Winter is mild, and not extrem cold.

VIII. The Qualities. Dandelion is cold and dry in the first Degree: Aperitive, Absterfive, Diuretick and a little Astringent, Stomatick, Hepatick, Splenetick and Nephritick.

IX. The Specification. It is singular against Obstructions of the Viscera, and Hypochondriack Melancholy.

X. The Preparations. You may have therefrom, 1. A Sallet. 2. A liquid Juice, 3. An Ejjence. 4. A Decoction. 5. A distilled Water. 6. An Ointment or half an. 7. A Cataplasm.

The Virtues.

XI. The Sallet. Whether eaten raw with other Herbs, or boiled, and dressed up with Butter, Vinegar, Salt and Pepper, it is said to be a good Diluent to open Obstructions of the Bowels, cleanse the Stomach, cause a good Appetite, and purify the Blood; the trenchard Dutch are said to eat them often in the Spring, but I believe for the most part as a boiled Sallet.

XII. The liquid Juice of Leaves and Roots. It may be given to two or three ounces in a Morning fasting, and likewise at Night going to Bed, either alone by it self, or mixt with a Glass of White Port Wine, to purify the Blood and Juices, open all Obstructions of the Bowels, expel the Jaundice, provoke Urine, resist Hypochondriack Melancholy, and ease the Pain of the Spleen.

XIII. The Ejjence of Leaves and Roots. It has all the Virtues of the liquid Juice, being more powerful to those Intentions: besides which, this ripens and digests inward Apertions of the Viscera and Urinary Passage, breaks, cleanses and heals them, and more powerfully opens the Passages of the Urine, whether in Young or Old. Dose three or four Spoonfuls in White Lisbon Wine, Morning and Night.

XIV. The Decoction in Wine or Water. It has the Virtues of the former Preparations, but in a lower degree: however, it is good to be drank half a pint at a time Morning and Evening, by such as are inclining to a Consumption, or have an ill Disposition of the whole Body, called by the Learned, *Ochexia*, in which cases being used for some considerable time, it gives a wonderful Relief, besides, being made in Water, and acuated with a few drops of Oil of Sulphur, it prevails against all sorts of burning, putrid, malign and pestilential Fevers.

XV. The distilled Water. Acuated with Oil of Sulphur, it prevails against the Spotted-Fever, and the Plague it self: mixed with the liquid Juice or

Effence, it is good to wafh and cleanfe old Sores, running Fiftula's and putrid Ulcers, and fo to difpofe them to a fpeedy healing.

XVI. *The Ointment or Balfam.* It digefts, ripens, cleanfes, dries and heals old and running Sores, and is a very good thing in all ftubborn and rebellious Ulcers, to bring them to a Cicatrize.

XVII. *The Cataplafm.* Being applied hot, and often renewed, it brings Apoftemations to Maturity : and being applied cold made of the green Herb, it difcuffes Tumors arifing in fimple Contufions, hinders the Aggregation or Flux of Humors, and eafes the Pain.

CHAP. CCX.

Of DANDELION Outlandifh.

I. *The Names.* It has no Greek Name j but X is called in Latin, *Dens Leonis peregrinus* 1 and in Englifh, *Outhndifh Dandelion.*

II. *The Kinds.* There are five Species hereof, ^{TM*}. 1. *Dens Leonis tenuiffimo folio, Hieracium Fcetidum Lohmn^Jme* jagged Dandelion. 2. *Dens Leonis minor foliis radial is, Trinciatella Italarum Cameraarii,* fweet Dandelion. 3. *Dens Leonis minor folio affero,* Small rough Dandelion. 4. *Dens Leonis, -fu^w^condis^* - *Dens Leonis Monfpelienfium,* five *Aphbodeh bulbuhs, Bauhini,* Bulbed Dandelion. 5. *Dens *Leoms Gadenfis, Cichorium Confiantinopelitanum,* Spanitti Dandelion.

III. *The Defcriptions.* *The fir ft, or Fine jagged Dandelion, has a thick reddifh Root full of Fibres, fending forth many very green and finely cut Leaves, each of them about a Hand breadth long, and two inches broad, being deeply jagged or divided again into two or three other fmall Rents or Divifwms, and ending in a Jmall point. The flowers which ft and at tops of the Stalks (which are naked) are yellow and much fmallr than thofe in the former Chapter which being pafs'd away, the downey Heads and Seed proceed, a& in the former.*

IV. *The fecond, or Sweet Dandelion, has a fmall ani blackijh Root, which is white within, and very fwcet in Tafie, (as are the Leaves alfo) which is Jo very tender, that it perifhes with the fir ft Cold it feeh -, and therefore with us is always to be houfed in Winter and cold Weather, by which means it will endure many Tears, and yield its Seed in the due Seafon. From this Root fpring up many Leaves, which fpreat themfelves on the Ground, about three inches long and half an inch broad, cut in on the fides with very deep Gajhes, whofe ends have each of them three very deep Dents, each of them having divers Points funding like a Star or Spur, the Foot-ftalks whereof are a little hairy: from among thefe rife up many fmoother, flender, naked Stalks, one of which jhmds up right, not above a Hand breadth high, the reft are lower, and bend downwards^ each of them bearing a fmall yellow Flower, like unto other Dandelions, which being paf, turns into Down, and flies away with the Wind, carrying the Seed with it, which is fomewhat long and broad, with hard Hairs, like a Beard, at the top of each Seed.*

V. *The third, or Small rough Dandelion, has a Root fmall and whitifh, which fends forth feveral jmall Leaves, lying round about the Root upon the Ground, about two or three inches long and one inch broad, cut, divided or torn in on the fides, and each*

of them Jet with fmall, fmoother, (harp bricks or tiairs, not much unlike to the Prickly Sowthiftle. The Stalks are about two or three inches high, and bear each of them a large, pale, yellow I lower, like to the other Dandelions; which being once Paffd away, do prefently after turn into Down, with Seed like unto the former.

VI. *The fourth, or Bulbed Dandelion, has a Root branched or Jpread out into fever al long tuberous Clogs, which fome call long Bulbs, much like to thofe of the Aphodil, but fmallr, fhorter and more pointed at the ends. From the Head of thefe Roots fpring forth many large and blewifh green hairy Leaves, lying upon the Ground, unevenly waved or cut in on the edges, but not deeply gafht, like the Common Dandelion, but which are of afharp and bitter Tafie like it : from among which rife up fever al bare or naked Stalks, with Flowers at their tops, larger and more double than thofe of the Common kind, but of a paler yellow color, which pafs into Down^ like the other kinds, having alfo like fafhioned Seed.*

VII. *The fifth, or Spanifh kind, has a Root of a moderate Largenefs, long, white, tender and fibrous, which lives with us all the Winter, if it is mild, Otherwife, if we have hard Frofts, it perifhes: from this Root fpring up fever al long Leaves, a fpan or more in length ^ the middle Leaf of the Root is bure from the Root to the half length of the Leaf, and then it has many Rents or Cuts on each fide, very much refembling the Leaf of the Common Dandelion, but fmallr and narrower: from among thefe Leaves rife up likewife long Foot-fUlks, as in the Dandelion, upon whofe tops grow fmall and yellow Bowers, which turn into Down, that is carried away with the Wind, with the Seed alfo, which is fmall, long and reddifh, like unto fome of the Hawkweeds.*

VIII. *The Places.* The firft is found in *Meadow and Pafure Grounds.* The fecond is an Original of *Italy,* and from thence it came to us. The third grows about *Florence,* and other parts of *Italy,* as alfo about *Mompelier* in *France.* The fourth is alfo of *Italian* Origination. The fifth came from *Spain,* and grows in the *Ifland of Gades* or *Cadiz,* as *Boel faith,* who called it *Cichorium Gadenje -,* but *Clufus Cur a pojleriores* calls it, *Cichorium fylveftre pumilum,* five *Hedypnois.*

IX. *The Times.* They all flower thro' all the *Summer Months :* but the fifth or *Spanifh kind* flowers in *July, Auguft* and *September,* and the Seed is foon ripe after the Flower is paf.

X. *The Qualities, Specification, Preparations and Virtues,* are the fame with the *Common Dandelion* in *Chap. 209.* aforegoing, and therefore we (hall fay no more thereof *

CHAP. CCXI.

Of DARNEL.

I. *The Names.* It is called in *Arabic*, *Wby* moft authors call it *Lolium temulemum,* *Arabic*, *Wby* 1, and in *Englifh*, *White Uarnei.* 2. *Lolium Rubrum,* *Arabic* & *Whnix Diofcoridn,* (afeminifcolorepbeenicea) *Ked Darnel.* \

III. The

White Darnel.

HI. The Description. *The White Darnel*, has a bunchy fibrous Root, from whose Head all the Winter long, arising forth several fat and rough Leaver, which, the higher they grow upon the Stalks, grow also narrower, but with their continued Roughness: **and** these first springing forth Leaves, several Stalks also arise, with many thick Joints, at most like Knees, from which Knees arise these afore said narrower Leaves, continued up to the top of Seed; for on the top of each Stalk is a long Spike, composed of many Heads, as it were at so many Joints, set one above another on each Side of the Stalk, containing two or three small chaffy Husks, with sharp, but short Beards or Aymes at the ends; in which Husks being somewhat tough, is contained the Seed, which is less than that of Wheat, and which is easily shaken out of the Ear.

Red Darnel.

IV. *The second, or Red Darnel*, has a Reel more bushy or fibrous, from whence arise Leaves sharper and narrower than those of Barley, as also several jointed Stalks, with Leaves springing from each Joint, but at the joints are lesser than the former. Leaves springing from them are also narrower and somewhat shorter. The Stalks are reddish, with reddish Joints, about seven or eight inches high, seldom attaining to the height of a foot, unless the Ground is very good: at the top of each Spike is a small and tender fat Spike or Ear, very like the former, but [smaller and sharper, and somewhat reddish] also, more especially when it is found growing in the dryer sort of Land.

V. *The third, or Darnel with Oaten Tops*, in its Root, Leaves and Stalks differs little from the first kind, saving that the Stalks grow somewhat bights, and the Leaves are a little larger, but in this it differs from the first, that the several tied of Seed are more like to winged Oaten Heads, growing on slender foot-stalks; and which Meads of Seed are also termed jointed Points.

VI. *The Places*. These all grow in Arable Land, in Fields of Corn, as of Wheat and Barley, and are to be found in such like places, in most parts of the Kingdom.

VII. *The Times*. They flourish in Summer, and the Grain is ripe in Harvest time, viz. in August.

VIII. *The Qualities*. Darnel is hot in the third Degree, and dry in the second, as Galen lays; it abounds with a Volatile, Narcotick, Salt and Sulphur, which is thought to be detrimental to the Head and Brain: it was accounted hurtful to the Eyes and Sight, as appears from that Verse in Ovid, lib. I. *Fajlorum; Et careant Lotusocules vitianthus agri*: and from this Cause it seems came, that the old Proverb in Plautus, *MiUJali. a.l.c. ? verjfo, LoliouUlitare* was wont to be interpreted to one dim-

IX. *The Specification*. It is laid to be peculiar to Decedations of the Skin, and to stop Gangrenes.

X. *The Preparations*. You may have therefrom, 1. A Decoction. 2. Meal or Flower. 3. An Ointment. 4. A Wafer. ;, A Cataplasm. 6. The Fit mitigation.

The Virtues.

XI. *The Decoction in Red Port Wine*. It stops the Terms, and all Sorts of Fluxes of the Bowels, and prevails against a Diabetes: Dose two or three ounces: but it is apt to cause a kind of Giddiness in the Head. It is also good to wash places affected with Scurf, Morpew, Leprosy and Ringworms, and stop the Progress of a Gangrene: made with Water and Honey, it is good to bathe with for the Sciatica.

XII. *The Meal or Flower*. Being applied, roist with Spirit of Wine or strong Wine, it is of special life to stop the Running of Gangrenes, and hinder the Fretting and Eating of old putrid Sores, Cankers and Phagedenic Ulcers, and to drant the Skin of Leprosy, Tettars, Ringworms, Hipt-s, Scurf Morpew, and other the like Distempers.

XIII. *The Ointment*, It is made thus: *Take of the Floater or Meal eight ounces: Suppur Vive in Vine powder four ounces: Oil of Roses three ounces: Vinegar enough to make it into the Form of an Ointment*. It has all the Virtues of the Meal or Flower aforegoing, and much more powerful to all those Intentions, being applied fresh Morning and Evening.

XIV. *The Wash.* It is thus made: *Jc of the flower or Meal two ounces: Water eight ounces: Juice of Radijhesfive ounces: Vinegar four ounces: Salt of Tartar a dram: mix them*, and therewith very warm Morning and Evening wash the Face and Hands, letting it dry on -, and after an hours time you may wash again with fair warm Water. It clears and cleanes the Skin admirably of almost all Deformities attending it.

XV. *The Cataplasm.* *Jc of the Meal twelve ounces: Linfeed bruifedfour ounces: Pigeons dung six ounces: boil all in a Sufficient quantity of Wine to the Thickness of a Cataplasm.* It is Diffusive, diffolves Knots and Kernels of the Kings-evil, and breaks those which will not be diffolved.

XVI. *The Fumigation.* *£ of the Meal or Flower a pound: Frankincense eight ounces: Myrrh four ounces: mix, melt and make the Mafs up into Troches.* These being put upon live Charcoal, and the fume from thence being received up the Womb by a Funnel, warms, comforts and lengthens those Veitels of Generation, and is said to help towards Conception.

as it were branched into others, wherein confits the chiefest Difference.

VII. *The fifth, or Double Darnel Grafs, in Roots, Stalks, Joints and Leaves, differs little or nothing from the last, but in the spiked Heads, which are thicker fet together, and the tops of them bow down, or turn a little round.*

VIII. *The sixth, Branched Marfh Darnel Grafs, has a creeping white jointed Root, with many Fibres adjoining to it; from which shoot forth two or three jointed Stalks, two feet or more high: the spiked Head is a foot long, branched as the fourth above is, each Branch of a Fingers length, with winged Husks, like unto Oats.*

IX. *The Places.* They grow in Meadows, Corn-fields, Fallow-fields, in Paths-ways and Borders or Fields, almost every where: but the last in Marjh and Wet Grounds, and on the Edges of Plowed-fields.

X. *The Times.* They spring and flourish with Corn, and the Seed or Grains are ripe in August.

XI. *The Qualities, Specification, Preparations and Virtues.* Authors have said nothing of: however, it is manifest that they are of a cleansing, drying and astringent Faculty-

CHAPTER. CCXII.

of DARNEL-GRASS,

I. *HE Names.* It is called in Greek, *Lolium Gramineum*, and *Gramen Phceniceum*: in Latin, *Phoenix ramineus*, and in English, *Darnel Grafs*.

II. *The Kinds.* There are about six kinds here-
1. *The smallest fingle Darnel Grafs.* 2. *Phcenix altera den-
Jwribus fpicis,* The greater fingle Darnel Grafs. 3. *Thcemx acerofa aculeata,* Small prickly Darnel Grafs. 4. *Phvnx multiplier fpicata panicula,* Branched Darnel Grafs. 5. *Vhcnix multiplici nut ante,* Double Darnel Grafs, with a bowing or bending down Top. 6. *Pbanix palustris & longius fpicata,* Branched Marfh Darnel Grafs.

III. *The Descriptions.* *The Brfl, or Smallest fingle Darnel Grafs, has a fibrous Root, from whence Spring up several grajfy heaves and Stalks, which are very like the Red Darnel, from the first, but that it has very few, slenderer and shorter Stalks, and the Leaves narrower and the (piked Head has a few fingle Husks fet veryparfedly thereon.*

IV. *The fecond, or Greater fingle Darnel Grafs, has Roots and Leaves like to the Red Darnel, but the Stalks grow a yard high, jointed and firaked: and the Spike is thinly fet with chaffy Heads, but they are bigger, rounder and thicker.*

V. *The third, or Small prickly Darnel Grafs, has a small white fibrous Root, whence Spring narrow grajfy Leaves, six or seven inches high, being rough, hard and full of Joints, pointed or prickly at the ends, and with a few short Leaves on them, which have withal small, short, rough and chaffy like Tongues, Jharp at the ends, and fet at the Joints.*

VI. *The fourth, or Branched Darnel Grafs, has like Roots, Leaves and Stalks, which are jointed as the others are, and lender, half a yard or more high and narrow Leaves, Grafs like: the spiked Head I*

CHAPTER. CCXIII.

Of DEVILS-BIT Common-

I. *Tpi/J? Names.* It seems to be unknown to the Greeks, for which Reason it has no Greek Name: but it is called in Latin, *Succifa*, and *Morfus Diaboli* -, and in English, *Devils-bit*.

II. *The Kinds.* It is certainly a Species of *Sca-
bious*:

bious: feræ have thought it to be the *Geum* of the Ancients •, others to be *Nigina Plinii* \$ but *Fabius Columna* referreth it to *Picnocomon Diofcoridis*: it is either *Common*, called, *Morfus Diaboli vulgaris*, of which in this Chapter *oxVario//s*, of which in the Chapter following.

III. The Defcription. *It has a Root which is fomewhat thick, but fhort and blackifh, with many Strings fajned thereto, and abiding after Seed-time many Tears: from this Root rifes tip a round, greⁿ, Smooth (not hairy) Stalky about two feet high, fet with divers long, and fomewhat narrow, fsmooth, dark green Leaves, fnipt a little about the edges for the moft part, beñg otherwife all whole, and not divided at all, or but wry feldvm, even to the tops of the Branches, which yet are fmailer than thofe below, with one Rib only in the middle, and being broken, yield not fuch Threads, as the Scabious does. At the end or top of each Branch, ftands a rþund He ad of many Flowers fet together in the fame manner, or more neatly and fuccintly than thofe of the Scabious, and of a more blewifh purple color, (not of a dark red, as Gerard fays) which being pcifs'd away, there follows Seed, like unto that of Scabious, which falls away in the fame manner.*

IV. *Not a.* 1. Some make of this kind a *Greater* and a *Leffer*: but this, in my Opinion, comes from the Nature of the Soil or Ground, rather than from the Nature of the Plant *h*, that being the larger and fairer which grows upon the richer or tatter Ground, and that the lef^r • which grows on the poorer Soil

V. *Nota.* 2. Some are of Opinion, that the *Scabiofa rubra Aufiriaca Clujii* belongs to this Plant, becaufe it lms a fhort koot with many Strings: *Bauhinus* makes mention of one of this kind, which has hairy Leaves, and not differing in any thing elfe, and he, from *Gefner*^ calls it *Morfus Diaboli hirfuta*.

VI. *Not a.* 3. Some Monks and Fryers (as I fup-pofe) have fabled, that the Devil, envying the Good which this Herb might do to Mankind, bit away part of the Root, by which means it became fo fhort a Stump as it is, and from thence it came to have the Name of *Morfus Diaboli*^ or *Succifa*, *Devils-bit*: but the Fable is fo ridiculous, that one which has but a Grain of Senfe or Reafon can never believe fuch a Fi&ion.

VII. *The Places.* It grows as well in dry Meadows and Fields, as moft in many places of cur Land ^ as alfo in Woods and by Highways fides: a great deal of it has been found growing in *Uamp-fiead Wood* near *London*, at *Lee* in *EJfex* ^ alfb at *Raleigh* in *EJfex*, in a Wood called *Hammered* and in feveral other places.

JS⁴. *The Times.* It flowers in *Auguft*, which [^]fcfomething later than the *Scabiofes**h*, and is hardly to be known from *Scabhus*, but when it is in Flower.

* IX. *The Qualities.* It is hot and dry in the? end of the fecond Degree *h*, and is Stomatick, Cordial, Sudorifick and Alexipharmick.

X. *The Specification.* It is a peculiar Antidote againft the Plague, Poyfon and Bitings of Venomous Beasts.

XL *The Preparations.* You may prepare therefrom, 1. A liquid Juice. 2. An EJfence. 3. A Decoffion. 4. A Pouder of the Root. 5. An Ointment or Balfam. 6. A Cataplafm. 7. A dijliUed Water. 8. A Spirituous Tincture. 9. An Acid Tincture: 10. An Oily Tincture. n. A Saline Tincture. 12. A Salt.

The Virtues.

XII. *The liquid Juice.* Taken inwardly to two, three or four ounces, according to the Age of the Patient, it is powerful againft the Meafles, Smali-Pox, Calenture, malign and spotted Fever, as alfo againft the Plague, and all malign and peffilential Difeafes, Poyfon, and the Bitings of Vipers, Rattle Snakes, or any other Venomous Beaft: and is an excellent thing to induce the Healing of Wounds and Ulcers.

XIII. *The EJfence.* It has all the former Virtues, but is more powerful to the laïd Intentions: befides which, it is good againft Fits of the Mother and Vapors, and provokes the Terms in Women. Dole two, four or fix fpoonfuls Morning and Night, in a Glafs of the Diftilled Water, or in a Glais of White Wine. ..

XIV. *The DecoUion in Wiñe.* It has all the Virtues of the Juice and Effence, but is yet lefs powerful: it may be ufed as a Wound-drink by Inch Patients as have Wounds, Ulcers or FiitulVs which are inveterate, or of difficult Cure. If it is sweetened with Honey of Rofes, it is faid to be very etfoftual to help inveterate Tumors and Swellings of the Almonds and Throat, which do hardly come, to Ripenefs *h* for it digefts, cleanlès, confumes the Flegm flicking thereto, and difcufles the Tumors by often gargling therewith. Dole four or fix ounces Morning and Night.

XV. *The Pouder of the Root.* If it is taken in any convenient Vehicle, it kills Worms, and drives them forth of the Body.' It breaks and diicufles Wind in the Bowels, and refifts Poyfon and all forts of malign Fevers. Dofe one dram inxt with Honey, the Effence aforegoing, or any other proper Vehicle.

XVI. *The Ointment or Balfam.* It cures fimple green Wounds, many times ar once drefling; for it is an incomparable Vulnerary. It ripens Apoitern, and fuch other Tumors as will in time come to Suppuration. It digefts old Ulcers, cleanfes, incarnates, dries, and in a (hort time induces the Cicatrize, or caufes them to be healed. Applied to the Gout, it eafes the Pain, and in a fhort time cures it.

XVII. *The Cataplafm.* It is made of the green Herb and Koot, and applied, it difcuffes Tumors in fimple Contufions, and is profitable to be applied to any place hurt or bruifed by any Fall, Blow, or the like, or crufted by any Cafualty, diftblving the clotted or congealed Blood, and taking away the black and blew Marks, which may afterwards remain.

XVIII. *The diftilled Water.* It is good to wafh green Wounds and old Sores, cleaning and drying them: and given inwardly with the Juice or Effence, it cleanfes the Body inwardly. If a little white Vitriol is diffolved in it, it is then good againft Scuffv Morphew, Herpes, Tettars, Ringworms, Itch, Pimples, running Sores and Ulcers, Freckles, Yellowtr^{*} nefs of the Skin, and other like Deformities, if the Parts affected be two or three times a day wafhed therewith, and fo fuffered to dry on without wiping.

*LIX. *The Spirituous Tincture.* It is powerful againft Poyfon, and the Malignity of burning and peffilential Fevers, as alfo the Bitings of Mad Dogs, Serpents, and other poyfonous Creatures. It has all the Virtues of the Juice and Effence, but more etfoftual than they are, where the Heart and Vitals are immediately concerned. It is good againft Convulfions, Lethargies, and all other cold and moit Difeafes of the Head, Brain, Heart and Nerves, Dofe two or three drams.

XX, *The Acid Tincture** It is a fingular Medicament

cament against the Plague and Spotted fever : it abates the Heat, and quenches the Thirst, tho never fo extredm, in the roaft violent malign and burning Fever, and that almoft upon the Spot, even to a Miracle : beſides, it refills all forts of Poyfon, more eſpecially ſuch as are volatile Poyſons, detroying them in their very Root and Effence. It admirably comforts and ſtrengthens the Stomach, refills Vomiting, creates an Appetite and cauſes a good Digeſtion. It ſuppreſſes Vapors and Hysterick tits in Women, refits Hypochondriack Melancholy, and is good for ſuch as are inwardly bruifed by a Fall, or any other Cafualty, diſſolving the clotted or congealed Blood, and cauſing it to be excreted. Doſe ſix much as will make the Vehicle pleaſingly ſour, and to be repeated three, four, five, fix or more times a day.

XXI. *The Oily Tincture.* It is good againſt inward Convulſions of the Stomach and other Viſcera, it gives eaſe in the Cholick, and other Torments of the Bowels, whether given by the Mouth in any proper Vehicle, or exhibited Clyſterwiſe in Broth or Poffet-drink. It provokes the Courſes, eaſes the Pains of the Mother, breaks and diſſolves Wind in the Belly and Stomach, opens Obſtructions of the Reins, and other Urinary Parts, cleanſes them of Sand, Gravel, and other Tartarous Matter, and fo gives eaſe in the Stone and Strangury. Doſe from ten to thirty drops in any fit Vehicle.

XXII. *The Saline Tincture.* Given inwardly to one dram or more in a proper Medium, it provokes Urine, opens Obſtructions of the Womb, Reins and Ureters, and gives eaſe in the Strangury and Stone: outwardly applied, it is good againſt Scabs, Itch, Pimples, Puſtles, Scurff, Morpew, Leprous Spots, freckles, Lentils, Sun-burning, Tanning, Yellowneſs of the Face and other the like Defoedations, the parts affected being bathed therewith two or three times a day, or ſometimes oftner.

XXIII. *The fixed Salt.* It is Diuretick, Alexiſtic and Antifebrick : it opens Obſtructions of the Urinary Parts, expelling Sand, Gravel and Tartarous Matter: it refills Poyſon, the Bitings of Seipsits and Mad Dogs, and the Plague: it opens the Paſſages of the Womb, cleaning it from Impurities, and given in a proper Vehicle, abates the Heat of burning Fevers, carrying off the Morbifick Matter by Urine. Doſe one ſcruple, or half a dram, in the diſtilled Water aforegoing.

C H A P. CCXIV.

Of DEVILS - BIT Various.

I. *The Names.* It is called in Latin, *Morfus J_ Diaboli verficolorattis*, and *Morfus Diaboli diverfus* : in Engliſh, *Various Devils-bit*.

II. *The Kinds.* It is twofold, viz. I. *Morfus diaboli flore albo*; Devils-bit with a white Flower. 2. *Morfus Diaboliflore carneo*; Devils-bit with bluiſh-colored Flowers.

M. *The Defections.* The firſt of theſe with the white Flowers, ſouls a port Stump of a Root, like the former, from whence many thready Radicles grow : from the Head of this Root ariſes a round, green, ſmooth Stalk, near two feet high, with a narrow Juncus, dark green Leaves, a little notch about the edges, but not at all divided; the Root is ſoft or Vent \$ grow ſmaller and ſmaller, a* the

grow nearer, to the tops of the Branches ; and on the top of each Branch ſtands a round Head of many Mowers, like the former Devils-bit, ſaving that theſe are only white, whereas they are of a bluiſh purple and indeed this Plant differs not from the former in any other thing but in the Color of the flower, which is of a pure white, as ſome other forts of the Scabiouſes are, and that the green Leaf is not altogether of ſo dark a green.

IV. *Theſeconi*, or that with the bluiſh-colored Flowers, is in Root, Stalk, Leaf, Color of the Leaf, and Form of the Flower, the ſame with the former, but in this it differs therefrom, that the flower hereof are of an incarnate or bluiſh color, whereat in the Common they are of a bluiſh purple, and in the former of a white color only.

V. *The Places.* Theſe two are more hard and rare to be met with than the Common kind, yet they are both found growing Wild about Appledore, near Rye in Suffex; and in ſeveral other places of the Kingdom.

VI. *The Times.* They flower later than any of the Scabiouſes, and commonly not until Auguſt.

VII. *The qualities, Specification, Properties, and Virtues,* are the ſame with the Common Devils-bit declared in the former Chapter, ſo that need be ſaid of it here, ſaving, that neither or theſe are in the leaſt inferior to the Vulgar in any of the Preparations or Virtues.

C H A P. CCXV.

Of DILL Garden.

I. *The Names.* It is called in Greek, "Awll", JL (« » ^ T » « fleiV-, quod cito crefcat) Math. il. 25. Theophrastus lib. 5. cap. 67. P/in. lib. 20. cap. 18. in Latin, *Anetbum*, and *Anetbum bortenje*, *Bortenus* has it : in Arabic *Zebet*, and *Sebet* \ *Engliſh*, *Dill*.

II. *The Kinds.* There are two principal kind hereof, viz. J. *Anethon Hortense*, Garden Dill, 0- which in this Chapter. 2. *Anethum Sylvestre*, WIL^r Dill[^] of which in the following Chapter.

III- The Description *It has a Root which is small and woody, perishing every Tear after Seed-time, and is unprofitable a* to Physick, never being put to any Use. From this Root rises up for the most part but one Stalk, feldom more, nothing so large, nor feldom above half the height of Fennel, being round, and with fewer Joints thereon, whose Leaves are Jadder, and somewhat long, divided almoji into an infinite number of fibrous parts almoji like unto Fennel, but harder in handling, and somewhat thicker, of a fironger Smell also, and not so pieasant. The tops of the Stalks have fewer Branches, and are repleat with Umbles of yellow flowers, smaller than those of Fennel*, which pass into small Seed[^] foniewhat flatter and thinner than Fennel Seed, and of a fironger anymore picquant Taste.*

IV; *The Places.* It is most usually fown in Gardens, and such like Ground for the purpose, and is also found Wild with us in some places: but if found, yet it is not of the Wild kind.

V» *The Times.* It flowers in July, and the Seed is ripe in the end of August.

VI. *The Qualities.* It is hot in the third Degree, and dry in the second -, more especially being green: but when the Herb or Seed are dry, they are hot and dry in the third Degree, and abound very much with Mercury and Sulphur* being Aperitive, Carminative* Digestive, Diffusive and Diuretick -, Neurotick, Stomack, Pe&oral, Splenetick arid •Hyfterick •, Sudorifick, Alexipharmick, Apalepuck© Galatogenetick and Spermatogetick.

VII. *The Specification.* It is a peculiar Remedy for the Cholick, and Windiness of the Stomach and Bowels.

VIII. *The Preparations.* You may prepare herefrom, 1. A Juice of the Herb. 2. An Effence of the Herb. 3. A Syrup*. 4. A Decotion of Herb and Seed. • J. A Poujler of the Seed. 6. An Ointment of Herb and Seed. 7. A Cataplasim of Herb and Seed. 8. A distilled Water of Herb and Seed. 9. A Spirituous Tincture of the Seed. 10. An Acid Tincture of the Seed.* 11. An Oily Tincture of the Seed. 12. A Saline Tincture of the Seed. 13. A distilled Oil thereof. 14. A Spirit therefrom. 15. Potestates or Powers. 16. An Elixir of the Seed: of all which in order.

The Virtues.

IX. *The liquid Juice of the Herb.* Mixt with the distilled Water, one or two spoonfuls of the Juice to four of distilled Water, and so taken Morning[^] Noon and Night, it increaseth Seed, as also Min[^] KinNurfes: it expels Wind, and easeth Pains of the Bowels, being drunk. If two or three spoonfuls of the Juice is mixt with Chicken-Broth, and exhibited as a Clyster, it helps in a Tenafimus.

X. *The Effence of the Herb.* It has the Virtues of the Juice besides which, if it be given two or three spoonfuls at a time in the Morning, fasting, in a Glass of Generous Wine, it wonderfully strengthens the Stomach, easeth the Pains and Wiridiness of the Womb, and stops Vomiting, and is very effectual to digest raw and vilcous Humors in the Stomach and Bowels.

XI. *The Syrup of the Herb or its Juice.* It is Pefitoral, good against Coughs, Colds, Hoarseness, Wheezing, and other Obstructions of the Lungs, and what Cause soever. Mixt with Nurieths Milk,

it increaseth Milk in her Breasts, and makes it more wholefome for the Child. It is a singular thing against a tickling Catarrh, or an inveterate Hux of Rheum upon the Lungs, being often taken.

XII. *The Decotion of the green Herb and Seed.* If it is made in Water, it increaseth Seed, as also Milk in Nuries. If it is made in Wine, it firs up Lust and provokes to Coition, and if it be too much taken, may provoke so vehemently for a time, 'as at length, quite to extinguish Veriery, by a too Laid-vicious Ejection of the Sperm.

XIII. *The Pouder of the Seed.* Taken to one dram in any fit Vehicle, it warms and comfoisth the Stomach and Bowels, and powerfully expels Wind: mixed with Honey, it is good against Coughs, Colds and tickling Catarrhs, and is good against Hoarseness, Wheezing and loss of Voice. Drank mixed with Wine, it is good against the Hiccough, Vomiting, Loathing and Convulsions of the Stomach and other Viscera.

XIV. *The Ointment of the Herb and Seed.* It is heating and drying, warms Parts which are cold and chilled, and is good to ease Pains in any Part proceeding from Cold, Moisture and Wind. It diffuses and dissolves recent Tumors, but digests and maturates Apoftems, and is good to anoint with for the Piles, and to diffuse any other like Tumor in the Fundament, and dries up all moist and running Sores whereever, but more especially in the secret Parts. It is an Anodyn or Easer of Pain, and gives Rest.

XV. *The Cataplasim.* It diffuses recent Tumors, and is profitable to be applied to any simple Contusion, provided it is done upon the Spot: applied to the Gout, whether in Hands, Arms, Knees or Feet, it has been found to give Relief: if it is heat very hot in a Frying-pan, and applied to the Side, it eases the Pains of the Pleurisy, and takes away Stitches: and so applied to the Region of the Abdomen or Belly, it prevails against the Cholick and Gripping of the Guts. Applied very hot to an Apoltem, and often renewed, it brings it quickly to Suppuration, and breaks it.

XVI. *The distilled Water of the Herb and Seed.* It is a good Vehicle to take any of the Preparations in, whether Galenick or Chymick: and being drunk sweetned with double-refined Sugar, breeds much Milk in Nuries Breasts, whatever Galen may say to the contrary.

XVII. *The Spirituous Tincture of the Seed.* It powerfully warms, comforts and strengthens the Stomach, expels Wind, and causes a good Appetite and Digestion. It is good; against Loathing and Vomiting, stops Fluxes of the Bowels, and digests raw and vilcous Humors in those Parts. It may be given from two drams to half an ounce, in a Glass of fragrant Wine, in the Morning fasting.

XVIII. *The Acid Tincture of the Seed:* It strengthens a weak Stomach, incides tough and vilcous Humors in the Bowels, and dissolves them, making them fit for Excretion. It cuts tough Flegm and tartarous Humors in the Stomach and Lungs, and makes it fit for Expectoration; for which Reason it prevails against Hoarseness, Loss of Voice, Shortness of Breath and Difficulty of Breathing. It abates the Heat of Fevers, and refists Putridity in what part of the Body soever. Dole it much as may make the Vehicle pleasantly sharp, whether it be Ale, Beer or Wine.

XIX. *The Oily Tincture of the Seed.* It is good against the Pally, - as also Convulsions, Cramps, Mumbnels, and Pains in any part Of the Body, proceeding from Cold and Moisture, outwardly anointed upon the Parts affected, and inwardly given in a proper Vehicle, from fifteen to thirty drops or more,

more, as the Exigency or Extremity may require. It provokes Urine admirably, and gives ease in the Strangury and Stone, cleansing the Reins and Bladder from Gravel, Sand and tartarous Slime lodged in thole Parts. It is a fingular thing alib to cure a Puncture of the Nerves and Tendons, in which, being applied, it gives prelent ease to the Pain, affivviges the Tuipor, and foon after cures the Af- fe&

XX. *The Saline TinSure of the Seed.* Mixt with the diitilled Water aforementioned, it makes a good Wafh for moift and running Ulcers and Sores, cleaning and drying up the Moilture, and difpofing them to healing. Given to two drams in a Clyiter, it prevails againit the Cholick: and taken inwardly to one dram in White Port Wine, it opens and cleanses the Uririary Paflages, &c.

XXI. *The dift tiled Oil of the Seed.* It has all the Virtues of the Juice, Effence, Deco&ion, Pouder, Spirituous, Acid and Oily Tin&ures, but it is more Powerful than any of them •, and may be given to Strengthen the Stomach, rdiff Loathing and Vomiting, caufe Appetite and a good Digeftion, effpel Wind, ease the Cholick and Tortions of the Bowels from Iharp Humors, cure Convulfions, Apoplexies, Lethargies, Palfy, Gout, Stone, Obftru&ions of the Reins, Ureters, Bladder and Womb, &c Dofe from eight to twenty drops, being firft dropt into white Sugar, and then mixt with fome proper Vehicle, in which it is to be given Morning and Night.

XXII- *The Spirit of the Seed.* It has all the Virtues of the Spirituous, Acid and Oily Tin&ures, but not all out fo powerful •, yet it is much more grateful or pleafant to the Pallate -, and may be taken, being dulcified, either alone or mixt with fome proper Vehicle, -from two drams to fix.

XXIII. *The Potejiates or Powers of the Seed.* They have all the Virtues of the Chymical Qil, Juice, Effence, Tin&ures and Spirit, but more powerful and fubtil, piercing admirably thro⁵ all Parts of the Body. By outward Application, being bathed upon the Parts affected, they are good againft Pains, Aches, Numbnefs, Palfy, Lamenefs, Convulfions, Spafms proceeding from a cold and moift Caufe: they resolve Humors, difcufs Tumors, and refill Dettuxions upon any Part, by ftrengthening the fame, Dofe inwardly from one dram to three or four, in any proper Vehicle Morning and Night.

XXIV. *The Elixir of the Seed.* This has all the Virtues of the diftilled Oil, Effence, Tinctures, Spirit and Powers, and is more fubtil and powerful than any of them, and therefore may very prq&tably be ufed to all thofe Intentions, both by inward Exhibition and outward Application. It is indeed an admirable Stomatick, fearcely any better in the whole Republick of Medicine: and for provoking Luft, one of the moft powerful of Vegetables. Dofe from one dram to two, in a proper Vehicle.

CHAP. CCXVL

Of DILL Wild.

i-HPi/E Names. It is called in Greek, *ϑυμύριον*, X *Thymus*: in Latin, *Anethum Sylvestre* • and mEnglJh, *Wild Dill*.

II. Tta iClf/cx. It is the fecond Species of *Thymus*: and of this Species there are two Ions, viz. i. A-

nethum Sylvestre majus, Great Wild Dill. 2. *Anethum Sylvestre minus*, Small Wild Dill.

III. The Defcriptions. *The firft, or Great Wild Dill, hem a Root like to the Garden kind ^ and in its Stalks, Leaves, Flowers and Seed differs little from it, but in its Largenefs, being much greater in all its parts than the Garden kind is: and the Smell thereof is much the fame.*

IV. *The fecond, or Small Wild Dill, hat a Root like to the firft or Garden kind, b"Ut fmaller than it I and Jo likewife, as the firft of these was greater in all its parts than the Garden Dill, fo is this leffer in its Stalks, Leaves, Flowers and Seed; the Stalk growing not above afoot high: the Leaves are fine and fmall on the Stalks, the Flowers yellow, and the Seedfmall and long, like the Garden kind, but only leffer in which the Difference chiefly lyes.*

V. *The Places.* Their native Place is Sicily, and Lisbon in Portugal: from the firft place they were lent by Columna to Bauhinus, and from the fecond place they were sent by Boel to us, and are now nurs'd up in our Gardens.

VI. *The Times.* They both flower in their native places in June, but with us in July, and their Seed is ripe in August, or fome fmall time after.

VII. *The Qualities, Specification, Preparations and Virtues,* are the fame with thofe of the Garden kind, and full out as effe&ual ^ and therefore fo the fame you are referred to the aforegoing Chapter.

CHAP. CCXVII

Of DITTANDER,

OR,

PEPPER-WORT.

The Names. It is called in Greek, *Αιτιόπ*, quod hincfa id est maculas iffquammas in cute detent: or as fome think, *dri* *S *«#» auod acnmonia urenti ulceret: mLatin, *Lepidium*, but it is not the *Lepidium Dioscoridis* iff Galeni for that is *Iberis Cardimantica*, of which we have already treated in Chap. 168. aforegoing: in Emliſh *Dittander*, or *Pepper-wort*.

VL *The Kinds.* Authors make three forts hereof: viz. 1. *Lepidium vulgare*, Jive *Piperitis*, tufr fuVLonicen, *Tiagi*, *Matthioli* V *CameraAi*: pidum magnum *Turnerij* *Cordi* & *Fuchj* • *Lepidurn Phnn*, according to *Lobel* & *Dodon* *w^h *Lepidrum Pauh* & *Phnn*, according to *Matthiolus*, *Lugdunenjis* U *Ufalpinus* • *Raphanus Sylvestris-oifficinarum*, according to *Lobel*, and *Lepidium latifolium Bauhini*, The vulgar *Dittander* or *Pepper-wort*. 2. *Lepidium Monspeliacum*, idmulla *GeJneri* (i hortis) *Herba SanSi Anthonii*, *Dentillaria Lobelii* & *Lugdunenjis* • *Dentaria Kondeletii* 5 *Molybden* * *Plinii*, according to *Anguifara* & *Camerarius* * *Plumbago Clufii* ET *Taberwnontani* 5 *Glaftum Sylvestre* C <eJalpini, French *Dittander*, or *Scar-wort*. ?; *Lepidium Annuu*?n *Lobe* hi, & *Lugdunenjis* • *Lepidium Glaftifolium Baithini*, Annual *Dittander*, or

HL The

III. The Defections. *The firft, or Common Dittander, has a Root which is flender, and runs much under Ground, and Jhooting up again in many places : both Leaves and Roots are very hot and/harp in Talie^ biting like Pepper, whence came the Name of Pepper-wort: from this Root fpring forth fomething long and broad Leaves, of a light blevoifh green color, finely dented about the edges-, and pointed at the ends, flanding upon round hard Stalks, thrèè or four feet high, fpreadingmany^ Branches on all fides, and having many fmall white blowers at the tops of them, after which fellow fmall Seed in fmall Heads.*

IV. *The fecond, of Frenc-H Dittander, commonly Dentillaria Rondeletii, has a Root which is comp(Od of many great Strings, with a woody Pith in the middle, running down deep into the Earth, and abiding many Tfars, althd both Stalks and Leaves perifh every Tear, frefh fpringing up again in the Spring. This Root Annually fends up a number of long and Umber Stalks, reddifh at the bottom, lying down upon the Ground, and not flanding upright, becaufc of their length, which are fome times four\ five or fix feet long, Jet with Leaves on allfides\ which arefomewhat narrow, long andfmooth, of n fad green color, fmailer at the lower end, and encompajing the Stalk about, but leffer Jiill as they grow nearer to the tops of the Stalks, wberg they are a little branched, and'do break forth into feveral dark purplifh flowers, fet together, confifing of five fmall pointed Leaves apiece, (landing in round brownifh Husks, in which afterwards is contained fmall, round and blackifh Seed, veryharp in Tafte, exulcerating the Skin, and burning it, being laid thereon, as the Leaves alfo do.*

V. *The third, or Annual Dittander ^ bat a Root which is fmall and fibrous, perijhing every Tear: from which Root rife up Stalks more upright than the Lift, about three or four feet high, fet withfuch like Leaves as the lajl, but fomewhat larger, aniencompajingthem at the bottoms. The Flowers are white, and fland upon fmall Branches one above another, Spike-fijhion, which afterwards give fntall^ round*

*and pointed Husks, tike fome of the Thlapfies or Treacle-Milliards, in which the Seed is contained: no lefs hot and fiery in Tafte, and exulcerating theSkin^ than the Seed of 1 he former**

VI. *The Places.* The firft of thefe is found growing naturally in many places of *England*, as *Clare* in *Ejjex*, alfo near *Excellhr*, and upon *Rochefter-Common* in *Kent*; at *Swale-Abby* near *Whaxdey*, in *Lancajhire* : it delights to grow in fandy and (hadowy places which are fbmeching moil; and is alfo nurs'd up in *Gardens*. The other two are of *trench* Origation, growing about *Mompeliey* \$ but-with us are nourifht up in *Gardens*.

VII* *The Times.* The firft flowers about the end of *June* and in *July*. The fecond iate with us, in *Auguft*, but fearcely ever gives ripe Seed in *England*. The third flowers in *July*, and the Seed is ripe in *Auguft*.

VIII. *The Qualities.* They are hot and dry in the fourth Degree \$ *Pyrotick*, *Stomatick*, *Arthritick*, *Ptarmick* and *Alexipharmick*.

XL *The Specification.* They are peculiar for the Cure of the *Sciatica* or *Hip-Gobt*.

X. *The Preparations.* You may have therefrom* I. *A liquid Juice.* 2. *An Ejjence.* 3. *An Injufiort in Wine.* 4* *A Pouder.* 5. *A Catapldfm.* 6. *A Spirituous Tintture.* 7. *An Acid Tintfure.* 8- *Art Oily TinBure.* 9. *A Saline Tintture**

The Virtues.

XL *The liquid Juice.* *Parkinfon* fays, that the Women of *Bury* in *Suffolk* do ufually give the Juice thereof in Ale or Beer to Women in Labor, to procure a fpeedy Delivery in Travail. You may give it from one fpoonful to two^ at a time.

XII. *The EJJence.* It has the former Virtues j. befides which, it is powerful to provoke the Terms in Women where they are ftopt, dry up *Caçarrhs* and tickling Rheums which fall upon the Lungs ; and being held in the Mouth, gives eale in the Tooth-ach to Admiration. Dole one fpoonful or more at a time, in a Glafs of Ale, Beer or Wine.

XIII. *The Infufion in Wine.* It warms and comforts a cold Stomach, expels Wind, provokes Appetite, and helps Concoction, and gives eafe in all Pains of the Stomach and Bowels proceeding from Wind, or Sharpnels of Humors, the Cholick, &c: being drunk for fome time by Worben, it is laid to caule Fruitfulne& Dofe a fmall Gill of three of four ounces Morning and Night.

XIV. *The Pouder.* Snuff up the' Noftrib, h is a good Errhine to purge the Head and Brain of coldy moift and flegmadck Humors, which it does very efie&ually. Taken inwardly from a fcruple to half a dratxi, or two fcruples in the Morning falling, it kills Worms in Childrèn, and expels Wind out of the Stomach; and ufed as a Topick to moift and running Sores and Ulcers, it cleanfes, dries and induces their Healing..

XV* *The CataplafnL* It is madè of the green heaves, either alone or mixed with *Hogs-hard*, by beating them together in a Mortar. It is hot, fiery and lharp, as is that of *Sciatica Creffes*, and works the fame Effe&s h for both *Paulus Mginetd* and *Pliny* fay, that it is efie&ual for the Cure of the *Sciatica* or *Hip-Gout*, or any other Pain pr Gout in the Joints, or any ocher inveterate Griefè being applied in the fame manner as *Sciatica Creffes* \$ and ufed in the fame order, it alfo 19 go6d againft the Deformities or Difcolorings of the Skin, and takes away Marks and Scars, Scabs, and Deformities made oy burning with Fire, or the like.

XVI. *The Spirituous Tinfiure.* It cures the Pain

of the Scouidch and Bowels, the Cnolick, and Torsions of the Bowels arising from (harp and corrosive Humors. It ittengchens the Viscera admirably, and itops Flaxes of the Belly- of all forts, as the Diarrhæa, Dyïenteria, Lientena, Hepatick-ilux, and withal reitores the Tone of the Parts hurt, by warming and comforting them. Dole half a spoonfil at a time in a Gbfs of Wine.

XVII. *The Acid TinSure*. It cuts thick and tough Hægms, diffolves tartarous Matter in what part of the Body foever, itrengthens the Stomachy reitores its depraved Tone, caules a good Appetite and a strong Digestion: and by its Infiltration into the Mafs of Blood, it deltroys its Difcray, and fo effe&ually roots out the Scurvy, whether in Old or Young. Dole fo many drops as to make the Vehicle pleafantly fharp.

XVIII. *The Oily TinSure*. It is good againft Rheumatick Pains and Aches in any Part of the Body, the Sciatica and Gout proceeding from a coldCaule, as also Palflies, Convulfions, Spafms or Cramps, in all which Galès it is to be bathed twice a day upon the Parts affected, rubbing it every time well in: in a Palfy, it ought also to be anointed all along upon the Back-bone, as well as upon the Part affected.

XIX. *The Saline TinSure*. It prevails againft Lettars, Ringworms, Herpes, Scurff, Morphey, Ake Breakings out: k also takes away Sunburning, tanmng, heckles, Lentils, Rednefs, Yellownels, and iuch other like Detoedations of the Skin, being only bathed Morning, Noon and Night upoh the ran affected, and then fuffering it to dry in.

C H A P . CCXVHI.

Of DITTANY Baftard White.

I*n* the Names of *Dittany* is called in some Books, *Dittamus*, *Diptamum* and *Diatantms*.

Dittamnus albus: in English, *White Dittany*, *White Baftard Dittany*, and *Fraxinella*.

: H. IfolftA. There are three kinds, viz. *Fraxinella vulgaris*, *Fraxinella flare rubens*. Common or vulgar Baftard Dittany with a reddifh Flower. 2. *Fraxinella flare rubp*. Baftard Dittany with a red Flower. 3. *Fraxinella flare albo wuleo*, Baftard Dittany with an Aft-colored Flower.

III. The Defcriptions. *The fir ft*, ^Common Baftard Dittany, *ba** a white large Root, fpreadding many ways under Ground, if it Jiands long: it is a goodly Plant, and rfes up wth feveral round, hard, brownijh Stalks, near two feet high, the lower parts whereof are farwfh with many winged Leaves fomewhat like unto Liquoricè or a fmall young Afh-tree, confifing of feven, nine or eleven Leaves fet together, which are fame thing large and long^ hard find roUgh in handling, of a darkifh green color, and of an unpkafant frong refinom Smell. The upper parts of the Stalk are furnifhed with many blowers growing Spike-fafhion, at certain diftances one from another, confifing of five long Leaves apiece, j which, four which ft and on the two fides are fomewhat bending upwards, and the fifth hanging down, but turning up a little the end of the Leaf again, of a fuint or pile red color, ftnped thro" every Leaf

with a deeper red color, and having in the middle a Tajel of five or fix long purp/ijh Threads, which bow down with the lower Leaf, and turn up alfo the ends again, with a littl Yrieze or Thrum at the ends of every one. After the Flowers are pafth arife hard, ft iff, rough, clammy Husks, horned or pointed at the end, four or five ft and ing together, fomevohat like un to the Seed-Vejjels of Wolfs-banè or Columbines, but greater, thicker and harder, in which is contained round, fhining, black Seed, larger than any Columbine-SW by much, and fmailer than cony-Seed-The whole Plant, as well Root s as Leaves, is of a frong Scent, not fo pleafing for the Smell as the Mowers are beautiful to the Sight.

IV. *The fecond*, or Baftard Dittany with a red Flower, for Root, Stalks, Leaves, Flowers and Seed^ with the Form and Manner of Growing, are all very like to the former, excepting that the Stalks and Leaves are of a darker green color, and that the blowers are of a deeper red color, and growing in a little longer Spike* in which things the Difference chiefly confifts.

V- *The third*, oY Baftard Dittany with an Aft-colored Flower, is afa m Root, Stalks, Leaves, Flowers, Seed, Form and Manner of Growing, like to the fecond, excepting that the Leaves and Stalks are of a frefter green color than any of the former and the Flowers are of a very pale or whitifh blew color, tending to an Afh.tobr.^m which the JO*ff&rence chiefly confifts. ^\vx~\

VI. *The Pl&es*. All thefe kinds are found to grow naturally in many places both oi Germany and Italy i but with us they are only niirs'd up in *Gardens*.

VII. *The Times*, they flower in JunezvA July* and their Seed is ripe in July or Auguft.

VIII. *The Qualities*. It is hot and dry in the fecond Degree; Anodyne, Aperitive, Attenuating, Inciding, Digeitive, Stomatick, Nephritick, Hyiterick, Emmenagogick and Alexiphaimick,

IX. *The*

IX. *The Specification.* It is peculiar against Poyson[^] Plague, Stoppage of Urine, and the Courfes[^] of Women.

X. *The Preparations.* You may have therefrom. 1. A liquid Juice of the Leaves and Root. 2. A Juice[^] of the same. 3. An Infusion of Leaves and Roots in Wine. 4. A Powder of the Seed. 5. A fumigation. 6. A Powder of the Root. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Spirit. These four last from the Root chiefly, or, Root and Herb.

The Virtues.

XL *The liquid Juice of Leaves and Root.* Taken from one spoonful to two in White Port Wine, it is good against the Strangury, provokes Urine, and is said to break the Stone in the Bladder, and expel it: it also provokes the Terms, and brings away both Birth and After-birth,

XII. *The Effence of Roots and Leaves.* It has all the former Virtues, besides which, it is good to Weakness and Illness of the Stomach, prevails against all cold and moist Diseases of the Womb, and is profitable against the Stings and Bittings of Hornets, Scorpions, Serpents, Mad-Dogs, and other venomous Beasts: it prevails against deadly Poysons[^] and all sorts of malign and pestilential Diseases. Dose one or two spoonfuls Morning and Night, in a Glass of Generous Wine.

XIII. *The Infusion of Leaves and Roots in Wine.* It has all the former Virtues, but not full out so powerful, and may be given to four or six ounces: it expels Wind, and eases the Cholick.

XIV. *The Powder of the Seed.* Given to a dram or more in White Port Wine, it prevails against the Strangury, provokes Urine, and breaks the Stone (as Authors say) in the Bladder, and drives it out.

XV. *The fumigation.* The Root made into little bits, or a very gross Powder, and the Fume of it, being cast upon live Charcoal, and received by a Funnel up the Womb, it warms and cleanses that Part, and is laid to bring away the After-birth[^] some of the Mence thereof[^] being taken at the same time inwardly.

XVI. *The Powder of the Root.* If it is given to a dram with fifteen grains of *Rhubarb*[^] it kills and drives forth Worms: and being given from one to two drams, it effectually refills Poyson and the Venom of Serpents, Mad-Dogs, &c. prevails against the Plague and other contagious Diseases, kills Worms in the Stomach and Belly, and gives ease in the Stone.

XVII. *The Spirituous Tincture of the Root, or of Root and Lewes.* It has all the Virtues of the Juice and Effence, but more powerfully warms and comforts a cold, weak and sick Stomach, restores a depraved Appetite, and causes a good Digestion: it expels Wind, and gives ease in the Cholick. Dose two or three drams.

XVIII. *The Acid Tincture.* It heals inward Wounds, and prevails against the Epilepsy & Falling-sickness, Vertigo, Lethargy[^] Head-ache, Megrims, and other cold and moist Diseases of the Head and Brain. It cuts tough Flegm, opens Obstructions of the Lungs and other Viscera, helps to break the Stone and expels Sand and Gravel, as also any kind of tartarous Matter from the Breast, Lungs, Reins, Ureters and Bladder. Dose so many drops as may make the Vehicle pleasantly sharp, to be taken three or four times a day.

XIX. *The Oily Tincture.* It is good against Convulsions and Cramps, as also Lameness, Numbness, Pains, Aches, Palfies, and other like cold ana-

moist Diseases of the Nerves, being well bathed upon the Parts affected Morning and Night: also taken inwardly, from ten to twenty five drops, in a Glass of White Port Wine, it is an excellent thing against the Strangury and Obstructions of Urine by Sand, Gravel, or any tartarous or liimy Matter in the Reins, Ureters and Bladder. Given to forty drops, as above said, to a Woman in Travail, it brings forth both Birth and After-birth.

XX. *The Spirit of Herb and Root.* It is a singular Stomachic, warming and comforting a cold and weak Stomach: it restores its Tone, expels Wind, prevails against the Cholick, and causes a good Appetite, and an excellent Digestion, being taken an hour before Dinner. Dose (dulcified) one or two Spoonfuls.

XXI. *Not a.* If the green Herb is bruised, and applied outwardly, it draws Prickles, Thornes, Splinters, and such other like things out of the Flesh.

C H A P. CCXIX.

O/ DITTANY Baftard, OutlandiiH.

THE Names. It is called in Greek, *Πικραλίς* 7*(JLV&'*) (pwMiKTzpw: in Latin, *Pseudodifamnum, PseudodiSamus*: in English[^] Outlandijb, Baftard Dittany.

II. *The Kinds.* It is opposed of the false kind of the *Dittany of Crete*, of which we shall create (God willing) in the Third Book of this *Herbal*. *Oi ihls Bdfiard Dittany* there are two principal sorts, v*z. 1. *PseudodiBannus primus*, (which, as *Angulara fayS*, is called by the now Greeks, *K/AM/W*?**;) Baftard Dittany. 2. *PseudodiSamnus alter fbeofhrafti, Dithimnam alterum Dioscoridis*[^] The other Baftard Dittany.

III. The Description. *The first has a pretty long Root, which is black, hard and woody, shooting down deep into the Ground, with divers Strings springing from it. From this Root rise up Stalks or Branches, half a yard long sometimes, on which are set such like round and hoary Leaves as the True Dittany of Crete has, but neither so thick in handling, nor so thick set on the Branches, but more dispersed, yet two always together, one again another: from the middle of these Branches, to the tops of them, come forth the blowers roundabout the Stalks at the Joints with Leaves, which are gaping, like those of the True Crete Dittany, as Pennyroyal, Mint, Calamint, and divers the like Herbs have, which Flowers are of a dull purple color, (landing in hoary Husks after which comes the Seed, which is greater and blacker than that of the True Crete Dittany, This Herb is somewhat hot and sharp, but not by half so much as is the True, or as is the Fraxinella in the former Chapter.*

IV. The second has a fibrous Root, which spreads it self, shooting pretty deep in the Earth from which rise up many square hoary Stalks, more than a foot high, set with two Leaves at a Joint, like unto the former, but something larger and longer: towards the tops whereof with the Leaves, come forth hoary Husks, like unto those of the Great Assyrian bawm, but the hollows out of which the flowers, mixed with white and red. The whole Plant smells very well, and abides all Winter, as the other does; and is encircled (as is also the former) by Slipping.

V. The Places, the first grows in many places of Italy, as near Pisa and Leghorn, the other is a Native of the Island Cerigo, they have been both brought to us, and flourish very well in our Gardens if the Winter is not too violently sharp and long. The first has been many times raised with us from Seed brought from Italy; but it grows very well also of the Slips, being put into the Ground about the middle of April, and a little defended from the Heat of the Sun for a time, after the setting, and now and then watered in the mean Sea.

VI. The Times. The first flowers with all the latter part of Summer, but seldom gives any good Seed: but the Seasons of the other have not been observed.

VII. The Vitalities, Specification, Preparations and Virtues, differ not from those of the True Crete Dittany, nor much from those of Fraxinella in the last Chapter, to which you are referred.

Lapathum Maritimum, Sea Dock, of which in Chap. 223. To these you may add, 5. *Lapathum Sanguineum*, Blood-wort, of which we have already treated in Chap. 182. foregoing. 6. *Hippolapathum* Patience, or Monks Rhubarb, of which in the following Part of this Work, in its proper place.

Hi. The Description. *The Common Wild Dock* has a gnarled Root, of a blackish brown on the outside,

CHAPTER. CCXX.

Of DOCK Common.

I. If it be E. Ka?nes. It is called in Greik, *Mma* and in Latin, *Wort* & *valet exinanire, vel Ventrem levare*, for that it loosens the Belly: in Arabic, *Jiamad* and *humadh*: in Latin, *Lapathum* and *Rimex* and in English, *Common Dock*.

II. The Kinds. There are several kinds of this Plant, viz. 1. *Lapathum fylvefle vulgare, vel Rwmex commitnis*, Common Dock, of which in this Chapter. 2. *Oxylapathum Diofcoridis, Lapathum kicutum, Riunex acutus* Sharp-pointed Pock of which in Chap. 221. 3. *Uydrolapathum, Rümex aquaticus*, Water Dock, of which in Chap. 222.

fide, and of a yellow color within : from this Root Springs up one large, stiff Stalk, and some times more, of a foot, and sometimes a foot and half high, (according to the Goodness of the Ground) as also a great many long and broad Leaves on long Foot-stalks lying upon the Ground, and some Hanging almoji upright, something round-pointed, having a great Rib in the middle., and full of Veins on each side the Rib, smooth, and not dented round the edges. The Stalk is of a brownish green, set with long narrow Leaves, and somewhat branched towards the top ^ the Branches* abound with Flowers and Seed in a spiked Form : the Flowers are reddish, and the Seed triangular, as most like a Tetrahedron in Geometry, contained in a brownish ted Husk, much resembling Chaff or Saw-duji.

IV. *The Places.* It grows in Field and Meadows, waste Grounds, Orchards, by Ditch-sides, and Highway-sides, more especially in the moister Grounds, in most parts of England.

V. *The Times.* It flowers in June and July, and the Seed is ripe in the end of August, and sometimes earlier.

VI. *The Qualities.* It is temperate in respect to Heat or Coldness, and dry in the second Degree, more especially the Seed, which is very Astringent. The whole Plant is very Astringent and Absterfiv, with a kind of opening Faculty *, and is Traumatick or Vulnerary and Hepatick.

VII. *The Specification.* It is peculiar for curing all Fluxes of the Bowels, chiefly the Bloody-flux.

VIII. *The Preparations.* The Root and Seed are most in Use, the Leaves only whilst they are young. From this Plant you may have these Preparations, 1. *The liquid Juice of the Root, extracted with White or Red Port Wine.* 2. *A Decoction of the Root.* 3. *A Powder of the Root or Seed.* 4. *A Vinegar of the Root.* 5. *The distilled Water of Herb and Root.* 6. *A Spirituous Tincture of the Root.* 7. *An Acid Tincture of the Root :* of all which in order.

The Virtues.

IX. *The liquid Juice of the Root.* It opens Obstructions of the Liver and Spleen, cleanses and strengthens the Stomach and other Viscera, stops a Diarrhea and Lienteria, and heals the Corrosion of the Guts in a Dyfenteria, strengthening them admirably **, and prevails against the Jaundice after a singular manner. Dose four ounces or more, first at Night going to Bed, and as much in the Morning falling.

X. *The Decoction of the Root.* It has all the former Virtues, but performs not full out so effectually * it is good against the wambling Pains and Sicknesses of the Stomach, the Bloody-flux, and Bitings of venomous Creatures *, and prevails against the Jaundice, Strangury or Stoppage of Urine, Stone, Gravel, &c.

XI. *The Powder of the Root or Seed.* It cures Fluxes of the Belly, and stops the overflowing of the Courfes in Women. Strewed upon moist and running Sores or Ulcers, it cleanses, dries and disposes them to a Healing. Given to a dram or dram and half in choice Red Port Wine, it helps a Diabetes.

XII. *The Vinegar of the Root.* It is Alexipharmick, being inwardly taken, and prevails against malign and pestilential Diseases: outwardly, it is good against Scurf, Morpew, Itch, Mange, Pimples, Pustules, Scabs, and other like Detractions of the Skin, the places affected being bathed therewith two or three times a Day.

XIII. *The distilled Water of the Herb and Root.* If it is mixt with the Vinegar just aforegoing, or with Juice of Limons, it is good to clear the Skin of Morpew, Freckles, Lentils, Sun-burning, Tanning, Yellowness, and other Discolorings of the Skin.

XIV. *The Spirit UOUS Tincture of the Root.* It admirably strengthens the Bowels, and is good against all their various Fluxes, as Diarrhea, Dyfenteria, Lientery, and Hepatick Flux; it is singular against fainting and swooning Fits, and Gripings of the Guts, proceeding from cold, (harp and Ilimy Humors. Dole one spoonful Morning and Night in a Glass of White, or Red Port Wine.

XV. *The Add Tincture of the Root.* It is good against the Yellow Jaundice, being taken in all that the Patient drinks, whether Ale, Beer or Wine. It strengthens and fortifies the Stomach, provokes Appetite, and causes a good Digestion ^ cuts thick and tough Flegm, and carries off tartarous Matter lodged in the Stomach, Lungs, Reins, Ureters and Bladder *, and destroys those Humors which are the Ground and Foundation of the Kings-evil.

C H A P . CCXXJL

Of D O C K Sharp-pointed.

T H E Names. It is called in Greek, *ῥόζα* for: in Latin, *Oxy lapathum, Lapathum acutum, Rumex acutum* ^ and in English, *Sharp-pointed*

Dock.

II, *The Kinds.* It is threefold, viz. 1. *Oxylapa* hummaji/s, Lapathum acutum ?najas, Rumex acinus Cordi,* The greater (harp-pointed Dock. 2. *Oxylapathum, vel Lapathum acutum minus, Rumex acutus minor,* The leis or small sharp-pointed

Oxylapathum, vel *Lapathum acutum minimum*, *Rumex 'acutus minimus*, The imailer or leaf iharp-pointed Dock.

III. The Defcriptions. *The firft*, or Greater. *bat a Root which is great, long, and many times forked, being blackish on the outside, and somewhat reddish and yellowish within, abiding many Tears, but sometimes ferishing by the Extremity of Winter.* From this great and long blackish Root spring forth many long, hard and narrowish green Leaves, very (harp-pointed at the ends, much more sharp than in the former fort: from among which Leaves rises up a stiff hard Stalk, two or three feet high, fet with the like* Leaves, but smaller still up to the top, not much unlike to *Sorrel*, but that it is neither so tender nor four, but rather of a bitterish Taste. This Stalk is branched forth towards the top into several large Branches or Sprigs, bearing small reddish Flowers in long Spikes; after which, in brown reddish, or dun-colored Husks,- is contained small triangular Seed.

IV. *The second*, or Less sharp-pointed Dock, *has a Root which is long and slender, parted diversly with small Fibres appendent thereto: which Root is of a yellow color on the inside; and from which rises up a strong, stiff Stalk, about a foot, and sometimes a foot and half high, having Leaves thereon, which are long and narrow, waved in on the edges, as if they were crumpled: this Stalk is branched forth into several other large Branches, almost from the bottom to the top all which Branches are also beset at due distances, with the like long and narrow Leaves, crumpled in like manner: the Stalks, bunches and Flowers, with the Seed following them, are like unto the former, but that they stand on such long Sprigs or Twigs; but closer together, some at the Joints or encompassing the Stalks, and others at the tops of; a darker color.*

V. *Tb.*- third, or Smaller kind, *has a Root which is small, and mere yellow than the first of this kind*

at left. 3. above; but it differs little therefrom in its form and Manner of Growing, except in its Greatness, this being much lesser, smaller and lower. The Stalk is not much above half the height of the first, and the Leaves very small, narrow, long, and sharp-pointed, not near the quarter part of the Largeness of the first of this Species: the flower is small, as is the Seed, which is triangular, and contained in the like chaffy Husks.

VI. *The Places.* They are all found most commonly in moist Meadows, and sometimes in upland Grounds also; at lower ends of Grounds which are moist and plashy, and near or bordering on Water-Courses.

VII. *The Times.* They rise up in the Spring < the Year, flower in June and July, and their seed is ripe in August.

VIII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the Common Dock declared in Chap. 220. foregoing excepting that the Great sharp-pointed Dock is much more efficacious and powerful to all the Intention* there named.

IX. *Observation.* The Great sharp-pointed Dock is esteemed by almost all Authors, to be a purgative or Opener, and a powerful thing against Scurff, Morpew, Leprosy, Pimples, Puftules, Knots, Tawnefcs, Tettars, Ringworms, Herpes, and all sorts of Scabbinefs happening, to the external Parts of the Body, and indeed it is the most excellent of all the kinds of Docks for those Intentions: and therefore the Juice of the Root is commonly put into those Ointments, which are made against Morpew, Leprosy, Herpes, Tettars, Scabbinefs, &c. it being a powerful Absterfive, to remove those Defecations of the Skin.

C H A P . CCXXII.

Of D O C K Water.

Names. It is called is 'Greek, in Latin, *Hydrolapathum*, and *Lapathum aquaticum*, *Rumex aquaticus*: in English, *Water Dock*.

II. *The Kinds.* It is twofold, vis.: 1. *Hydrolapathum majus*, *Rumex palufiris Tragi*, *Lapathum palufire Tabernmontani*; *Uippolapathum fylvestre Gefneri*, *Matthioli*, *Dodonai*, *Hydrolapathum magnum*, vel *majus aquaticum*, The greater or great Water Dock. 2. *Hydrolapathum minus*, *Rumex aquaticus minor*, *Lapathum aquaticum minus*, The lesser or small Water Dock.

III. The Defcriptions. *The first*, or Great Water Dock, *has a thick Root blackish on the outside, but of a dark reddish or reddish yellow within which is shorter than the Great sharp-pointed Dock and fuller of Fibres - from this Root spring up several large Leaves, growing upon pretty long stalks, which Leaves very much resemble the Common Dock Leaves, but that they are much larger and longer, a little crumpled as to their Subjiance, but smooth on the edges, and for the most part sharp-pointed.* There grows up-alib one large brownish green Stalk, which is sometimes spotted towards the Root with a few reddish Spots: the Leaves growing upon this Stalk are much like those just now described, but lesser, and growing lesser and lesser as they approach near the top, with some little or lesser Leaves

Leaves springing from the same Joints of the Stalk, where the greater Leaves grow, which lesser Leaves seem to grow in the Bosom, as it were, of the greater Leaves. The top of the Stalk (hoots it felt forth into several small Sprigs or Twigs, each of which, when in Flower and Seed, are of a spiked Form, and all together with the main top of the Stalk make one great spiked Head of Flowers and Seed, which Flowers and Seed differ nothing in Appearance from those of the *Common Dock*, excepting that they always grow closer together.

IV* *The second, or Lesser Water Dock, has a Root like the former, but it is smaller, and full of long Fibres or Strings: the firji Leaves' a/Js are like the fir ft Leaves of the former, but much lesser, long and ?im*rower^ being atfofljarp-pointed.* The Stalk is lower, and fuller of Branches, with Flowers and Seed like to the former, and to the rest of *the Docks*: so that there seems to be little or no other Difference between this and the *Greater*, but in the Magnitude of all the Parts, this being less every way, but in its Form and Manner of Growing, it is much the same with the other.

V. *The Places.* They both grow in wet and marshy places, and by the edges of running Waters and Ditch-sides: I have found them growing plentifully in the *tens* in *Cambridge/hire*, in Ditches, and by Ditch-sides, and in the midst of Hanging f hallow Waters ^ as also in low midland Grounds, at the lower parts of the Land, bordering upon the fenny parts, where the Earth is moist and watry, and by hallow Rivers-sides.

VI *The Times.* These also flower in *June* and *July*, and the Seed is ripe in *August*.

VII. *The Realities, Specification, Preparations and Virtues* of these, are the same with those of the *Common* and *Sharp-pointed Dock* and therefore to the two former Chapters! refer you: but this you may take notice of, That the Roots and Seed of the *Water Dock* are little inferior to those of the *Sharp-pointed Dock* ^ and some learned Men which I know, affirm, that they exceed in Efficacy.

VIII *An Observation.* The Roots of *Water Docks* or *Sharp-pointed Docks* being boiled in Water till they are soft, and then beaten in a Mortar with Hogs Lard, and so ritade into an Ointment, is good against Scabs, Itch, Mange, Scurf, Morphew, Leprosy, &c. the Patient being daily anointed w^th it*

C H A P . CCXXIII.

0/ t D O C K Sea.

[^X^HE Names. It is called in *Greeks* Α Ι Α » J W , X } *fahJiojiw*: in *Latin*, *Lapathum Maritime*, *Rumex Maritime*: in *Etiglish*, *Sea Dock*.

II. *The Kinds.* It is singularark Jui generis, and because it is a very strong-scented Plant, Authors are pleased to call it *Lapathum Maritimum stvtdum*, Stinking Sea Dock.

III. *The Description** It has a long Root, which is pretty thick with some Fibres thereat, and goes somewhat deep into the Earth, it being generally very light and sandy Ground in those marshy places* From this Root rises up a Stalk which "is reddish, a foot, and sometimes half a yard high or long, which bends several ways. The Leaves grow at the gouty Joints upon long Foot-stalks, which are broad at bottom, long with a breadth, foujidish towards the top, and then (harp-pointed -, they are of a dark red color, waved about the edges, and winged usually at bottom, with two final pieces like Ears. The Stalk spreads itself into many Branches, with the like, but lesser Leaves on them, and a little dented about the "edges: At the top of the Stalk Hands a Spike" of Flowers, composed of four moist Leaves apiece, after which follow leaved round Heads, which contain the Seed*

IV. The Places. It grows in Salt Marshes, by the sides of Rivers and Brooks which daily flow with Salt Water, and in standing Waters which are continually overflowed with Salt Floods, or where the Salt Water flows so high as to reach the floods thereof. I found it growing in and near the Marshes by Kings-Lynn in Norfolk, and near the Sea-shore in many other places.

V. The Times. It flowers in June and July and the Seed is ripe not long after.

VI. As to its Qualities and Virtues Authors have been silent thereon, and I knowing nothing by Experience concerning it (shall forbear any farther Discourse about it.

CHAP. CCXXIV. Of DODDER.

The Names. It is called in Arabic, Chaf-fith, and Cicut: in Greek, Κικκω, Σισ-σ&mt: in Latin, Quscud, Cajfata, Cajfyta, Podagra I'm, Angina lini: in English, Dodder.

II. The Kinds. It is a singular Plant of the kind, and yet is various, for being a Climber, it is said by Authors to be as manifold as are the Plants upon which it climbs, and accordingly has gotten as many Surnames; as, E-nfyMv, Epithymium, Dodder of time: iamM'e?@-, Epit'bymilusjDoier of Spurge: E-phmica, Dodder of Nettles: i^w^7^vritum Dodder of Eryngo: i^w^8^*^ Epia-pbace, Dodder of Tares: wfi aw, Epibicium idem. CSIKTIOIJA Epigenijhn, Dodder of Broom: in/ikmup, Epidi'damnus, Dodder of Dittany: Wfl^ff^ ibp-thymbra, Dodder of Savory: i<tf4w, Epibatdn Dodder of Brambles: iriwGV? Epiliniw^ Dodder of Flax: htkiCünm^ Epi'ibarwtisy Dodder of Rofema-

ry, or Herb Frankincense: b^wag^ Epimarum, Dodder of Herb Mafticha*: inK*n*Gts, Epicannabis, Dodder of Hemp: iaijvov, Epibryon, Dodder of Hops: vnhiov-, Epyopolium, Dodder of Poimountain: w&r.uC** Epiflatbe, Dodder of Knapweed: m^At^0^ E F^~ maracium, Dodder of Marjoram: WIMMF, Epabfinthion, Dodder of Wormwood: h^%lt* <ttJ'tvf, Epichimedrys, Dodder of Germander: 'v^xt^*.*TM, Epicoomaatte, Dodder of Dwarf Elder: ~vmvc*av&, Epibijfopus, Dodder of Hyflbp, tfc. And yet, notwithstanding all this Variety of Names, it is but one Plant or Herb, and has but one Description.

III. The Description. This Herb taking Root in the Ground from Seed^ Jboots forth Threads or Strings graffer or finer, at the Property of the U; mate, Quality of the Earth, and Nature of the Plant on which it grows will admit, creeping and sp^f'~ ing on that Plant on which it fastneth, or upon vobtco it climbs, be it high or low, clasping about the very Grafts, if it meets with nothing else. These Strings are many, but have no Leaves at all, and wind and interlace themselves so thick many times upon a small Plant, that it deprives it (as it were) of the Heat of the Sun, and feemingly chokes it: after these Strings are risen up to that height and strength, that they may draw Nourishment from the Plant upon which they climb, you shall scarcely see any Appearance of the Rife of those Strings from the Earth, they being broken off by some Accident, or withered by the Heat of the Sun, or otherwise Wcayed; (from which Appearance I believe it was, that Matthiolus and some others did think it to grow without Root, and not first to spring out of the Earth as it certainly does, and as they who may be pleased to Tow the Seed in a Pot by it self, may observe, and see its springing up, but if they meet with no Herb or Plant, upon which they may twine themselves and clamber, they soon perish and die away:) and from this Reason I suppose *c 13, > that several have thought them to grow as m>J upon Trees, or like Miffelto: but after they have lost their Ground-roots, I am apt to think, that the whole Plant draws its Nourishment (like as Ivy) from those Plants on which it grows. Upon these Strings or Threads, which are sometimes white and sometimes red, according to the Herb or Plant on which they grow, are found Clusters or small Heads of Husks, out of which proceed whitish Flowers; which being past away, do afterwards give small pale-colored Seed, somewhat flat, and twice as large as Poppy Seed.

IV. Observation i. Pliny B. i6. ca 8# ^s two sorts of Epithymum, making the one to be the Flowers of Time, as Dwarfuk* before him did, both green and white; the other to be red Threads of f?^f^SS^i^T^n; T^h^o^u^t^R^o^<*. This Duplicity

our modern Authors acknowledge but one kind, tho' it may have sometimes white and sometimes red Strings, as Traguj first observed, growing on several Herbs, according to which, they are found to be of those two differing Colors

V. Observat. 2. By this also it may appear, that neither Time nor Savory, nor any other Herb, do naturally, of their particular Seed, bring forth these Strings, but that they spring from their own Seed, either thick or scattered of themselves upon the Ground, or coming among the Seeds of other Herbs which are sown. As also they creep upon various Plants, so in the hotter Countries they clofe upon hot Herbs, as on Thyme, Savory, Hyffop, Marjoram, Rofemary, &c. but in England they, for the most part, climb upon colder Plants, as or. Yearn, I'fox, Hemp,

• *hemp, Kettles, Dwarf Elder, Tares*, on which left it grows abundantly in some places, where it destroys the *Puffe*, or at least makes it much worse. It is called by the Country People, *Hell-weed*, because they know not how to destroy it.

VI. *The Pluces.* *Dodder* grows in *Afia minor*, or *Natolia, Greece*, the *More a, Spdin, Italy*, and other hot Countries, as allb plentifully in *England*. : I found it growing Wild in several places in *Cambridge/hire*, upon *Dwarf-Elder*, and upon *Nettles*, as also in several *Hemp-tends* upon *Hemp*. It grows on several Plants upon *Hamstead-heath*, as upon *f'em*, &c. as also on several places on *Black-heath* in *Kent*, where *Parkin/on* lays he found it. It grows plentifully upon *Nettles* in *Somerfetjhire*, and in several other parts of this Kingdom, as also upon *Tares* near *London*.

VII. *The Times.* It flourishes in *July* and *August*, in which times, and also after, it bears its Flower and Seed.

VIII. *The Qualities.* It is said to be hot and dry in the second Degree : but I am of the Opinion, that that *Dodder* which grows on the hot Plants, as *Thyme, Marjoram, Savory, Hyjop*, is hot in the second Degree, but that which grows on the colder and more temperate Plants, as *Fern, Nettles, Flax, Hemp*, &c. does not exceed the first Degree of Heat: for the Qualities and Properties of this Herb much follows those of the Plants upon which it grows, and so in some measure changes and alters accordingly, so that enquiring into the Nature of the Plant upon which it is nourished, you may in part see into what Nature and Properties it may be altered. It is Absterfive, with an astringent or binding Quality, especially that which grows upon the *Bramble*, and other astringent Plants, since it is manifest, that it receives a certain Quality from its Parents, by whose Juices it is nourished. That which grows upon hotter Herbs, as *Thyme* and *Savory*, becomes hotter and drier, and of thinner parts. That which grows upon *Broom* is Diuretick, and provokes Urine more forcibly, and withal makes the Belly more soluble. That which grows upon *Flax* is less drying. It is dedicated to the Liver and Spleen, as also the other *Bovine's* and has a gentle fort of Cathartic or Purging Faculty With it.

IX. *The Specification.* It is a peculiar thing against Oppressions of the Spleen, and Hypochondriack Melancholy.

X. *The Preparations.* This Herb admits not of many Preparations, the chief are, x. *A Juice or Effence.* 2. *An Infusion or Decotion.*

The Virtues.

XL. *The liquid Juice or Effence.* It opens Obstructions of the Liver and Spleen, and purges Melancholy and adult Cholera from the Spleen and Hypochonders, and indeed from the whole Body. Dose three ounces, sweetened with an ounce of choice Manna dissolved in it. It evacuates Flegm from the Head and Viscera, discharges the Lungs, and is profitable against a Vertigo, Megrim, and other inveterate Pains of the Head. It prevails against fainting and swooning Fits, by carrying off the stur and acrid Humors which cause them. It is powerful against Madnefs and Agues, especially Quartanes, tho' they have been of a long continuance. And as it is good against Hypochondriack Melancholy, so also it prevails against those Diseases which that Humor breeds, as Scirrhus, Cancer, Hardnefs of the Spleen, Pain and Windnefs of the Spleen, Stoppage of the Reins, Itch, Scabs, Leprosy, Elephantiasis, malignant and cancerous Ulcers, as also the Malignity of the *French-Pox*, h very much cleanses

the Blood from Melancholy and adult Humors, is good against the Yellow Jaundice, and tho' it has 2 purging Property, yet it also strengthens both Liver and Spleen, and cures Agues in Children, if a little Worth-feed be added to it. It provokes Urine plentifully, and cleanses the Urinary Passages from Sand, Gravel and tartarous Matter, especially if a little of the Powder of *Anifeed* and Tincture of *Wormwood* be added, and then it also eases Gripings in the Bowels, and brings down the Terms in Women. Mix the Dose with a Glass of White Port Wine, and so let it be drunk.

XII. *The Infusion or Decotion in White Wine.* If you make a Decotion thereof the Boiling must not be much, for it will not endure long boiling, because it will lose its force. It has all the Virtues of the liquid Juice or Effence aforesaid, and may be taken to half a pint, more or less, at a time, sweetened by dissolving an ounce of pure Manna in the same. It is said to cure Children of Agues, being given from two to four ounces, as aforesaid.

XIII. *Nota.* *Dodder of Flax* is peculiar for opening Obstructions of Liver, Spleen and Gall. *Dodder upon Brambles* is good against the Yellow Jaundice, and strengthens the Viscera much: *Dodder of Nettles* provokes Urine, opens Obstructions of the Womb, and loosens the Belly. *Dodder of Thyme* comforts and warms a cold Stomach, and restores the Difcrasy of the Blood and Humors, prevailing against old Head-ach, the Megrim, Vertigo, Madnefs, Epilepsy, purging downwards black Cholera and Melancholy. *Dodder of Broom* is good to open Obstructions of the Reins, Ureters and Bladder, provoke Urine, expel Sand, Gravel and tartarous Matter, and give ease in the Strangury, expelling watry and hydropick Humors. In a word, *Dodder of all other Plants*, in like manner, partakes of the Nature, Qualities and Properties of them on which they grow, (as aforesaid) whether they be hot or cold, cathartic or astringent, and it is thought to work more effectually for those Diseases, whereunto, to the Herb it self is applied. But *Epithimum*, of *Dodder of Thyme*, is that which, by all Physicians, is accounted the most principal and most powerful *Dodder*, and doubtless is the best of them all, to be used to cold and moist Habits and Constitutions of Body.

CHAP. CGXXV.

Of DOGS-BANE.

Names. It is called in *Greek*, *Κανκίντιον* X *5 *Kvropi&v*, (*quia Cank inte'fuit*.) the *Greeks* also call it *VAC*, from its climbing Property: in *Latin*, *Apocynum*, and *Periploca*: in *English*, *Dogs-bane*.

II. *The Kinds.* There are five kinds hereof, viz. three *European* kinds, and two *American*. The *European* kinds are, 1. *Apocynum angujifolium five repens*, Climbing Dogs-bane, or Narrow-leav'd Dogs-bane. 2. *Apocynum latifolium non repens*, Broad-leav'd upright Dogs-bane. 3. *Apocynum folio angusto Salicis*, Willow-leav'd Dogs-bane. The *American* kinds are, 4. *Apocynum refrum minus angujifolium Americanum*, The lesser upright narrow-leav'd American Dogs-bane. 5. *Apocynum retfum majus latifolium Americanum*, The greater upright broad-leav'd American Dogs-bane, or *Virginian* Silk.

III. The Description. This Narrow-leav'd climbing Dogbane, has a Root which spreads in the Ground like the other, and sometimes sends forth Suckers, whereby it is encreas'd. This Root sends forth several woody Branches, but tough and flexible, of a dark greyish green color, and sometimes brownish, especially near the Ground, where it bears no leaves after it is grown to any bigness or height, which wind themselves from the Sun-ward to a

very great height, twenty foot high, or more sometimes, if any thing grows or stands by it, upon which it may climb higher, or else falling down again with its top, on which stand at several good distances (saying at the tops, where they stand thicker set together) two Leaves longer and narrower than the next described, and pointed at the ends, somewhat thick, and of a deep green color, almost shining. The Flowers stand in the same manner as those in the next, and consist of five thick Leaves, each of them pointed, and bending something backwards, seeming to have two Leaves apiece, one lying upon another, like unto those of Barren-wort, the undermost being greener and larger than the upper Leaves which lie upon them, and are not so large to cover them wholly, but leave the green brims or edges of the lower Leaves to be seen round about them, which upper Leaves are of a dark purple or reddish color, and cleave so fast to the lower, that it is very hard to separate them, In the middle of each Flower stands a green Pointel, encompassed with five dark yellow Chives, each of them twining inwards. After the Flowers are fallen, small long Pods appear, of warm Countries, but scarcely in England) two always joined together, but more frantically than in the following Plant, bending something more outward in the middle, and meeting together almost at the points, in which lies flat Seed, wrapped in a kind of filken Down. This Plant loses its Leaves but not its Stalks, in the Winter, fresh coming again in the Spring.

IV. The second, or Broad-leav'd upright Dogbane, has a Root which grows down into the Ground, producing it self out into several Branches, with several small Fibres adjoining: from this Root springs up a woody Stem, of the thickness of ones Finger, covered with a greyish Bark, from whence arise several woody, but flexible greenish Branches, easy to twist or wind about any thing, being very tough and hard to break, standing for the most part upright, and seldom trailing, or laying hold of any thing which may grow near it, having two broad dark [green] Leaves, but sharp-pointed, and not round, set at every Joint all along, but not very near one unto another, full of Veins, and something softer than Ivy Leaves, but thick withal, whose Stalks and Branches being broken, yield a pale yellow-colored Milk of Juice. But as Dioscorides and other Authors say, of a much deeper yellow, which thing may be admitted when it grows in warmer Climates than is this of ours. The Flowers spring forth at the Joints with the Leaves, growing upon Foot-stalks not very long, and at the tops three or four or more of them stand, sometimes together, which consist of five small pointed Leaves, of a whitish color, yet larger than those of Aclepia, or Swallow-wort. After which (in the hotter Climates, but scarcely in ours) grow long, crooked and pointed Pods, something more hard and woody than those of Swallow-wort, altho' nothing so much as those of the Oleander or Rose Bay-tree, two most usually standing together upon one Stalk, but severed at the setting to the Stalk, and are full of a filken white Down, (like the former) in which lie dispersed many flat, blackish brown Seeds. This Plant loses not its Branches in the Winter, but only its Leaves, they every Spring shooting forth new again.

V. The third, or Willow-leav'd Dogbane, has a Root much like the first, from which arising woody Stems or Branches, having set at every Joint of the climbing Twigs two narrow Leaves apiece, like to the first kind, but they are not so thick, rather a little thinner, and much narrower than they, almost resembling the form of a Willow Leaf. The Flowers are like the first and blow as late, being

much like to the former *Narrow-leaved* in its Form and Manner of Growing-, and it looses its Leaves in the Winter, as that other does, renewing them again in the Spring.

VI. *The fourth*, ar-Leffer upright narrow-leaved American Dogs-bane, has a thick Root, but it creeps not in the Ground, a* the Greater American doth, but from many long Fibres, it shoots forth a round-brown Stalk, about half a yard high, having at each Joint a pair of long narrow Leaves, and such a large Tuft of Flowers at the top, a* the following has, but of a deeper purple color, which have a certain Clamminess on them, which will detain Flies or other light things which happen to fall thereon. After Which come long and frait Cods, (not crooked, like the Greater fort following) with flat brown Seed therein, lying in a white kind of Down, like unto *Afclepias* or *Swallow-wort*. This being broken, yields a milky Sap or Juice, like the other.

VII. *The fifth*, or Greater upright broad-leaved American Dogs-bane, called *Virginia Silk*, has a Root which is long and white, of the thickness of a Mart's Thumbs running under Ground very firm, and shooting up again in divers places, the Heads Jet full of small white Knobs or Knots, sending forth many Branches, if it stands any longtime in a place. Yrdm this Root rises up one Stalk, and sometimes more, being firong and round, and three or four feet high, on which are Jet, at the several Joints thereof, two fair, long and broad Leaves, round-pointed, with many Veins therein, growing close to the Stem, without any Foot-fiall. At the tops of the Stalks, and sometimes at the Joints with the Leaves, grows forth a great Bufl of Flowers, out of a thin Skin, to the number of twenty, and sometimes of thirty or forty, every one with a long Foot-ftalk, hanging down their Heads for the most part, especially those which are outwardmost, every one Handing within a Husk of green Leaves, turned to the Stalkward, like to the *Lyimachia* or *Looftrife* Flower of *Virginia*, and each of them consisting of five small Leaves apiece, of a pale purplifli color on the upper side, and of a pale yellowifh purple underneath * both sides of each Leaf being as it were folded together, making them seem hollow and pointed, with a few short Chives in the middle. After the Flowers are past, long and crooked Cods, pointed, and standing upright, succeed, in which are contained flat brownifh Seed, difperfedly lying within a great deal of fine, soft and whitilh brown Silk, very like unto the Cods, Seed and Silk of *Afclepias* or *Swallow-wort*, but that the Cods are greater, and more crooked, and harder also in the outward Shell. The whole Plant, as well Leaves as Stalks*, being broken, will yield a pale kind of Milk or Juice.

Vttl. *The Places*. The first and third grow in *Italy*, *Apulia* and *Calabria* in the Kingdom of *Jules*. The second grows in *Syria* and the *Eaftern* Countries, as also in *Italy*, as *Matthiolvs* reports -, but with us they grow in *Qardens*. The two last came from our *Englifh* Plantations in *America*. The last, *Parkinson* says, came to him from *Virginia*, where it grows abundantly, he raised it from the Seed which he had from thence.

IX- *The Times*. The three first flower late in the Year, if they flower at all with us, viz. about the end of *Auguji*, and to the middle of *September*. The two latter flower in *July* and *Auguji* *, and their Seed is ripe in *Auguji* and *September* following.

X, *The Qualities*. These Plants are hot and dry in the fourth Degree, venefick or Poyfonous; they are fo great Poyibns, as to kill Dogs, the which they will do, if the Herb is mixed with their Bread, Broth or Meat, and fo given them 5.

and therefore they are not to be given to Mankind; The three first are laid to exceed in Malignity both *Woolfs-bane* and *Oleander* or *Rofe-Bay*: but as most Poyibns have their Antidotes, as that of *Thora* is *Anthora*^ that of *Pardalianchs* is *Herba Pans** fo the Antidote to this *Apocynum* is *Afdepias* or *Swallow-wort*. Some may object: it as a Fault to me; that I have put into my *Herbal* such poyfonous Plants as this is -, but to such I answer, That the more poyfonous they are, the more necessary to be known, that People may take notice of them, and beware of using them -, yet their Poyfons are not without their Virtues also -, for tho' they are not fit to be given inwardly,* yet sometimes they may be applied outwardly to advantage. As to the aoregoing Plants, all Authors have concluded the first three under the Character of being Deleterious or Deadly: as for the other two, nothing is yet known of them by Experience *, yet by their milky Juice which is burning, fiery and exulcerating, they may almost be concluded in the same Class -, for which Reason I should desire every one to be cautious in their Use.

XI. *The milky Juice* of any of the three first Plants, is very hot and burning, and being outwardly applied, it is good against Tettars, Ringworms., Scurff, Morphew, Leprosy, and to fetch Hair off from Hides, if they be steeped in it. Even in the outward Application it is to be used with Caution.

XII. A *Qataplasm* made of the Leaves of either of the American kinds, by being beaten either crude or boiled in Water, and io applied, it is said to be good for Tumors and Pains proceeding from a cold Laufe.

XIII. *Gerard* says, that the Cods of the last, or Greater upright broad-leaved American Plant, are fluffed full with a most pure Silk, of a shining white color: The Cods (says he) are not only full of Silk, but every Nerve or Sinew, wherewith the Leaves are ribbed, are likewise most pure Silk; as also are the Peelings or Bark of the Stems or Branches, like as is the Peeling or Bark of *Flue* or *Hemp*, Cordage for making Linnen*. But the *Indians* have not the Understanding in them to make use of it, fo as to cover their Nakedness, notwithstanding (says he) the Earth is covered over with this Silk. This they daily tread under their Feet, which would be sufficient to Cloath many Kingdoms, if it was carefully CherKhed and Manured.

XIV. This last Plant *Parkinson* tells us he raised up in *England*, from Seed which was sent to him from *Virginia* ^ but he says there is another Plant growing in *Virginia*, called *Silk-Grafs*, which is very much differing from this.

CHAP. CCXXVI

Of DOGS-STONED

THE Names. This Plant is called in *Greek** *Rvvoafyt*: in *Ardbeck*, *Chafialkes*, and *Qhafi* icbels: in *Latin*, *Cynoforchis*^ and *Tefticulus vel Testiculi Canis*: in *Englifh*, *Dogs-ftones*.

IL *The Kinds*. This Plant is of the kinds of *Scrbis*; now, how manifold the chief and principal Species or Kinds of *Orchis* are, we think necessary to declare here, that things may be fet in a true and clear Light. *Orchides* then are divided into nine principal kinds, vis. into, 1. *Cynoforchis*^ Dogs-ftones,

itones, of which only in this preient Chapter. 2. *Orchis moru* tools-(tones). 3. *Orchis Serapias*, vcl *Teiiculus Vulpius*, Fox-ftones. 4. *Tragorchis*, Goats-itones. 5. *Orchis odor at us*, *Teficulus odor atus*, Sweet Cull'ions, which fee in Chap. 184. aforegoing. 6. *Orchis abortive vel Kidus avis*, Stones mif-lhapen, or Birds-nelt, which fee in Chap. 73. of this Book. 7. *Orchis palmata*, Handled Orchis. 8. *OrckJs prufuf* rJ*Si Yemy-bones*, p. Dfdvs MrfT-diria^ Fly Orchis \$ of all which (not yet treated of) we fhall fpeak hereafter in their proper places.

III. *Dogs-ft ones* (the fubjett Matter of this Chapter) are accounted by Authors to be about fourteen, or fifteen feveral kinds, but we (hall only treat of thofe which are found to grow in England, which are thefe following, viz. 1. *Cynoforchis major latifolia*, The greater broad-leav'd Dogs-Hones. 2. *Cynof orchis major purpurea latifolia*, The greater broad lea v'd purple Dogs-ftones. 3. *Cynof orchis majorfpica compatta*, Marfh Dogs-itones, or The greater pale purple-liowred Dogs-ftones. 4. *Cynof orchis latifolia minor*. The fmaller pale purple Dogs-ftones. 5. *Cynof orchis maculata*, Spotted Dogs-ftones. 6. *Cynoforchis mil? tar is*, *Jive Strateumatica major*, T. E. greater Soldiers Dogs-ftones. 7. *Cynof orchis militaris minor*, The lefler Soldiers Dogs-ftones. 8. *Cynoforchis militaris minima*, five Pannonica, The leaft or Hungarian Soldiers Dogs-ftones.

IV. The Defcriptions. *The firft*, or Great broad-leav'd Dogs-ftones, has a Root which is compofed Of two round white Bulbs^ fet together, like the two Stones of a Dog, with long Fibres at the Heads of them, one fomewhat higher fometimes than another, and always one of them, which is the higher, is firm, full and hard, the other lank, wrinkled and foft, which wafte away to nothing, leaving the firm Root, which fo abides all the Winter, and in the Spring nother is engendred, and encreafes from the fide of the old one, and then that begins to grow lank, while the other new one encreafes. This Root fends forth five or fix broad Leaves near the Ground -, from among which rifes up around green Stalk, half a yard high, bare or without Leaves, or but one or two, imaller ftanding below, at the top of which ftand

a fpiked Head of purplifh Flowers, let thick and clofe together, made like unto open Hoods, from the middle whereof hangs down a fmall Body, as it were, of a Dog, or other fuch Creature, being of a pale purple color it felt, fpotted with deeper purple Spots, and Lines -, after which come fomewhat long and round fmall Husks, containing therein rather fmall Duft than Seed, it is fo fmall.

Jⁱ. The ftoff, or-Greater broad-leav'd purple Dogs-ftones, bat a Root like the former ^ but tkfi fort hat Leaves fomewhat narrower than the other: the Stalk is nearly of the fame height, and the fpiked Head of Flowers is neither fb long nor fo thick 5, and the Flowers are of a whitifh purple color, marked with fome purple Spots and Lines more inward, formed like open Hoods, and fmall Bodies hanging forth, like the former j. the Seed being alfo like the fame.

VI. *The third*, or Marfh Dogs-ftones, hat a Root like the firft aljo-, and the Leaves of this are fotewhat narrower than in the laft -, and the Stalk alfo is fomewhat lower, with Leaves upon it, which are fometimes fpotted *, and the fpiked Head flort and clofe -, with the like Rowers for Form, but fomewhat lefs, thick fet together, which are of a whitifh purple color, and fpotted.

VII. *Jbe fourth*, or Smaller pale purple Dogs-ftones, (which Gerard tails White Dogs-ftones) *hi** Roots altogether like the firft aforegoing, from which fprings up a Stalk almoft a foot high, Jet with five or fix Leanest clapping or embracing the fame round about : and the firft Leaves rifing tip, are likewife broad, long, broad Leaves, but lefler and narrower than thofe of the firft kind. The fpiky Head of Flowers is fhort, thick, bufhy, compact of many fmall whitifh purple-colored Flowers, and fpotted with the infide with many fmall purple Spots, and little Lines or Streaks. The fmall Flowers are like an open Hood or Helmet, having hanging out of finery one, as it were, the Body of a little M&i without a Head, with Arms ftretched forth, and Thighs ftreading abroad, after the fame manner asU molt that the Children are wont to be pictured, hanging out of Saturn's Mouth.

VIII. *The fifth*, or Spotted Dogs-ftones, have Roots like the others, but leffer -, from whence come forth narrow Leaves, ribbed in fome fort like unto the Leaves of Narrow Plantane or Ribwort, dajht with many black Streaks and Spots. The Stalk is a foot and half or more high ; at the top of which does grow a Tuft or Ear of Violet-colored Flowers, mixt with a dark purple, but in the Hollownefs thereof whitifh, not of the fame Form or Shape which the others are of, but lefler, and as it were refembling fomewhat the Rowers of Larks-Spur,

IX. *The fixth*, or Greater Soldiers Dogs-ftones, has round bulbous Roots, great and thick; from the Heads of which Bulbs many Fibres or Threads fpring forth. This Root fends forth feveral large Leaves below, and fome lefler on the Stalk, which feem to enclofe it. The Stalk is fsmooth, green, and about half a yard high. The fpiked Head of Flowers ftands fomewhat loofe, the Flowers being a little feperated one from another: each Flower is alfo like unto a Man, whofe Body has its Arms and Legs cut off, and a Hood fet thereon, or a Leg-lefs Soldier with his Helmet on, the Hood or Helmet being white, and the Body fpotted with purple Spots.

X. *The feventh*, or Ltffer Soldiers Dogs-ftones, has Roots, Leaves, Stalks and Spike of blowers altogether like the laft, but that they are all of them every ways lefs, and the blowers fomewhat whiter.

XI. *The eighth*, or Leaft Hungarian Soldiers Dogs-ftones, has Roots like the others, but fmaller

much, from whence five or six little Leaver spring out of the Stalk is about six or seven inches high, 7h about with somewhat kffer heaves. The Tuft of Flowers at the top of the Stalk are of a purple color, (small, with a white Lip, divided into four Partitions, hanging down, which is also spotted lightly with purple. It has a little Spur hanging down on the hinder part of each Flower. The Seed is small, and contained in such twined Heads as in other Plants of this kind.

XII. *The Wees.* These grow in many places of this Kingdom, in moist and fertile Meadows. The *Mtirjh Dogs-fioncs* grow for the most part in moist and watery Woods, as also in Marsh Ground. The last grows in *Auftria, Germany, Hungary*, and in many places of *England*.

XIII. *The Times.* They flower from the beginning of Winter till the end of Spring, but, says Gmztf, to the end of August.

XIV. *The Qualities.* *Dogs-fiones* are temperate in respect to Heat and Coldness, and the full *Teficicle* moist in the second Degree. The *wrinkled or Soft one* temperate in respect to Dryness or Moisture. The full *Teficicle* seems to be Digestive, Diuretick, Hyijerick, Chylifick and Spermatogenetick. The *Soft or wrinkled Stone* is opposite to all the foregoing Qualities, and rarely used Physically. All the sorts or kinds of *Teficuli* provoke or stir up Lust, and they are promiscuously used for that Purpose * but the best and most effectual for that Purpose, are the *Tejiculi Canini*, of which the *harder and fuller Bulb* is to be chosen, as aforesaid. The fuller Root is not always the greater, but oftentimes the lesser, especially if they are gathered before the Plant has filed its flower, or when the Stalk first comes up nor does it attain to be the greatest till the Seed comes to be perfectly ripe. For since that every other Year, by course, one Bulb or Stone grows full, the other empty, and so perishes, it cannot be, that the harder and fuller of Juice should be always the greater * for at such time as the Leaves come forth the harder and fuller Stone begins to encrease, and as that encrease, so the other, by little and little, decreases and withers away, till the Seed is ripe, at what time the whole Plant above Ground does forthwith decay and perish, and that which all this while has been encreasing, remains still fresh and full till the next Year.

XV. *The Specification.* They are peculiar for the curing Impotency in Men.

XVI. *The Preparations.* You may have, 1. *The Effence.* 2. *The Sanguis or Blood.*

The Virtues*

&Vif. *The Effence.* Being taken daily, first in the Morning fasting, and last at Night going to Bed, from one spoonful to three in a Glass of generous Wine, it not only provokes Lust, but it also takes away the Imbecility or Impotency of the Instruments of Generation, but also promotes a plentiful Generation of Seed.

XVIII. *The Sanguis or Blood.* It has all the Virtues of the Effence, but is indeed more powerful to all the mentioned Intentions, it comforts and warms the Instruments of Generation, making a liberal encrease of Animal Spirits, stirring up the Person who takes it to an ardent desire of Coition. The Dose is one or two spoonfuls in a Glass of *Madera* or other generous Wine, Morning and Night.

CHAP. GCXXVII.

Of DOGS--TOOTH

I. *The Names.* Some will have this to be *Wortov Diofcoridis*, I.e. *Satyrium habens Radicis Corticem rubrum*, Diof. lib. 3. cap. 144. but this other Authors will not allow of: *Farkinfon* will have that (and I believe rightly enough) to be our *Tulip*. Others will have this Plant to be a kind of *Violet*, (tho' there is nothing like a *Violet* in it) and so call it *Dogs-tooth Violet*. It is called in Latin, *Dens caning Dentali Clufii Cf Lobelii HermodaUylm Gefneri Pseudohermodatfylus Matthiolii* and in English *Dogs-tooth*.

II. *The Kinds.* It is doubtless one of the kinds of *Satyrium* tho' not the true *Satyrium Diofcoridis*, and our Moderns have given to it the Name of *Dens caninum*. It is threefold, viz. 1. *Dens caninum flore albo*, Dogs-tooth with a white Flower. 2. *Dens caninus flore purpurafcente* Dogs-tooth with a purple Flower. 3. *Dens caninus flore rubro* Dogs-tooth with a red Flower.

III. the Defections, the first, or White-flowered, has a white bulbed Root long and *S^mK J[?]** commonly larger than either of the two following, bigger below than above, with a small piece adjoining to the bottom of it. from this Root, in the beginning of the Spring, after the Winter Crofts are past, two Leaves for the most part (very rarely three) rise up, when it will flower, (otherwise but one) which are closed together when they first come up out of the Ground, and enclose the flower between them. The Leaves, when they are opened, do lay themselves flat on the Ground, or not much above it, one opposite unto the other, with the Stalk, and the Flower upon it, (landing between them, which Leaves are of a whitish green color, long and narrow, yet broader in the middle than at both ends, growing

leiſ by degrees each way, fpotted and flipad all o-
ver the Leaves with white Lines and Spots. The
Stalk rilēſ up lev en or eight inches high, bearing at
its top one Flower, and no more. This Flower
hangs down its Head, and is larger than any of the
following kinds, ynd confitts of fix white, long and
narrow Leaves, turning themſelves up again after it
has felt the Warmth of the Sun, that they do al-
moſt touch the Stalk again, Very like to the Flow-
ers of *Cyclamen* or *Sowbread*: it has in the middle
of the Flower fix white Chives, tipt with dark purple
Pendants, and a white three-forked Stile in the
midft of them. The Flower has no Smell at all,
but is commendable chiefly for its Beauty and Form.
After the Flower is paft, there comes in its place a
round Head, feeming three-fquare, containing there-
in fmall yellow Seed.

IV. -The fecond, with a purple Flower, has'a
white 'bulbed Root, like unto the former, but lejjer,
as aforehinted: the Leaf hereof is not Jo long as that,
hut broad andfhort, fpotted with darker Lines and
Spots. The Flower is like the other, but fmaller,
and of a delayed purple color, very pale fometimes,
and fometimes a little deeper, turning it ſelf as the
other, with a Circle round about the middle. The
Chives hereof are not white, but declining to purple
: in all other Refpeds it is like to the afore-
going.

V. The third, with a red Flower, has alike white
bulbous Root. The Vorm and Largeneſs of the Leaj
is llike to the laſt defcnbed, fo alfo the form and Big-
neſs of the floLr I but in thiſ the chief Difference
confiſt tint the Leaves of thiſ axe of a yellowiſh,
S t ' g S n color, fpotted and ftreaked with red-
der Spots and ftripes, and the Flower of a deeper
reddiſh purple color -, and the Chives alfo more purple
than the laſt •, but in all other things they are
very like one another.

VI. The Vines. All the forts of *Dens caninus*
grow in Foreign Countries, as in *Italy* on the *Euga-*
trean HU^> , on the *Apenine*, alfo about *Gratz* the
chief City oF*Stiria*, and about *Bayorine*, and in fe-
ver al other places: they alfo grow in the *Gardens*
of our *Yfcrifts* in *England*.

VII. The Times. They moſt commonly flower in
JSlarch, and many times in *April*, according to the
Warmth or Coldneſs of the Seaſon.

VIII As to the Qualities, Specification, Prepara-
tions and Virtues, they are much the fame with
the *Orchides* or *Dogs-Jiones* in the former Chapter,
to which I refer you: only it is ſaid, that theſe are
more efficacious for Venereous A&ions than any of
the *Orchides* and *Satyrions*.

IX. Obſervation. The Pouder of the Root being
given inwardly in Broth, Milk or Wine to one or
two drams, is ſaid to be effe&hial againſt Worms in
the Belly -, to eaſe the Pains of the Cholick, to
ftrengthen and nourifh the whole Body, and to cure
the Falling-fkknēſs in Children.

CHAP. CCXXVIII.

Of DOVES-FOOT.

The Names, it is called in Greek, r^...
in Latin, *Geranium Columbinum*, *Pes Columbinus* -, and in Em-
liſh, *Doves-foot*.

II. The Kinds. There are many kinds of this
Plant, but the principal which grow in *England* we
the three following. 1. *Geranium Columbinum vul-*
gare, *Pes Columbinus communis*, The common Doves-
foot. 2. *Geranium Columbinum Laciniatum*, *Pes*
Columbinum alters The jagged Doves-foot. 3. *Ge-*
ranium Saxatile, *Pes Columbinus Saxatilis*, The
Stone or Rock Cranes-bill, or Doves-foot.

III. The Deſcriptions. The firſt, or Common,
Doves-foot, has a Root which is ſomething long ana
woody, having ſome Fibres adjoining to it -, from
whence ariſe ſeveral ſmall, round, pale, green Leaves,
cut in about the edges, much like unto Mallows, cr
rather a Doves Foot, ſtanding upon long, reddiſh, hai-
ry Stalks, lying in a round Compafs upon the Ground -,
from among which riſe up two or three or more
jointed, reddiſh, hairy Stalks, ſlender and weak,
with ſome ſuch like Leaves thereon, but fmaller,
and more cut in up to the tops, where grow many
very ſmall, bright, red Flowers of five Leaves a-
piece 5 after which follow ſmall Heads, with ſmall
hott Beaks pointing forth, as all the other forts of
Cranes-hills do, of which this is a kind, whereby
they are known to be of this Family, how differing
foever the Face or Form of their Leaves may be.

The ſecond, or Second, Doves-foot, has a Rod
like the former, from whence ſpring up Leaves,
which are greener, not full out ſo round, and Jove-
what more cut in on the edges, making the Leaf to
ſeem of ſeveral parts more than the other, or like
the *Vervain Mallow*, but ſomething teffet: The
Stalks are weak and leaning, like the former, as al-
fo are the Flowers and Seed with its long Beak.

The third, or Rock or Stone Doves-foot, is J
leſſer Plant than the Common Doves-foot, and has
a Root which is ſmall and yelloiſh, yet abides maity
Tears and periſh not, and alfo encreaſes plentifully
of the Seed it lets fall. From this Root ſpring forth
many ſmall Leaves, very like to thoſe of the Com-
mon Doves-foot, which are ſomewhat hi in on the

edges, very green and Jh in ing, fo very like to a small Sanicle Leaf, that it may eajily deceive the unawary •, thefe heaves grow upon reddijh iojt-Jhrfks, and lye upon the Ground all the Autumn, Winter and Spying until the Summer that the Stalks rife up, which are about feven, eight or ten inches high or more, bearing a few Leaves on them, and veryfmall, purplijh red flowers, brighter and redder than thofe of the Common Doves-foot, which being pafs'd away, yield very fmall Seed, but like the others in its Beak-like Shape or fajhion.

VI. *The Places.* The firft grows in Meadows and Pafure-grounds, by Ditch-fides, and Banks of Ditches, and by Path-fides, almoft every where. The fecond is alfo found in Meadow and Pafure Grounds, where the Ground is fat, and near Ditch-fides, but not fo frequent as the former. The third grows in ftony, rocky and gravelly Grounds, in *Harcyniafylva*, as *Camerarius* and *Tbalusiky*, and about *Naples*, as *Columna* fays: and it has been often found in feveral rocky, ftony and gravelly places of this our Kingdom of *England*.

VII. *The Times.* They all flower in the Summer Months, in *June*, *July* and *Auguft*, fomemore early than the others * and their Seed is ripe in fome fhort time after.

VIII. *The Qualities.* They are cold and dry in the firft Degree ^ Aftringent, Carminative and Traumatick or Vulnerary •, Arthritick and Anaieptick.

IX. *The Specification.* It is a peculiar thing to flop Bleeding, and cure Wounds and Ruptures.

X. *The Preparations.* You may make therefrom, 1. A liquid Juice. 2. An Effence. 3. A Decottion in Wine. 4. A louder of Herb and Root. 5. A Balfam. 6. A Cntaplafm.

The Virtues.

XL *The liquid Juice.* Given to two or three fpoonfuls in a Glafs of Sherry, Madera, or other generous Wine, it prevails againft the Cholick, as alfo againft Wind and Pains in the Stomach, and o-

ther Viicera : and it given m YVhice VV me, IC JS good to expel the Stone and Gravel in the Reins.

XII. *The Effence.* Ic hits all the former Virtues; befides which, it is good for ibch as have inward Wounds, Hurts or Bruifes; it ftops inward Bleedings, and diffolves and expels the congealed Blood. It is found alfo by Experience to be a fingular good thing for Ruptures or Burftennefs, whether in Old or Young. You may give two or three fpoonfuls Morning and Night, in a Glafs of White or Red Port, Sherry, &c.

XIII. *The Decoffion in Red Port Wine.* It is an exceeding good Wound-drink for fuch as have inward Wounds or Bruifes, it ftops the Bleeding, cleanfes and heals the Parts, and has indeed the Virtues of the Juice or Effence, but in a lower Degree. Dofe five or fix ounces twice a day.

XIV. *The Pduer of the Herb and Root.* Gerard fays, that if it is given half a fpoonful at a time in the Morning falling, and half a fpoonful at Night going to Bed, in Red Wine or old Claret, for the fpace of one and twenty days together, it will miraculoufly cure Ruptures or Burltennefs, as he had oftentimes proved, by which he had gotten much Money and Reputation. If the Rupture is in an aged Perfon, it (hall then be needful to add thereto (fays he) the Pouder of red Snails, (thofe without Shells) to the number of nine, dried in an Oven* by which the Pouder of the Herb will be fortified, fo as it ftiall not fail of a Cure, tho' (fays he) the Rupture be great, and of long continuance. It is good alfo for thofe who are wounded in the Body, to flop the Flux of Blood, and heal the Wound, as has been often proved. Dofe one dram Morning and Night in Red Port Wine.

XV. *The Balfam.* It is admirable in curing of Wounds limple or contufed, as alfo in healing of Sores, Ulcers and Fiftula's: it digelts, cleanfes, incarnates, dries and heals to Admiration.

XVI. *The Cataplafm.* If it is made only of the Herb bruifed, and fo applied, it heals limple green Wounds after a fingular manner. It is good alfo to difcufs limple Contufions; and applied to Parts Sained with the Gout, it gives ealein the fame. It ftops the Bleeding of green Wounds, allays the Heat of Inflammations, and difcuffs hot Tumors. It gives eafe in any Pains of the Extreem Parts, proceeding from a hot Caufe, or from Defiuxion of Humors, or from any over-ftaining of the Nerves or Joints, by lengthening the fame.

C H A P . CCXXIX.

Of DRAGON Greater and Lefter,

I. *np HE Names.* It is called in *Greek*, * & & ' m * : JL in *Arabic* ^, *Luf* and *Alluf*: in *Latin*, *Dracontium* •, and in *Englijh*, *Dragon* or *Herb-Dragon*, and *Dragon-wort*.

II. *The Kinds.* It is manifold, 1. A ^ ; TM u ^ , \$ * & * * *] « M & n ' . in *Latin*, *Dracontuonmajin*, and in the Shops, *Serpent aria major*, ot iome, ' *Bijcana* and *Colubrina*, The great Dragon, or Dragon-wort.

2. & & Kbvov ptKe)v, cJ^wtow pixeJ- : w Laiin^ *Draunculus*, *Draunculus minor*, *Draunculus Polyphyllos Cordl* : in *Englijh* *Small Dragon*, or *Dragon-wort*. To thefe we may add, ? . & & X . Qv7J v ^ CV : in *Latin*, *Dracontium ?vagnum*, *vel maJus*, The great or greater Dragon -, this is the *Dracontium ma/or Matthio/i*, which leems not to me to be of the Stock

ui ±'ni&un⁸ but lamer a very large kind of *Bijort* : of these three kinds we shall treat in this Chapter.
 4. &&KQV7iw 'isy'fiv : in Latin, *Dracontium cujitacaw*, vel *D'acunculus aquaticus* *, and in English, Water Dragon, or Dragon-wort -, of which in the next Chapter.

III. The Defections. *The firji*, or Greater Dragon, hiU a thick tuberous Root like to a Knob, many times of the Altitude of a midd/e-ftzed Apple, iWtt, covered with a thin p^l full of white little

fibres appendent thereto, continuing many Iturs, very white within, and like >unio A ion loot, t afting fomewhat Jnirp, like to it. From this Root rifes up a iiraight Stalk, a Cubjt and half high or higher, which is thick, round, imooth, whkifii and hare or naked, but spotted very much with purplliJi Spocs and Strakes, or with Spots of diveis colois^ like thofe of the Adder and fome other Serpents. Tins Stalk bears a few green Leales, Itanding upon long Foot-ftalks, much divided on all hands -, they aie great and wide, each Leaf confifting of icven or more joined together in order, every one of whici^ is long and narrow, much like to the Leaves of /VX', fmoother and flippery. Out of the top of the Stalk, in the middle thereof, comes forth a -great long Husk or Hole, (if the Root is old enough) greater than that of the-Cuckw-pint or Aron, o\ i greenifft color on the outside, and of a crimlon or dark purplilh color on the infide, with a long lIender Peftel or Clapper in the middle thereof, which is blackifh and pointed like a Horn, the Skin or Film whereof, when the Seed grows big, being Itretched or broken afunder, there appears the Fruit, like to a Bunch or Clufter of Grapes, the Bsrries whereof at firft are green, afterwards red and full of Juice, in which is contained Seed, which is fontthing hard.

IV. *Thefecond*, or Small Dragon, h^u <i Root not unlike to Aron-root, having th\$ form of a Bulb, full of Fibres or Strings, with dive to rude Shapes of tew Plants, hy which it greatly encreafes. The whole Plant is much like to Aron m its Leaves, Hofe or Husk, Peftel and Berries, (and feems to me to be theleffer fort of Aron O the Leaves are spotted either with white or brownifli Spots, and perifh not prefently, but endure together with the Berries, even till Winter \$. and the Berries are noj; tJr'a deep red, but of a color enclining to Saffron. * •

V. *The third*, or Great Dragon of Mutthiolns, bos' a round bulbous Root, larger jomething than this former, ^ with many Fibres at bottom thereof ^ from which rifes one large, high, upright Stalk, with very great Leaves thereon/ folded and lapped, ©if within another: at the top of the Stalk caii-es

a spike of Flowers, not much unlike to those of *Bifort*, with like filial! Seed. Some Authors will not have this to be a *Dracontium* or *Dragon-wort*, but rather a very large fort of *Bifort*. *DoJonaus* says, — *qiti, fi in rerum natura ejj*^ *Bifort a Species videtur.*

VI. *The Placet.* *Dragons grtatr* and *leffer* delight to grow in shadowy places, and with us they grow in *Gardens*.

VII. *The Tims.* * They flower in *July*, and the Fruit or Berries are ripe in *August* and *September*.

VIII. *The Qualities.* *Dragons* or the *Dragonvoorts* are hot and dry in the third Degree -, *Aperitive*, *Attractive*, *Suppurative*, *Stomack*, *Pectoral*, *Hyfterick* and *Alexipharmick*.

IX. *The Specification.* *Dragon-wort* is an *Antidote* against *Poyfon*, *Plague* and *Bitings* of *Venomous* *Creatures*.

X. *The Preparations.* You may have therefrom, 1. *The prepared Root* 2. *A liquid Juice of heaves or Roots*. 3. *An Effence of the fame*. 4. *A Powder of the Root*. 5. *A Lohoc of the Root*. 6. *A Cataplasm of the fresh and green Leaves*. 7. *The Fruit or Berries*. 8. *A Spirituous Tincture of the Root*. 9. *An Acid Tincture of the fame*. 10. *An Oily Tincture*. 11. *A Saline Tincture*. 12. *A distilled Water of Leaves, Root and Fruit*.

Its Virtues.

XI. *The prepared Root.* It is prepared by boiling it till it is soft, and all the *Acrimony* pass'd off. It then *notirifies* and is good for *Food*, it is also good to expel thick and clammy *Humors* from the *Breast* and *Lungs*: they also restore in *Consumptions*.

XII. *The liquid Juice of Leaves or Root.* It is laid to rest above the *Pin* and *Web*, as also *Spots* and *Pearls* in the *Eyes*, being put into *Collyriums* or *Medicines* which are made for the *Eyes*. *Dioscorides* says, that the *Juice* being dropped into the *Eyes*, cleanses them, and helps *Dimness* of *Sight*. The lame mixed with *Oil Olive* and dropped into the *Ears*, eases their *Pain*.

XIII. *The Effence of the fame.* It has all the *Virtues* of the *liquid Juice* besides which, being taken inwardly (*Universals* being premixed) to one spoonful at a time in the *distilled Water*, or in *White Wine*, and repeated as oft as need requires, it powerfully provokes the *Terms* in *Women*.

XIV. *The Ponder of the Root.* If it is made into an *Elettuary* with *Honey*, it is good for such as are troubled with *vehement Coughs* and *Catarrhs*, *Convulsions*, *Cramps*, &c. for it incides, absterges and consumes *gross*, *tough* and *tartarous Humors*, and cleanses all the *inward Parts*. Dose of the *Powder* from half a *dram* to a *dram*. Outwardly applied, it cleanses all *fretting* and *malign Ulcers*, which are difficult to be healed: it also removes all *Scorbutick Breakings* out in any part of the *Body*.

XV. *The Lohoc of the Root.* It is made of the *Root* prepared by boiling, (as at *se*. 11. above) by beating it in a *Mortar* with twice its weight of *Honey*. It is an excellent thing against *Coughs*, *Salt Catarrhs* and *Defluxions* of thin *Rheum*.

XVI. *The Cataplasm of the fresh and green Leaves.* Being applied, it is good for *Ulcers* and *green Wounds*, and heals them after an *admirable* manner. Being dry, they are more (*harp* or *biting*, and not fit for *Vulneraries*).

XVII. *The Fruit or Berries.* They are of greater Power than either *Leaves* or *Root*, and therefore are laid to cure *virulent* and *malign running Sores*, and to eat away that *canerous Excretion* in the *Nostrils* called *Polypus*: they are also good to be laid

to *Cankers*, and *itch* like *fretting*, *eating* and *coining* *Ulcers*.

XVIII. *The Spirituous Tincture of the kepi.* *GU* veil to one *dram* or two in any proper *Vehicle*! *Morning* and *Evening*, (after the *Life of Universals*) it opens *Obstructions* of the *Womb*, and provokes the *Courfes*. It eases *Pains* of the *Stomach* and *Bowels* proceeding from *Wind*, or from *cold*, *flimy* and *tartarous Humors*, prevails against the *Cholick*, and warms and comforts all the *inward Parts* and is an excellent thing against *Poyfon*, *Plague*, *spotted Fever*, or *any other malign Distemper*.

XIX. *The Acid Tincture.* It is a *famous Stomick*, takes away *Nauseousness* and *Vomiting*, warms and comforts a *cold Stomach*, causes a good *Appetite* and *Digestion*, and strikes at the *Root* of all *royfons Vegetable* or *Animal*, especially it refits the *Biting* of *Vipers*, and the *Malignity* of *Mad Dogs*. It is also a *singular* thing against *malign Fevers*, *spotted Fever*, and the *Plague* or *Pestilence* by overturning the very *Fountains* of the *infectious* *Miasmata*. Dose from *thirty*, *forty* to *sixty* or *eighty* drops in the *distilled Water*, or any other *specifick Vehicle*, viz. so much as may make it pleasantly *acid*, according to the quantity given at a time.

XX. *The Oily Tincture.* It is good against *Cramps*, *Convulsions*, *Numbness*, *Palfies*, *rheumatick*, *raings* and *Aches* proceeding from *Cold* and *Moisture*, or in a *cold* and *moist Habit* of *Body*: it is to be anointed upon the *Parts affected* *Morning* and *Evening*, and to be well *rubbed* in.

XXI. *The Saline Tincture.* It is good against *Blackness*, *Greenness* and *Yellowness* of the *Skin*, and to take away *Tanning*, *Sun-burnings*, *Scurf*, *Morphew*, *Leprosy*, *Scabbiness*, *Freckles*, *Lentils*, and other the like *Deformities* of the *Cuticula* or *Scarff-Skin*.

XXII. *The distilled Water.* It is used as a *Vehicle*, to convey many of the *foregoing Preparations*: it is also a *Cosmetick*, fit for the *beautifying* the *Skin*, or to mix other *Cosmeticks* with for that *Purpose*. It prevails also against the *Pestilence*, or any *malign* and *pestilential Fever*; as also the *Poison* of *Serpents* or *mad Dogs*, being drunk warm, with a *dram* or two of *Mithridate* or other like *Antidote* mixed with it.

CHAP. CCXXX-

Of DRAGON,

OR,

DRAGON-WORT Water,

This Name. It is called in *Greek*, *Dracortium* *Dracunculus aquatics*, *Aronia aquatic a*, *Dracunculus palufinis five aquatilk*: in *Engl/Jh*, *Water Dragon*, and *Water Dragon-wort*, *jaatf Dragon wort*.

II. *The Kinds.* It is the last *Species* of *Dragon wort* mentioned in *Chap. 22Q. Seff. 2**

III. *The Description.* It has a *Root* which *is not round like a Bulb*, but *very long*, *creeping*, *jointed* and of a moderate *bigness* out of the *Joints* whereof arise the *Stalks* of the *Leaves* which are *round smooth and pungy* within, *certain* *white* and *fiend*

der Strings growing downwards. The Fruit springs forth at the top upon a Chart Stalk, together with owe of the Leaves, being at the beginning covered with lictle white Threads, which are instead of the Rowers, (fee the fecond Figure annexed*) alter that it grows into a Bunch or Cluffer, at the first green, and when it is ripe, ted; lefter than thiat 01 Aron, but not Ids biting. The Leaves are broad, grtenilh, fsmooth and fhining as it were, in Fafhion almoft like thofe ot'Iiy, yet letter thanrhofe of A-ran or Cuehvs-point : and that Subftance to which the duftred Fruit grows is alib letter : and in that pact which is towards the Fruit, viz. its upper part, it b white.

Water Dragon-wort.

Water Dragons.

IV. The Placvs. Witter Dragon or Dragen-ivort grows in marth and warry places, and for the molt part in fenny and landing Waters in rrtauy parts or this Kingdom.

V. The Tints, it flowers in %fy, and the Fruit is ripe in Augtiji or September,

VL The Vitalities, Spcciji'cutiion, Vreparations and Virtues, are the fame with the first and fecond kinds in the former Chapter, ib that no more need, be faid thereof in this place.

CHAP. CCXXXI.

0/ DROPWOIT Common.

Names. It is scalded in Utbin, Wf: -L drol (quod dumerfji iU'iUhiRak&c hulbituu quafi ex fihpendere videantur :) atfo Saxifrai* ~bra, (RedBreak-ttone:) in Enghjh, Dv'p'aort.

IL Fbe Kinds. It is threefold, vis. j. •rtni**' Kicholai Mynffi, tilfeniuiua vulgarity jfiife^ major vulgark, The common great Dropworr. - i'ilipenduts ahera major. Another great Klipenduw or Dropwon. j. V,iipenila vtmsr, Small Dropwort. Some will halle this Chisn On Dropwort to be Oenanlbe hiofeoridk^ \wlib a. « * 152. b it is a

HI. The Defaitions. TLV fan or Great com

tfmiff 6hcA, tuberous Ymet or Drops, p - j g thr by many f.m.^ l bhu-kilj) Strmg^ wbieb run frm me to mother. Worn this Reel fhoof forth j l h %eaves viz. mny/mallLemxt, d fme fcjfer, fit on each tic oj A and egcbvfibcm de/ilt d aieut theedge*, ahvjil

alwoft like a Saw, fomewhat refembling Burnet or Wild Tanfie, or rather Agrimony, or between them all, but harder in handling: among which Leaves rijcs up one Stalk, and fometimes more, two or three feet high, having fomc fuch Leaves thereon or grow below-, and fometimes alfo divided into other Branches, /reading at the top into ?nany white, fwet- swelling Flowers, compo/ed^ of five Leaves apiece, will? fome Threads in the middle of them, janding together in a Tuft or Vmble, each upon a/mall foot- fhi/k ; which after they have continued for a good while. open or blown, they fall away, and in their places /mall chaffy Heads appear, like Buttons, in which is contained a kind of chaffy Seed.

[V. The fecond, or Other great kind, ha* a Root confining of very many /mall Tuber ofities, fomewhat longer, and whiter-than the former, enchmngtored- nejs, which are fajned together by many long fibres or Strings, as' the other are. The Stalks and Leaves are fo like the former, that this Plant can fearcely be difcerned from that: the Flowers at tops of the Stalks are of a white coloj, enclining to a purple, and made of five Leaves apiece, like the other ^ after which come the Heads, which when fully ripe, contain within them round and blackifh %ed.

V. The third, or Small Filipendula or Dropwort, h\$ a Root manifoldly /pread out into feveral glanduhs or tuberous Knobs, like the jit'ft^ but/mailer^ and redder, and tyed together by Strings, like them. ti%om this Root rife two,^three or four fuch like Leaves as in the jirft, but much /mailer^ and more nearly re/embling Wild Tanfie Leaves ^ but not white, as they are, but of the fame dark green color with the former. From among thefe Leaves arifes up a Stalk, not above an hand breadth high, which AS fometimes without Divifion, and fometimes fpread out into two or three feveral Branches, on which ftand many fmaller white Flowers, and fwetter than in the former, but with Threads therein, like them, and fet together in an Umble in the fame manner: which being pafsd away, then come the Heads of Seed, • many fet together, and formed almoft like unto a fmali Bunch of Grapes*

VI. The Places. The firft grows plentifully upon ftony Rocks or Mountains, and rough places, as alfo in fertile Paftures: it is found upon St. Vincent's Rock by Bristol; and in great plenty in a Field adjoining to Sion-houfe, fome time a Nunnery, near London, on the fide of a Meadow called Sion-Med* dow; as alfo in the corners of dry Fields and Clofes^ by their Hedge-fides. The fecond grows on the tops of rocky, (toney or mountainous places. The laft alfo on ftony and rough Grounds, efppecially about Mompelier in France •, and in many the like places in England.

VII. The Times. They all flower in May, Jun^ and July, and the Seed is ripe in Auguft.

VIII. The Qualities. Dropwort is hot and dry in the third Degree •, Aperitive, Incifive, Carminative, Diuretick -, Stomackick, Pectoral, Nephxitiick, Hyfte- rick, Emmenagogick and Alexipharmick.

IX. The Specification. It is famous againft the Strangury, Stone and Gravel in Reins and Bladder.

X. The Preparations. You may have therefrom^ 1. A liquid Juice of the Roots or Leaves^ 2. An Effence of the fame. 3. A Decoffion of the fame in wine. 4* APouder of the Roots, Leaves or Seed* j. A Balfamof the Root. 6. A diftilled Water, ji. A Spirituous Tinture of the Root. 8. An Acid TinUure of the fame. 9. An Oily TinUure thereof * 10. A Saline TinUure. ii. The Spirit. 12. The fixed Salt: where note, that you may ufe Roots or Leaves * but the Roots are much more effectual

The Virtue Si

XL The liquid Juice. Taken three or four fpoonfuls at a time in a Glafe of White Port Wine, is very effe&ual in opening all the Urinary Paflages, to help the Strangury, and to expel Sand, Gravel, fmall Stones, and other tartarous Matter in the Reins, Ureters and Bladder. Authors fay it is very helpful in breaking the Stone \$ and this the Juice will do, whether taken from Roots or Leaves: but that from the Roots, is moft effe&ual, as aforefaid.

XII The Effence. It has all the Virtues of the liquid Juice, befides which, it is Very effectual to force away the Birth, as alfo to expel the Secundine or After-birth, and prevails againft the Yellow Jaundice, Epilepfy, as alfo Obftruaions of the Breft and Lungs, it expels Wind and helps difficulty of Breathing. Dofe two or three fpoonfuls in a Glaft of generous Wine, Morning and Night-

XIII. The DecoSion in Wine. It has the Virtues of the Juice and Effence, but not full out fo powerful : it may be fwetted with Honey> and given Morning and Nigh% or upon an Exigency from four to fix punces : it very much comforts and ftrenghens the Stomach.

XIV. The Pouder of the Root. Taken from one to two drams in White Port Wine, it provokes Urine powerfully, opens Obftru&ions of the Reins and Bladder, and is laid to difblve or break the Stone, and expel it ^ but this mult be understood, where the Stone is compacted of a Subftance friable or brittle and gritty, and not grown to any great Magnitude. If it is made into an Fie&uary with Honey, it is an excellent thing for the Wind and Gout in the Stomach, as alfo to open Obftru&ionS of the Breft and Lungs, help Coughs and Colds, Hoarfnefs, Wheezing, lo!sof Voice and fhortjnefs of Breath, caufing an ExpeSoiation of the cold, tough and vifcous Flegm from all the Parts of Kefpiration.

XV. The hat/am of the Root. It is good to dif- geft, cleanfe, dry and heal old Sores, and fuch as proceed from the Kings-evil, and moilt and tunning Ulcers.

Illiceis. Applied to Parts afflicted with the Gout, it quickly eases the Pain, and in some measure attracts forth the (harp Humors and morbid Matter thro' the Pores of the Skin.

XVI. *The distilled Water.* It is a good Vehicle to convey any of the other Preparations in : it is Diuretick, opening the Obstructions of the Urinary Parts.

XVII. *The Spirituous Tincture of the Root.* It is Alexipharmick, good against Poyfop, Plague and all sorts of peffential and malign Diseases, it warms and comforts the Bowels, restores the Tone of the inward Parts, and is singularly good against Fluxes of the Bowels of all sorts, and forces away the Birch of a Woman in Travail. Dose from two drams to four in any proper or specific Vehicle. It powerfully expels Wind, corrects (harp and acrid Humors in the Stomach and Guts, and gives present ease in the Cholick-

XVIII. *The Acid Tincture.* It is a high Stomack, warms, comforts and strengthens it, causes Appetite and a good Digestion, dissolves crude and tartarous Humors, and makes them fit for Expulsion, cleanses the Urinary Parts, and promotes the breaking or dissolving the Stone in the Reins or Bladder. It strikes at the Root of those Humors which are the Cause of the King's-evil, and of Tumors or Swellings in the Throat or other glandulous Parts, cutting and dissolving them, preventing their Increase or Generation, and making those which are present to be fit for Excretion. Dose for many drops as to make the Vehicle pleasantly (harp.

XIX. *The Oily Tincture.* It is good against Cramps, Convulsions, Numbness, Palsy, &c. being bathed well in twice a day upon the Parts affected. Given inwardly to twenty or thirty drops in the distilled Water aforefaid, or in some other appropriate Vehicle, it is an admirable thing against all manner of Obstructions of the Reins, Ureters and Bladder, expels stoney and tartarous Concretions, and carries off the morbid Cause of the Yellow Jaundice by Urine. It also prevails against Lethargies, Vertigo, Apoplexy, Convulsions, Epilepsy, Paralysis, and all other cold and moist Diseases of the Head, Brain and Nerves, and provokes the Terms in Women.

XX. *The Saline Tincture.* It is dedicated to Diseases of the Reins, Bladder and Ureters, prevails against the Strangury, and dissolves the Matter breeding the Stone. Outwardly, it is good against Scurf, Morpew, Scabs, Itch, Tetters, Ringworms, and other Detachments of the Cuticula, being bathed therewith twice a day.

XXI. *The Spirit.* It is a singular Cordial, cheers the Heart, revives the Spirits, strengthens the Stomach, and fortifies the whole universal Frame. It is good against fainting and swooning Fits, Sickness of Heart, Wind, and the Cholick Torsions of the Bowels, occasioned thro' either Flatulency or sharp and acrid Humors. Dose from two drams to four, either alone or mixt with a little Glass of Canary, or off as occasion requires.

XXII. *The fixed Salt.* It is a strong Diuretick, opens all the Urinary Passages, and expels large quantities of watry Humors in the Dropsy by Urine, and the morbid Cause of all Fevers. Dose from twelve grains to a scruple or half a dram, in the distilled Water above-mentioned, or in White Wine.

C H A P. CCXXXII

Of DROPWORT Narrow-leaved

The Name. Authors ascribe the Name to this Plant, tho' it is not the true *Oenanthe Diofcoridis* : and therefore it is called in Latin, *Oenanthe recepta herbariorum*, or *Ylipendula angustifolia* : in English, 'Narrow-leaved Dropwort.

II. *The Kinds.* It is the second general Species of Dropworts, and is threefold, viz. i. *Oenanthe Apii foliis major*, *Fdependula folio Apii major*, The common or ordinary great Parsly-leaved Dropwort.

2. *Oenanthe vel Fdependula Apii foliis minor*, *duarwnspeeierum*, Two smaller sorts of Parsly or Stallage leaved Dropworts. 3. *Oenanthe angustifolia*, *Lobelii*, *Lobelii* Narrow-leaved Dropwort.

III. The Description. *The fir or Great Parsly-leaved Dropwort, has for Roots many round, white, and somewhat long Aphodil like Clogs wined together at the tops, making one Head of a Root thin ending in small fibres : from this Root rise many green winged Leaves, made of many parts cut into the Form almost of Parsly or Smallage Leaves, but much smaller, even as small as Garden Creis Leaves: and from among them spring forth two or three thick, round stalks, a foot and half high and sometimes two feet high, beset with such like Leaves as grow below, but as they grow higher on the Stalk, grow much smaller, lesser and narrower, to the perfect looking of the Form of those below. At the tops of the Stalks grow Umbles of white Flowers, which being pass'd away, there follows Fennel like Seed, but smaller, and of a dark whitish color.*

IV. *The second, or Small Smallage-leaved Dropwort, which is fivefold. The Roots of these two kinds are much alike, but only differing in Greatness, each*

of

of them cox/ifting offeviewlfwdUTubers.; with W Strings among them. Their Leaves are winged, an like in their Divifions to the ibrmer, but both inul kr by much, and more green, the one of thefe bein alib (mallei* than the other -, mid the Idler of then a liule finer jagged, which evidently ihews the Dif ference as well-as the Seed : the Flowers in botl. are white, hue differing-in Greatnefs. The Seed of the greater of thefe is fmaller by half than the Seed of the former Great kind*, and the Seed of the left ici- is yec fmaller und rounder, and ibmething lik unto Dill Seed.

V. The third, or Lobel Narrow-leav'd Dropwort, has a Root compofed of many white, long, tuberow parts, fending forth many Strings from their lower parts, and on their tops all uniting in one Head of a Root. From this Head or Root arifes a ftrong crefted Stalk, two feet high, dividing it felf towards the top into feveral Arms or Branches. From the hollow Place or Bofom of every Joint, out of which do grow thofe Branches *, the Leaves do al%pfoceed, very much cut or jagged, likeFiw-nel /At the tops of thefe Branches come forth fpok\$ Rundles or Umbles of white Flowers, fafli- onec^jke Stars.

VI. The Places. They grow in many places of England, but for the moft part near Ditch-fides, and Brooks or Rivers fides, and upon the Borders of Ground near ftanding Waters.

VII. The Times. They flower from May to the end of June, and the Seed is ripe not long after.

VIII. Vje.^ualities^ Specification, Preparations and Virtues, are the fame with the Common Dropwort in Chap, 231. fo that no more need be faid of them here-

C H A P. CCXXXIII.

0/DROPWORT Hemlock like.

I-/Tp//£¹ Names. It is called in Latin, *Qcnamhe JL dcuta facie* ; alib *Fil/pendu/a Cicuta juic* : and in Englifh, *Hemlock-leav'd Dropwort, LobePs Hemlock like Dropvoort.*

II. The Kinds. It is finguiarh fui generis, thefe being neither a greater nor leflr fort of it.

III. The Defcription: Tbh Plant has a Root which is white and glandulom, or repleat with many long and gouty Glandules, Aphodil like, zybuch are foft and tender, but Jharp and unpleafant in Tajie, yielding a white Milk at the fir ft, and turning yellow afterwards, which is faid to be poyfonous, virulent and exulcerating. From this Head or Root ipring forth feveral winged Leaves, ftanding upon a long Foot-ftalk, more like Meadow Rue than Smalage or Hemlock, having many fmall ones fet together, of dull, dark green, and fomewhat like Hemlock in colorp as alfo in the Flowers -y but more in its Ef- f.as.

IV. The Places. It grows many times in moift flowed Land, as in the moift and wet Furrows of a field belonging to Batter/lea near London : it grows ilfo in great abundance in many places by the Lames-Mt, as a little above the Horje-Ferry againit Lambeth, 2*c.

V. The Times. It flowers in May and June, and fome part ok July \ and the Seed is ripe in July and Auguft.

VI. The Qualities. It is hot and dry in the tourih

iourcli iJcgvcc ; fyroc̄tck, Kxulceraing, Anhritick, and siMrnzi*, Venefick or Poy toning.

Vii. The Specification. It troubles and overturns the Brain and Scnies, caufiugMadnds, and if taken in any confiderable quantity, Death,

VIII. The Preparations. * You may make therefrom, i. A CaUiplafm. 2. An Ointment.

The Virtues.

IX. The Caiaphm.- It exnlcemes, or is blifftering, and is of good life to Ie applied in a Sciatica, or Gout in Hands or Feet: it alib draws forth the Poyfon if it is immediately applied to the Biting of a mad Dog, or the Biting of a Viper or Rattle-Snake, or other venomous Creatures.

X. The Ointment. It is good to mix with in all forts of fcrophulous or itrumous Tumors, and to be applied in Kings-evil Sores, where it is not ufed without a fingular Advantage.

CHAP. CCXXXIV.

Of DROPWORT Water.

I. *~P if E Names. It is called in Greeks (according to our Moderns) Ovw8» ^Jk-mh)^ >f lw-JW * in Latin, Oenanthe aquatica, and Filipemula aquatica: in Englijh, Water propwort.

II. The Kinds. It is the fourth grand Species of the Dropworts, and is twofold, viz. 1. Oenanthe, vel Yilipendula aquatica major, The greater Water Dropwort. 2. Oenanthe, vel Yilipendula aquatica minor, The lesser Water Dropwort*

III. The Defcriptions. The firft, or Greater Water Dropwort, has a Root like to the other Drop-

worts, replenijhed with many finally white Tubers or Knobs growing among the Strings, joining together above, and making one Head of a Root.- from this rife feveral large fpread Leaves next the Ground, and lying thereon, being winged and cut into many finall Divifions, fomewhat refembling Varfl) but much fmaller, and divided into fmaller parts than any of the former kinds. From among thefe Leaves rife up crefted, thick, hollow Stalks, with Leaves on them, cut into longer and finer Divifions, bearing at the top Umbles of white Flowers, which turn into finall, flat, greyifh Seed, fomewhat leffer than Fennel Seed, and not much unlike Hemlock Seed.

IV. The fecond, or Leffer Water Dropwort, has a Root made up with feveral finall Tubers or Knobs, and fanned among the fibres^ vbhich are as finall as Hairs. From the Head of which Roots fpring up many fmall Leaves, lying upon the Ground, which are very finely cut in: alter them fprings up the Stalk, which carrying up the firft Iprungup Leaves with it^ tijejr fcarcely feem to be Leaves, but rather like th^ Ribs of Leaves, of a dark and fhining g^*een color, as tije Stalk alfo is, which very nearly & fembles^K^*, and below the top thereof, which is pointed like a Rujh, comes forth a fmall Umble of fmall wluifh fweet Flowers, which turn afterwards i4to ais finall Seed as Smallage, but blacker.

V. The Places. They both grow in wet Grounds and ndar Brook-fides in many places in England yet will they both flourifli being nurs'd up in our Gardens^ but grow not there all out fo large and fair, as in their natural places: and as it grows by the fides e£ Rivers and Water-ftreams, fo it has been found ijeqr the River of Thames, as, rr,ar St. GeorgeWtfs, and about the Bifliojv^f Lmdorfs Houfe at Fulham, and in fuch other like places.

VI. The Times. The fecond or Leffer, flowers earlier than the Greater^ and commonly the flowering time of the Leffer is pafte before the other comes, which is not until Auguft.

VII. The Qualities, Specification, Preparations and Virtues^: the fame with thofe of the Common Dropwort in Chap. 251.- aforegoing, fo that no more need be laid of them here.

CHAP. CCXXXV.

Of DUCKS-MEAT.

THESE are called by the Greeks, and in Latin, Lenticula aquatica, and in Englijh, Duck-meats. The Authors make fou* kinds hereof,

as, 1. * Pffis vel aquatica vubaris, Common or vulgy Ducks-meat. 2. Lens palufi *** dn\$oha, Crofs-leav'd Water Lentils or Ducks-meat. V^htifolia punUata, Broad-leav'd spotted Water Lentils. 4. Lens vel Lenticula aquaticabijolia Neapolitana, Neapolitan Water Lentils. Of all thefe, 'tis only the firft which grows in England, which we (hall treat of in this place: the reft being Strangers, we (hall have nothing at this time to lay concerning them.

III. The Defcription. This Small Plant has for a Root only certain finall fine Fibres or Threads^ which

which grow 'only from the middle of each Leaf on the under side, an. I pifs down into the Water, but reach not to the bottom, to drayo Nourishment from the Earth : be fides ðm Root, the whole Plant confists of nothing but finally round, green heaves, lying on the Surface or lop of j) and ing Waters^ in Pools, Ditches -4jpd Ponds, without either Flower or Seed that could t) e ever observed.

IV. Not a *Matthiolus*, and from him *Lugdunenfts*, makes a ftrange Relation concerning this Plant, fcarcely to be believed •, and it is this : That if it (ould happen (as Ibmetimes it may) by Inundations, or any other Accident, that thefe fmail *Lentils* or *Ducks-meat* be carried away into running Waters, as Rivers, Brooks, fmall Streams, &c as foon as they ftick to or touch the Shoar, they are •wonderfully encreafed •, for by their Roots, which grow from them like Threads, they penetrate and faften themfelves into the Ground, and then growing, come to be Plants, like unto *Sifymbrium*, *Water Mint*, or *Ladies Smocks* •, and that this thing has been observed by the diligent Searchers of Nature, and not without much Admiration of the Matter of Faft. *Vix credo*, indeed I know nothing of it.

V. *The Qualities*. According to *Galen*, *Ducks-meat* is cold and moift in the fecond Degree •, Anofk Repercuffive, Arthritick and Alexipharmick: but this laft it is by Accident.

VI. *The Specification*. It refills and cools Inflammations after a peculiar manner.

VII *The Preparations*. You have, i. *The green Herb*. % *An Ointment*. 3. *A Cataplafm*. 4- *A dijiilled Water*.

The Virtues.

VIII. *The green Herb*. Applied to the Forehead, it eafes the Head-ach coming of Heat. Applied in Extremity of the Pains of the Gout, it alleviates them ^ but Ibmetimes endangers the lending or the Humor up into the Stomach ^ therefore umverials

ought to be premifed, and to be utèd at the lame time. *Diofcondes* fays it is a Remedy againft *St. Antbon/s-fae*, all manner of Inflammations, and the burning Firs of Agues. Ducks greedily devour it, alfo Hens, if mingled with Brail and given them.

IX. *The Ointment*. It is a fine cooling thing* good againft Phlegmons and hot Pains of the Joints, and the Haemorrhoids or Piles, whether broken or not broken, if anointed thereon.

X. *The Cataplafm*. If it is made of the Herb beaten up with J3<rtly-flower, it prevails againft the Gout, and confolidates Ruptures in young Children * and is profitable againft the Swelling of the Cods, and of Womens Breafts before they be grown too much, becaufe it does not weakly repel the Humors. If it is made with *Wheat Flower* or *Meal*, it prevails much againft hot Tumors, as Phlegmons and the like, asalfa Pains of the Joints proceeding from Heat 5 and helps the falling down of "the Fundament in young Children.

XL *The dijiilled Water*. It is good againft an Eryfipelas j and *Matthiolus* eftcems it highly for relieving all inward Heats and Inflammations, as alfo peftilential Fevers, to help the Rednefs of the Eyes and the Swellings of the Tefticles, by repelling of the Humor, Cloths four times doubled being wet therein and applied : and fo applied, it cools an E* ryfipelas or *St. Antbon/s-foe*.

CHAP. CCXXXVI.

Of DYER S--WEED,

Called,

WOLD or WELD.

THE Names. It is a Plant which was unknown to the *Greeks*: the *Latins* call it *Luteola* and *Herba Lutea* 4 it is the *Lutea Plinii lib. 33. cap* 5*. *Vitruvius lib. 7. cap. 14*, calls it *Luteum* -, and *Virgil Bucol. Eclog. 4*. calls it *Lutum*: in *Englijh^ Dyers-weed^* alfo *Wold* or *Weld*,

II. *The Kinds*. It feems to me to be an Herb of its own kind ^ but *Bauhine* refers it to the *Geniija Tinfforum*, or *Green-weed*, of which we (hall, God willing, treat in the next Chapter, but to that we think it has no Relation. Some thought it to be the *Refeda of Pliny*, becaufe they agree well in divers parts. *Cafalpinus lib. 9. cap. 35*. makes it the *Myagrurn, vel Melampyrum Diofcbroidis* : but all thefe things are to be difputed. It took its Name of *Lutea* and *Luteola*, not only from the yellow color of the Herb and its Flowers, when it is dry, but chietly from the yellow color which it Dyes things into. *Tragus* took it to be *Antirrhinum*, becaufe the Seed-Veffels have (as it were) holes therein. Some will have it to be *Phyteurna Diojcoridis* -, others *Struthium Diofcoridis*, as *Lacuna* and *Gefner*. *Mattbi* olus* calls it *Pseudofiruthium*. *Dodonaus, Herba Lutea. Lobe I, Luteola. Lonicerus* and *Tabernmonta • nus, Catenance*: but all thefe things it is impoffible to be ^ I am induced therefore to hold to my own Opinion before declared.

III. It is twofold, viz. 1. *Lutea vel Luteola vulgaris*, Common Wold, Weld or Dyers-weed. In *Candia* there grows a fmail fort of *Luteola* •, which fome Authors would make to be a diifferent kind from that jult now named, which *Honorius Bcllus Epijt. 2. aiClufwm* will have to be *Struthiam ve-*

Diofcoridis, and fays it is called *Cumene* thro^o all *Greece* : but this we think to be one and the fame Plant with the aforegoing, viz. Our *Luteola vulgaris* ^ and of this Opinion is *Camerarius in Horto*, wh⁹ makes it and *Our common fort* all one. 2. "*Lutea Cretica maximã*, which is *fcecunda* (if *infoscunda*, or *fertilises? fertilis*, The great Wold, Weld or Dyers-weed of *Candia*, wliich is both fruitful or bearing Seed, and barren bearing no Seed ^ and differ one from another only as our *Hemp*, which is, bearing Seed, and barren bearing no Seed. ^

IV. The Description. *The first, or Our common Wold, Weld or Dyers-weed, hoi a Root which long, thick and white, abiding all the Winter. I be riant grows bushing out, with many long and narrow flat Leaves upon the Ground, of a dark, blezwfl) green color fomewhat like unto Wood, but nothing so large a little crumpled a* it, were, and fomewhat round-pointed which do fo abide the Jirft Tear.* And the next Spring rife up from among them feveral round Stalks, two or three foot high, befet with many fuch like Leaves, but fmaller and f hooting forth ibmefmaii Branches, which with the Stalks bear very many fmall yellow Flowers, in a longipiked Head at tops of them-, after which come the Seed, which is fmall and black, enclosed in Heads, which are divided at the top into four parts.

V. *The Great Candia Dyers-weed has a Root which is very great and woody, and shoots it felf forth into many long Arms or Branches, which in the native or natural places of its Growth, and other warm Countries, will abide many Tears, but with us will fcarcely endure our cold Winters, (unlefs houfed) a* has been feveral times proved.* From this Root this great Plant riles up (in *Candy*) with feveral great Stalks, fome of them as big as a Man's Arm, and in height five, fi, feven or eight Cubits •, fometimes nine or ten Cubits high, which yet perifh in Winter: ^ they are bare or naked of Leaves next the Ground for a foot and half high, the loweft Leaves being without Foot-ftalks, joining clofe at the bottom : the other growing higher up towards the

cops, have all of them Foot-ftalks, of *Vipã* long : the Leaves of themfelves are very large," made of many fomewhat broad and long green fhining ones, fet one againft another on a middle Rib, and nor yet always dire&ly oppofite one to another ; every one of them being ibmething like unto the Leaves of *Hemp*, (of which it is molt likely to be a Species) ragged or dented about the edges, yet none of them divided, but the end Leaf; which is fbmetimes parted, feldom into two, but fometimes into three Divifions, each ending in a long Point. The Stalks are branched, but has only divers linall Stalks .or long Spikes of Flowers thruft forth, which are yellowifh, green and moffy, bowing downwards, with many long and narrow Leaves among them, and ftand in yellowifh green Husks; in which, after the Flowers are fallen, come Heads full of very final reddifh Seed. The barren Plant is like the former, fave that it bears no Seed.

VI. *The Places.* The firft grows every where by the Way-fides, as well in moift Grounds as in the dry, and in corners of Fields and By-Lanes, in and about Villages almoft every where : in fome places in *Kent* they fow it in their Fields after their *Barley*, which abides until the next Year, and then it is gathered. The other is a Native of *Candia*, and is nurs'd up with us only in *Gardens*.

VII. *The Times.* The firft flowers in *June* and *July*. The fecond flowers late with us, and fometimes not at all

VIII. *The Qualities.* It is hot and dry in the third Degree, the Root, as alfo the whole Herb. It is Aperitive, Digeftive, Attenuating, Inciding and Refolutive -, Arthritick and Alexipharmick.

IX. *The Specification.* It is peculiar againft Punctures of the Nerves, Bitings of Serpe[^], irjad Dogs, and other poyfonous Creatures, bittwaidly applied, and inwardly taken ₅ and prevails againft the Infettion of the Plague ^ for which Reafon, as *Matthwlm* fays, it is called *Theriaca*.

X. *The Preparations.* You may have therefrM
1. *The green Herb bruifed.* -2. *A liquid Juice.* ?
3. *An Effence.* 4. *A DecoHion in Wine.* 5. *A Voider of the Root.* 6. *A half am or Ointment.* • 7. *A *Spi-rituousTinfure.* 8. *AnAcidTintlure.* 9- ^{^o}
10. *A Spirit.*

The Virtues.

XL *The green Herb bruifed.* Applied to Guts or fimple Wounds in Hands or Legs, it heals them. It is good to be applied alfo to the Bitings of Serpents, mad Dogs, or other venomous Creatures, to draw out the Poyfon.

XII. *The liquid Juice.* It provokes the Terms in Women, opens Obftmtions, incides or cuts tough Humors, and refills Poylon, as alfo the Malig.^v of the Plague, being taken from one to three i f e fũls at a time in a CM of generous Wine, and t^e peating the Dofe as Reafon recmires

XIII. *The Juice.* It provokes the Terms in Women, opens Obftmtions, incides or cuts tough Humors, and refills Poylon, as alfo the Malig.^v of the Plague, being taken from one to three i f e fũls at a time in a CM of generous Wine, and t^e peating the Dofe as Reafon recmires
XIII. *The Juice.* It provokes the Terms in Women, opens Obftmtions, incides or cuts tough Humors, and refills Poylon, as alfo the Malig.^v of the Plague, being taken from one to three i f e fũls at a time in a CM of generous Wine, and t^e peating the Dofe as Reafon recmires

XIV. *The DecoHion in Wine.* It has all the Virtues of the Juice and Effence but much lefs efficacious or powerful j and therefore may be given (dulcifed with white Sugar) from three ounces to fix ounces or more, Morning and Evening. It is a good Gargle alfo for a fore Mouth and Throat.

XV. *The Pouder of the Root.* It is good againft the

the Plague or Peltence, the spotted Fever, and other-peltential and malign Fevers, refills both Vegetable and Animal Poyibns, and is good againſt Sickneſs at Heart. Dofe one dram in a Glaſs of Wine. Applied to Wounds, it heals them, and cleanſes; incarnates, dries and induces the Healing, of midft funning Sores, old Ulcers, and the like, being lire wed on them.

XVI. *The Balfim or Ointment.* They are admirable Viulneraries* The Balfam cures fimple Wound many times at one or two Dreffings. It cleanſe-foul and filthy Ulcers, dries, incarnates and heals And it is profitable to any Part affcted with the Gout, giving eaſe to all forts of Pains from a cold

XVII. *The Spirituous Tintfure.* It refills Poyfon, and particularly the Poyfon of mad Dogs, of Vipers, Rattle Snakes, and other Venom's of like kind. It removes Sickneſs at Heart, fainting and fwooning Fits, is good againſt Cramps, Conuulfions, Lethargies, Apoplexies, Palfies, and fuch other like cold Diftempers of the Brain and Nerves. It is good againſt Pun&cures of the Nerves, and gives preſent eaſe to the Pain, the Part wounded being well bathed therewith, and Cloths wet therein being laid thereon. Dofe inwardly is from two to three or fouV drams in a Glaſs of choice Wine.

XVIII. *The Acid Tinſure.* It refills the Motion of the Plague to a Miracle, as alfo of the spotted Fever, and of all other malign and peftilential Fevers. It cuts tough Flegm in the Breſt and Lungs, and is good againſt Hoarfenefs, Wheezings, ſhortneſs of Breath, and difficulty of Breathing, cauſing an admirable Expeftoration. It opens Obſtructions in the Urinary Parts and Paſſages, expelling Sand, Gravel and tartarous Matter thence; and powerfully reſſe Poyfon of mad Mogs. Dofe ſo much at a time as may make the Vehicle, whether Mead, Cyder or Wine, pleaſantly acid.

XIX. *The Oily Tincture.* Outwardly applied, it is good to give eaſe in the Pain and heal the Puncture of a Nerve or Tendon. It gives eaſe alib in the Gout in any Part, ariſing from a cold Cauſe. Inwardly taken alfo from ten to twenty or thirty drops (according to Age and Exigency) in any proper Vehicle, it expels Wind, prevails againſt the Cholick, and alleviates all forts of inward Conuulfions, is a good Hyfterick, and a fingular thing againſt the Strangury, or any Obſtru&ion of the Urinary Parts.

XX. *The Spirit.* It is purely an Antipeffilential and Alexipharmick Cordial, wonderfully comforting and warming the Stomach and all the other Viſcera. It gives eaſe in Conuulfions, and the Tortions of the Bowels proceeding from Wind, Poyfon, or the Prevalency of acrid and (harp Humors. Dofe two ſpoonfuls at a time, (being firſt dulcified) need requires.

An Obſervation. The great Uſe we in make of this Plant, is to Dye Cloth, Linen, Woollen, Yarn, Silk, woven or raw, into a yellow color -, and alfo to give a green color to thoſe Cloths or Silks, Yarn, &c. which have been firſt Dyed with Woad, into a blew color. And of this *Vitruvium* ſeems not to be ignorant, for that in his time he ſays, in *lib. 7. cap. 14.* That a yellow color coming upon a blew, changes it into a green. And for this purpoſe* there is a great deal of this Herb made uſe of in all Countries, and many Fields fown therewith, for this very Purpoſe of Dying Cloths, Scuffs, Silks, &c.

C H A J, GCXXXVII

Of DYERS GREEN-WEED,

I. *The Names.* It has no known *Greek Name*: X it is called in *hat in*, *Genijla Tintford*, and in *Engliſh*, *Dyers-weed*, and *Dyers Green-weed*.

II. *The Kinds.* It is certainly of the Stock or Family of *GeniJ] a* or *Broom* and is a fingular Plant of the kind: and by reaſon it is out *Common Green-weed* it is called *Genijfa Tintforia vulgaris*. It is alfo called *Gemſtella infeſtoria*, *Genijiella Tinfforia*, *b/os Tinlionm Brunſelfu*, *Fuchfii*, *Loniceri 5 CorneoU Anguillarx & Cvfalpini*, *Chamluce Cordi*, & *Genijla Tinttoria Germanic a Bauhini*: in *Engljb*, *Dyers-weed*, *Green-weed*, and *Dyers Green-weed**

III. *The Deſcription.* It has a thick and woody root, much diſperſed under Ground: from whence riſe up many tough green Stalks, ſome of them having ſeveral Branches, about two feet in height thereabouts, upon which do grow (without any order) a great many ſmall, long Leaves, ſome what like thoſe of Flax, of a ſad green color. The Flowers grow at the tops of the Branches, not much unlike the Flowers of *Broom*, (of which this is a Species) but ſmaller, of an exceeding fair yellow color, but ſomewhat paler than thoſe of *Common Broom*: the Flowers being paſſ'd away, there come in the places ſmall flat Pods or Cods, leſſer than thoſe of *Broom* in which is contained a like flat, *Broom* like Seed.

IV. *The Placed* It grows in many unfenced or unmanured Grounds throughout *Englnd* as alfo by the Hedges and Way ſides in many open Commons. It grows alfo in fertile Paſtures and Fields almoſt every where. Now it is ſown in Fields for the purpoſe for the Profit which is made therefrom.

V. *The Times.* It flowers from the end of June to the end of August, and the Seed is ripe soon after.

VI. *An Observation.* Clujhti sets forth another kind of Dyers Green-weedy which Dodontus calls also *Gcnifta Tinfloria* *, but then it ought to be *Genifta Tinfferia alt era*. It has a thick and woody Root, which sends tip Stalks, almoji like those of the Spanifli Broom. Upon these Branches do grow long and small Leaves, like flax, green on the upper Side and of an hoary shining color on the other, The Ylowers grow at the tops of the Stalks Spike-fashion, which are in Color and Form like the former. But this Plant grows not, commonly in England, unless it is planted by the Curious in their Gardens.

VII. *The Qualities, Specification, Preparations and Virtues* of this our Common Dyers Green-weed, are the same with those of our Common Broom, which we have already at large declared in chap. fyJM. 7. ad 29. of this Book foregoing, to which you are referred,

Tho' the Medical Virtues of this Plant are admirable, and not in the least inferior to those of our Common Broom aforementioned, yet the chief life our People in England have ^{WV s > ^\ PTO} of Cloth, Stuffs, Silks, Yarn, Woollen and Linnen, &c. for the Dyers do Dye a yellowish green Color with it, viz. with the Leaves and stalks *, and therefore provide themselves of it in great Stores: and for which Reason, in some places, whole Fields are sowed with it, as with the Luteok or Dyers-weed in the Chapter just foregoing.

CHAP. CCXXXVIII. Of EARTH-BALLS.

I. ^r ^v [!] ^L ⁿ [^] ^{*} ^{oh} ^{er} ^v ^{om} *HE Names.* This kind of Plant is called in *GrCck*, *CJivi K> v/r<*, *abimbri* y vel, *gll<*, *M huwore*: in *Latin*, *Tuber Terra*, *pi. Tubera Ter-* ^{rst} ['] [•] *in Aralneck*, *Uamxcb*, *Alchamcch*, *Tamer* and *Kema* • *in English*, *Earth-balls* and *Under-ground Mufbromes*.

H. ⁷ [^] ^{Kw} ^{*}. *Matthiolus* will have three sorts of these Balls; but then with the *Tubera Cervina*, there will be four. We divide them into two kinds, viz. 1. *Tuber Terra vulgare*, The common Earth-ball, *i. Tuber Cervinum*, *pi. Tubera Cervi-* [»] ^{*}, *Deers Earth-balls*. Of the *Vulgar* or *GM/KW Matthiolus* makes three sorts, w/z. 1. One whose Pulp is white. 2. One whose Pulp is more brown, and the Rinds of both of them black and full of Chaps. 3. One which is less pleasant or infipid in Taste, and whose Rind is smooth and more brown.

II. *The Descriptions.* They, viz. the Common Earth-balls, have no Roots, but grow under Ground, viz. under the Superficies of the Earth, yet not cleaving thereto, causing it sometimes to swell, and sometimes to break, gape or cleave, by which it is discerned where they grow, being of a black or brown color on the out side, and of a left white Subfiance ^{zsrthn}, having, at John Baptista Porta says, under the outward Skin certain small black Subjhneces, which are the Seed, (the? Pliny says they have none.) *Tim Seed is like unto the Seed of the Cypres-tree*

by which they not only propagate themselves where they grow naturally; but as it has been often observed, they have some times been found growing where the Parings of them have been cast. These Tubera are unequally round, blackish and rough, whose Skins, Shells or Out sides, are without Rosts, fibres or Leaves, and within, their Pulp is white or whitish.

IV. *The Tubera Cervina, or Deers Earth-ball* which *I suppose Matthiolus intends in his Epifib-* ^{lib} ^{*} [?]. *Epifit. ult. growing under Ground in the Woods of Bohemia, (f?c. are always unevenly round, and rugged, their outward Skin is blackish, and the inner Pulp or Subfiance whitish: while they are fresh they have a strong and evil Smell, which in drying, they loose.*

V. *The Places.* The first kinds grow plentifully in *Tuscany*, and several other places of *Italy*: they also grow in *Spain* and *Germany*, *France* and *England*, not only in dry and sandy Grounds, but also in such as are more moist, and in places where Shrubs grow, as in Copes, Groves, Parks, woody Land, &c. The *Deers Earth-balls* grow also in Woods, and where *Deer* do much haunt, especially where they Co[»] ^{*je}, (as the former also do.) Hunts-men and Country People imagine, that these *Deers-balls* grow out of the Sperm of those Beasts, which falls on the Ground, others think, that they are first produced by their Urine, but these are will Conjeures and Country-mens Philosophy, and so not much to be trusted to: however it is probable, that in some places that Beast's Urine &c. may add to their Growth, and the Encrease of their Substance.

VI. *The Times.* They flourish and encrease in April, May and June, and are in Perfection in June, July and August.

VII. *The Qualities.* *Galen* and *Matthiolus* say they have no manifest Quality in them: *Avicenna* says they have a more earthy than watry Substance, and so abound more with saline than with fulphureous

or splrituous Principles. The *beers Earth-balls* iëem to be temperate in Quality, as to Heat or Cold, Moiftute oi Drynels •, and *die* Alexipharmick, Galleftogenetick and Spermatogenetick*

VJIL *The Specification.* The *Common.*, if much eaten, are laid to "breed Wind, and to engender the Pally and Apoplexy. The *Dcers* are laid to provoke Luit to the tail Degree.

IX. *The Preparations,* the firft are ufed moftly in, i. A *Picicle.* 2. A *fresco* Uion in Wine. The *Deers Earth-balls* are ufed in, ?< A *Pouder:* 4. A *he coition* in Wine. 5. A *Fumigation.*

The Virtues.

*\$t. *The Vickie* of the *Common kind,* they are ufed as *Savvee,* and are very pleafant to the *Palate,* but breed grofs and melancholy *Humors* more than any other *Food •,* they are hard of *Digeftion,* and in ibme *People* rife again in the *Stomach-* Some eat them rolled in the *Embers ^* and fome boiled in *Broth,* and fo eat them with *Pepper, Salt, Vinegar and Oil •,* they certainly encreafe *Luit.*

XL *The Decotliofi in Wine.* It provokes *Luft,* as the *Sallet* before does: but after the *Deco&tion* is made, you may drefs the *Subftance* with *Pepper, Salt, Vinegar and Oil,* to be eaten as before. *Pam-fibylM* or *Diphulvs* in *Athentm* will have it, that they yield a good *Juice,* eafe the *Belly* by excreting the *Excrements,* are windy and encreafe *Seed.*

XII. *The Pouder* of the *Tubera Cervina.* They are firft cut into pieces, then dried by hanging them on a *String •,* after which they are reduced to *Pouder,* by beating in a *Mortar.* Dofe of the *Pouder* a dram and half in a *Glafs* of generous *Wine,* or fome other *Vehicle* provoking *Luft:* it wonderfully incf?©^^oition, by breeding much *Seed** and encreafel *Milken* *Nurfes* *Breafts :* it may be taken alfo in fome *Ptifan,* with a little *Sugar* and *Long Pepper* added thereto.

XIII. *The Decotfion in Wine.* It has all the fame *Virtues* with the *Pouder,* more efpecially if a dram or dr;m and half of the *Pouder* be given at a time in it. Thus taken, the *Medicament* expels *Poyfon,* and defends againft the *poyfonous Bitings* of venomous *Creatures.*

XIV. *The Fumigation.* If the dried pieces of the *Tubera Cervina* be put upon live *Charcoal,* and the *FumeS* be received up the *Womb* by a *Funnel,* help *Women* troubled with the *Mother,* and open the *Paflages* of the *Womb* when they are clofed, thereby in fome meafure provoking the *Terms.*

CHAP. CCXXXIX-

KQf EARTH-NUTS,

GROUND-NUTS.

I. *Tp#E *Names.* Some Authors fay, that this Plant has no *Greek Name,* but what it has acquired from the *Latini,* which is, *Agriocafтанum* B*c. which laft word is taken from *Trallennus'* lib. 7. in *Latin,* *Agriocafтанum, Bolbocafтанum* and *Nitcula Terreftis :* in *Englijh,* *Earth-nuts* *Ground-nuts, Earth Chett-nuts,* and *Kipper-nuts.*

II. *T<b& Kinds.* It is twofold, -L/&E. I. (*Wv(t) Mitthhli* (folio 627.) of *Bauhinm* his Edition J3##0-

cajlanum ??iajus, *Agncaftanum majus, Apios Turn?-17, Pancajeolus Caifalptni,* (becaiife the *Vulgar* eat the *Root* of it initead of *Bread* and *Cheefe*) *Bulbocajlanon grandius hugdunenfis^ Kucula Terreftis major,* The greater *Earth-nut,* or *Ground-nut.* I am almoft of *Opinion,* that this *Plant* br *Species* is the true *Oenanthe Diojcoridis.* 2. *Agncafтанum, vel Bulbocafтанum minus^ Bulboeaftanum m.u Tral-Hani, Bulbocajlanum alterum foliis & bulbis minor7-bus Camerarii ^ Ornithogali Species Loniceri^ Nucula Terreftis minor.,* The leffer *Earth* or *Ground Nut.*

III. *The Defcriptions.* *The firft, dr* (Jreattf *Ground-nut, bds* a large *tuberous Root,* not *fulfy round or fmooth^* but *bunching out in one place* or *another* and *fome what rough,* of a *blackifh brown color* on the *outside,* and *white within,* of a *pledfarit Tafte,* between a *Chett-nut* and a *Filberd ^* for the *mo ft part* eaten raw, by *reafon* of its *Pleaf ant nef^* the *fome* have alfo *rodified* it by the *Fire,* or under the *Embers** From this *Root* come forth feveral long *Stalks* of *Leaves,* of a *bright green color,* which are finely cut in and divided, fomething like unto *Parley Leaves,* which grow on the middle of top of the *Stalk,* as *Dodohjeus* fays, when he compared them * but they are larger than the next, of *Small Earth* or *Ground Nuts :* from among thefe *Leaves* rifes up a {*tender Stalk,* a *foor* or more high* having many *Leaves* like our *Englijh Saxifrage,* bearing at the tops many *fmal white Flowers* in art *Umble,* which turn into *fnall^ long* blackifh Ssedj* fmelling fomething *fweet-*

IV. *'Me fecond, or* *Leffer Earth* or *Gfottftj Nut,* has a *fnall tuberous* or *roundifh brown Rc/or^* like tht *former,* but *leffer •,* from whence rifes up a long, *Render,* *whiti/h Stalk* or *String,* (callit^ by which *Name* you *pleafe*) which is a* it were the *Clet^* which *Wadiy* from the *upright Stalk* to the *Root* in the *Ground* and runs *four* or *five inches* deep into the *Ettrth^* but *folding* or *crumpling* it *felf* to and. fro unto the *tap* of the *Ground,* from whence it rifs up 3 little bigger^ but *naked* or *bw^r pf* *Leaves* for *w* each or *twa,* i n i

then-fends torch from the fides of the fame Stalk feveral fmall Stalks, of very fine cut Leaves, almoit like them of *Parley* or *Hemlock*, but much fmaller and finer jagged, of a fad green color. At the top of the Stalk grow feveral Branches of white Flow-ers in Lmbles, not unlike to the former, or thofe of *D/7/*, but much leffer, and fuch like Seed as in the *Greater kind*, but that it is letter •, and is fharp in Taite.

V. *The Places.* The firft grows Wild, and very frequently in *France, Germany* and *Italy*, and in fome places in *England* •, but with us it is for the moft part nurs'd up in *Gardens*. The fecond grows with us in *Corn-fields*, and in *Meadows*, almoft e-very where, as in the *Meadows in Lynn Regis*, near *Alhallows Churchy* and in the *Pafures* going from *Hardwick*, within a Mile of *Kings-Lynn* to *Weft-wench* : alfo in fome of the *Meadows by Hamp-jead*, near *London*: in all which places I have ga-thered it. There is a Field adjoining to *Highgate*, covered over with the fame -, and likewife in the next Field to the *Conduit-head* by *Maribone*, near the Way which leads to *Paddington*, not far from *London*: I have found it to grow alfo in many ^Leadows in *Kent* and in *Surry*, and in feveral other places.

VI. *The Titties.* They flower in the beginning of *June* (juft at which time their *Roots* are in *Perfection*) and in *July* •, and the *Seed* is ripe in fome little time afterwards.

VII. *The differences.* The *Greater* differs from the *Leffer*, for that the *Leaves* are larger and green-er : the *Root* alfo of the *Greater* is not fo far with- in the *Ground* , and it alfo fends forth fome *Leaves* from the *Tuber* or *Bulb* it felt* whereas the *Smaller kind* has only the end of a fmall *Root*, (like a *String* as it were) which carries the *Stem* and *Leaves* up- on it, as you may fee. exprefs'd in the *Figure*.

VIII. *The Qualities.* They are hot and dry in the firft Degree , the *Seed* in the fecond; they are

Aperitive, yet Aftringent and Diuretick *, Stomack, Nephritick, Spermatogenetick and Analeptick.

IX. *The Specification.* They provoke *Urine*, and peculiarly help fuch as *Spit* or *Pifs Blood*.

X. *The Preparations.* ;The *Seeds* and *Roots* are chiefly ufed -, and therefore you may have there- from, 1. A *Ponder of the Seed*, 2. A *Spirituus Tinllure of the Seed*. 3. *The raw Roots*. 4. *Thi Roots prepared*. 5 ; *Sanguis, or Blood of the Roots*.

The Virtues.

XL *The Pouder of the Seed.* You may gly ^ it to a dram or dram and half in a Glafs of Vi^ite Port Wine, Adoming and Night, againft the Strangury, Sand, Gravel and tartarous Matter in the Reins, Ureters and Bladder ^ it opens Obftru&i- Oils of the Paflafles, provokes *Urine*, and expels Wind.

XII. *The Spirituous TihUure.* It has the former Virtues, and may be given from one to three drams in any fit Vehicle. It is very Stomack, warming* comforting and ftrengthening a cold and weak Stomach. It expels Wind from the Stomach and Bow-els, gives eafe in the Cholick, and is of good Ufe againft all forts of Fluxes of the Belly.

XIII. *The raw Roots.* They are commonly eaten as *filberds* and raw *Chefi-nues* are eaten •, they yield p good Juice, which cleanfes the *Urinary Paflages*, pleafes the *Stomach*, and nourilhes in. Confump- tions.

XIV. *The Roots prepared.* They are prepared by baking in an Oven, covered with Milk -, or by boiling them in Water as *Turneps, Parfneps* or *Carrots* * and then dreffing them up with *Butter, Pepper, Salt*, and a little *Vinegar* : they gratify, pleafe {aid ftrengthen the *Stomach*, reftore in *Cojiftmpttons*, and provoke *Urine*. The *Root* roasted in *Embers*, flops *Bleeding*, and is good for them who *Vomit, Spit* or *Pifs Blood*, or have a *Bloody-flux*, or any other *Flux* of the *Bowels*. The raw *Root* does alfo the fame thing.

XV. *The Sanguis or Blood.* It is prepared as is that of *Cullions Sweet* in chap. 184. fetf. 22. *Parfneps* * *Carrots* ^ *Orchis, Satyr ion*, and other like *Roots*. It has all the former Virtues of the *Roots*, whether raw, roasted, baked or boiled * and is much more powerful, being given from half an ounce to an ounce or more, drinking with it a Glafs of generous Wine. It is of fingular Ufe for all *Confumptive Perfons*, breed good Juices and plenty of *Seed*, and provokes *Lull*.

CHAP. CCXL.

Of EARTH-NUTS Peafe Wood.

It is called ^ Greek, Vodon* iix& luherrm<ms>ani: in La- ftrwfp^ f'K>ie from its Form, being Pear telhion-jp/eudoapios Matthioli, Cbamxbah- *MrDodoaai, (from its fomewhat Refemblance to an Acorn*) Terrt glans pl. gMes hobelii* tf Vena- Glmdes lerrefires Clufu : in Enghjh, Wood and Peafe Earth-nuts.

II. *The Kinds.* There are three forts of them, viz. 1. *Bahnns Lathyrine* ^ *Terra glandes* ^ *Balanus ttfane*, with all the reft of the Names in a forego- ing

ing Section : Peafe Earth or Ground Nuts. 2. *Ajragah/s fylvaticus Thalii, Lathyrus fylveftris*, Wood Earth-nuts, or Ground-nuts. 3. *Terrx glandes American**, vel *Virginians*, American or Virginia-Earth-nuts.

III. The Defcriptions. *Thefirst, or Peafe Earth-nut, has Roots which are glaniulous or tuberous* (mt)

*much unlike in Shape to an Acorn, or fontcforts of Pears) which are black and finally but much greater than Acorns, fajined to lung Strings, and spread much under Ground; in Tafte very like to a dry left-nut ^ out of which beneath does hang one or more long, flender Fibres or Strings *; and out of which does alfo grow other Strings, near to the Head of the Root or Jetting on of the Stalk t> unto which creeping aflope lender the Surface of the Earth, other hernelled or glaniulous Roots do grow, by which way this Plant does very much multiply it felf* From this Root fpring feveral weak, flender, fquare, trailing Stalks, running upon the Ground four or five feet in length. The Leaves are thin and fmall, ufually fet two and two together upon flender Stalks, each having a Claffer at its end, taking hold of what ftands next to it. The Flowers come forth at the Joints towards the tops of the Stalks, and at the tops of the lame, Hanging upon long Foot-ftalks, in Shape like tfofe of *Peafe*, but lefs, many growing together, being narrow, and of a deep reddifh purple color, and bright, in Smell not unpleafant. They being pafs'd away, there fucceed, in their places, flender long Cods, in which are contained three or four fmail round Seeds.

IV. *Thefecond, or Wood Earth-nut, has not only greater, but longer and harder Roots, confifting of many black Particles, here and there fending forth Fibres, almoji woody, or more hard than the former -, the Stalks alfo are harder, and ft raked or cornered^ and rife up to be about afoot high, fmall below, and fomewhat larger above : the Leaves grow forth at the Joints of the Stalks, confifting fometimes of two, and fometimes of four, which are longifli and narrow, and fometimes five on a Branch, fattned to one Foot, which at the fetting on has two little Leaves or Ears, and one Claffer or Tendrel at the end. Out of the Bofoms of thefe Ears grow Stalks about two inches long, each of which ufually carry a couple of *Peafe* fashioned Flowers, of a *cvimibn* or purple color, which fading, ufually become blew : after which Cods fucceed, which are long, narrow, fraight, round and black when they grow old, within which are contained in each Cod nine or ten white, round Seeds fomewhat lefs than a Tare.*

V. *The Virginian Earth-nut has a Root which fpreads it felf under Ground many ways, each String of Tubers or Glands confifting of a fmall String and a Gland, a fmall String and a Gland to the end of the fame, each Gland being almoji of an Oval fafhion, thick in the middle, and narrow-pointed at both ends, where it is held by the Strings, and having many fmall Fibres proceeding from its Body in feve^ ra/places: from this Root rifes up a Stalk, which fpreads it felf forth into many large Arms or Branches, and every one of them again are divided into feveral others, which are manifold. The Leaves are long and green, which are many, and fet on both fides of a middle Stalk, the main Stalk it felf winding it felf upon any thing Hanging next unto it, and rifing from a tuberous brown Root, as aforefkid, At the Joints of the Stalks with the Leaves, and in other places of the Stalks, come forth the Flowers, many hanging together Spike fhation, of a dull blufh color, made almoft like Hoods : afte* which, in *Virginia*, come Cods of Seed, but not bearing any with us: the Leaves and Stalks perifh before Winter, and fprout from the old Root again in the Spring.*

VI. *The Places.* The firft grows in many places of *Germany* in Coria-fields, both with the Corn it felf and alfo about the Borders of Fields among Briers and Brambles. Thefecond, *Gerard* fays, grows in *Hampjead* and *Come Parks*, near *London* *, as alfo

on Richmond-heath, and in several other places. That which grows in the Woods has a Root which is more hard and woody, but if it is planted or sown in Gardens, in a good Soil, it is more pulpy and tender. That from America grows not with us but in Manured Grounds, and with us they are all planted in Gardens.

VII. The Times. They all flower in June, July and August, and then the Nuts are dug up and gathered.

VIII. The Alikes, Specification, Preparations and Virtues, are much the same with the Earth or Ground Nuts in the former Chapter, so that we shall not need to say any more of them in this place.

CHAP. CCXLL
Of EDDO of Carolina,

Linnaeus Names. It is called in Greek, 'Αρτυμα, in Latin, Arum Mgyptium, & Pseudocolocasia, (for the true Colocasia is the Tabae JEgyptia Dioscoridis:) in English, Eddo, Eddo of Carolina, and Carolinian Eddo.

II. The Kinds. It is certainly of the Family of the Arons or Wake Robins, and is here only a singular Plant.

III. The Description. It has a great and bulbous or rather tuberous Root, in some more round than in others, round in the middle, and tapering at the ends, or thick, and covered with a white skin on the outside, and white within, cutting very firm or jassy, closer than a heavy elnye Turnep, some of them are reddish on the outside, having several small birings many bulbous or tuberous Heads, shooting from all sides thereof, whereby the Root encreases, from itsence viany Wres Jhoot deep into the Ground, from this Root Jhoot forth several x'ry large fhi-

ning green Leaves, almost of the Shape or fashion of Arum or Wake Robin, pointed at the ends, but much rounder, each of them a foot and half, and some of them near two feet long, and a foot, fifteen inches, or foot and half broad, not so thick and fappy as Aron Leaves, but thinner and harder, full of Veins running every way, and refilling Moisture, tho'they be laid in Water, itanding every one upon a veiy thick Stalk, about three feet or something more in height, as I have seen them in America, especially in Carolina, or about five feet high, as they grow in Mgypt, as Authors relate. This Salk is not fet to or fasthed to the Leaf at the very Q. of the Leaf into two parts, as the Aron oWam, Robin is, but more towards the middle, fonif like unto the Water Lillies, the Divifio of each Leaf at bottom, being much rounder than tholē of the Wake Robin. As this Plant is long, and the Leaves thereof very great, without any other main Stalk (for a long time) but only the Stalks of Leaves, so it has been reported to be without fter and Seed, but very falsely, because the Encreaie which it usually has, is by the Fibres, which run and spread themselves from the Root, or by bits of the Root call into holes or hills in mellow Ground: they usually cut one tuberous Root, as big as a large Apple, into twenty or thirty pieces, so as every piece may have a final quantity of the outside S& upon it, these being planted in those made or prepared holes, in Artificial Hillocks of moist fat Earth in the Spring time, will all for the most part grow, so that a Crop of the Roots may be gathered in July and August following, which is the Reason that never any stalk of Flowers, fter or Seed are seen upon them. But if these Roots are suffered to continue for many Years & place, (so as they may be defended w're & r'v from the Frost) you will find, that between these very tall Stalks of Leaves that there will rise up a Stalk, and sometimes two or three according to the Years of the Age and Strength of the plant, which length of time helps to the fter & ify of it, so, for otherwise it would not bear any fter, Hope, or Pestel, or Flower, as I my self, who have planted them, have manifestly seen. Each of these Stalks are much shorter than those of the Leaves, at the tops of which they bear a long open Husk, the middle of which rises up for the most part into several narrow Husks or Holes, (never one almost as the Arum or Arifarum do) with every one thereof a Pestel or Clapper in the middle of them, which is small, whitish, and about six or seven inches long, from the middle downwards it is bigger and found about with small whitish Flowers, which are very sweet, the lowermost first flowering, and by degrees upwards, which last not above three days, and from the middle upward bare or naked, ending in a small long point. After the Flower are & the lower part abides, and bears many fter, Arum or Art fter, do but

IV. The Places. It grows plentifully in && being planted there for their only Use in Meats, so for Food, which they seldom take without it. It grows naturally in Candia, as Bellonius says, in Portugal, as Clufms reports. It grows also in Italy in many places, and in the Country of Sicily in the Kingdom of Naples as Columna relates. It grows also in the Islands of Java and Surrat, where they use it as familiarly as they do in Fgypt, as the Dutch have declared in their Navigation Journal Anno 1595. It is also found in several places of Africa, and in divers other places, which Theophrastus remembred. Some will not have it called Arum Mgyptium, because our late Travellers say,

ior ibme Ages it has not been known to grow there at all -, 'tis poffible, that for fome Years pad it may have been neglected and diluted •, yet I am apt to believe, if good fearch was made for it there, by induftrious and fkilful Botanifts, it might be found again. It grows in a vaft plenty in *Carolina*, it being a great part of the Food of the Country, irtfomuch as moft Families in that Colony plant whole Fields with it, confuting of many Acres, for the principal and almott iole Subfiftance of their Families, it being there of a very great Encreafe.

I. The Times. It comes up from the planted bits in the Spring time, and the Roots come to their Perfection in *July*, *Auguji*, *September* and *October*, proportionally according to the times they were planted in. It Flowers (when it is of Age, fo as to come to the Perfection of Flowering) with its Hole and Peftels or Clappers very late, even in warm Countries, feldom before *October* or *November*, and yet the Fruit or Berries do not often come to Per-

VI. The Qualities. The Root (for nothing elfe of this Plant is ufed) is hot and dry in the end of the third Degree :. it is Aperitive, Abfterfive, Inciding, Digeftive, Difcuffive and Carminative, Stomack* Pe&oral, Hyfterick and Arthririck; Alexipharmick, Chylifick and Analeptick: it is very (harp and biting in the Mouth, not to be tafted of without Caution ^ yet it is more biting in fome Countries.

VII. The Specification, Preparations and Virtues, are the fame in every Refpe&t with thofe of *Aron* or *Wake Robin* Roots in Chap. • following of this Work, fo that I need fay no more thereof in this place ; this Plant being indeed a kind of *Aron* or

Via AftObfervation. In *Carolina* they boil them in Water till they are foft, then they eat them with Butter, Vinegar, Salt and Pepper •, they are incomparable Food, and the very beft of all Roots in the World which are eaten boiled; they are grateful to the Palate, pleafing to the Stomach, very Nutritive and Reftorative in Confumptions: but in the boiling of them, you muft be fure to do it fo well as to take away all the biting Quality of them •, left, being hot and biting in the Throat, they ihould caule in Inflammation in thofe Parts, and alfo difoblige the Stomach.

IX. Obfervat. 2. In that Country, when I was there, they made the greateft part of their Bread of the Roots boiled foft, by mixing therewith fine Flower of *Maize* or *Indian Wheat*, and kneading it in with their Hands, It made wholfome, good-tailed Bread, which was very nourifhing, and which would keep moft a great deal longer than that which was made of *Maize* or *Wheat* alone.

Y^{ph}ervat. 3. Of the boiled Root a *Sanguti* or iy[^]/rny be made, as you make it of *Comfrey*, *O^c Jm^{at}y^roⁿ* and *Par^{net}* Roots*, which not only jggies much and reftores in Confumptions buC^{aj}R[^]reedsSeed, and cure^s Impotency in Men.

C H A P - CCXLII

Of E L D E R Dwarf.

L H p HE Names. It is called in *Greek*, X^U*UIKT* : JL in *Latin*, *Chamaetfe*, *Ebulus*, *Sambucus bu-mlti* * and in *Englijb*, *Dwarf Elder*, *Dane-wort*, and *Wall-wrt*.

II. The Kinds. It is twofold, viz. I. *Ebulus*, *Sambucus humilis vulgar k*, The common Dwarf Elder, Wall-wort or Daue-wort. 2. *Ebulus joins laciniatis*, Jagged Dwarf Elder, or Wall-wort.

III. The Defcriptions. *The firft, or Common Dane-wort, ha* a Root which creeps under the upper Crujl of the Groan:!, Springs up afrejh in divers places, being of the Bignefs of a Man's Finger or Thumb ^ it PS tough, and of a good re ajon able Lengthy having a very great many Branches and Fibres fpringing from it, being more excellent for Medical Ufes than the Leaves. From this Root rifes up a journeyuare, rough^ hairy Stalk, which is jall of Joints, like to young Branches and Shoots of Elder, and rifing to be four or Jive feet high. The Leaves are winged, and grow by couples, with wide Difances, each Leaf confifting of many fmall Leaves, fome-what narrower than the Elder-tree Leaves, but elfe fo like, that they might eafily deceive one not very well vers'd in the Plants: thefe Leaves ftand upon a thick ribbed Stalk, of which every one is long, with a fit Breadrh, and finely cut in on the edges, like a Saw, yet the Dents are wider and greater chan in the Leaves of the Common Elder. At the tops of the Stalks grow Tufts or Umbles of white Flowers, dafht ortipt with red -, they grow in Umbles, very like thofe of the Elder-tree^ but more fweet in Smell, with five little Chives in them, pointed with black: which being pafsd away, black Berries fucceed, very like Common Elder Berries, full of a red Juice whilt they are trefh, and in which are contained fmall, hard, long Kernels or Seed. This Plant is very like to Elder in Leaves, fpoky Tufts ard Berries, but has not a woody Stalk, but only brings tortli green herby Scalks, which wither away in Winter, rifing again every Spring' from the old Root, but it is doubtlefs a kind of Elder, as may appear by the Leaves, Flowers and Fruit, as alfo by the Smell and Tafte •, in all which Particulars, this is very like to that.*

IV. The fecond, or Jagged Dwarf Elder, ha* a Root like to the former, very full of Branches and Fibres^ from which fpring up Stalks like the other alfo, and indeed in all things, excepting in the

Leaves, is like to the former, that there is no Difference: but the Form of the Leaves does alter the whole Face of the Plant, and put it out of Knowledge, like the *Jagged Elder*, that scarcely any one would think it to belong to the first kind, the Flowers, Fruit and Smell only making us to judge of the Species, and whereunto it is to be referred, for the Leaves are almost as much jagged and divided as the *Jagged Elder*, which is the only thing in which this differs from the first before described.

V. *The Places.* The first grows Wild in many places of *England*, where, if it is once gotten into the Ground, it will so creep and run, that it will be difficult to get it forth again. It grows in unfenced places near to Hedges, Ditches and common Ways, and in the Borders of Fields. It grows plentifully in the Lane at *Kilbury Abby* by *London*, as also in a Field by *St. Joans* near *Dartford* in *Kent*, and in the Highway at *Old Brantford* Towns-end next towards *London*, and in many other like places. The second is only nurs'd up with us in *Gardens*.

VI. *The Times.* They flower in *July*, and the Retries are ripe in the latter end of *August*, but for the most part in *September*.

VII. *The Qualities.* It is said to be hot and dry in the third Degree, Aperitive, Absterfive, Difcussive, Diuretick, Pectoral, Hepatick, Nephritic, Hyterick, Arthritic, and Emetick or Cathartic.

VIII. *The Specification.* It is peculiar for curing the Dropfy. The Roots and Seed are of greatest Force to purge away watry and pituitous Humors, and the Leaves have the chiefest Strength next, to digest, walte away and consume: the Juice of the Berries are weakelt of all.

X. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Decoffion or Infusion in Wine. 4. A Ponder of the Grains or Seeds. 5. An Oil or Ointment. 6. A Cataplaism of the Leaves. 7. Ebuli-mel, or Honey of Wall-wort: of all which things we shall now treat in Order.

The Virtues.

X. *The liquid Juice.* This and all other Preparations of *Dwarf Elder* are more efficacious or powerful than those prepared from *Common Elder*, in all the Diseases, and for all the Purposes unto which that is applied, but more especially in those Cases in which *Elder* is little or nothing prevalent. The Juice of the Root applied to the Throat, prevails against the Quinsey and Kings-evil. The Fundament bathed with it, prevents the felling of it down, the same also put up the Womb in a Pessary, or injected with a Syringe, brings down the Terms in Women. It is also a mighty Purger of flegmatick and watry Humors, and has been approved as the most effectual thing against an Anasarca or Dropfy of the whole Body. Dose from two to four spoonfills or more in White Port Wine, Morning and Night, according as the Strength of the Patient will bear it.

XI. *The Effence.* It has all the former Virtues, and given before the coming of a fit of an Ague, it prevails effectually against it, that it will either put it off or make it much more easy, and at second taking seldom fails of perfectly curing it. It opens Obstructions of the Breast and Lungs, incides and dissolves pituitous and tartarous Matter in those Parts, or the Urinary Vessels, carrying off the morbidick Matter of Catarrhs, Stone, Gravel, Gout, Kings-evil, Jaundice, Dropfy, and other like Diseases. Dose two or three spoonfills in White Wine, Morning and Night.

XII. *The Decoction or Infusion in White Port Wine.* They have all the Virtues of the liquid Juice and Effence, but much weaker in Operation, and therefore much better and safer to be given to Children, Women kind, and weak People. It cures Agues in Children in two or three Doses, given two hours before the coming of a Fit. And being taken to five, six or eight ounces in the Morning fallings and sometimes also at Night going to Bed, it prevails against a Cachexia and Leucophlegmatia, and has had a good Effect in curing the Kings-evil and Dropfy.

XIII. *The Pouders of the Grains and Root.* The Pouders of the dried Berries or Seed, given dram in White Port Wine fasting, has the Virtues of the liquid Juice, Effence and Decoction for it mightily provokes the Terms, and carries off the Water in Dropfies, and cures Struma's. Being given in Decoction of *Camapitys* or *Ground irine* with a little *Cinnamon*, it is an approved Remedy for all Joint-Aches, Rheumatisms, Gouts, Sciatica, Dropfies, and even the French Disease it self, eases the Pains, by withdrawing and expelling Humors which are fluent, peccant and offensive. The Pouders of the Root works after the same manner, and does the same things.

XIV. *The Oil or Ointment made of the dried Leaves, or Roots in May.* It is said to be an admirable Remedy for all external Aches, Pains, Cramps, Gouts, shrinking of Nerves or Tendons, and Lameness caused by Blows, Falls, Cold or other Accidents, and to warm, comfort and strengthen all the external Parts so affected, to mollify the Hardness to open the Pores, and ease the Spleen, the grieved Pains being therewith anointed: it also cures the Piles or Hemorrhoids by anointing.

XV. *The Cataplaism of the Leaves.* It is useful five and Arthritic, and of singular use to be applied to the Throat in a Quinsey, and to dissolve stumorous Tumors in the Neck. Applied to the Region of the Reins or Bladder, it is held to give ease in those Pains. Applied to the Testicles which are swollen and hard, it quickly eases the Pain and quickens the Tumor: and put to the Fundament, it strengthens the Sphincter of the Urinary Bladder.

XVI. *Ebuli-mel, or Honey of Dwarf Elder.* It is taken to two or three drams or more, as Age and Necessity require, it dissolves the Tartar of the Lungs, opens their Obstructions, as also the Obstructions of the Reins and Ureters, purging away gently Choler, Flegm and watry Humors, is good against the Bittings of Serpents, or of a mad Dog; prevails against the Colick and Stone, as also the Strangury or other Difficulty of making Water. It helps Coughs, Catarrhs, Hoarseness, Shortness of Breath, and Difficulty of Breathing. And outwardly applied, is good against old running Sores, putrid and fistulous Ulcers: and dissolved in Wine, it cures Sores and Ulcers in the Mouth.

c H K P. ccxvii Of 'E L E C A M P A N E.

I. *Names.* It is called in *Græc* *Elecamp*, in *Arabick*, *Jafin* & *Rafin*: in *Latin* *Elecamp*, *Enula*, *Enula Campana* in *English* it is called, *Scab-wort* and *horje-beah*.

II. *The Kinds.* It is a singular Plant of its kind.

But *Anguilara* and *Cordus* took it to be the *Panax Chironium Thcophrafti*. There is another Plant which is called *Helenium*, or *Helenium alterum Diofcoridis*, which is *Helianthemum* or *Dwarf Ciftus*; but it is not akin, nor has any Relation to, this, the Which you may fee (with all its kinds) in Chap. 131. aforegoing.

III. The Description. It has a Root which is great, branched forth several ways blackish on the outside and white within, of a very bitter Taste, but good Smell when it is dried of a very compact and solid Substance whilst it is fresh and wholly gathered, from this Root shoot forth many large Leaves lying near the Ground which are long and broad, small at both ends somewhat soft in handling, yet rough withal to look upon and very full of Veins of a whitish green on the upper side, and grey underneath, lightly nicked on the edges, each of them standing upon a short Foot-stalk. From among these heaves rise up several great and hairy Stalks, three or four feet high, with some heaves thereon, compassing them about at the lower ends, and are branched towards the tops, bearing several large flowers, like unto those of the Corn Marigold, both the Borders and heaves, the middle Thrum being yellow, afterwards turn into Down, with some long, brownish Seed among it, all which is carried away with the Wind.

IV. The Places. It grows in moist Ground and shady places, more than in the dry, in the Borders of Fields and Lanes, and in other waste places almost every where, but more especially in fat and fruitful Land: it is sometimes found also upon Mountains, and shady places which are not altogether dry. It grows very much in the Fields on the left Hand going from Dunstable to Puddle-stone, also in an Orchard going from Colebrook to Dittouferry, in the Way to Windjor, at hidde and Yalkfione near to Dover, by the Sea-side. I have often found it growing in Orchards in many parts of this Kingdom.

V. The Times. It flowers in June and July, and the Seed is ripe in August: The Roots are gathered for Use as well in the Spring, before the Leaves come forth, as in the Autumn or Winter.

VI. The Virtues. The Root is the chief thing which is used, and is hot and dry in the third Degree full of Mercury and Sulphur: it is Aperitive, Absterfive, Afringent, Anodyne, Carminative, Digestive, Relaxive, Incarnative and Vulnerary highly Pectoral, Stomachick, Neurotick and Hytfrick 5 Emmenagogick, Sudorifick, Alexipharrick, Spermatogenetick and Analeptick.

VII. The Specification, it is peculiar against old Coughs, Catarrhs, and tartarous Matter obstructing the Lungs.

VIII. The Preparations. From the Root of this Herb you may make the following Preparations, viz. 1. A Juice. 2. An Ejjence. 3. A Syrup. 4. A Deception or Injufion. 5. A Pouder. 6. An Eleffuary. 7. An Ointment. 8. A Balsam. 9. A Gtaplqm. 10. A distilled Water. 11. A Spirituous Tinbure. 12. An Add. Tinffitre. 13. An Oily Tintture. 14. A Saline TinSurc. 15. A Spirit. 16. A distilled Oil. 17. Potestates or Powers. 18. An Elixir. 19. A fixed Salt. 20. Scinguis or Blood. 21. The Preferve or Conferee. 22. EnuU-mcl or Honey of Elecampane.

The Virtues.

IX. The liquid Juice. It expels Wind in the Stomach and Bowels, and takes away pricking Pains and Stitches in the Side, caused by the Spleen: it is also good against Coughs, Colds, Wheezings, Shortness of Breath, and Obstructions of the Lungs by tartarous Matter. Dose two or three spoonfuls in a Glass of generous Wine, in Morning and Night.

X. The Ejjence. It has all the Virtues of the liquid Juice besides which, it strengthens the Viscera much more, and secures a Perion lately cured of a Dropsy, that the Disease shall not return again upon the old Foot. It is good against the Obstruction of Urine, provokes the Terms in Women, and facilitates the Delivery of a Woman in Travail, brings forth both Birth and After-birth; it is good against Vapors and Fits of the Mother, refits Poyson, and prevails against the Venom of the Viper, Rattle-Snake, and other Serpents, as also the Bittings of mad Dogs: it destroys the Putridity of malignant and peffilential Fevers, contending even with the Plague or Peffilence it self! Dose two spoonfuls Morning, Noon and Night, in a Glass of generous Wine, if it is upon an Exigency: otherwise twice a day may be enough.

XI. The Syrup of the Juice. It is highly Pectoral, and causes Expectoration to a Miracle, being admirably good against Coughs, Colds, Catarrhs, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and all other Stoppages and Obstructions of the Lungs, dissolving the tartarous Matter lodged there, as also in the kidneys, Ureters and Bladder: it gives ease to such as are pained with the Stone in the Reins or Bladder: in a word, it has all the Virtues of the Juice and Efficence, but must be taken in a larger Dose, because the truly Medicinal part of the Plant is so much clogged with Sugar.

XII. The Decoction or Infusion in Wine. It has all the Virtues of the aforegoing Preparations, but is more powerful, and therefore may be taken to three, four or five ounces, Morning and Evening: this being daily drunk, besides being a Pectoral, it is laid to be good for such as have weak and dim Lyes: or it clears, it strengthens and quickens the Sight admirably: it kills and drives forth all manner of Worms

in Belly, Stomach or Maw. Gargled in the Mouth, and the Root chewed also, it eases the Tooth-ach from a cold Cause, and fattens loose Teeth, and helps to keep them from Putrefaction.

XIII. *The Powder of the Root.* It warms and comforts a cold Stomach, rectifies the Indisposition of the Bowels, expels Wind, and gives ease in the Colick: it is good for such as spit or piss Blood, and prevails against the Bloody-flux, and other Fluxes and Weakness of the Bowels proceeding from a cold and moist Cause, and has indeed all the Virtues of the Juice, Effence and Syrup foregoing. Dose from two scruples to a dram and half in Wine or some proper Vehicle, Morning and Night.

XIV. *The Electuary.* It may be made limply with the Powder of the Root, but it is commonly compounded thus: *Take fine Sower of Elecampane seven ounces, Nutmegs in powder five ounces, Flowers of Sulphur three ounces, Crocus Martis aperitive two ounces. Oil of Aniseeds one ounce, clarified Honey fifty four ounces: mix and make an Electuary.* Dose as much as a *Chefi-nut*, or something more, washing it down with a Glass of prompt Wine, and this to be done Morning and Evening by all such as have any Obstruction of the Lungs, or Ulcer of the fame, or spit or piss Blood, or have a Bloody-flux, it is of singular Use for all such Persons who have a Cachexia or Leucophlegmatia, and for Virgins who have the Green-sickness, and want their monthly Purgations. It strengthens the Tone of the Viscera so admirably, that such Persons who, by reason of vehement Obstructions, long Sickness, or Debilities of Age, or some other Accident, have not been able to go cross a Room, or up Stairs, have, by the taking hereof, in four or five days time, been able to go three or four Miles, and that so stoutly as to do it without complaining of any Weakness or Weariness. It opens Obstructions of the Thorax, eases Coughs, and stops the most profuse Catarrhs, though inveterate.

XV. *The Ointment.* It is good against Convulsions, Cramps, Aches, Rheumatick Pains, the Gout, Sciatica, Weakness of the Joints, and other like Disorders of the extrem Parts: if it is made of the Pulp of the Root, or the Juice thickned, by boiling four pound, mixed with Oil of Trotters Bees of each one ounce, and *Urnib* & ounces, it will be good for an *Scab* or *Wart* in Old or New Sores, it will be so much the better if *Urnib* be also added to the Composition.

XVI. *The Balm.* It is an extraordinary thing for *Wounds* and Punctures of the Nerves and *Risks* - heals *green* Wounds at two or three times dressing: and it digests, cleanses, incarnates, and heals moist and Sinning Sores, old Ulcers and rebellious *Fistulas*, some good inward Wound-drink being taken in the mean while. Applied in the Gout, it gives ease to the Pain.

XVII. *The Cataplasim.* It is made of the Meal of *Aiz* of *A* mixt with *Bread*, Milk and White Lilly Roots. It purgates Tumors or Apoftems, eases in arthritick Pains, and applied to the side, gives ease in Pains of the Spleen. It diffuses windy Tumors of the Cods, and where the Swelling is such, that it cannot be diffused by breaking it quick, it is to be used.

XVIII. *The distilled Water.* It is Peccoral and Carminative, and good to be used as a Vehicle to convey other Preparations of the Root in; it is good to cleanse the Skin of any common Defection, and to be mixed with white Sugar Candy to put into the Eyes, to clear the Sight of Clouds.

XIX. *The Acid Tincture.* It has all the Virtues of the liquid Juice and Effence, powerfully opens all manner of Obstructions, and fortifies the Stomach and Bowels to a Miracle. It creates a good Appetite, causes a good Digestion, incises or cuts tartarous Humors which breed the Stone and Gravel, and is a mighty Relief in a cold Gout, if gently anointed therewith, and well rubbed in, gives ease in the Stone and Gravel, and in the Strangury.

XX. *The Acid Tincture.* It has all the Virtues of the liquid Juice and Effence, powerfully opens all manner of Obstructions, and fortifies the Stomach and Bowels to a Miracle. It creates a good Appetite, causes a good Digestion, incises or cuts tartarous Humors which breed the Stone and Gravel, and is a mighty Relief in a cold Gout, if gently anointed therewith, and well rubbed in, gives ease in the Stone and Gravel, and in the Strangury.

XXI. *The Oily Tincture.* It is good against Punctures and Contusions of the Tendons: it gives ease in Convulsions, Contraactions of the Nerves, Tendons, and is a mighty Relief in a cold Gout, if gently anointed therewith, and well rubbed in, gives ease in the Stone and Gravel, and in the Strangury.

XXII. *The Saline Tincture.* It is used for the molt part outwardly to bathe all such Parts and Places as are affected with *Urticaria*, *Morphew*, Spots, Blemishes, Yellowness or Tawiness of the Skin, Herpes, Tetters, Ringworms, Scabs, Leprosy, or any other Defecation of the Skin.

XXIII. *The Spirit.* It is highly Cordial and Peccoral, good against fainting and swooning Fits, Sickness at Heart and Stomach, and gives ease in Colick, and Gripping in the Guts. It is good for a weak Stomach, and causes a good Digestion. It gives ease in a Cough, and conduces to the flopping or *Expectoration*. It refits Poyson and the Venom of mad Dogs, and all sorts of malignant and peccoral, a spoonful or more at a time.

XXIV. *The distilled Oil.* It is made of the liquid Juice, Effence, and Spirit, and may be given in phlegm, and of them, being much more powerful than the Juice. I have had great Experience of its Use in the Birth, and bringing away of the Child, and it is very effectually provokes the Birth, and it is nothing better than the Juice of the Hoar-fends, and is to be used from six drops to fourteen or twenty, soft into white Sugar, and mixing then mixing with a Glass of good

and

and fo drinking it off. It opens Obftructions of Reins and Bladder, and provokes Urine powerfully.

XXV. *The Pot elf ares or Powers.* They have all the Virtues of the Juice, Effence, Pouder, Spirit and Oij, and may be uied to all the laid Intentions, both internally and externally, but are indeed much more fubtil and penetrating, linking to the Bone in a moment. They eafe the Pain of the Head tho' extream^ by duffing them often up the Noftrils, and alfo bathing the Forehead and Temples therewith. D]Te is fifty drops, more or lefs, in a Glafs of generdfe Wine, and in cafe of Vapors or Fits, in a Glafs offeir Water.

XXVI. *The Elixir.* This Medicament is only Potefiates exalted, and brought to the highelt degree of Perfe&ion. It is one of the greateft of all Peftorales and Anticolicks; and provokes the Terms in Women after an admirable manner. In a word, it has all the Virtues of the Powers, and performs whatever they can do, with Advantage. Dofe from forty to fixty drops in any proper Vehicle.

XXVII. *The fixed Salt.* It is made of the whole Plant, burnt to Afhes whilft it is green. It is highly Diuretick, and a great Purifier of the Blood, defroying all preternatural Acids in the Juices and Humors, more epecially in the Stomach, and other places of Digeftion. Being mixed about a scruple or half a dram at a time with a fpoonful of Juice of Limons, it-takes away Vomiting immediately, tho' never fo extream, and gives eafe in the molt pertinacious Colick.

XXVIII. *Sanguis or Blood.* It acuates the Juices of the Body, fortifies the Stomach, comtorts the Faculties, chears the Heart, revives the Spirits, and puff whole Nature into an excellent Habit and Conditio|> And as it is one of the moft admirable thingi in hit World againft Coughs, Colds, Catarrhs, Afthma's and fpitting of Blood •, fo it is a moft fingular thing to reftore in Confumptions, there being not many better things upon Earth. Dofe from two drams to three, or more, according as the Necessiqr may require, in a Glafs of homogeneous Wine, fuch as the Prudence of the Phyfician fhall direct.

XXIX. *The Conferve or Preferve.* It may be taken in a Morning falling againft malign and infe&ious Airs •, and in contagious and peftilential Times, there being very few things much better. I commend it for fuch as have had an Afthma of long continuance •, for the conftant taking of it for fome confiderable time, diflblves the Tartar of the Lungs, and caufes free Breathing.

XXX. *EnuU-mel or Honey of Elecampane.* It is highly Pe&oral, and is very efficacious to warm and comfort a cold and windy Stomach, and to eafe Prickings and fitches in the Sides •, as alfo Pains of the*Spteen, and to help Coughs, Catarrhs, Wheez-j^, and Shortnefs of Breath. It is an excellent .fflSig^fo for provoking of Urine, and to openObfcaaidiis of the Womb whe*£ the Courfes are ltopt, fiippeffing Vapors, and preventing Fits of the Mother. Dofe as much as a Wall-nut Morning and Night for fome time.

ba : in Latin, *Intubus* 6^t *Endivia*: in Englij), *Endive*.

II. *The Kinds.* It is either *Garden*, of which in this Chapter -, or *Wild*, of which in the next. The firft kind is called *Endivia hortenfis*, *Intubus major Alaithioli*, *Intubum fativum*, *Garden Endive*.

III. *The Defcription.* It has a Root which U long, white, with fibres or Strings appendent to it, which withers and dies away after it has perfected its Seed. From this Root fpring forth long Leaves, broad, fsmooth, and more green than white, like almoft to thofe O/Lettice, fomewhat notched in cn the edges. The Stalk grows up among the Leaves, being round and hollow, divided into feveral Branches : out of which, being broken or cut, there iffues a Milk like Juice, a little bitter. The Flowers grow at the tops of the Branches, and conjiji of many Leaves, in color commonly blew, feldom white.

IV. *White Endive.* It is raijed of the Seed of the former *Garden Endive* fowed (not in the Spring, as is ufual, but) in July, whereby it remains till Winter, at which t'nve it is taken up by the Roots, and laid for two hours in the Sun or Air, by which means the Leaves will become tough, and eajily endure to be wrapped up into a heap; after which they are buried in the Earth, or in Sand, a* fome fay, with the Roots upwards, Jo cu no Earth or Air can get within, (which, if they could would caufe Rottennefs:) the which fo covered ?nay be taken up su need requires, and fo ufed in Sallets all the Winter, as is ufual in London, and many other places. This is called *White Endive*, and it feems, that the ancient Romans were not ignorant of it, *Pliny, lib. 20. cap. 8.* fpeaking to the fame purpofe.

V. *Curled Endive.* There is alfo another fort of *Garden Endive*, called *Endivia Calamiitrata*, *Inruoum intortum*, *Intubus Criopus vel Cripiiffimus*: this has a thick Root, with Fibres annexed, as the former has, which Root perfl'es, as does the whole Plant, after it has brought forth its ripe Seed. From this Root fpring up many Leaves, not much unlike to the

C H A P . CCXLIV.

O/ E N D I V E Garden.

I *TP H E Names: It is called in Greek, 2i «: by JL the Arabia/is, Dumbebe, Anubebe and Ende-

the Leaves of the Curled Cabbage-Lettice, but much larger, from among these Leaves spring up strong and thick Stalks, Jet with the like Leaves, but left, and not so amply curled or crimped as those below, or as the Leaves were, before it ran up to Seed. The Viewers grow at the tops of the Stalks, much like the former, and are of a like blew color. This (as well as the first kind) being whited according to the following Direllion is called White Endive, and is much used in Winter time as a Sallet, with great Pleasure and Satisfaction: but this Curled Endive is much the tenderer, and far the fairer and better for that purpose.

VI. *The Places.* These grow in Gardens only, but not only with us, but also thro' all Europe.

VII. *The Times.* They are sown in the Spring, and they flower in June and July, and their Seed is ripe in August, the whole Plant perishing before Winter. But when they are sown in July, then they will remain till Winter, and so taken up, may be whitened, (by the former Directions) and so be prepared for Salleting all the Winter.

VIII. *The Qualities.* They are cold and dry in the second Degree, Aperitive, Afringent and Hepatick.

IX. *The Specification.* They are peculiar against burning Fevers, the burning Heat and also Stoppage of Urine.

X. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Syrup. 4. A Decoction. 5. A Cataplasm. 6. A distilled Water. 7. A Powder of the Seed. 8. A Sallet.

The Virtues.

XL *The liquid Juice.* It is a singular Cooler, and therefore cools the excessive Heat of the Stomach and Liver, and is profitable against Inflammations of the other Viscera, and Heats in any other Parts of the Body: it is of very good life to be used in the hot and burning Fits of Agues, to cool the fame, being given three or four spoonfuls at a time, mixed with fair Water or distilled Water of the Plant.

XII. *The Effence.* It has the Virtues of the Juice, besides which, it cools the Heat and Sharpness of Urine, opens Obstructions of the Liver, Spleen and Urinary parts, and heals the Excoriations of the fame. Dose three or four spoonfuls at a time in a Glass of the distilled Water.

XIII. *The Syrup.* It is good in thin Rheums, causes Expectoration, helps the Strangury, and takes away the Burning and Scalding of the Water. Dose two spoonfuls or more at a time.

XIV. *The Decoction.* It has all the Virtues of the Juice, Effence and Syrup, but nothing near so powerful. It is usually made in Water, because it is more cooling, and more agreeable to the Nature of the Plant, and so it cools inward Inflammations, and heals admirably: it opens Obstructions of the Liver, Spleen, Gall, Reins, Bladder and Womb, and is said to be profitable against the Yellow Jaundice.

XV. *The Cataplasm.* It being applied, serves to attemperate and cool the Sharpness and Heat of the Humors, and qualify the sharp and corroding Matter which proceeds from ill-natured and fretting Ulcers. It is also good against hot and inflamed Tumors or Swellings, and peltential Sores, and admirably helps not only the Redness and Inflammations of the Eyes, but also the Dimness of Sight: and gives present ease in the same.

XVI. *The distilled Water.* It is finely cooling, and a singular Collyriumi to be used for, hot, inflamed, red and blood-hot Eyes, being dropt into them four, five or six times a day, it serves also for a Vehicle to convey some of the other Preparations in.

XVII. *The Voucher of the Seed.* It has all the Properties and Virtues of the Juice and Effence, and if we may give Credit to Authors, it is rather the more powerful, besides, it is available for Faintings and Swoonings, and other Passions of the Heart, given in a Glass of generous White Port Wine or Madera, Morning and Evening. Dose one dram or dram and half at a time.

XVIII. *The Sallet.* It is singularly cooling, and being made of the Whited curled Endive, it is very tender and delicate, agreeable to the Stomach, cooling and refreshing the weak and fainting Spirits, and is one of the best Sallets, to be used both in Autumn and Winter time.

CHAPTER - CCXLV.

Of ENDIVE Wild,

L^AT^A* *HE Names.* It is called in Greek, *Ἰνδία* *Jvit* > \$*yejL&: in Latin, *Endivia* *f. Intubumfylvestre*, and in English, Wild Endive.

II. *The Kinds.* It is twofold, viz. i. *Endivia fylvestris angustifolia*, Narrow-leav'd Wild Endive. 2. *Endivia fylvestris, vel Campestris latifolia*, Broad-leav'd Meadow Wild Endive.

h *w* *f* *e* *r* *i* *p* *t* *i* *o* *n* *s* - *T* *h* *M* *o* *r* *N* *a* *r* *r* *o* *w* *l* *e* *a* *v* *d* *W* *i* *l* *d* *E* *n* *d* *i* *v* *e*, has a pretty thick, tough and fibrous Root, which perishes every Year, as that of the Garden does. From this Root several very long; smooth, green Leaves arise, lying on the Ground, narrower than the Garden Kindive, and being much more bitter. The Stalk is (tenderer and lower than the other, yet growing many times half a yard high, being towards its top more full of Branches. On the tops of all which it bears small blew Mowers, like the Common Garden Endive; which being pulled away, there follows the like Seed also.

IV. *The second, or Broad-leav'd Meadow Endive,* has

has a thick, tough and woody Root, with many Strings adjoining thereto ; from which rife up many broad Leaves, fspread upoi the Ground, like to thofe of Garden Endive, but leifer, and fomewhat rougher : among which rife up many Stalks, immediately from the Root, every one of which are divided into feveral Branches, upon which do grow many blew Flowers, in Falhion like the former, fave that they areiefler.

The Places. The fecond grows in Meadows, borders of Meadows in many places. The firft is filpnd to grow Wild in feveral High-ways, and the Heads of Ploughed Lands in feveral Parts of the Kingdom, as alfo upon wild and untilled barren Grounds, epecially in chalky, ftony and gravelly places.

VI. The Times. They flower from the latter end of July to the end of Auguft, the Seed ripening foon after.

VII. The Qualities, Specification, Preparations and Virtues, are the fame with thofe of the Garden Endive in the former Chapter, fo that no more need be faid of them in this place.

VIII. Nota. In the Spring time the vulgar People are ufed to boil thefe Herbs in Pottage or Broths, for fickly Perfons, and fuch as have weak and ill-difpofed Stomachs ; for fo they correft the ill Ferment of the Part, ftrengthen the Ventricle, and purify the Mafs of Blood.

white within, zwith a Pith in the middle, of a very pieafant Tafte, but much more delicate, being Preferred or Candied zwith Sugar. From this Root; fpring up feveral Leaves, broad, almoit like to Mallow Leaves, but cornered on the edges, and deeply dented or cue in, fet round about with hard Prickles, (harp-pointed, and alfo a little crumpled, fat, of a blewifh white, of an Aroma tick or Spicy Tafte, and each ihnding upon a long Foot-fhlk, but they which grow up higher with the Stalk, do as it were encompaif it at the bottom : thefe Leaves are gentle, or nothing fo hard and prickly as when they grow older. The Stalk it ielf is round and frong, yet fomewhat crefted, having Joints, and Leaves on thofe Joints, more divided, (harp and prickly Ntlia the lower -, this Stalk is thick, about a Cubit in Height, now and then fomething red below, Branching it felf out towards the top, which Bunches have alfo feveral other Branches proceeding from them, each of them bearing on their tops feveral blewifh, round, prickly Heads or Knots, about the Bignefs of a Wallnut, held in tor the molt part ^ with fix fpall, jagged, prickly Leaves under them/ or encompassing the top of the Stalk round about, and ihnding like a Star ^ which Leaves, as well as Heads, are of a glittering blew, and fometimes are found greenifh or whitilh.... The Flowers coming forth of the Heads are liKewife blew, with white Threads appearing in the middle.

· C H A P. CCXLVI.

Of ERYNGO,
O R,
SE A « H O L L Y.

I. *!* HE Names. It is called in Greek, Eryngion ; JL in Latin, Eryngium, Erynge Plinii, Centum Capita ^ and by fome Apothecaries it is called, Iringus : in Englifh, Eryngo and Sea Holly.

II. Nota. Some referr Acanos to Eryngium *, but Lobe! doubts thereof, and referrs it to Drypis Theophrasti -, but Coefalpinus to the Crocodilion Diofcoridis : Lacuna calls it Glycyrrhiza fpinofa.

II. The Kinds. Authors make fix feveral kinds of this Plant-, but there are but two which are known to, and grow with us, viz. 1. Eryngium JymriKiim, Eryngium Mantimum Bauhini CfGefneri jfc hortis, Glycyrrhiza fpinofa Lacuna, Our common or V4ilgar Sea Holly. 2. Eryngium Mediterranean Gefrierti, Turneri, Gerardi, Lobelii, Eryngium Campejire Lobelii , Eryngium%ulgare Bauhini, Clufii, Qamerarii, (becaue in Germany there is no other fo frequent *,) Eryngium Montanum, Matthioli p hugdunenfts h Eryngium Lacuna, Cordi, Ccefilpini tfTabermontani, limply fo called without any E-pithite, and we in England call it, Mediterranean Mountain or Land Eryngo.

IV. The Defections. The firft, or Common Sea Holly, has a Root of an admirable Length, even to eight or ten feet long, fo that it can fcarcely ever be all pulled up, and about the Thicknefs of a Man's finger, fet with Knots, Rings or Circles here and there towards the upper part, but fsmooth and without Joints down lower, brownijh on the out fide, and very

Eryngo, or, Common Sea Holly.

V. The fecond, or Mediterranean Eryngo, has a long Root, like the former, but jhorter and flenderer, yet nearly a Fingers Thicknefs, black without ami white within, being of a Tap and Smell like the Other, which whilft newfprung up, and that they are youngs arealfo tender and fit to be eaten, thd not altogether jo fweet to be Eaten, nor fit to be Preferred, nor full out offo Aromatick a Tafte. The Leaves are diverily cut into feveral parcels or pieces, being all full of Prickles along the edges *, they are more divided, more prickly, and lefs Aromatick than the former/ The Stalk and Branches are not fo thick as the firft * but the Stalk is divided or ipread out (like

(iikeic) into many branches, which bring forth prickly Heads, but leſſer than thoſe of the other, from whence there alſo come forth blew Flowers, feldom yellow. There grow likewiſe, under every one of theſe Heads, fix rough and prickly Leaves, like to thoſe of the other, but thinner and ſmaller.

VL *The Places.* The firſt is found upon the Sea Shore or Coaſt almoſt in every Country, as in *Spain, Italy, France, England, Holland,* and in moll of the other *Northerly Countries*, it grows upon the Seaſide upon Beechy and Stoney Ground. It has been found growing plentifully at *Whitſtable* in *Kent*, at *Rye* and *Winchelsea* in *Suffex*, and in *EJTex* at *Landamer Lading*, at *Harwich*, and upon *Langtree Point*, on the other ſide of the *Water*, as alſo in *Gardens*, where it is ſometimes planted. The ſecond grows naturally on the *Mediterranean Coaſts*, upon the *Shores of the Levant Sea* as alſo in moll parts of *Germany*, and in *Eſpecial* in *Franconia*, in the *Vineyards* and *Highways* every where, as alſo in the upper and farther remote parts from the Sea, about *Narbone* in *France*, as *Label* and *Pena* lay, but with us it is only nurſ'd up in *Gardens*, where it very well thrives.

VII. *The Times.* They both flower in *June* and *July*, after the *Summer ſolſtice*; and give ripe Seed in about a *Month* after, viz. in *Auguſt*.

VIII. *The Qualities.* They, viz. the *Roots*, are temperate in reſpect to *Heat* and *Coldneſs*, and dry in the firſt *Degree*, having a *Thinneſs* of *Subſtance*, as *Galen* ſays; *Aperitive*, *Abſterſive*, *Anodyne*, *Carminative*, *Diuretick*, *Peſtoral*, *Nephritick*, *Alexipharmick*, *Analepſick* and *Spermatogenetick*.

IX. *The Specification.* They are peculiar againſt *Stone*, *Sand*, *Gravel* and *Tartar* in the *Reins*, *Ureters* and *Bladder*, *Strangury*, and all *Obſtructions* of thoſe *Parts*, eaſe the *Colick*, and *ſtrongly* provoke *Luſt*.

X. *The Preparations.* You may have therefrom
1. *The Root*, raw, roaſted or boiled. 2. *A Condi-
ture of the ſame.* 3. *A Juice* thereof 4. *An Ef-
ſem*. 5. *A Decoction* in *Wine*. 6. *A Powder* there-

of. 7. *An Ointment.* 8. *A Cataplaſm.* 9. *A li-
quid Water* of the whole *Plant*. 10. *The Juice* of
the *leaves*.

The Virtues.

XL *The Root*, raw, roaſted or boiled. They are thus eaten to provoke *Luſt* and encreaſe *Seed*: they open *Obſtructions* of the *Liver*, are good againſt the *Bitings* of *poyſonous Beaſts*, provoke the *Terms* in *Women*, prevail againſt *Convulſions*, *Quaiſys*, *Epilepfies*, and other like *Diltempers* in the *Heart* and *Brain*,

XLI *The Conditure.* The way of this dry *Prv* is thus: Take double or treble reſpect Sugar a pound or more, fair *Water* a pint or better, boil them together till they become a good *ſtrong Syrup*: to which *Syrup* add (being almoſt cold) two ounces or more of choice *Damask-Rolè Water*, an ounce of *ſtrong Cinnamon Water*, and a grain and half of *Musk* in fine powder, (the three laſt muſt be mixed, and the *Musk* infuſed together firſt for twenty four or forty eight hours, and then ſtrained out; and ſo put into the *Syrup*, being firſt half cold.) This being done, your *Roots* being waſhed, are to be laid to ſoak in fair *Water* for twenty four hours, and then very well pickt and cleanſed, after which they muſt be boiled in fair *Water* for the ſpace of four hours, till they are ſoft, after which they are to be taken out, and peeled clean, as you do *Parſneps*, and the *Pith* muſt be drawn out at the end of the *Root*, but if there is any whole *Pith* cannot be ſo drawn out, then you muſt flit them, and ſo take it out: theſe you muſt alſo keep from much handling, that they may be clean, put them into the afore prepared *Syrup*, in which let them remain to the next day, then ſet them on the *Fire*, in a fair broad *Confeſing Pan*, (made of *Copper* or *Braſs* double *Tinned* over) until they be very hot, but without any boiling at all; let them remain over the *Fire* an hour or more, removing them gently in the *Pan* from one place to another with a wooden *Slice*. This done, have in a *Readineſs* a great *Cap* or *Royal Paper*, upon which ſtrew ſome *Sugar* double or treble refined, upon which lay your *Roots*, having taken them out of the *Pan*. Theſe *Papers* you muſt put into a *Stove* or *Hot-houſe*, or a warm *Oven*, to dry and harden, but for want of ſuch a place, you may dry them over a gentle *Sand Heat*, in a *Sand Furnace*, or by laying them before the *Fire*. After this manner you may *Condite* or *Preſerve* any other *Roots* whatſoever. The *Roots* thus *Condited* or *Preſerved* are exceeding good for old and aged *People*, ſuch as are withred and confumed with *Age*, and which want natural *Moifture* or the *Humidum Radicale* as it is called, and therefore of confluence muſt be good for ſuch as are in *Conſumptions*: they are alſo good for ſuch as have al-
moſt loſt the *Defire* or *Appetite* to *Veneral*: A & L nounſting and reſtonje the Aged, and he Wg gainſt the Defeds of Nature in the Youn.
XIII. *The liquid Juice* of the ſe. It may be taken to two or three ounces Morning, Noon and
White Lib-
bon, White Madera Mountain White Wine, &c.
It breeds *Seed* admirably, and is ſaid to cure *Impo-
tency* in *Men*. It prevails againſt the *Kings-evil*,
the *Colick*, expels *Wind*, breaks the *Stone*, and
drives forth *Gravel*, *Sand*, and other *tartarus Mat-
ter* out of the *Reins*, *Ureters* and *Bladder*, provokes
Urine, and cures the *Strangury*, being drunk for
about fifteen days together. One would nor grunch
to drink it for a *Month*, to have all theſe great
things performed by it. It may be taken for four
ounces, upon occaſion.

C H A P . CCXLVII

Of EYE-BRIGHT Common or Meadow*

XIV. *The Effence.* It has all the Virtues of the liquid Juice; and by reason of its Fineness, much the better and pleasanter Medicine to be taken. It powerfully opens Obstructions of the Liver and Spleen, Reins, Bladder and Womb, is good against the Yellow Jaundice, Dropfy and Gout, and provokes the Terms in Women. It is good against the Bitings of Serpents, and the Poyson of the *Aconite*, or other poysonous Herbs, but in case of the Stone, Gravel, Sand, Strangury, &c. it ought to be taken fifteen or twenty or thirty days together, first falling in the Morning, and last at Night going to Bed. If the Use of this Medicine is continued longer, it not only removes the Stoppage of Urine and pissing by Drops, with the Sand, Gravel and Tartar of the Reins, and all other Defects of the Urinary Parts, but it is said perfectly to cure them, as also those who are troubled with the Stone, so as that those Pains shall never return again; which thing Authority has been proved by Experience, on such as have been a long time troubled therewith. Dose three or four Spoonfuls at a time in generous Wine.

XV. *The Decoction in Wine.* It has all the Virtues of the liquid Juice and Effence, but is less powerful, and therefore ought to be taken three or four times a day, sweetened with a little double-refined Sugar. It is usually taken (as well as the other things) to excite Coition, and is said to be good against the *French Disease* itself.

XVI. *The Powder of the Root.* This being taken to a dram in a Glass of White *Lisbon Wine*, with the Addition of half a dram of *Daucus* or *Wild Carrot*, Seed, expels Stone and Gravel from the Reins and Bladder, provokes Urine and the Terms, eases the Colick, refits Poyson, and cures the Bitings of Serpents and other venomous Creatures. It is singular good against the Scrophula, or those Tumors and Kernels in the Throat called the Kings-evil, being often taken Morning and Night in two or three ounces of the Effence above said.

XVII. *The Ointment.* It is made of the bruised Root, boiled in Hogs Lard. This being applied to broken Bones, Splinters, Thorns, &c. remaining in the Flesh, does not only draw them forth, but heals up the place again, making new Flesh where it was consumed or eaten away.

XVIII. *The Cataplasm.* It is made of the Roots beaten into a Pulp, or raw, or boiled, and then beaten into a Mass. This being applied to Struma's, or Kings-evil Sores, or to the Bitings of mad Dogs, Serpents, or of any other venomous Creature, it draws out the Malignity and Poyson, and quickly heals the Sore. In the Gout, whether of Hands or Feet, it gives present ease, and applied to Apotems, it quickly ripens and breaks them.

XIX. *The distilled Water.* It is drawn from the whole Plant when the Leaves and Stalks are young: it is profitably taken for all the Purposes above said: it removes Melancholy from the Heart, and is good for Quittan and Quotidian Agues, as also for them who, by Convulsions, have their Necks drawn awry, or cannot turn them without turning their whole Bodies: but in all these Cases the Juice or Effence are more powerful, and they may be taken in this distilled Water for a Vehicle.

XX. *The liquid Juice of the Leases.* Being dropt into the Ears, it is said to suppurate Apotems therein. And *Gerard* says, that being drunk with Wine, it is a Remedy for those who are troubled with a Gonorrhoea or Running of the Reins,

I. *THE Names.* It is called, as some say, by the Greeks *Evy&evitz*: in Latin, *Euphrasia*, *Euphrasia*, *Euphrasine*, (which is also a Name of *Bugloss*) *Ocularis*, *Ocularia*, *Ophthalmica* and *Eufrafia*: in English, *Eye-bright*.

II. *The Kinds.* There are many kinds of this Plant, but there are but two principal Species which are known to us, or at leastwise grow in our Country, viz. 1. *Eufrafia*, *Euphrasia*, and *Euphrasia vulgaris*. Our common Meadow Eye-bright, of which in this Chapter. 2. *Euphrasia*, and *Euphrasia linifolia Columnis*, (yet the Leaves are far less than those of *Flax*;) *Euphrasia fylvestris*, *Euphrasia*, vel *Euphrasia Lignosa*, Woody Eye-bright, of which in the next Chapter.

III. *The Description.* It has a Root which is long, small and thready at the end, from which usually rises up one small, low, blackish green Stalk, which spans high, or not much more, spread out from the bottom into several Branches, on which are set small, long, dark green Leaves, pointed at their ends, and dented about the edges, almost like a Saw, two always set together, and very thick. At the Joints with the Leaves, from the middle upwards, come forth small white Flowers, striped with purple and fellow Stripes, and Spots mixed therewith, after which follow small round Heads, with very small Seed therein. This being found on some hilly Ground, does sometimes vary in Color of the Flower, as being sometimes more whitish, sometimes more yellowish, and sometimes more purple.

IV. *The Places.* It grows in dry *Mezoria* in green and grassy Ways, and Pastures lying to the X %

Sun. I have found it in several Meadows near *lyn Regis* in *Norfolk*, within a Mile or ibmething more of the Town -, in Meadows near *liardwick*, and between *Hardtvice* and *Wcjl wench* : alfo in many places in *Kent*, in the barren Fields and walte Grounds near *Gravefend*, and in the places thereabouts •, and indeed it is frequent in Meadows and Grafy places in moll parts of the Kingdom.

V. *The Times*. It flowers in *Auguft* and continues to *September*, the Seed ripening loon after.

VI. *The Vitalities*. It is hot in the firft Degree and dry in the fecond, and is epecially appropriated to the Eyes: it is gently Afrtringent and Difcuffive.

VII- *The Specification*. It is a fingular Remedy (confirmed by Experience) againft all Difeafes of the Eyes.

VIII. *The Preparations*. You may have them, i. A *liquid Juice*. 2. An *EJfence*. 3. A *Decoftion or Infufion in Wine*. 4. A *Powder of the herb*. 5. A *Conferve thereof*. 6. A *Drink*. 7. A *Catapofm*. 8. A *diftilled Water*.

The Virtues.

IX. *The liquid Juice*. Taken inwardly Morning and Evening to two or three fpoonfuls, in a Glafs of generous Wine, it ftrengthens the Eyes and Optick Nerves, helps a weak Brain and Memory, iirengthens a weak Sight, and reftores it, being decayed, in a ftiort time. Outwardly dropt into the Eyes five or fix times a day, it takes away Clouds, Films, Bloodshot, and other things which obfcure the Sight.

X. *The EJfence*. It has the Virtues of the liquid Juice, being inwardly ufed and outwardly applied : it may be given inwardly to two or three fpoonfuls in a Glafs of Wine, Morning and Night

XL *The Decoffwn or Infufion in Wine*. It may be made in *White Lisbon or MaderaWme*, or your *Spanjfh Mountain Wine*. It has the Virtues of the liquid Juice and Effence, but not altogether fo powerful : a quarter of a pint of it may be drunk in the Morning falling, then half an hour before Dinner; as much at five in the Afternoon •, and laftly, the like quantity at going to Bed. It ftrengthens the Stomach admirably, and by confequence the Head and Optick Nerves.

XII. *The Powder*. Its Virtues are the fame with the Juice, Effence and Wine aforegoing, but it exerts not its Virtue fo obvioufly, or fo foon: it may be given to one dram Morning and Night, in a Glafs of Wine. If the Powder be thus compounded, you will find it much better: *Take Powder of Eye-bright five ounces, Powder of Rofemary-flowers three ounces, Powder of Nutmegs one ounce, Powder of Mace half an ounce, Powder of white Pepper two drams: mix them.* Dofe one dram, as before.

XIII. *The Conferve*. It has the Virtues of the Powder, but not altogether fo efficacious, becaufe of its being clogged with Sugar. You may take as much as a Walnut of it Morning and Night, drinking after it a Glafs of good Wine. If you make it of equal parts of *Eye-bright* and *fo/mary-flowers*, it will be fo much the more effectual ^ for *Rofemary* feems to be a Specifick to cure Difeafes of the Eyes.

XIV. *The Brinh* It is to be put into, or Tunn'd up with new Ale before it has done Working, to every Gallon you may put eight handfuls of the Herb, which you may gently bruike, and put into a thin Bag made of a Dairy-Wives Milk-cloth, with a Stone in it, to make it fettle. This is to be pu into the Ale or Beer whilft it is Workings which, sifter three or four days, may be drunk as ordinary

Drink : the conftant life of it admirably iirengthens the Eyes and clears the Sight.

XV. *The Cataphifm*. The green Herb made into a Cataplafm by beating in a Mortar, and then applied to the Eyes, is good againft hot, (harp and fcalding Rheums, Weeping of the Eyes and Bloodshot, abates the Inflammation, eafes the Pain, takes away the Dimnefs, and clears the Sight.

XVI. *The diftilled Water*. It is faid to have the Virtues of the Juice and Effence, but much more weak ; but may ferve as a Vehicle to take fom Sfor the other Preparations in. Outwardly ufed to the Eyes, (efpecially if a little white Sugar Cand^A is diffolved in it) it is of good Ufe againft an Oj^A-thalmy, Pains and (harp Humors •, it takes away Clouds, Films and Pearls, and clears the Sight.

CHAP. CCXLVIII.

Of EYE-BRIGHT Woody-

I. >np *HE Names*. It is called in *Greek*, *Ευφρασία*

X *fyhotifhs* : in *Latin*, *Eufragia*, vel *Euphrasia Lignofa* ^ *Eufragia pratensis rubra* :A in *Englifh*, *Woody Eye-bright*, *Red Woody Eye-bright*.

II. *The Kinds*. There are two Species hereof, viz. I. *Euphrasia lignofa major*, *Eufragia pratensis rubra major*, The greater red woody Eye-bright. 2. *Eufragia*, vel *Euphrasia lignofa minor*, *Eufragia pratensis rubra minor*, The lefler red woody Eye-bright.

III. *Nota*. The firft of thefe is the *Eufragia ahera Idodoneoi*, *Lobe Hi & Aliorum* : the *Sideritis pratensis rubra Lugdunensis*: the *Odontites Tabernmontani*: the *Ericoides rubrurn Thalii*; and the *Cratogeomom Euphrofyne Gerardi*. who makes it a kind

kind of *Crataegonon*, againft the Evidence of *Dodo fevs*, which is indeed an Error. The fecond is the *hrunella It alien Bauhini*, (in his *Phytopinax* -,) but the *Euphrasia pratensis latijolia Italica*, (in his *Pnax*;) and *Eufrajia purpurea minor*, (in his *Pndromms*;) and the *Eufrajia non fenpta tertia* G.

IV. The Defcriptions. *The Jirjt of thefe*, Greater red woody Eye-bright, has a Root which is made of fever al hard and woody Strings -, from yahid - rifes up one woody, fquare, brownijh Stalk, dividet to fever al Branches, a little above the Ground, feuf itfeems to be a pretty Bujh, about half a yard two feet high, fet with fomewhat long and narrow Leaves, pointed at the ends, and a little dented in about the edges, two always fet together at a Joint, one againft another, which will, in the Heat of Summer, turn reddifli : the Flowers are gaping and Hooded, of a purplifh red color.

V. *The fecond, or Smaller red woody Eye-bright*, has a fmall woody Root, jiringy and black -, from whence rifes up one fquare, reddifh, hairy Stalk, an handful or more high, fometimes without Branches, and ufually but with two, very feldom more, which are compaffed with a few thick, hairy and almoft round Leaves, fet two together* and deeply cut in* 6 parts -, the lower Leaves, which are the lefs, but into three parts, but the upper, which are the greater, into five or fix parts. The Flowers come forth fometimes from between the Leaves and the Stalks, and fometimes they ftand in Tufts at the tops, two ftanding together, Hooded, and of a purplifh color, coming out of long green Husks * fometimes the Flowers have been obferved to be white, yet but very feldom : which being faded or pafs'd away, there comes after them (contained in the faid Husks) long and comered white Seed.

VI. *The Places*. They are found in feveral parts of England, the firft chiefly in many places of Kent, in barren Fields and wafte Grounds, and in fome places near and about Gravefendi

VII. *The Times*. They flower about the latter end of July, and in Auguft, the Seed ripening foon after.

VIII. *The Qualities, Specification, Preparations and Virtues* of thefe Plants, are much one and the fame with thofe in the former Chapter, fo that no more need be faid thereof in this place.

CHAP. CCXLIX.

Of FETHERFEW Garden.

THE Names. It is called in Greek, *n&tfivov* (quafi planta Virginalk, quia mulierum morbis uterinis medetur, £f in Ae vulgomatricaria:) in Latin, *Parthenium, Matricaria Cf Febrifuga* : in Englijh, *Fetherfew* and *Feverfew*, (from the Latin Name) it being good againft Fevers or Agues.

II. *The Kinds*. It is twofold, viz. 1. *Parthenium, vel Matricaria hortenfis*, The Garden Fetherfew, of which in this Chapter. 2. *Parthenium, vel Febrifuga fylveftris*, Wild Fetherfew, of which in the next Chapter.

III. *The Garden kind* is alfo twofold, viz. i. *P*rthenium, Matricaria, vel Febrifuga vulgar it flore jimplici*, The common Fetherfew, with a fingle Flower. *Galen* fays this was called *Anthemit, Helxine* and *Linozofitis* in his time: *Pliny* fays, that *Helxine* was called *Perdicium* ^nd *Parthenium, dHbLeuctanthenum* and

Tammacum, fo that it teems *Par the mum* was a woid applied to many Herbs •, but it is only proper to our *Alatricaria*. 2. *Parthenium, vel Matricaria flare pleno* -, *Ar themeJia tenuijolia ft ore pic no*, Double-flowered Fetherfew.

IV. The Defcriptions. • *The firft, or Single-flowered*, has a Root which is fomewhat hard and fhort, with a multitude offtrong fibres at it, making it like a Bujh of them : from the Head of this Root fpring up many large, frejh, green, winged Leaves, very much cut in en the edges : the Stalks are hard and round, fet with many fuch like Leaves, but fomewhat fmaller, and at the tofe ftand many fingle Howers, growing upon many fmall Foot-ftalks, conftituting of ftyerai finall white Leaves, longifh and pointed, itanding about a yellow Thrum in the middle. The Smell of the whole Plant is Itrong, but agreeable enough to that Senfe, and of a very bitter Talte.

V. *The fecond, or Double-ftowered Fetherfew*, has a Root like the former *, and in its Stalk and Leaves a* alfo the Smell and Manner of Growing, it is Jo like the other, a* not to be ettily difcerned from it till it comes into Flower, and in that is the only difference -, for whereas in the former the Flower wa\$ only fingle, in this they are very thick,, and doubtly filled, as it were, with white Leaves, ib that only a little yellow Spot is to be i'eQn in the middle.

VI. *The Places*. They both grow in Garden* with us, and yet they have both been found growing Wild in this Kingdom, which is a Rarity. I rather think, that where they have been found growing fo, that it was by fome Accident they grew there, as the fcattering otibwe Seed, or Weeding the Plants out, and calling them into fome other place, where poffibly they might take root again, and fo grow up and feed, and ihed their Seed in the fame place.

VII. *The Times*: They flower in June and July and their Seed is ripe not long after.

VIII *The Qualities*. They are hot in the third Degree, and dry in the fecond \ alre Aperitive? Inci- fito*

five, Absterfive, AIMngent, Carminative, Digestive, Diuretick and Suppurative •, Cephalick, Neurotick, Stomatick, Pe&oral and Hyltrick •, Emmenagogick and Alexipharmick.

IX. *The Specification.* It is peculiar for provoking the Terms in Women, and forcing away both Birch and After-birth.

X. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Decofion of the Herb and flowers in Wine. 4. A Wine. 5. A Syrup. 6. A Ponder of the Herb and flowers. 7. A Cataplafm. 8. A difilled Water. 9. A Spirit u-om TinUure. 10. An AcidTintfure. 11. An Oily Tintfure. 12. A Saline TinUure. 13. A Spirit. 14. A diJtilledOil. 15. Potefiates or Powers. 16. An Elixir.

TJye Virtues.

XL *The liquid Juice.* It is good againft the Fits and Riling of the Mother, the Hardneis and Inflammation of the Womb, being taken once or twice a day, two or three fpoonfuls at a time, in a Glafs of Wine.

XII. *The Effence.* It has the Virtues of the Juice, and comforts and warms the Womb and all the Parts of Generation affii&ed with Cold and Moifure, and obftru&ed with thick, tough and tartarous Humors : it provokes the Terms powerfully, and brings away the Child, either dead or alive ^ as alfo the After-birth: it cleafes the Reins, Ureters and Bladder, expelling Stone, Gravel, Sand or vifcous Matter obitruQing them. It provokes Urine, and gives eafe in the Strangury- Dofe two fpoonfuls in the difilled Water, or in White Lisbon Wine.

XIII. *The Decoffion in White Port Wine.* It has the Virtues of the Juice and Effence, but lefs powerful ^ and therefore muft be given to all the faid Intentions in a much greater quantity, viz. to five or fix ounces, dulcified with white Sugar, and to be taken thrice a day, viz. Morning, Noon and Night.

XIV. *The Wine.* It is made by a reiterated Infufion of the Herb and Flowers in White Lisbon or Port Wine, for a Week or more. It admirably ftrengthenes the Stomach, warms and comforts the Vifcera, and cleafes them from cold, pituitous and vifcous Humors : if it is drunk for fome Months, it is faid to re&ify and ftrengthen the Confiftency of the Seed, and to cure Barrennefs in either Sex: it is good againft Melancholy, and Heavinefs or Sadnefs of the Spirits. • Dole a quarter of a pint three or four times a day.

XV. *The Syrup.* It is dedicated to the Breft and Lungs, and is ufed with good Succefs againft Coughs, Colds, Stuffings of the Lungs, Afthma's, Wheezing, Shortnefs of Breath and Difficulty of Breathing ^ it opens the Pipes, and cleafes them of the tough and vifcous Matter adhering to them: Dofe one or two fpoonfuls, to be lick'd alone with a Liquorice Stick, that it may diftil down the Throat gradatim.

XVI. *The Ponder of the Herb and blowers.* If it is taken, as Diofcorides fays, in Wine, to a dram or fomewhat more, mixed with Oxymel^ it will purge like to Epithimum^ both Cholera and Flegm, and will be available for all fuch as are Short-winded, or are Afthmatick, Bechick, or are troubled with Hypochondriack Melancholy, Heavinefs, Grief or Sadnefs of the Spirits. It is good for fuch as have the Vertigo, or Pains or Aches from Stuffings of Humors, or from a cold and moift Caufe.

XVII. *The Cataplafm.* Being made of the green bruifed Herb, and applied to the Crown of the Head,

it eafes all Pains thereof, as Cnmer arias lays, coming from a cold Caulè : it is alfo profitable for fuch as have a Giddinefs or Swimming in the Head. Applied to the Wrifts, with fome Salt mixt with it, two hours before the coming of the Fit of an Ague, the Patient withal drinking at the fame time half a pint or more of the aforementioned Decoction in Wine, it cures the fame, being four or five times ufed.

XVIII. *The difilled Water.* Authors fay, that it is good to take away Freckles and other De % ^ mi ties in the Face and Skin. This I know, that if to every quart thereof you put one ounce of r'al Nitre or of Sal Tart art, mixing, diftblving and Altering it thro' brown Paper -, you will then have Jiv excellent Cofmetick to clear the Skin of Tanning, Sun-burning, Yellownefs, Freckles, Lentils, Pimples, Scurft, Mbrphew, and other like Defoedations of the Cutis.

XIX. *The Spirituous TinUure.* It expels Wind, and is powerful againft the Colick, whether in Stomach or Bowels: it warms a cold Stomach, comforts and ftrengthenes it, revives the Spirits, cheers the Heart, fortifies the Womb, and makes it vigorous and fit for Conception. Dofe half a fptfmful or more in a Glafs of White Lisbon^ Morning and Night, or two or three times a day.

XX. *The Acid TinUure.* It is good againft Naufeating, and flops Vomiting, freighting the Stomach after an admirable manner. It is prevalent againft the Cachexia, aind the Green-ficknefs in yir* gins, makes a good Stomach and a ftiong Digestion, opens the Obfturations of the Womb and provokes the Terms, and reftifies the Defects of the Inftuments of Generation, occafionèd thro' Weaknefs. Dofe fo many drops as to give the Vehicle a pleafant Acidity, and that three or four times a day or more.

XXI. *The Oily TinUure.* It is good againft all cold and moift Difeafes of the Head, Brain and Nerves, as Head-achs, the Megrim, Vertigo, Apoplexy, Epileply, Convulfions, Palfy, Rheumatick Pains, Colicks, and other like Diftempers of thofe Parts. It is inwardly to be taken Morning and evening from twelve drops to twenty four or thirty, dropping it firft into Sugar, and mixing them well together ^ then mixing them with a Glafs of Wine, and fo drinking it off ^ it powerfully opens Obfturations of the Womb, Reins, Ureters and Bladder, prevails againft the Strangury, and expels Gravel, Sand and tartarous Matter from the Urinary Parts. Outwardly, againft Pains and Aches, Convulfions and Palfies, it is to be well anointed upon the Parts affected Morning and Night.

XXII. *The Saline TinUure.* Tho' it provokes Urine and opens Obfturations of Reins and Ureters yet it is moltly ufed againft Pains of the G. . . ternal Affe&ts and Defoedations of the Skin, fuch as we have enumerated at Sea. 18. affbreoime. for which Purports the Parts affected are Slo be bathed with warm Ware? to open the Pores of the Skin, then being wiped dry with a Cloth this Saline Tinaure is to be laid on, bathing the Vm well with it twice or thrice a day, and Stingit^ Y on.

XXIII. *We Spirit.* k i s h i . . . Cordial's good againft fainting and swooning Fits, refills the Power of malign Fevers, and the Poylbn of the Plague: it felt Given in a little Poffet-drink, it drives out the Meales and bmall-Pox powerfully, and fo lectures the Litè of the Patient. It is fingular alfo. againft Convulfions.

XXIV. *The difilled Oil from the whole Plant dried.* It has all the Virtues of the liquid Juice, Hence, Tin&ures and Spirit, but is much more powerful

powerful than them all, and may be given to all the same Intentions, from eight drops to sixteen or twenty, first dropt into Sugar, and then mixt with the Vehicle you design to give it in, whether it be Wine or any other specifick Liquor. It may be given twice a day, viz. Morning and Evening, but in case of a Woman in Labor, or in any Fits, whether of the Mother, Colick, Convulsions, Apoplexies or Fallisg-ficknefs, it ought to be given at that moment of time.

JKXV. *Potestates or Powers.* They have all the Virtues of the Juice, Effence, Tinctures, Spirit and Oil exalted in which the Virtue and Efficacy of the plant is so subtilized, as that it penetrates more readily into any Part they are applied to, whether they be inwardly given or outwardly used. Dose is from one to two drams, and upon Extremity to three, mixed with a Glass of Wine, or any other specifick Vehicle.

XXVI. *The Elixir.* This is the Powers elixirated and brought yet to a greater degree of Efficacy in Operation, being vehemently subtil, and still much more exalted in their Virtues and Effects. It may be given inwardly from half a dram to a dram and half or two drams (according as the Necessity may require) in a Glass of Wine or other fit Vehicle, Morning and Night, or oftner, as you see fit.

CHAP. CCL.

Of FETHERFEW Wild.

THE Names. It is called in Greek, *πάρθενιον*; in Latin *Partbenium fylvestre*, *Matricaria agrestis*, *Febrifuga agraria* and in English *Wild or Field Fetherfew*.

II. *The Kinds.* This is the second Species of *Fetherfew*, and is twofold, viz. 1. *Pcirtheniur*, vel *Matricaria bullatis floribus aureis*, Naked Fetherfew. 2. *Partbeniu?* vel *Matricaria grati odoris*, *Matricaria alt era Camerarii* Ar the me fid tenuifol'ni odorata *Tabernmontani* Matricarid odor at a hauh'au Sweet-scented Fetherfew.

III. *The Descriptions.* The first, or Naked Fetherfew, has a bushy fibrous Root like to the others, from whence spring vtp Leaves and Stalks, spreading themselves forth into many Branches, not at all differing from the former in Shape or Manner of growing. At the tops of the Stalks and Branches grow the Flowers, not like the former for this is a Head of naked yellow Thrums, without any Pale or Border of white Leaves, as are in the others, which is the only thing by which this kind differs from the other two, and for which Reason it is called *Naked Fetherfew*.

IV. *The second, or Sweet-scented Fetherfew, has a bushy fibrous Root, like the first Common kind, and in its Leaves, Stalks, Branching forth and blowers, it differs not at all from the first, being in all things so like, that there can no Difference be perceived between them, till you come to smelling to it, and then you will find it to be of a more pleating and odoriferous Smell, which is continued in the kind, and is not altered, nor made by Art, but is the Work of Nature only nor yet degenerates from this Excellency by any Accident or Casualty whatever.*

V. *The Places.* The first grows in the Levant, and was there found growing by one Mr. William Coys; The second has been found Wild in many places of England (as well as the former naked kind.) *Comerarius* also says, that it grows in an Island called *Uva* in the *Levant Sedi*: but they are both of them nurs'd up With us in our Gardens.

WbJTimt; The flower both of them is

June and July, and the Seed ripens in the mean time.

VII. The Qualities, Specification, preparations and Virtues of both these, are the same with the two former in the Chapter just foregoing, so that no more need be fo'd thereof in this place ; but this is to be noted, That these two Plants fall no ways below the other two, in their Power, Force and Efficacy.

CHAP. CCL

O/FENNY-S TONES, OR, MARSH-PALMS.

I-TPHE Names. We know of no Greek Name X belonging to them : but in Latin they are called, Serapias^ vel Orchis palustris, and Orchis palmata palustris : in English, Fenny-ftones, and Palmed Fenny-ftones, or Marjh-Palms.

II. The Kinds. There are several kinds of them, as, i. Serapias vel Orchis palmata palustris latifolia, Fenny or Marfh hand'gl Stones with broad Leaves. 2. Serapias vel Orchis palmata palustris Leptophylla, Thin4eav'd Fenny or Marfh handed Orchis or Stones. 3. Serapias vel Orchis palmata palustris Icevifolia, Marlh or Fenny handed Orchis fsmooth-leav'd. 4. Serapia* vel Orchis palmata palustris maculata, Spotted Marfh or Fenny handed Stones. 5. Serapias vel Orchis palmata palustris Dracontias, Marfh or Fenny Dragon handed Orchis or Stones. 6. Palma Chrifti palustris maxima, The greateft Fenny handed Stones. 7. Palma Chrifti palustris radice repente, Creeping Fenny or Marfh Palms.

III. The Descriptions. The fir ft, or Marfh hand'ed btones with broad Leaves, has a Root which has

long Divifions at the bottoms of lbs Hands, the top of the Root is thick and knobby, divided into lingers; like thofe of Palma Chrifti, of which this may be did to. be a kind. From this Root rife up thick, fat and fpongy Stalks, fet with broad, fsmooth, green Leaves, like thofe or Plant ane, but much longer; theie are growing in order, upon the Stalk, even from the bottom to the top or beginning of the Spike of Flowers, growing fhaller as they grow higher, and appear nearer to the Spike. The Tuff or Spike of Flowers is large, confifting of many, Spall hooded flowers, of a lbmewhat whitifh or pale blufh color, fpotted within with deep purple Soots, the backfides of which Flowers are of a Violet tolor mixt with purple : and every Flower, at its rifng up from the Stalk, has a fmall greeniih Leaf accompanying it.

IV. The fecond, or Thin-leav'd Fenny handed Stones, has Roots exaBly like to thofe laft defcribed.; the Stalk is aljb like 5 but it differs from the former Somethng in the Leaves, for in this Plant they are fmall, being neither fo broad nor yet fo long, iomenmes fpotted, but more ufually without; neither is the fpiky Tuft of Flowers fo large or long, tho' they are thck fet, like the firft, nor has it fo many green Leaves or long Leaves mixed with, or growing between the Flowers, which are of a Violet purple color, but not altogether of fo dark a purple as the former are.

V. The third, or Fenny or Marfh handed Stones fsmooth-leav'd, has a handed and fingred Root with Some Strings adjoined to the upper parts of them like unto the two others: the Stalks are much alike the Leaves are like the laft, but Smaller and narrower* and without Spots: and the Flowers are of a whitift color, but more purely white; the Flowers and the whole Plant being in Magnitude, Shane or Form, and Manner of Growing, but little differing from the others.

VI. The fourth, or Fenny or Marfh handed Stones fpotted, has a Root fafhwned like a Hand, -with Some Strings faft ned to the upper parts thereof: from the Head of which Root rifes up a fair tuft Stalk, armed with large Leaves, very notably dafht with blackifh Spots, clipping or embracing the Stalk round about. At the top of the Stalk ftands a fair Tuft or Spike of purple Flowers, with many green, Leaves mingled among the fame, which makes the Buth or Turt much greater. The Seed is nothing elfe but Duft, as it were, (like all the reft of the kinds) and is contained in fmall twined Veflek which VefTels are not peculiar to this alone, but common to molt of the other Orchides

VII. The fifth, or Fenny or Marfh Dragon-ft Stones, ha* cleft or divided Roots 7 i p much like unto the Roots of P... this is a kind; and from this... of a foot high, fet here and Lilly like Leaves, of a red color or embrace the Stalks almoft rot... Leaves of Thorow-war. At the top of the Sta... grows a fair Buth of... which Flowers are... Leaves. The Seed is...

VIII. The... or G reateft ^ nny handed Stones, ft. has hand'd Roots, like to the others, from which the feel X*? *... the Leaves are much like to thofe of the former kinds of lenny-ftones before defcribed • and the Growing on a large fpiky Head are of an elegant purple, with little Hoods, like the top of an rieU met: whence Gemma called the Plant, Cynojbrchis _ Conopfaa.

[G?/ra/d?rf and *Alacrocaulos* from its height.] These Flowers smell sweet, and are succeeded by Seed, like that of the rest of the Kindred.

IX. To these Gerard gives us another, which he calls, *Palma Chrifti* (*palufiris*) *raice repent c*, Creeping Penny or Marsh Palm, or Creeping Palma Christi: it has creeping Roots, without Testicles which are many and long, creeping far abroad in the Ground, contrary to all the rest of the Orchides, which Roots are of the Bigness of large Wheat Straws, in Stance like those of Soapwort \$ from the which & immediately rise four or five broad smooth Leaver like unto Small Plantane Leaves: from a Joint which (hoot up a small and tender Stalk, at the top of which grows a pleasant spiky Head of Flowers, of a whitish color, spotted on the inside with little bloody Specks, which leave V effete containing very small Seed.

X. *The Places.* They all of them grow in fenny Grounds, or in marsh or moory Grounds, also in shady Woods or Groves which are watery and marshy, and often over-flowed with Water. The sixth, or *Great Palmi Chrifti*, delights to grow in Grounds of an indifferent Temper, not too moist nor too dry. The seventh, or *Creeping Palme*, was found by Mr. Robert Abbot of Bishops hat field, in a boggy Grove, where a Conduit-head does stand, which sends Water to the then *Queens-house* in the same Town. It also grows plentifully in Hampshire, within a Mile of Petersfield, in a moist Meadow, called *Wood-mead*, near the Path leading from *Petersfield*, toward *Beryton*.

XI. *The Times.* The first flowers more early than the *Ordinary Orchis* or *Cynorchis*. The second flowers after the former: but they all flower from the latter end of April thro' all May and June, some of them flowering more early, as the first and second kinds, and other some more late.

XII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the *Cynorchis* or *Dog-fiones*, which we have declared at large in Chap. 226. foregoing, so that no more need be said thereof: yet this is to be noted, That these *Fenny-fiones* are not of so great Power and Force as are the *Cynorchis*, and several other kinds of the *Orchides* or *Testicuti*, of which we speak in their proper places.

rot undo minore, Small termed, or tennei with smaller round Seed.

IV. *The Descriptions.* The first, or *Common Garden Fennel*, has a Root which is long and whit, running down deep into the Ground, spreading it self up into several Branches: from this Root rise up divers round stiff Stalks, four or five feet high, which spread themselves out (at many of their Joints) into divers Branches of long Stalks, of fine, small, long, fibrous Leaves, swelling somewhat in range, but not unpleasent: and at the tops, on several Branches there are Tufts or tumbles of small yellow Flowers, which turn into small, long, roundish-cornered, bitterish, greenish Seed, two always together, as in the other Umbelliferous Plants which being ripe, and once dried, become of a sad grey color. Of this Plant there are truly two sorts, (tho' one Description does serve them both) the one wholly with green Leaves the other with reddish Leaves, or with reddish green Leaves, they not differing one from another in any thing else.

V. *The second, or Small Fennel* With foal let round Seed, in its Roots, Stalks and Leaves differ from the former, but only that they are every way less, being much lower than it and that the Umbles at the Heads of the Stalks are white, and the Seed which follows is less than the ordinary sort, being more like to Caraway or Caraway Seed: the whole Plant, both in Smell and Taste, and in its Form and Manner of Growing, is the same with the other *Common Garden kind*.

VI. *The Places.* These Plants grow in all hot Countries, in Asia, Africa and America, and in some of the West India Islands, 'tis said, they feed their Cows with it: but with us in England it grows only in Gardens.

VII. *The Times.* They flower in June, July and August and the Seed is ripe not very long after.

VIII. *The Qualities.* According to Galen, it is hot in the third Degree, and dry in the first it is admirably Aperitive, loGifive, Anodyne,

CHAP. CCLII

Of FENNEL Common-

THE Names. It is called by the Arabians, *Raienigi*: in Greek, *Μελλαν* & *ν*. Latin, *feniculum*, and in English, *fennel*.

~ II. *The Kinds.* There are four principal kinds of fennel, viz. 1. *Yeniculum vulgare*, of which in this Chapter. 2. *Feniculum dulce*, Sweet Fennel, of which in Chap. 253. 3. *feniculum fylvestre*, Wild Fennel, of which in Chap. 254. 4. *Peucedanum*, Hog or Sow Fennel, of which in Chap. 25 J. following.

III. Of the *Vulgar or Common Garden fennel* there are two sorts, viz. 1. *feniculum majus vulgare*, The greater common Garden Fennel. But *Casalpini* calls it *feniculum fylvestre*: *Carrier-artus* in *horto* says, that some took it to be *hippomarathrum*, but that was a Mistake, as we (hall (hew in Chap. 254. 2. *feniculum minus* & *feniculum jmine*

five, Digestive, Diffusive, Suppurative and Traumatick \$ Neurotick, Stomack, Peccoral and Hyterick •, Emmenagogick, Sudorifick, Alexipharmick, Analeptick, Galeogenetick and Spermatogetick.

IX. *The Specification.* It is peculiar for healing Ulcers in the Lungs, helping against the Strangury, and to open Obstructions of the Womb and all the Urinary Passages, Strengthening the Tone of all those Parts.

X. *The Preparations.* You may have therefrom, 1. *The whitned Leaves and Stalks.* 2. *A liquid Juice.* 3. *An Effence.* 4. *A Decoction of Leaves and Roots.* 5. *A Syrup.* 6. *A Powder of the Seed.* 7. *An Oil by Infolation.* 8. *A Balsam of the Leaves and Roots.* 9. *A Cataplasim of the Leaves.* 10. *A Spirituous Tincture of the Seed.* 11. *An Acid Tincture of the Juice.* 12. *An Acid Tincture thereof.* 13. *An Oily Tincture thereof.* 14. *A Saline Tincture of Herb, Root and Seed.* 15. *A Spirit.* 16. *An Oil distilled.* 17. *A halfam.* 18. *Pot est at es or Powers.* 19. *An Elixir.* 20. *A fixed Salt.* 21. *A Liquor of Fennel.* 22. *The Gum.*

The Virtues.

XL *The whitned Leaves and Stalks.* They are whitned after the same manner as you whiten *Curl-ed Endive* or *Sallery* or *Smallage* Stalks, &c. being thus whitned, the *Italians* are said to take great delight in eating them as a Sallet, for then they are very tender, and pleasant to the Taste: they comfort and warm a cold Stomach, help to digest crude flegmatick Humors bred from viscid Meats, *fennel* being thus eaten, it breeds Milk in Nurseries Breasts, provokes Urine, and encreases the Seed •, opens Obstructions, expels Wind, and provokes Urine. The constant eating of this whitned *fennel* for some considerable time, I have known to cure a vehemently stinking Breath, and to make it as sweet as theirs which never smelt amiss.

XI. *The liquid Juice.* Mixt with a Glass of Wirie or Ale, and so taken by Nurseries, it encreases Milk in their Breasts, expels Wind, provokes Urine, eases the Pains of the Strangury and Stone, expelling all the preternatural Matter in the Urinary Parts. It is said to break the Stone, more especially if it is made of a gritty Substance. Dose three or four spoonfuls Morning, Noon and Night in any fit Liquor.

XII. *The Effence.* It has all the Virtues of the Juice-, besides which, it encreases Seed, prevails against the Colick, eases the Tortions of the Bowels or Gripping of the Guts from acrid or sharp Humors, strengthens the Stomach, and causes a good Digestion. It opens all the Obstructions of Liver, Spleen and Gall, and thereby much conduces to the Cure of all such Diseases as arise from those Causes, as windy Swellings of the Spleen, Hepatick-flux, Yellow Jaundice. Being dropt into the Eyes it cures almost all Diseases affecting that Pair. It opens Obstructions of the Womb, and provokes the Courses estequally. Dose three or four spoonfuls.

XIII. *The Decoction of the Leaves and Roots, or Seeds in Wine.* This has not altogether so much Force as the Juice and Effence, yet it is very good for all the same Intentions, and is much more used than either of them, because it is pleasanter • but then it must be taken in a much greater Dose. It is an excellent thing to open all Obstructions in the whole Body, to cleanse the Blood, to stop the Hiccough, and take away Nauseating, to provoke Urine and the Menstrues, to amend the ill Color in the Face after a long Sicknes, and to cause a good Habit thro' the whole Body. If such as are grown

over fat should often drink of it, it would lessen their Fat, abate their Fleth, and much remove their Unwieldines, making them more nimble, agil and pleafant.

XV. *The Syrup.* It is one of the greatest of Peccorals ^ for as it is a powerful Opener of Obstructions of the Lungs, and Diffuser of their Tartar, so it famously causes Expectoration, and gives ease in Asthma's, Coughs, Colds, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and other like Difficulties of those Parts. If here-with you sweeten well either the Juice, Effence or Decoction, and let the Patient take two or three ounces three or four times a day, it cures Ulcers of the Lungs, or any Sourness of the Stomach, and such restores in Consumptions: in which last case it is good for the Patient to use a Milk-Diet, and to drink a quart of Milk warm from the Cow, well sweetned with this Syrup, every Morning failing •• as much Milk so sweetned at Eleven before Noon •, another quart at Five in the Afternoon •, and lastly, another quart at Bed-time in like manner. If the Patient cannot drink a whole quart, let him drink as much as he can, and continue this Course for several Weeks, or till he recovers ^ by this Method I have known several perfectly restored out of very deep Consumptions.

XVI. *The Powder of the Seed.* It strengthens the Stomach, gives ease in the Colick, opens Obstructions, and helps Shortness of Breath. You may give it Morning and Evening from half a dram to two drams in any convenient Vehicle. The constant Use of it wonderfully strengthens the Sight.

XVII. *The Oil by Infolation or Boiling.* It is Anodyne, and eases all sorts of Pains in any Part of the Body, coming from a cold and moist Gu*£. It gives ease also in Inflammations, by gently diffusing some part of the thinner Matter. If it is an Apoptem, which will come to Suppuration, it softens it, and brings it as much as may be to a point. It eases the Gout and other Pains of the Joints and Nerves.

XVIII. *The halfam of the Leaves and Roots.* It is one of the greatest of Vulneraries, and cures simple Wounds at one Intention, for the most part at one Dressing. I am apt to believe, that this Balsam, for the Curing of Wounds and Ulcers, &c. is not inferior to any Balsam made of the greatest Wound-Herbs, as *Sanicle*, *Selfheal*, *Clowns Wound-wort*, *All-heal* &c. It digests fordid and eating Ulcers, cleanses, incarnates, dries and heals after a very admirable manner.

XIX. *The Cataplasim.* It gives present ease in the Gout, being applied, as also, diffuses and heals any simple Contusions •, and applied as hot as can be endured to the Sides or Hypochonders, it eases the Pains of the Sides, takes away Stitches, and give* Relief to the Distempers of the Spleen and Paf, ^

X. *The distilled Water.* It is of good Use, as a Vehicle, to convey other Preparations of this Plant in, and has all the Virtues of the foregoing Preparations, but in a much lower degree: it is used to be dropt into the Eyes against Ophthalmies or Inflammations and Blood-flux, as also against hot and sharp Rheums with which the Eyes are commonly afflicted, which causes Clouds, Films, Pearls, &c. to breed in them, but it is better for all those Purposes, if white Sugar-Candy or clarified Honey be dissolved therein ^ then if ulcerated, it cleanses the Ulcer or sore, prevents the Afflux of Rheum, dries and heals them.

XXI. *The Spirituous Tincture of this.* It is famous against Pains, Aches and Sicknes of the Stomach, Pains of the Spleen and Womb \ it gives ease

cafe in the Colick, and prevails againft the Yellow Jaundice. You may take from two drams to four in a Glafs of White Port Wine, at time of Extremity, otherwife Morning and Night, fo long as Need requires. Bathed upon places affe&ed with the Gout or Sciatica, Cramps or Convulfions, in a fhort time it gives Eafe and Relief.

XXII. *The Acid Tincture.* It cures preternatural Vomiting, Naufeating of Food, want of Appetite and Digeltion, the Colick and the Gout, when by copent it afflicts the Stomach; it warms and wonderfully corroborates that Bowel, reftoring and lengthening its Tone, tho' very much depraved. It is powerful againft the Bitings of mad Dogs, Vipers, Rattle-Snakes, and all other Serpents and yernorous Creatures whatfoever: and after a fingular manner prevails againft Afthma's, and all forts of Obftructions of the Lungs, inciding, diffolving and caufing an Excretion of the tartarous Matter affe&ing them. Dofe *ib* many drops as to make the Vehicle gratefully pleafant in all the Patient drinks.

XXIII. *The Oily Tincture.* It prevails againft Cramps and Convulfions of the Nerves ^ is powerful againft the Colick, and all Obftructions of the Reins, Ureters and Bladder, whatfoever * breaking any gritty Stone in thofe Parts, and caufing it, as alfo Sand, Gravel and tartarous Matter to be expelled by Urine. Bathed upon the Back-bone, and upon the Parts affe&ed with the Palfy, it is very effectual in the Cure of that Difeafe, but then you muft anoint therewith Morning and Night, rubbing it very well in for a confiderable time. It gives prefent eafe in the Gout and Sciatica proceeding from a cold Caufe, and by a conftant Application thereof many times cures thofe Difeafes. Inwardly, tP give Relief againft Stone and Strangury, you may take from ten drops to thirty in any fit Vehicle.

^ XXIV. *The-Saline Tincture.* It is good againft Strangury, Stone and Gravel, being given a dram or more at a time in White Lisbon Wine. Outwardly bathed upon Parts affe&ed with Herpes, Tettars, Ringworms, Pimples, Rednefs, Yellownefs, Tawinefs, Blacknels or Blewnels of the Skin, as allb Scurff, Morphew, Scabs, Leprofy, Freckles, Lentils, *fffe*. it quickly takes them away and cures them, being ufed two or three times a day.

XXV. *The Spirit from the Seed, or Juice fermented.* It is a fingular Stomatick and Cordial, it refrefhes, comforts and ftrengthens the Stomach after an admirable manner, taking away Vomiting, Naufeating, want of Appetite and Indigeltion, OV. It cheers the Heart, revives the Spirits, fortifies the whole Habit, and makes the Body able to withftand pifealés. It fingularly expels Wind, and gives eafé in all griping Pains in the Stomach or other Vifcera. It may be taken to one fpoonfull or two, either alone of it felf (being dulcified) or mixt with a Glafs Vt *Rne, every Morning falling.

51XVI. *The Oil diftilled out of the Seed.* It has ali/the Virtues of the Juice, Efflence, Deco&ion, Sy-^{up}, Pouder, Tin&ures and Spirit, and much ex-^{£u4s} them all in its Potency and Might of its Operation. It may be given from four drops to twelve, fifteen or twenty, according to the Age, and as the Keceffity of the Occafion may require. In the ufing of it, drop it firft into white Sugar, and mix them well together, then mingle all ia a Glafs of Wine, and *ib* drink it off. This may be done Morning and Evening, or at the time of any Paroxyfm, fo long a? you fee need. Outwardly anointed upon the Wound or Pun&ure of a Nerve, it gives immediate Eafe and Relief-, anointed down the Back-bone, and upon the Parts affe&ed with a Paralyfis Morning and Evening, it wonderfully reftores the Paralytick Parts, and in a little time after compleats the Cure.

XXVII. *The Balsam.* This Balam is twofold, 1. *Balfamian F&niculi Vulnerarimn.* It is thus made: *Take of half am Cap hi three ounces, half am of Verity Beef-feet, of each an ounce and half Chymicd Oil of Fennel-feed one ounce, fine Bees-voax half an ounce r melt, mix, and make a Balsam.* It is one of the belt of Balfams for green Wounds, epecially thole of the Nerves and Tendons, and commonly cures fimple green Wounds at once Dreffing. 2. *Balfamum Pefforale.* It is thus made: *Take choice Oil of Nut* megs by Expreffion four ounces, Balsam of Tolu, Chymical Oil of Fennel-feed, of each one ounce, Balsam of Peru and Capivi, of each half an ounce 5 welt, mix, and make a Balsam.* It is an excellent Pettoral -5 and being taken to the quantity of a Nutmeg at a time, it not only helps againft Colds, Coughs^ Catarrhs, Hoarfenefs, Wheezing, Shortnefs of Breath and Difficulty of Breathing, but alfo cures Ulcers in the Lungs. It may be taken Morning and Evening. It alfo heals, by outward Application, Wounds of the Nerves and Tendons, and eafes and rakes away any Ach or Pain proceeding from a cold Caufe, in any Part of the Body, being anointed upon the Parts affe&ed Morning and Evening.

XXVIII. *The Potentates or Powers.* They have all the Virtues of Juice, Effence, Deco&ion, Tin&ures, Spirit and Oil, and are alfo more volatile and fubtil than any of them *, for which Reafon thpy more* effe&ually pierce any Part they are applied to. Inwardly you may give from one dram to three in any fpecifick Vehicle. Outwardly you may bathe any pained, numbed or Paralytick Part with the l&me twice a day, rubbing the l&me well in.

XXIX. *The Elixir.* As this is the Powers drill more fortified, fo it is more efficacious in Operation, and may be given to all the Intentions and Purpofes for which the Potestates are given. You may give from one dram to two in a Glafs of Wine\$ Morning and Evening, *h* and in cafe of a Paroxyfm or any great Neceffity, at the fame time. It is one of the greateft of all Pectorals, and therefore profitable againft all Difeafes of the Lungs from a cold and moift Caufe; and being given in a molt vehement Colick, it gives immediate Eafe *h* provokes Urine, and prevails againft the Strangury.

9 XXX. *The fixed Salt.* It admirably abforbs A^ acids in the Stomach and Lungs, deftroys the Tartar of the Lungs, Reins, Bladder and Joints, and there^ fore prevails againft all fuch Difeafes as proceed from that Caufe. It is alfo peculiar in opening all Obftructions of the Vifcera, and in particular thofe of the Womb. Dofe from ten grains to a fcruple or more in any fit Liquor.

XXXI. *The Liquor of Fennel.* It is made two ways: 1. Take the green Stalks of Fennel towards the end of Summer, and whiift green put one of their ends into the Fire, which hold there for a lit* tie while, fo will a certain Liquor drop out there' from at the other end, which receive and keep for Ufe. It is a very good thing for the Eyes, for it ftops any Rheum or Defluxion, heals Blood-hot, and clears the Sight from any Mifts, Clouds' or Films. 2. Cut a hole in a green Fennel Stalk as it grows, about a foot or more from the Ground, near the upper part of the Joint, and put thereinto white Sugar-Candy in fine pouder, as much as it will hold, then flop it clofe up with Wax, and Leather tied over it, fo, a\$ no Rain or Wet may fall into it; when it has remained three or four days or more* place a good piece of foft Wax a little below' th^ lower Joint of the fame Internode, fo formed as that it may make a little hollow Gutter ^ and a little a^ above this Gutter, at the lower part of the Joint, cut another hole> fo. will a Liquor diftil therefrom^

which, by means of the Gutter, you may receive in a Veffel, which keep for life. This has all the Virtues of the former, and full as beneficial for fore, blGod-fnot, dim, cloudy and blemifhed Eyes as the ocher, being dropt into them three, four, five or fix times a day, as you fee need requires,

XXXII. *The Gum of Fennel, or its In/pi(Jlute Juice.* It has all the Virtues of the liquid Juice, and may be given from one dram to two, difflvled in any fpecifick Liguor or Wine. If this Gum or Juice is difflved in fome of the difilled Water, ^nd fweetned a little with white Sugar-Candy, and it is given to Nurfes to drink, it breeds much Milk in their Breafst: and if it is dropt into the Eyes, it very much clears the Eyes from Clouds, Mifts, Films, Blood-fhot, and other like Matters which onfucate the Sight. In *Southern Climes*, and very hot Countries, if ftwW-Stalks are wounded whilft they are green and growing, the Juice will exfudate and become this natural Gum: but in our cold Countries, it yields not to this Operation^h therefore we are obliged to make the Juice by Expreffion[^] and then to infpiflate it by a gentle Evaporati-on on a Sand Heat, till it is perfectly dry.

CHAP. CCLIII
Of FENNEL Sweet.

THE Names. It is called in *Greeks* M*&Q&v yteM&v: in *Latin*, *Yosniculum dulce Matthi- oji*, *rxmculum vulgare Ijudunenfis* \$ and in Eng-^lfh, *Sweet Fennel*

II. *The Kinds.* It is the fecond general Species of the *Fennels* ^ but differs in Sweetnefs according to the Country in which it grows.

III. *The Defcriptions.* *Tbx in its Roots, Stalks, Leaves, Flowers and Manner of Growing, is per- jectly like our Common Fennel, excepting that it neither in Foreign Climates, where it grows natural- ly^ nor yet here with its in England, does grow Jo large,; or rife to jo great a height on the Common large Garden kind does: and with us it with fome difficulty endures the Hardnefs of our Winters: but the Seed of this is much larger and longer than that of the Common kind, yellow, and very much fweeter in Taft, coming near to the Sweetnefs of Anifeed, which fo continues in hot Countries, but holds not out any long time to that Perfektion; nei- ther as to its Magnitude, Color or Sweetnefs -, but decaying yearly, does z£ the third Years Sowing- yield as ordinary Seed as the Common kind.*

IV. *Not a. i.* From this you may obferve, that it is the Clime and change of Soil which caufes this Alteration, making it either larger or fmaller, long- er or fliorter, yellower or paler colored, and makes it to be either fweeter or bitterer in Taft ^ which Change of Accidents has made fome think, that thefe were divers forts of this *Sweet kind*, whereas indeed there is no more than one.

V. *Nota. 2.* There is a kind of *Fennel*, which the *Italians* call *Carduus Fennel*, and which they would make different from this *Sweet kind*^h but it is no fuch thing, for it is only the Art of ordering it, which feemingly makes the Difference from this *Sweet*, which is done by Tranfplanting and Whi- tening it, by which means the Leaves are made to grow much more thick and bufhing together than the *Ordinary*-, the Whitning of it alfo giving it a fweeter-Rellifh, a pleafanter Taft, andafhorter Crifpndſ in eating.

VI. *The Places.* It grows univeifMly in almott all hot Countries * and flourifties well enough in our Gardens, being lbwn with Foreign Seed every Year, where the Seed it felf comes to Perfe&ion; but you ought to fow every Year new Foreign Seed, not the Seed of the *Englifh* Production, becaufe that is very apt to degenerate.

VII. *The Times.* It flowers and feeds with us in July wA'Auguft, and if it is an early and warm Spring, towards the latter end of June *, and the Seed is ripe in Auguft or September.

VIII. *The totalities, Specification, Preparations and Virtues* of this, are the fame with the *Common fennel* in the former Chapter, faving that this is ac- counted the more excellent and efficacious of the two^h and therefore to the Difcourfe and Sections of the former Chapter I lhali wholly refer you.

CHAP. CCLIV.
Of FENNEL Wild,
OR,
HORSE-FENNEL.

THE Names. It is called in *Greek*, *Tr-mutigfiyy*: in *Latin*, *Marath-unt* *agrejtps*, *rxmculum hieftre*, *tipfomarathon-*, and in *Englifh*, *Wild Fennel* and *Horse Fennel*

II. *The Kinds.* It is the third Species of *fennel*, and is threefold, viz. i. *'cemculum fylvejire com- muni**, *Fd'niculum erraiicum* AUtkioll. The vulgar or

or common Wild Fennel. 2. *Fenniculum fylvestre Creticum, Hippomarathrum Creticum, Honorii Belli, Platecumino Creticorum,* Great or Horfe Fennel of Candy. 3. *Hippomarathrum spharoccephalum,* Great round-headed Horfe Fennel. *Anguillara* supposes the first of these to be *Hippomarathrum verum.*

~ III. The Descriptions. *The first, *A Common Wild Fennel, has a Root like to the Common Garden kind, and grows up with great Stalks, but fewer than it, having also but few Leaves, and those very thinly set thereon, but somewhat stiffer or harder in handling, and shorter also. At the tops of the Stalks grow small Umbles of yellow Flowers, not much unlike the Common, saving that they are letter, which being puffed away, the Seed follows, being small and a little roundish.*

IV. *The second, or Great Horfe Fennel, has a great ivhitijh Root, not much unlike the former, from whence springs up a round, but crested Stalk, three, four or five feet high, about the thickness of ones middle finger or Thumb, having very fine Leaves thereon, but shorter than the Ordinary sort. This Stalk is divided into several branches, bearing at their-tops Tufts or Umbles of yellow Flowers, which being puffed away, there comes in their places great, large, and almost round Seed. This is the Plant which Belltus makes mention of in his first Epistle to Clufws, Which is extant in the end of his History of Plants, whose Seed, as he there says, is as large as those of Cachrys or Canchrys, Herb Frankincense, nearly as big as Hordea Decoraticata, or Hull'd Barley.*

V. *The third, or Great round-headed Horfe fennel, has a Root which is long and white, and endures many Tears, from whence rise up large Stalks, four or five feet high, with Fennel like Leaves, and Spreading themselves forth towards the tops into many Branches. At the tops of which Branches grow round, Globe like Umbles of Flowers, of a purple Violet color-, which being puffed away, there comes in their places large fennel like Seeds, but of a very*

strong Smell, almost linking. This Plant is taken notice of by *Alpinus libro de Exotick.*

VI. *The Places.* They all grow naturally in hot places, as *Turkey, Barbary, Spain, Italy, &c.* The first was brought to us out of *Spain* by *Eoeh,* and the rest grow well in our Gardens, being raised from the Seed brought to us out of their native Countries.

VII. *The Times.* They all flower in the end of Summer and beginning of Autumn, as in *July, August* and *September* -, and the Seed is ripe not very long after.

VIII. *The Qualities Specification, Preparations and Virtues* of all these, are the same in all respects with those of our *Common Garden fennel* in Chap. 252. foregoing so that nothing more need be said of them. Authors say, that these *Wild Fennels* are hotter and stronger than the *Common Garden* or *Sweet Fennel,* and therefore more powerful against the Stone; but not so effectual to encrease Milk in Nurses Breasts, because dryer in Quality. *Bellus* says, that in *Candia* they use the Seed of the second sort to Dye their Hair yellow*

CHAP. CCLV,

Of FENNEL Hogs,

O R,

SULPHUR-WORT,

I. *Hp H E Names.* It is called in *Arabick, Harbd-JL tuth:* in *Greek, mvx,ijkv@* :* in *Latin, Fenniculum Porcinum, Peucednus* and *Peucedanum* by *Apuleius,* *Pinafellus,* (I suppose from its Pitchy Smell .,) and in *English, Hogs Fennel, Sow Fennel* Hoar-Jrange and *Sulphur-wort.*

ii. *Ibc r-jn-h.* Authors nuke generally three kinds of this Plant, viz. 1. *Feucedanum vulgare, Veucedanum Gennariicum hauhini, Ptucedanum- Tra- gi, Fufchii, Dodonai, iff aliorum -, Focniculum Forc- inum, Can la Forcina Tahcrnmontani, Common^ a** Ordinary Kogs Fennel. 2. *Ftucedanum Matthioli, jinguillartf. & aliorum, Fcucedanum majus, & ma- jus Italicum Lobe Hi & ljtgduncfnu,* The greater Hogs Fennel. 5. *Fcucedanum ?nin/s, Feucedanum facie pcrpujilla Lobetii, Feucedanum Fannonicum Clufii,* Small Hogs fennel: this both *Bguhinus* and *Clufu/s* luppose to be the *Saxifraga fecunda Mat- ibicli.*

III. The Defcriptions. *The firft, or Common Hogs Fennel, ha* a Root thick and long, fometimes almoft as large or thick as a Man's Thigh, black without and white within, of astrong andfulphure- cn/s Smell, and full of a yellow Sap or Milk, which hang extratted, quickly grows hard and dry, fmel- ling not much unlike to Sulphur or Brimstone, which inducedfome to call it Sulphur-wort, having alfo at the top, towafds the upper Face of the Earth, a certain fiuh of Hair, of a brown color ^ from a- mong which the Leaves and Stalks do fpring up. From this Root then, fprings up a itiff and hard Stalk, fiill of Knees, Knots or Joints, befet with Leaves, like to Fennel, but greater, coming nearer to Ferula, or rather like to the Leaves of the Wild Fine-tree, (from whence, as alfo from the Smell- might come the Name *VinafteUr**.) Auhe tons of the Stalks grow round fpoky Tufts, full of little yellow Flowers, which being palsd away, do turn into broad brown Seed.*

IV *The fecond, or Great Hogs tennel, has a Root zrowinz & rē<it and deep into the Earth, with many other Branches and Fibres about them, having a Ifrone Smell, like hot or melted Sulphur, which be- in* cut yields forth a yellowifh Milk or clammy Juice, almpft like to a Gum.* From the Head of this Root proceeds feveral long branched Stalks, of thick and ibmewhat long Leaves, three for the molt part joined together at a place ; among which rifes up a creited Stalk, ftrait, and near as thick as a *Common Fennel* Stalk, with fome Joints thereon, and Leaves growing thereat ^ towards the top of which fc freads ic felt out into feveral Branches, and on the tops of the Stalk and Branches.gOw feveral Tufts of yellow Flowers, which being pafs'd away, there comes fomewhat flat, thin and yellowifh Seed, • twice as large as *Fennel* Seed.

V. *The ihird, or Small Hogs Fennel, which k the Dwarf kind, has a Root about the Bignefs or Thick- nefs of a Man's Thumb, fometimes greater, fome- times leffer, with a Bufl) of Hairs at the top, black- if)) or brownifh on the outside and whitifh within, with a thick Bark, of a pleafant sweet Tafte at fir ft, ami afterwards fharp :* the whole Plant is lefs than the hrft kind before defer!bed, having fmaller and fhorter Leaves, of a blewiuh green color, of a little bitter Tafte, but almoit of no Smell. The Stalk is flender and round, about half a yard high, which freads it felt into feveral Branches, at the tops of which grow fmall Tufts of white Flowers in an Umble •, which being pais'd away, there fuceeds thick fhort Seed, almoit like *Parley* Seed, but of an Afh color, and of a bitter fharp Tafte.

VI. *The Places.* The firft grows in many places of this Kingdom, as in the fait low Marthes near *Feverham* in *Kent*, and in die Meadows adjoining, where it is found plentifully h alfo on *Hit South* fide of a Wood belonging to *Waltham* ; at the *Nafe* in *Ejfix*, by the Highway fide •, alfo at *Whitftable* in *Xent*, in a Meadow near to the Sea fide, fome tim-

•eloning to *Sir Henry Cri/p7* and adjoining to his Koufe there.. The fecond grows upon the Sea Coaf: of *Italy, Spain* and *France*, and is only found with us in Gardens. The third was found on *Vincent's- Rock* by *Bnftol*, where *Label* gathered it, and fome others : as to this third kind, *Gerard* fays, that it grows not above a foot high, and is in Shape and Leaves like to the True *Peucedanum*, or cur firft /L^bNit Jvbnjbn (the fucceffive Author of that ••rbdyfiys the Stalk ^s about half a foot high, di- vided into fundry Branches, crejied, broad, bearing at their tops little Umbles of white Flowers, confifting of five Leaves apiece. The Reafon for thefe vari- ous Differences, as to the Height of the Stalk or Plant, I • fuppole muft be from the Variety of the places where it grows, and from the Richnefs or Poverty of the Soil, which makes many Plants differ in that Refpect, making one and the fame Herb to be fometimes greater, fometimes leffer.

VII. *The Times.* They all flower in the end of Summer, viz. in *July* and *Auguft*, and the Seed fe 15 ripe foon after.

VIII. *The Qualities.* *Hogs Fennel* is hot in th* fecond Degree and dry-in the third : it is Attraftive Aftngent, Cleanfing, Anodyne, Carminative and Traumatick or Vulnerary ., CeDhilirlr XT 1. Peoral, Hyfterick and Aiffidk^ ••• Ptarmickand Alexipharmick, * ••

IX. *The Specification.* ••• You may have it made up into a Juke. 3. A Decoffion of the ••• in Wine or •••

6. jT B m - > ASpirhnn Tincture. I An AalTmUure. 9. An Oily Tintliure.

The Virtues.

• 5L VZl hq^ Juice of the Root tiff is mixed with a little Vinegar and Rofewater, or with a lit- tle *Euforbium* in fine powder, it makes a good Er- rhine

rhme to purge the Head of pituitous, cold and moilt Humors, and fo does good to thoiē who are troubled with the Megrim, long and inveterate Head-achs, Vertigo, Lethargy, Epilepfy, Apoplexy, Phrenfy, Madneis, Pally, and molt other Difeafes of the Nerves and Tendons. Given to two or three fpoonfills in a Glafs of White *Lisbon*, it purges the Belly gently, expels Wind, difcuffes the Hardnefs of the Spleen, and eafes the After-pains of Women in Child-bed.

XII. *The Infuffate Juice.* It has all the Virtues of the Liquid, being difflbled in Wine or Water, and ufed in the lame manner: difflbled in Wine and* dropped into the Ears, it eafes the Pains in them, and put into a hollow Tooth, it eafes the Pain thereof: difflbled in Water, and given to fuch as are troubled with Vapors or Fits of the Mother, it cures them: difflbled in Wine to the Thicknefs of Turpentine, it cures the Ruptures of Childrens Navels when they flick forth, being applied with good Bandage: and given to one or two drams, difflbled in White *Lisbon* or Port Wine, it provokes the Terms in Wbmen, and facilitates the Birth, brings forth both Child and After-birth.

XIII. *The Decoffion of the Root in White Lisbon or Port Wine.* It has all the Virtues of the liquid and infuffate Juices, but in a much lefs degree of Efficacy: fweetned with Honey or Sugar-Candy, it is good for Coughs, Colds, Catarrhs[^] Afthma's, Shortnefs of Breath and Difficulty of Breathing, expels Wind, and gives eafe in the Colick. Dofe four, fix or eight ounces three or four times a day. It is a good Lotion to waih moift running Sores withal, for it cleanfes and dries them, ftrenghens the Part, and induces the Healing.

XIV. *The Pouder of the Root.* Being put into inveterate and foul Ulcers, running Sores, and fuelike of dfficult Cure, it cleanfes them thoroughly, removes any Splinters of broken Bones, or other things in the Flefh, ftrenghens the Part admirably againft Defluxions, dries them, induces their Cicatrizing, and perfectly heals them -, and therefore is alfo of extraordinary Uie to be put into fuch Ointments and Baliaims as are Vulnerary, and applied to the Cure of ftubborn and rebellious Ulcers, fultula's, and the like. This Pouder being taken to a dram or more, mixed with the Seed of *Garden Rue* half a dram, and taken in Wine and Water mixt, or in Water alone, it allays Vapors from the Spleen and Womb, and cures Fits of the Mother.

XV. *The Cataplafm.* It is good to be applied to the Bitings of mad Dogs, Vipers, Rattle-Snakes, and other Serpents and venomous Creatures for by its powerful attractive Force, it draws forth all the Venom and Poyfon from the Part, and lecures the Life of the Patient: but this is to be underftood, that it muft be made of the green Root beaten to a Pulp, and it will be fo much the better, if half the quantity of *Garlick* be added to it, and alfo that it be applied to the Wound whilft it is recent, or preffently after it is made. Th[^] Cataplafm draws forth iikewife Thorns, Splinters, and fuch like things which are got into and ftick in the Flefh *, and it is good againft Pains, and Aches of the Joints, or any other Parts, proceeding from Cold and Moisture.

XVr. *The Balfam.* It is good for cleanfing, drying and healing of old Sores, putrid and foetid Ulcers, and the like, in any Part of the Body. It is an excellent thing againft the Sciatica and Gout, whether in Hands, Arms, Legs or Feet *, and gives eafe in any other Pain, as alfo in Tumors or Swellings, bringing Apoltems to Suppuration in a little time: it warms, comforts and ftrenghens any Part debilitated thro' Cold, or a Flux of Humors upon the lame,

XVii. *The Spirituous Tindure of the Root.* It powerfully warms and comforts a cold Stomach, cleanfes and incalidates the Womb, facilitates the and Nerves, as Vertigoes, apoplexies, Hpilepfes, Lethargies, Convulfions, Rallies, and the like, being inwardly taken, and unvaidly appl'ea to etie Parts affected. Dofe from oje co cwo dnms in fome ipecitick Vehiēle Morning and Night.

XVIII. *The Acid Tincture.* It cures Naufeounefs and Vomiting, and lo alibiutely ftrenghens a weak Stomach, that there are for chat purpote but few things better. It is 9 fingular thing to iuppreff Vapors and the Fits'pf the Mother, expels Wind, and gives eafe in the Colick. Bathed upon places affe&ed with the Gout for fome time, it absolutely cures it. It caufes a good Appetite and a flmng Digeftion, realties the Difcraiv of the Blood and Humors, purifies them, and absolutely cures the Scurvy, whether in a hot or cold Habir of Body. Dofe fo many drops at a time as may make a Draught of Wine, Beer or Ale ple&antly acid.

XIX* *The Oily Tmifure.* It cures D>ieafes A the extrem Parts arifine from Cold ai,a Mo-iV're, ftrenghens the Nerves and Tendons, being anoiitied upon the Parts afiefted, and is a truly nopi[^] thing againft Convulfions and Pailies. It ope:s Obftu&ions of the Reins, and cleanfes the Ureters and Bladder from Scones, Gravel Sand and-taitarousor vifcous Matcer adhering to them, and gives preffent Relief in the Strangury ! if alfo prefflts the Fits of Agues, being given in fome rir Vehiēle cwo hours before the coming of the Ht. Dofe from ten to twenty drops or more in a Glafe oi generous-Wine, being firft we'l mijt with white Sugar, and chat Morning and Night.

CHAP. CCLVL

Of ANUGREEK Garden,

I. *TP# 2? *Names.* It is called in *Arabick*, *Olbd V Hebbe* and *Helbe*: in *Greeks* *Tsw* by *Dhcorides*: B?^©- *Theophrasti*, a *Comic jimitudine five fit Capri vel Bovis*, the crooked Seed-Veffete being fo like to their Horns ^ jte&ā™, ^ dt^akjtf ft<pocratis: in *Latin*, i'&numgr&cum^tevnum *Græcum*^ for that *Columella lib. 2. cap. 11.* fays the *Greeks* had two times of fowing it, the one before Winter, to be Fodder for their Cattel, the other in *February*, for Seed ^ for which Reafon he calls ir, *Siliqua* * *Pliny* calls it, *Silicia* ^ and *Varro*^ *Si lie ul4*: in t:glijh we call it, *tcsnugreek*^ which is as much as to fay, *Greek Hay*.

II. *The Kind's.* They are principally two, viz. i. *Yoenumgroecum falwum*, *Garden Fcenugreek*, of which in this Chapter. 2. *Vosnumgrscum fylvefle* *Wild Fcenugreek*, of which in the next.

III. *The Defcription.* *It bos a Root which is fmall^ and made of many Fibres^ perfifung every, rear after it has perfeited its Seed^ before Winter: from this Rootfpring forth fometimes but one, Jomvtimes two or three long^ flender, trailing, hollow, green Stalks, which fpread themfelves out into jveral Branches-, on which do grow, at jveralJ faces, many Leaves, almbfi like thfe of the Meadow Trefoil* but rounder and leffer, green on the upper fide, but tending*

tending to an Ajh color or grey on the lower side, they are always, three fet together on a toot flalk, almost round at ihs cnis, and a little dented about the edges. From the Joints of the Stalks, with these Leaves, come torch small white flowers, not much unlike to Peafe Blooms, but much less, which being pafs'd away, after them, follow long, slender, narrow, fiattUh, crooked Cods or Horns, small or sharp pointed, in which are contained small, uneven cornered Seeds, of a yellowilh color, which being dried, have indeed a pretty strong Smell, but not unpleasant.

IV. *The Places.* It grows almost in ^U parts of the World : in Foreign Countries the ^j whole Fields of it, for Fodder for their Cattel, but with us it is only sown in Gardens, and yet it grows as well here as in any other place. #

V. *The Times.* In Foreign Nations, they sow it for Seed in the end of *January* or beginning of *February*, but we in *England* sow it not until ⁿ, and it flowers with us in the beginning of *July*, and the Seed, is ripe in the end of *August* or beginning of *September*: but for Food for Cattel, it is sown before Winter, as is before hinted.

VI. *The qualities.* *Galen* says it is hot in the second Degree and dry in the first : it is Aperitive, Cleanfing, Aitriiigent and Vulnerary, a good Pectoral and Hyfterick, and withal Cathartick, purging away gross Humors.

VII. *The Specification.* It is peculiar against the Dyientery and other Fluxes of the Bowels, as also a Gonorrhoea.

VIII. *The Preparations.* 1. You may have therefrom, 1. The prepared Pulve or Seed. 2. A Decoction in Wine. 3. A Bath. 4. A Meal. 5. A Mucilage. 6. An Oil. 7. A Cataplasma. 8. A Juice from the Leaves.

The Virtues.

IX. *The prepared Pulve.* They bury it a while in Earth or Sand till it sprouts a little, to make it sweet; then it is carried to the Market to be sold

or Food. This, says *Alpinus* the *Egyptians* eat * and *Qalen* says it was used (among the *Grecians*) in his time, for that it makes such as eat it to grow fat, and therefore is thought to cure Consumptions, and to be good for Consumptive People. Those *Eajern* People did use to eat it as they did *Lupin*, for that it was more agreeable than *Lupins* having nothing in its own proper Substance which is obnoxious : sometimes the Pulve is preserved in Pickle, and so eaten to keep the Body soluble.

X. *The Decoction in Wine.* It mollifies the Hardness of the Spleen and Womb, and eases the Pains of those Parts, opens their Oblstructions, and is good against Hypochondriac Melancholy, makes smooth the Bowels, and helps the Pile called *Tenasmus* which is a desire often to go to Stool, without doing any thing. It prevails against a Dyentery or Bloody-flux, and all other Fluxes of the Bowels. Applied to the Forehead with Cloths dipt therein, it stops the Flux of Humors to the Eyes, eases their Pains, and takes away their Inflammation. Used also in Clysters, it is said to be good against the Stone, by opening and mollifying the inward Parts. It cures Ulcers in the *Intestinum ReSum* and the Other Guts : drunk to the quantity of half a pint, it purges and cleanses the Stomach of gross and evil Humors. If the Decoction is made with Dates and Honey, it mundifies or cleanses the Breast and Lungs, causes Expectoration, and heals Ulcers of those Parts. The Decoction being made in Wine or Water and given inwardly half a pint or more at a time, Morning and Night, for some days together, cures a Gonorrhoea. *Alexis*.

XI. *The Bath.* It is made by boiling the Seed in Water till it is broken. If Women sit in it as hot as they can endure, it opens Obstructions of the Womb, and (if it be about the time) provokes the Terms. Bathed upon Parts affected with the Gout, it eases the Pain thereof, and removes Aches which come of Cold : it is also good to wash the Hair and Head, and to cleanse it from Scurf, Morpew and dry Scabs. It heals Ulcers of the Womb, strengthens the Part, cleanses, dries and restores its Tone.

XII. *The Meal or Pouer.* Taken to two drams mixed with a little Honey, it is Pectoral; and causes an Excretion of many pernicious Humors which lodge in the Stomach and Guts, matures inward Apertems, cleanses Ulcers in the Breast and Lungs, and heals them, and eases the griping Pain of the Bowels : but in some People it is apt to overturn the Stomach or cause a Loathing, especially in such as are weak and tender, but troubles not such as have strong Stomachs, as have most of your robust Country People.

XIII. *The Mucilage.* Applied to the Joints, it gives ease in the Gout and other like Pains. Applied to the Forehead with Cloths dipt therein, it stops Fluxes of Humors to the Eyes, eases their Pains and Inflammations. Taken inwardly with Honey, it is Pectoral, and causes an Expectoration of thick, tough and gross Humors out of the Breast and Lungs, and is profitable against Coughs, Colds, Catarrhs, Asthmas, and other Difficulties of those Parts.

XIV. *The Oil made by Expression or Infolation.* *Lobefkys* it is of more Virtue than will be believed, and that it is good to dissolve hard Tumors or Kernels, difficultes scirrhus Swellings, mollifies the Intraills, Womb and other Parts, removes Scurf and Morpew, and cleanses, dries and heals Ulcers of the privy Parts.

XV. *The Cataplasma.* It is always made of the Meal, mixed with other proper Ingredients. If it is made by boiling it to a Thickness with Mead, it

is Emollient, and waftes away hard Swellings. If it is made with Vinegar and Nitre, it cools all manner of Inflammations, softens hard Tumors, and causes them to waft away, it eases the Pain, and it tenses the Hardness of the Spleen. Applied to the running Sores of the Head, called "A^y^ Achores, it cleanses, dries and heals them : and if it is also applied to weak and feeble Parts, whether ulcerated or not ulcerated, it strengthens them * and if ulcerated, cleanses, dries and heals them. Made with Linfeed and Marfh Mallow Roots, it is an excellent Emollient, and also a Maturative, where the Tumor will be brought to Suppuration. The Meal beaten up with Gooie-Greafe made into a Peiary, and put up the Womb, softens the Hardness thereof, opens its Obstructions, and mollifies all the Parts adjacent to it. Made into a Cataplasm, by boiling it up with the best White Wine Vinegar, and applied to the Testicles, it is an excellent thing to soften and abate any hard Tumor or Swelling there, and to ease the Pains thereof. Applied also to the Joints, it eases the Pains of the Gout.

XVI *The liquid Juice of the Leaves.* Physicians seldom use any thing of this Plant besides the Pulve or Seed, yet Experience has informed us, that if the Juice of the Leaves is taken with Honey, that it purges the Body by Stool from all corrupt and obstruive Humors, cleanses the Stomach and Bowels, and by reason of its mucilaginous Substance, alleviates the Sharpness of the Juices, and eases the Tortions of the Guts ; and by reason of its cleaning and scouring Faculty, it expectorates tough and sharp Humors out of the Brest and Lungs : this it more effectually Performs, if it is made into a Lohoch, with Pulp of fat Dates.

CHAP. CCLVII.

Of FENUGREEK Wild

THE Names. It is called in Greek, *Τύνη*, *tyttA* in Latin, *ferium Gnecumfylvestre* -, and in Engliſh, *Wild Fenugreek*.

II. *The Kinds.* It is twofold, viz. 1. *Fenum Grxcum fylvestre majus*, The greater Wild Fenugreek. 2. *Fenum Grxcum fylvestre minus*, The lesser Wild Fenugreek.

III. *The Descriptions.* The first, or Greater Wild kind, has a Root which is thick, tough and pliant, having some Fibres adjoining thereto, from which spring forth several Stalks, which are round, and spread themselves forth into many Branches, which are full of Knees or Joints, not much unlike to the Garden kind. From each Joint proceeds a small tender Foot-stalk, upon which do grow three Leaves, and no more, somewhat fringed about the edges, like as the former, or somewhat like to those of Saint Foine or Burgundy hay : and from the same Joints also come forth small yellow flowers, like unto the Manured, which stand more together at the end, bringing forth small long Cods, like those of the Garden, and which contain within them smaller and darker Seed.

IV. *The second, or Lesser Wild kind, has a tough creeping Root, with some fibres thereat; from the Head of which Root rises up but one slender Stalk, 4 inch but seldom branched, of about a foot high, and scaly, as it were, at the bottom ; upon which does grow such like Leaves as the former ^ and at the*

Joints Flowers like to those of the Garden kind, but which were lesser, and also (standing single; which being puffed away, Cods or Horns succeed, which are broader and more flat, and ending in a final Thread, in which is contained the Seed, which is also less.

V. *The Places.* They both grow Wild in *Spain and Italy*, but with us are only nurs'd up in Gardens.

VI. *The Times.* They flower with us in *July* and the Seed is ripe in *August* or *September*.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are not declared by any Author but if one may make a Judgment by the Form, Smell, Taste, Substance and mucilaginous Properties of the Herbs and their Seed, they differ not from those of the Garden kind in *Chap. 2; 6*, a forego^{ing}

CHAP - CCLVIII.

Of FERN Male,

THE Names. This Plant is called in *Antient* *bick, Sarax*: in *Greek*, *ῥίτφ ἕκ x) n^ b^* cause the Leaves are like to the Wings of Birds 2 in *Lix^ Filix 3* and in *Engliſh, Fern*.

• II. *The Kinds.* There are many kinds of *Te>%* as, 1. *Felix Mas*, called by *Nicander* in *theriacis^* *BAM^BAJUWF*, Male Fern, (and yet this very Species *Anguilara, Cxfdlpinus* and *Gejner* call *Kr>mina*) of which we shall treat in this Chapter. 2. *Felix Femina*, Female Fern, of which in *Chap. 259** 3. *Felix Quermt*, Oak Fern, of which in *Chap. 260*. 4. *Felix Saxatilis*, Rock or Stone Fern, of which in

Chap. 261. *S. Filix Florida, Aquatica, vel pain-
jlrh*, Water Fern, or Ofmund Royal, of which In
"Chap. 262. To these you may add, 6. *Polypodium*,
Filicula, *Polypodie*. 7. *Lonchitis aspera*, Rough
Spleen-wort, or Efridges Fern. 8. *Aplenium cctc-
rach*, Smooth Spleen-wort -, of all which in their
proper places.

III The *Måle kind* is that which we treat of in
this Chapter, and is called by *Nicander*, *Blethron*.
It is, 1. *Yd'ix mas vulgaris*, Our common Male
Fern. 2. *Filix mas aculeata*, *Filix mas aculeata mi-
nor Bauhini*, Prickly Male Fern. 3. *Fi'ix mas acu-
leata major Bauhini*, The greater prickly Male Fern.

IV. The Description. *The first, or Common*
Male Fern, has a Root consisting of a brown, Ically,
*thick He-ad; from which Head nothing but a multi-
tude of small black, hairy Fibres or Strings proceed,*
growing from the lower parts thereof: from this
Head of the Root spring forth several hard, rough,
unbranched Stalks of winged Leaves, naked or bare
at the lower ends. These at the beginning of the
*Spring you may perceive to come forth of their fold-
ing Clusters, covered with brownish Scales at the Su-
perficies of the Earth, very closely joined together.*
A young Plant has but a few Leaves, but an old one
has ten, twelve, or more. Each Stalk of Leaves,
at its lower end, near the Joining to its Fellows, at
its first appearing, before it is an inch long, has
*some of those black fibrous Roots for its Nourish-
ment. The Leaves being come to their full Growth,*
have each of them a threefold Division, (as has the
Femak Fern,) 1. The main Stalk. 2. The fide
*Branches growing from it. 3. The Nerves grow-
ing on those fide Branches bearing the Leaves. The*
main Stalks of some of these Leaves, are sometimes
one, two, three or four feet in Length or Height,
which are full of those brownish Scales towards the
backside of which, the Seed for the
falling of it is contained. These Leaves are firm,
meane while, the other fide, naked
*flat on one fide and round on the other (accord-
ing to the Height thereof) whereof the longest pair*
are the third pairs from the Root, being in some
Plants, six, seven, eight or nine inches long and
from this longest pair they grow shorter and shorter
towards the top, and are many times in number
fourteen, eighteen or twenty pairs: for the most
*part towards the Root they grow by couples, al-
most opposite, but as they grow higher towards the*
*tops, they grow nor opposite, but in the middle, be-
tween their Opposites. The Leaves on the fide*
Branches, are from an inch, to an inch and a half
long, and so grow shorter and shorter toward,
the tops of the fide fide Branches or Wings, from
twelve or fourteen to twenty in number on each fide
the longest Wing or fide Branch. The small Leaves
grow by couples for the most part on the Nerve,
each Leaf being a little cut in on the edges, each
*Dent ending with a sharp Point, green on the up-
per fide, and paler on the under fide, each Leaf has*
two Rows of dusky red Scales, of a brown

blackish color. Towards the top of the main Stalk
those fide Branches change into Nerves, bearing on-
ly the Leaves. When the Leaves are at their full
Growth, you may see in the midst of them at their
Roots, the laid scaley folding Clusters -, and as the
old Leaves, with their black thready Roots, whol-
ly perish, so the laid scaley folding Clusters spring
up again, but in warm places, you will many times
find the old Leaves green all the Winter.

V. *The second, or Prickly Male Fern, differs not*
much from the former, but only that the winged
Leaves are not dented in, but whole, having a small
Prick at the end of each of them, and growing not so
high. This Parkinson thinks to be the Filix mas
aculeata minor Bauhini; but thinks, that there is but
little difference between it and his major.

VI. *Gerard describes that which he thinks to be*
Fi'ix mas aculeata major Bauhini after this manner:
The Leaves of this are of a deeper green than either
of the former, and are placed on the Nerve not very
close together, but that you may plainly see between
them, each Leaf (especially those next the Stalk)
having on that fide farthest off the Stalk, a large Ear
or Outgrowing, ending with a very sharp Point,
and very fine or small, as doth also the top of the
Leaf. Some of the fides of the Leaves are also
notched or dented in, ending with the like Trick or
Hair, and each Leaf has two Rows of dusky Seed-
Scales.

VII *The Places.* They all grow on Heaths and
open places of Hills, as also in shadowy places by
Fields Tides, and are frequent in many Counties of
England. The first grows plentifully in the boggy,
shadowy Moors near *Durford Abby* in *Suffex*, as also
on the moist shadowy Rocks by *Maple Durham*
in *Hampshire*, near *Petersfield*: it has also been
found growing on the old rotten Stocks or Bodies
of *Oaks*, near the said Moors. The second grows
in shadowy Woods and Copfes. The third Mr.
John Goodyer found growing on the shadowy moist
Rocks by *Maple Durham* near *Petersfield*, afore-
named.

VIII. *The Times.* They seldom keep their Stalks
with their Leaves green in Winter, but first forth
new from the Root in the Spring, which at their
first rising are brownish and folded in round, as a-
fore said: the time when these Heads or Scales on
the back of them are ripe and do fall, is Midsum-
mer -, and falling on the Ground, do spring again,
by which the Plant is increased.

IX. *The Qualities, Specification, Preparations,*
Virtues and Uses, are the same
with those of the *Female*, related in the next Chap-
ter, and thither I refer you.

CHAP. CCLR.
Of FERN Female.

I. *n p H E Names.* is Greek, *Ἰβελύτερης*
in Latin, *Ibelypteris* and *Fernina* and *Fem-
ale Fern, Brake* or *Common Fern*.
It is the second general Species,
and is threefold, viz. 1. *Filix Fxmina vulgaris*, *Oax*
common female Fern: but *Gefner* in *hortis* calls it
Mas, *wdBaubvus* in his *Pinax*, *Fi'ix ramqfa pin-
nuhs obtujis, non dentatis*, 2. *Fi'ix Fcxmina pinnuli**
dentatis, *tilix Fcxmina altera tenuifolia Thatii*, *Fem-
male*

male Fern dented. ? Ff/v Fcsmia pinnulis aculeatis ; Ff/v ramosa minor pinnulis dent at is Baubini -, Ptvridium mafcultm Cordi & Thalii, Female Fern iharp-poinred.

III. The Descriptions. Tfo /r/? , or Common Female Fern, has a Root which is long, and flenderer than the former^ of about a Fingers Thickness^ and blackish for the most part, creeping under Ground: from this Root rises up but one Stalky (feldom two) which is rounds chamfered, and something edged^ growing sometmes higher than the Male, and branched forth into such like winged. Leaves^ growing on both sides, like to the Leaves of the Male Fern, but leifer, Jet on both sides thereof for the woft part one against another, and more dented than the Male, yet not sharp, but round-pointed^ of as firon a Smell as the former, and having the like Spots on the back/sides of them. This Stalk (as also the Root, as some say) being cut alope somewhat long, will in the white Pith thereof have some certain Refemblance or Form of a spread Eagle.

IV. The second, or Dented Female Fern, has a Root like the former -, from which springs tip one main Stalk, which is fuller of Branches, and grows not up so high as the other, nor so straight: it has also small winged Leaves, like the first or Common Female, which are set on each side of the middle Rib, but somewhat (sharp-pointed, of a more faded green color, and narrower than the other, and spotted on the backside -, but in any thing else little differing from the first Female kind.

V. The third, or Sharp-pointed Female Fern, from a pretty thick black Root, sends forth the main Stalk, which is about a foot in Height, and branches it self out into winged Leaves, each of which is not dented, but whole, and ending in a small Prick or Point.

VI. The Places. The first grows more frequently than the Male kinds on barren Heaths and Hedge-sides in moist places thro⁵ the Kingdom, and indeed in almost all barren, dry and desert places. The two latter grow rather on moist Rocks and feady Hills,

Female Fern Dented.

VII. The Times. They flourish at the same times that the Male kinds do -, and their Leaves perish in Winter in like manner.

VIII. The Qualities. They are all of them, both Male and Female, hot and dry in the first Degree, h Afringent, Aperitive, Absterfive, Cofmetick, Diuretick and Vulnerary h, dedicated to the Liver, Spleen and Womb, Cathartick and Emmenagogick.

IX. The Specification. Ferns kill Worms, provoke the Terms in Women, heal Wounds and cure putrid Ulcers.

X. The Preparations. You may have therefrom, 1. The green Leaves. 1. A Decofion of the Roots in Mead or White Port Wine. 3. A Powder of the Roots. 4. An Oil or Ointment. ? A Mixture. 6. Aghes, of which Spanish Barilla is made.

The Virtues.

XL the green Leaves. They being eaten purge the Belly, cleansing the Bowels of colerick and waterish Humors *, but they also at the same time trouble the Stomach, and cause either Vomiting or Naufeoufness.

XII. The Decofion of the Roots in Mead or Wine. It kills Worms in the Body, both long and broad, powerfully opens Obftructions of the Spleen, taking away its Swelling and Hardness, and preffes Hypochondriack Melancholy. Dose half a pint Morning and Night, falling an hour after it in the Morning, and taking it an hour after Supper.

XIII The Powder of the Roots. Taken to a dram inwardly in a Glafs of White Port, it opens Obftructions of the Liver, Spleen and Womb, and provokes the Terms : but the often taking it causes Barrenness. It is used with success in foul, putrid and malign Ulcers, for it cleanses them, incarnates and dries up the putrid Moisture, and induces a speedy Healing. The Powder of the Leaves, brings away both Birth and After-birth, being taken to one dram

dram in White Wine, and repeated as the Midvvite ihall fee occasion.

XIV. *The Oil or Ointment.* It 5s made by boiling the bruifed Root either in Oil or in Hogs Lard till it is cripp, and fo draining it out, and repeating the boiling with frefh Roots, in like manner, two or three times. They are laid to be excellent for healing fimple green Wounds and Pun&ures (tho⁵ of the Nerves) in any part. If to every pound of the Oil or Ointment a quarter of a pound of Turpentine be added, it then proves an excellent thing to digeft, cleanfe, incarnate, dry and heal old running Sores and putrid Ulcers.

XV. *The Mixture.* Take *Pouder of fern' Roots (Mule or Female) one dram, Scammony or Black Hellehor Roots in fine pouder fifteen grains : mix them for a Dofe.* It effectually kills Worms in the Stomach or Belly of what kind foever: it alfo brings away the After-birth of Women in Labor.

XVI. *The Afhes.* Country People make them of green Fern, and ufe them inftead of Soap to wafh their Cloaths withal, for with the Salt of Fern-Afhes much Soap is made.¹ A Salt alfo for making of fair Cryftaline Glafs and Cryftal is made of thefe Afhes. They ufe them in Spain, and the Afhes or Salt they make of fern, is that they call *Barilla*, which is profitable not only for making Soap, Glafs, Cryftal, &c. but for many other Phyfical Ufes, as to break and diffolve the Stone, or fandy and gravelly Concretions. See the eighth Edition of our *Polygraphice, lib. 10. cap. l.fetf. 8.¹?, 12, ad 18.*

C H A P . C C L X .

O f F E R N O a k .

I. *THE Names.* It is called in *Greek, ἄρνικα*; in *Latin, FHixg>uernavel§>uercina*; in *Arabian, Quaji Filix mufcofa*, and in *Englifh, Oak fern*: but here is to be noted, that there is another fort of *Oak Fern*, called *Polypodie*^ which is no Species of the Plant we here intend, and therefore ihall fay nothing of it in this place.

II. *The Kinds.* This *Oak Fern* is threefold, viz. I. *Αρνικα* itizov, *Filix Querna repens, Dryopteris reyens Lobelii, Matthioli, Gefneri aliorumque*, *Dryopteris five Filix arborea Tragi*, *Vtenon Fcemim Cordi & Tbalii, Creeping Oak Fern.* 2. *Af^ei MVM, Dryopteris alba, Dryopteris Candida Dodonai, Adiantum album Plinii, Adiant urn filicis folio Bauhini, White Oak Fern.* 3. *Onopteris mas, Black Oak Fern.*

III. *The Defcriptions.* *The firft, or Creeping Oak Fern, has a Root which is jmall and blackifh, creeping under the upper Crujlof the Earth, with feveral fmall black Fibres growing from it, and fomewhat like unto the Root of Polypodie, but nuch fmailer and flenderer, and of a more harjh, auften and ftyptick Tafte.* From this Root fpring forth feveral flender blackifh Stalks, little more than half foot high, bearing many fmall winged Leaves, each Handing againft the other, fomewhat like to thofe of the *Female Fern*, but much fmaller and finer, and of a darkilh green color 5 the backide of which are not brown, but with white Spots on them, fet in a double Row, as *Lobe!* affirms.

IV. *Thefecond, or White Oak Fern, ha* a thiC, Bent, having a Bunch or Knot of blackifh fibres of Threads growing forth from it fo many as even t*

bjcure the thick part thereof. From the Head of this Root fpring up many Stalks of winged Leaves, but not much higher than the former, feldom exceeding feven or eight inches in Height * but the Leaves upon the Wings are broader than the other, fhorter -, alfo more deeply cut in the edges: they are likewife of a much paler green color, and spotted on the backside with Spots fomewhat like to thofe of the *Male Fern*.

V. *The third, or Black Oak Fern, is both Male and Female: the Male has a Root made up of many Strings, not much unlike the firft Male Fern, but leffer.* From the Head of this, fpring forth feveral Stalks of winged Leaves, which are diverfly, but not fo finely indented: the Stalks and the Ribs of the Leaves are blackifh, but the Leaves themfelves of a deep green color. The *Female black Oak Fern* is almoft like *o the *Male*, faving that its Leaves are not fo lharp at the Points, and are more white and broad than the *Male*, in which confifts the chief Differences.

VI. *An Obfervation.* The firft of thefe defcribed at/df. 3. above, fome Authors fay, *does fold its Roots among themfelves, like the Roots of Polydodium*, but they are not above the Bigneffs of a *Wheat Straw*, coal black without, White within, and about fix or feven inches long, having an innumerable company of Ml Fibres like Hairs growing thereto, and is of an astringent Tafte, enclining to Sweetnefs. 2. *That the Stalks fpring from the Roots in feveral places, variable in number, according to the Length and increafe of the Root: fome Plants have but one or two Stalks of Leaves others again have fix, eight, ten, fourteen or fifteen, &c.* 3. *That the Stalk has a twofold Divifion, firft the Stalk growing from the Root fix or feven inches high and no higher, (and yet fome Authors fay it is about a foot high:) fecondly, the Neive bearing the Leavts; the main Stalk is no bigger than a Grafts Stalk or Bent, fiat on the one fide and round on the other, ftnOQito and green.* 4. *That the firft pair of Nerves grow*

grow about three inches from the Root, and all the rest following grow by couples, abnoft exally one against another, in number about eight, nine or ten pairs, the longest seldom exceeding an inch in Length. % That the Leaves grow also on the Nerves by couples, eight or nine couples on a Nerve, of a yellowish green color, and without any Dents on the edges : yet some other Authors say, that the Leaves are like those of the female fern, but much lesser, and more finely indented or jagged, so finely cut in, that in few they resemble Feathers, let round about a small Rib or Sinew. 6. *Ibat the backfides of the Leaves are/printed, not with rufet or brown Spots or Specks, as the other Ferns are,* but are as it were painted with white Spots or Marks, not Hanging out of the Leaves in Scales, as the Spots in the Male fern, but smooth, or fiat, and double in each Leaf, close unto the middle Rib or Sinew.

VII. *The Places.* These do indeed grow in shadowy thick Woods on Mountains, and sometimes in the open Vallies near them -, as also among the Mosses growing on old Trees, chiefly Oaks, whence came the Name *filix Mulcofa* which is a kind of Moss fern, growing amongst the Mosses on Oaks and other Trees, and in the tops of their Trunks when they begin to rot.

VIII. *The Times.* Neither these nor any of the other Ferns (except Water fern) have any manifest Flower or Seed, so that their Seasons are not to be specified. As for the Leaves, they perish in Winter, and put forth anew in the Spring.

IX. *The Qualities.* The first is hot in the first Degree and dry in the fourth. Astringent, biting and very styptic in Taste, and, as Rognedeletim thinks, of a deleterious or mortiferous Quality. The other three kinds are like in all their Qualities to English Maiden-hair, and therefore, as to their Specification, Preparations and Virtues, we shall refer you thither.

X. *The Specification.* The first of these kills Worms, and destroys the Roots of the Hair.

XI. *The Preparations.* You may have therefrom, 1. *A Ponder of the Root.* 2. *A Cataplasm.*

The Virtues.

XII. *The Yonder of the Root.* Matthioles says, that if it is mixed with Salt and Bran, and given to Horses, that it kills Worms in them: but I suppose it must be repeated Morning and Night for several days.

XIII. *The Cataplasm.* It is made of the Root and Leaves bruised and beaten together. Dioscorides says, that if it is applied to places troubled with Hair after Sweating, (because then the Pores are open, and so give a more ready inlet to the Virtue of the Medicament) it is a Depilatory, or a good Remedy to destroy the Roots of Hairs.

CHAP. CCLXI.

Of FERN Rock or Stone-

THE Names. It is called in Greek, *ἰσχυρὸν* X u u uriei* mT&i& : in Latin, *filix Saxatilis* Cbamafilix : in English, *Rock or Stone fern* -, also *Dwarf or Small fern.*

II. *The Kinds.* Authors make many kinds hereof, as, T. *filix pumila faxatilis prim a Clufii*, The first Small or Stone Fern of Clufius. 2. *filix fumila faxatilis alt era Clujii*, The second Stone Fern of Clufius. 3. *filix faxatilis jolis nonjerratis*, Small Stone Fern, with Leaves not dented. 4. *filix faxatilis crispata*, Small curled Stone Fern. 5. *filicuU font ana*, Small Rock Fern. 6. *Cbamafilix Angliad*, English Dwarf Fern, or Sea Fern. 7. *filix faxatilis Tragi*, Naked Stone Fern.

III. *The Descriptions.* The first small Stone Fern of Clufius, *bat a long, black and slender Root, creeping under the tipper Cruft of the Earth, and spreading ajlant, with a few slender hard fibres adjoining thereto.* From this Radicle spring forth several Stalks of winged Leaves, about a foot high, which is branched out into several Wings of Leaves, very like unto the female Fern, but much less, much tenderer and delicate than they, and more finely indented on the edges, and spotted also on the Backs of them, like to the other ferns.

IV. *The second, or Second Stone Fern of Clufius* has a thick Head of a Root, much like to that of the first Male Fern. From which spring forth many small Knobs, with a vast number of black Fibres or Threads. From this Head of the Root spring up several frait round Stalks of Leaves, green at first, but blackish when full grown, about four or five inches high, (hooting forth winged Leaves from the main Stalk upwards, with Dentings in on both sides, like unto the Male fern, but much less, and finer, and spotted on the back of them*, as the former.

V. *The third, or Small Stone Fern With Leave not dented, ha* a Root like to the Male Fern, an* grows very like it, with Stalks of winged Leaves* Javing that they are very much less, (as is the whole Plant) and not indented on the edges, but whole or smooth, like unto the Water Fern.

VI. *The fourth, or Small curled Stone Fern, bas a Root composed of many blackish Fibres, Springing out from the thick Head of a Root :* from which Head spring up small Stalks, scarcely four or five inches high, which are set on both sides with tender soft Strings of very small Leaves, so finely divided and dented, that they seem curled of a dark green color upwards, and paler below towards the bottom, having brownish or reddish Dull like Spots on the backfides, as *Spleen-wort* has.

VII. *The fifth, or Small Rock Fern, is a small Dwarf Fern, resembling in its Root, Stalks and Leaves the Common Fern, but very much less, yea much less than any of the last described :* tho' it grows low, yet it bushes out with many small and dark green Leaves, resembling the Ordinary Ferns.

VIII. *The sixth, or English Dwarf Fern, bat a thick brownish Root, composed of a multitude of Fibres or small Strings.* From the Head of this Root spring up several bright, shining, blackish Stalks, two or three inches high, on which are placed many rough thick, shining, blackish Leaves, with some brownish Spots on them, as other Ferns have, and are finely snipt about the edges.

IX. *The seventh, or Naked Stone Fern, pa* & thick tufted Root, composed of a multitude of small Fibres: from the head of which spring forth many hard and rough Stalks, naked or bare, without Leaves, having some Spots on them, a* the Ferns have: these Stalks are only forked at the tops, divided into two, and sometimes into three short parts, bowing or bending down their Heads, having the SmeU and Taste of Fern.* In my Opinion, as this has not the least Resemblance in its Form of Fern, but rather of Gramen or Grass -, so it ought to be

accounted one of the Species thereof bat for Com pan/ lake with other Authors, I have not contended the Point, hut have let it pals among the Ferns ic is the Uoloftium after urn Lobe Hi.

X. The P/ces. They all grow in Rocky an' Stoify places : the fifth, fixth and feventh. Lobe Ijys, grow near the Sea in Cornwall, in moifl Roc ky places.

XI. The Times. They fpring up and flourifh at the times when the other terns do, and perifh in the like Seafons.

XII. The Qualities^ Specification, Preparations and Voiles are the lame with the Common Male and lew ale terns 5 and therefore to Chap. 29 a foregoing, I refer you.

CHAP. CCLXII.

Of FERN Water,

O I?,

OSMUND Royal

THE Names. It was unknown to the Greeks, and therefore can have no Greek Name; but it is called in Latin, Fix florida, Yilix aquatica, ymund Regal; s, FHixpaluftris, Fix Lunaria Gef-TMn, F-lix latifolia Cordi, Filicajirum : mMnglifh, Water Fern and Ofmund Royal.

II. The Kinds. It is the fifth Species of Ferns, and a fingular Plant of the kind.

Ju-Peferi P'tio ns. It bat a great and thick Root- folded, and covered over with many Scales and interhang Roots, having in the middle of the £>** and hard woody pan thereof a small white Pith tdwb by some u called the Hem of Ofmund[pe

Water-man : from this Root (hoot forth in the Winter time feveral hard rough Stalks, half round, and hollowifh or flat on the other fide, which grow up to the height of two feet, having fundry Branches of winged yellowim green Leaves, ipread out on all fides, and let one againit another, longer, narrower, and not indented on the edges, as the Common Ferns Mae and Female. From the tops of fome of thefe braiks grow forth a long Bu/h of fmall fcaley bpiques, as it were, of a more yellowifh green color, fet on the fame manner on the Stalks as the Leaves are, which by fome Authors are accounted the Flowers and Seed, tho' others again as much deny it.

IV. The Places. It grows in Moors, Bogs and Watery places in many parts of England : it did grow m the midft of a Bog, at the farther end of hmpjtqad, death from London, at the bottom of a Hill adjoining to a fmall Cottage ; alfo in divers Bogs on a Heath or Common near unto Burnt Wood in Mex 'efpecially near unto a place formerly dig-

f mnrS n,^ f a w^ is & benqpted out of thofe places: it wonder- Goull

6a Loads of it might beh? ^f places adjacent to AJhly, Coyer and W and in leverai other parts of the fame CoUm

V. The Times. It is green and flourifhe\$ all the Summer, as do the other Ferns, and the Spikes of Flowers and Seed are in Perfection in June, 7, iv and Auguft the Leaves decay and die away m Winter, but the Root continues good, and la\$ f many Years. Gerard & That^fit iftran S- RIVTSS: n profers m as Wu as ^

VI. The Qualities, Specifcations, Preparations and Virtues, zre the fame with thofe of the MaleZd Female fern in Chap. 259. a foregoing excenrns that this is more etfeaual than the S £ \$ % and outward Difeafes, and therefore rather to be chofen than either of them, or any of them all: alfo over and above what has been there faid, the following Obfervations have been experimentally

VII. The Virtues of the Root. It is a fingular and efpecial Remedy, and ufed in curing the following Diforders, and all Difeafes proceeding from the Spleen, Womb, Reins, L and it alfo prealls againit Ruptures or Burftenef: is made in White Wine, and

running-Sores and old good againft the Gout, out of Joint.

CHAP. CCLXIII

0 / FIGWORT Great Common.

I. THE Names. It does not seem to be known to the Greeks, for it has no Greek Name; but it is called in Latin by many Names, as *Ficaria*, *Mille Morbia*, *Ferraria*, *Cajirangula*, *Chryfippea* *Plinij*, as some think, *Galeopsis Diofcondis*, as *Fuchfws*, *Cordus* and *Dodonxus* think, *dtbScrophularia major*: in Engliffl *Figwort*.

II. The iC/Wx. We make two Genecal Kinds of this Plant, viz. 1. *Scrophularia major vulgarit*, The Common Great Figwort, of which in this Chapter. 2. *Scrophularia major Peregrina*, Foreign Great Figwort, of which in the next Chapter.

III. Of the first of these sorts there are two Kinds, viz. 1. *Scrophularia major vulgatiore*, *Ocimafirum alterum Tragi*, *Clymenum laa* Gefneri* in *Hortis*, *Galeopsis Fuchbijy* *ifj Cordij*, The more Common Great Figwort. It is called *Scrophularia* in most Authors, because it is available #1 *Scrophula**; and *major*, to distinguish it from *Scrophularia minor*, which is *Pilewort*, of which* in its place. 2. *Scrophularia major altera Elegans*, The Noble or Beautiful Great Figwort.

IV. The Descriptions. *The first, or more Common Great Figwort, has a Root which is great, white and thick, with several Knobs or Tubers growing at it, and running along under the upper Cruij of the Earth, which abides many Tears, the Green Herb dying away in the Winter. From this Root spring forth sundry great, strong, hard, square, brown Stalks, three or four Feet high, on which grow large, hard, and dark green Leaves, two at a Joint, which are larger and harder than any Nettle Leaves, but not flinging, and not much unlike in form to*

the Leaves of *Water Betony*, in that they are sometimes mistaken the one for the other, being difficult to be known afunder, without a narrow view of them; but these Leaves are not *ib* round dented about the edges, and are all smaller at the ends. At the tops of the Stalks come forth many Purple Flowers, set in Husks, which are somewhat gaping and open, but not so much as any of the *Galeopsis* or *Dead Nettles*, but doffer and smaller, somewhat like those of *Water Betony* aforementioned; which being past away, hard, round Heads come in their places, having a small point in the middle, in which is contained several brownish Seed.

V. *The Second, or Elegant Great Figwort has a great, thick, white, and knobby Root, like the former, which sends forth from it one or more great hard, strong, brown Stalks, with Leaves at the Joints, very like the other, but they are fairer, and more sometimes standing at a Joint, especially at the lower Joints. The Flowers are not gaping, as the first, but made of four reddish Leaves, which commonly stand at the joints with the Leaves; which being past, there comes in their places hard round Heads of Seed Vessels, but without any point in the middle, in which are contained a small kind of Seed.*

VI. *The Places.* They are very frequent; especially the first, in most places through the Kingdom; growing in moist and shady Woods, and in the lower parts of Fields and Meadows: it may be found in great abundance in *Hornsey Wood*, near *London*, as also in *Store Wood*, and *Shotover*, near *Oxford*.

VII. *The Times.* They Flower in *June* and *July*, and the Seed will be ripe in a Month after the Flowers are past.

VIII. *the Qualities.* Figwort is hot and dry in the Third Degree, Anodyne, Dificuffive, and Vulnerary.

IX. *The Specification.* It is peculiar for Curing the *Scrophula* or *Kings-Evil*, as also the *Hsemorrhoids* or *Piles*, *Scabs*, *Leprosie*.

X. *The preparations:* You may have therefori

i. A Liquid Juice. 2. An Effence. 3. A Decoffion in Wine. 4. A Dip lied Water. 5. An Ointment. 6. A Gutaplafm. 7. ii Spirituous Tmffure. 8. iit AkN/ Tincture.

The Virtues.

XL Tfo L^//f1 7^N<? of Herb and Root. It is a moil admirable Vulnerary ^ taken to two Spoonfuls, or more, in the Diftilled Water of the Plant, it is effectual to diflblve clotted or congealed Blood within the Body, which happens by means of any Wound, or by any Bruife or Fall ^ and is very powerful to waſte away, confume, or deſtroy that Humor which is the Cauſe of Struma's, Scrophula's, Leprofies, Scabs, and other like Breakings out.

XII. The Effence. It has the fame Virtues, but is more powerful to the Intentions above named, being outwardly applied, by bathing it upon Scrophulous Tumors, Hemorrhoids, Scabs, Scurff, Morphew, Leprofie, it is of fingylar good uſe, becauſe it refits the protrufion of the Humors which cauſe them, and alſo waſtes away what is contained in the parts afte&ed *, it alſo cleanſes, dries, and induces the healing of running Sores, old Ulcers, Fiſtula's, and the like^ and may be taken inwardly as a Diet, in order to facilitate thoſe Cures.

XIII. The Decoffion of the Roots and Herb in Wine. It is a fingular good Wound Drink, and of great efficacy (being conſtantly taken Morning, Noon, and Night to the quantity of half a Pint for a Doſe, for ſome conſiderable tiffte) to cure inveterate and malign Fiſtula's, or which yield a malign Jchor, known by its putrid ſubſtance, ill color, andfcetidity. The fame is alſo no leſs effectual againſt the Kings-Evil, or any other Knots, Kernels, Bunches, or Wens, growing in the Fleſh, in what part of the Body foever. It is alſo of very good uſe to be applied to the Haemorrhoids or Piles when they grow painful and fall down, and for fuch other Knobs, Tumors, or bunchings out, (as *Yicus irrAno*) which ſometimes-happens to the Fundament.

XIV. The Dip!ied Water from the whole Plant. It is uſed for the fame purpoſes, either to take inwardly, or apply outwardly, by bathing, OV. It is of good uſe for foul and putrid Ulcers, which are hollow or corroding, to ſtay the malignity, and to dry up the ſuperfluous virulent moiſture of them. It alſo takes away all Redneſs, Spots, Freckles, Scurf, ©V. in the Face and Skin, or any other foul Deformity thereof, tho' inveterate, as the Leprofie, &c. but it will be more effe&uaHf you diflblve therein a proportional quantity of Nitre, Salt of I artar, or *Sac char urn Saturni*, according to the nature of the Difaffe&ioh you apply it to. y/ ;.

XV. The Ointment of Herb and Roots, butfnord tpecially of the freſh Roots. It is made according ro the uſual Rule of making Ointments, but Authors, have left this Prefcription. Take the Roots,* walk them dean, bruife them, and put them into a Jar *Glaſs, or Earthen Pot, with a ſufficient quantity of Gutter, or Hogs Lard, or⁵Beſf Stfet, mixt with an equal quantity of Oil Oli%, Which is the better of the three, tie over the Jar Glaſs or Pot with a Blad-der, or Leather and brown Paper, and let it fo ſtandj in the hotteſt Sun for 15 or 26 days, then afterwards upon a gentle Fire boil foftly-for-almoſt an hour, and whilſt hot itrain it forch, and keep it in a Jar Glaſs or Gally-pot cloſe covered for uſe. You may alſo make it by boiling the bruifed Roots and Leaves in Hogs Lard, or in Oil and Wax, and then ſtraining it out as-afoteſeid. It is exceeding good to a-noint with, in order to cure Scrophulous Tumors or Swellings in the Neck, as alſo *Yicm in Ano*, and the Hemorrhoids or Piles, it eaſes the pains, and

many times difcuſſes the Tumors, and if any of them are Ulcerated, it is of extraordinary uſe to heal all thoſe kinds of Ulcers, as alſo Scabs, Leprofie, &c*

XVI. The Cataplafm. It is made of the Herb, or of the Root, or of Herb and Root, being beaten in a Mortar till they are foft, being applied it cures Simple Contuſions, cauſed by any Blow or Fall, diP ſolves the coagulated Blood, and ſoon heals the Hurt or Wounded part_h and it is alſo no leſs effectual againſt Struma's, or the Kings-Evil, and to diflblve any bunchings out, Wens, or Kernels in the Throat or other parts.

XVII. The Spirituom TinQuere. It flops inward Bleedings, and expels Wind out of the Stomach and Bowels, corre&s the cold pituitous Humor which breeds the Kings-Evil Kernels, and other like Tu-mors, in any part of the Body ^ and is very etficaci-ous againſt the Colick, the pain of the Spleen, and Hypochondria* Difaffe&itions. Doſe from two drams to four in the Diftilled Water, or in Wine, or other proper Vehicle, Morning and Night.

XVIII. The Acid TmSure. It ſtrengthens ana fortifies the Stomach, andrectifies the Juices in their firſt Conco&ion, preventing the generating and concreting of that Matter, or thoſe Humors which breed Struma, or the Diſeaſe called the Kings-Evil. It cauſes a good Appetite, and a ſtrong Digeſtion, ^nd powerfully opens the Obſtru&ions of the Stomach, Liver, and Spleen, and therefore abſolutely cures the Rickets in Children, of which I have had a particular Experience ſeveral times. Doſe fo many drops as to make the Ale, Beer, or Wine grateful.

C H A P . CCLX-IV.

Of FIGWORT Great Foreign.

J-T HE Names. It is called in Latin *Scrophula-X r'm major Peregrina*, and by reaſon the Roots are without Tubers, or Knobs, it is called by ſome *Scrophularia major abſque Tuberculin*: in Engliſh *Foreign Great Figwort*.

•II. The Kinds. Authors have given us many Kinds or this Plant, divers of which we can never come at, but ſo many of them as may be found growing in the Gardens of the Curious here in England. ~~war~~ may poſſibly grow in ſome of our Plantations beyond bea in America we llall here give you the Defcription of, and thoſe are, i *Scrophularia major Americana*, *ScrophulanaCreticaprimaClufii*: American or Cretick Great Figwort. 2. *ScrophulaT'r Amencana* alters *vellindica altera*, *Scrophularia major Ilijpamca* *Scrophularia foliu LaciniatkBaubin_h*

~~...~~

IC] The Defcription. V*-F'rA ^ Americanor *gort*, has a W \^ch *ſabout *lingers tbickneſs*, which ſpreads jt ſelf out into ſeveral Branches, running under the Superficies of the Earth not very deep, and boeing many fibres ſpringmg from the *f_{mc}*. From this Root riſe up a ſquare cornerd green Stalk, biowniſh on the ſide next the Sun, "at the bottom of which grow ſeveral large and long Winged Leaves, let upon pretty long Footstalks, made of many parts, and almoſt in ſeſiion like the *Cdhtmon Thifile*, but without Prickles. The Leaf is large, and much cut in on the edges, making

making every Leaf look almoft like to the Leaf of the *Red Rattle*. From the middle of the Stalk upwards it fpreads it felf out into other Branches, almoft to the very top, thofe Branches growing fmaller and fmaller as they grow higher and nearer to the top, having on all fides fuch like Leaves, but leffer than thofe growing below. At the tops of the Stalks and Branches are many fmall Flowers, letalmoit like unto the firft *Common Figwort*, but part of a deeper, and part of a paler Purple Color, with fome yellow Threads rifing out of the middle. •

IV. *The Second*, or Indian or American Great Figwort, ha* a Root which is thick and bufhy, which perijhes in the Winter, if it comes up to Flowering,^ but if it Flowers not, it continues all the Year. From this Root fpring up divers thick, but weak, Stalks or Branches, all lying round about upon the Ground, full of Joints, with large and long dark green Leaves, cut in on the edges into five long Divifions, all of them dented about the edges; and from the fame Joints come forth alfo other leffer Leaves, divided and dented, and with them, towards the tops of the Stalks, feveral large Flowers of a yellowifh color on the outfide and lower parts, but of a reddifh color, mixt with yellow within. The Flowers being part away, larger and harder Heads fucceed than in the Common Kinds, and pointed at the end as the reft, which contain within them fmall blackifh Seed.

V. *The Third*, or Yellow Flowered Great Figwort, ha* a Root which is thick and blackifh, with many Fibres or Strings thereat, but without any Tubers or Knobs at all. From the Head of this Root fpring forth feveral fquare brown Stalks, a little hairy and loft, above two Feet high, at the Joints of which grow two large, broad, roundifh, hairy, loft, green Leaves, deeply indented about the edges, and ftanding upon very long Footstalks, thofe at the lower pJrts of the Stalks being largeft, which in Winter lye in a compafs upon the Ground about the Root, and thofe which grow on the Stalks leffer, growing leffer and leffer till they come to the tops *, at each Joint with the Leaves comes forth, even almoft from the bottom, one fmall naked Branch, bearing njany Flowers in Tufts at the ends of them, which are round and yellow, fomewhat like unto the *Ordinary* or *Common fort*, parted or cut in at the brims into divers pieces, having fome long yellowifh Threads in the middle. After the Flowers are part away, larger round Heads come than in the Common Kind, but not fo large as thofe in the laft defcription, which have at the end a long point, a little crooked, and contain within them fmall black Seed.

VI. *The Y laces*. The two firft I have found growing in feveral parts of *Florida*, in the South of *Carolina*, and in thofe parts leading to the Cape of *Florida*. The firft alfo has been found growing in *Candia*, being *Clujius* his *MiCretick* Species. The fecond has been found growing in *Spain* likewife, but as I am informed was Tranfplanted thither from *America*. The third is a Native of *Germany* and *Hungary*, from the former of which places it was brought to us, but here in *England* they are all niver in the Gardens of the Curious.

VII. *The Times*. They Flower in *July*, and the Heads of Seed will be ripe in *Auguft* or *September*.

VIII. *The Qualities, Specification, Preparations and Virtues* are the fame with thofe of the *Common Kind* in the former Chapter, and therefore I (hall lay no more of them in this place.

C H A P . CCLXV.

Of F L A G Sweet Smelling,

O R,

True ACORUS.

THE Names. It is called in *Greek* ἄκος, ἄκος \$ *AKQ&V* in *Latin* *Clujus* or *Acorum*, *Ac* *vert/s*, and *Acorum verum*: *Clujus* or *Acorum* is taken to be *Butomos Theophrasti*: and in *Engliffj* The true sweet fmelling Flag.

II. *The Kinds*. Authors make but one Kind thereof, which *Camerarius*, *Clujim*, *Cordus*, *Gefner*, *Lug-dunenfis*, *Lobel*, *Matthiolus*, *Monardus*, and others, call *Acorus*, or *Acorum*, which is the vulgar *Calamus Aromaticus Officinarum*, according to *Amatus Brajfavolus*, *Cafalpinus*, and *Fuchfms*, but it is not the true *Calamus Aromaticus* of the Ancients, for that was really a *Reed*, whereas this is really and truly a *Flag*, (but sweet fmelling) and the Root here intended the Root only of a *Flag* •, as for the True and Ancient *Calamus Aromaticus*, I am apt to believe it is not to be found thro' all *Europe*, that is to fay, not in the Shops ^ but of this we mail have occafion to fpeak more in our III. Book.

III. *The Description*. It ha* a Root like to the *Common Water Flag* in the next Chapter, but fmaller, and nofo red, of a sweet fmell and fomewhat bitter tafte, it is thick and long, ping tender the upper Face of the Earth, hooting forwards^ and with fmall Roots, ax Suckers on all fides, not much unlike to *Garden Valerian*,^ vohittifh on the outfide, or greenifh if it lyes above Ground, and more pale or zwhittijh en the infide, confifting of many Joints, from vobich it hoots forth underneath many long thick Fibres, by which it takes hold in the Ground, the thick part of the

the Root is of a firm or falifubjiancc, yet not woody, but cafcic to cut. From thlis Root rife up feveral flaggy Leaves, like unto the *Water Flag*, or *Flower-de-lucc* in the following Chapter, but narrower, and two or three Feet in length, of a frefh green Color, and Aromatick Smell •, yet fometimes they are brownifh at bottom, the one Leaf growing out of the fide of the other, after the fame manner that other *Flags* or *Flower-de-luces* grow, which are thin on both fides, and rigid or thick in the midft, the longeft for the moft part ftanding in the midft, and fome of them curled or plaited towards the ends or tops of them, fmelling very fweet as well when they are dry, and kept a long time, as when they are frefh and green. Thefe Leaves abide a long time in the Garden, as tho' they never did, or never would bear any Flowers, they every Year dying down to the Ground, and (hooting out frefh every Spring-, but after two, three, or four Years continuance in a place without removing, it fhoots forth Leaves as formerly, (but no Stalk, as other *Flags* or *Flower-de-luces* do) befides which it fhoots forth a long narrow Leaf by it felf, flat, like unto the other Leaves, efpecially from the middle thereof upwards- but from the faid middle downwards it is thicker, narrower, and rounder, or rather almoft triangular. From the middle of this lone Leaf comes forth one long round Head, very feldom two, in form and bignefs like almoft unto the *Aglet* or *Catkin* of the *Hafle Nut Tree* •, it grows upright, an Inch and half, two Inches, or more in length, as thick as a large Reed, or ones little Finger, fet with feveral fmall Lines and Divifions, like unto a green *Pine Apple*, and for the moft part of a Purplifh fcreen Color, or as G^vWfays, of a Greenifh Yellow Coloꝝ, CUrioufly Chequeredjjas if it wer^t Wrought Hfith a Needle, with greelFand yellow Silk intermix[^] out of its Bunches •nall pale whitifh Flowers fhoot forth, confifting of four fmall Leaves apiece, (without any great fmell) which quickly fall away, without giving any Seed, fo far as any Author has obferved.

IV. *The Vlaces*. It is a Foreigner, and grows with us only in Gardens, but bears very rarely its Tuft or Head in our cold Country, for which reafon fome have faid that it is barren, but that doubtlefs is a miftake, for *Clufius* fays that he had feen it bear its Flower'or Head in that place where it grows naturally: tho' in *England* it fometimes may be barren. Its Native places are in feveral parts of *Turkey*, where it grows in moft Grounds, and in fuch like places it thourifhes with us, where are found the largeft Roots, the faireft, firmed, whiteft, and fweeteft, which being dryed are a little fhrivelled. It g^sj#s in *Candia*, as *Pliny* fays, as alfo in *Galatia*, and other adjacent places, and naturally at the Foot of a Hill near to *Prufa*, a City of *Bithynia*, not far from a great Lake. It alfo grows in great plenty in fome parts of *Ruffia*, but its Roots when dryed are more lank or fmall, not fo firm nor white, nor of fo choice an Aromatick Smell

V. *The Times*. It fprings up with its Leaves in *March* and *April*, and bears its *Catkin* (in thofe Countries where it does bear, or is not barren) in the beginning or middle of *July* and *Auguft*. *John/on* upon *Gerard* fays, that in *may* 1632. he received the *Julm* or *Catkin* from Mr. *Tbomtu Glynn*, of *Glynn-ibivon*, in *Carnarvonshire*, from which it is manifeft, that with careful looking after, it may with us be made to bear its Head of Flowers •, yet here about *London*, tho' it grows well, and in great plenty in many Gardens, it has fcarcely ever been feen to bring forth any thing of that kind.

VL *The %j<alities*. it \$ hot and dry in the fe-

cond degree, Aperitive, Abfterfive, Afringent, Carninative, Diuretick, Cephalick, Neurotick, Stomack, Cordial, Sudotifick, and Alexipharmick.

VII. *The Specification*. It is a peculiar thing againft Poyfon, the Plague, and all contagious Difcaes.

VIII. *The Preparations*. The Root is only of ufe, and you may have therefrom, i. A *Liquid Juice*. 2. An *ESSENCE*. 3. An *inSuSion in Wine*. [^].A *Deco&wn in Wine*. 5. A *Pouder*. 6. A *Cataplafm*. 7. [%]A *Spirituos Tin&ure*. 8. An *Acid Tin&ure*. 9. An *Oily Tin&ure*. 10. A *Spirit*. 11. A *CbymicalQiL* 12. *Potejtiates or Powers*. 13. An *Elix-ur*. 14. A *Collyrium*. 15. A *Preferve*. 16. A *Jyrup*.

The Virtues.

IX. *The Liquid Juke*. Taken to a Spoonful or two in a Glafs of Generous Wine it provokes Urine, eafes Pains and Stitches of the Sides, and prevails againft the Bitings of Mad Dogs, and other Venomous Creatures, but it ought often to be repeated, at due intervals of time.

X. *The ESJence*. It has the Virtues of the Juice, and eafes pains of the Stomach and Bowels, eafes the Colick, and Gripings of the Guts, prevails againft Convulfions, and is an Antidote againft all forts of Poyfon, and the Infe&ion of the Plague it felf* and is a fingular good thing to help a tinking Breath; It is alfo commended as an excellent thing againft Ruptures or Burftennefs. Dofe one Spoonful, or more, Morning and Night, in a Glafs of Generous Wine, or fome other fit Vehicle.

XI. *The Infufion in Wine*. It has the Virtues of the Juice and Effence, but not all out fo powerful* it wafes the Spleen, helps thofe who fiatfe the Strangury, and frees thofe from danger who are Bitten by any Venomous Serpent: it warms and comforts the Stomach, and caufes a good Appetite and Digeftion^ expels Wind, dries up Rheums, and clears the Sight. Dofe five or fix Ounces Morning and Night.

XII. *The Beco&ion in Wine*. It has the Virtues of the Infufion, and being mixed with a little Wormwood Wine, and fb drunk, it is of good ufe to COHort and ftrengthen a cold and weak Stomach.

XIII. *The pouder*. It is given to one Dram in the Morning falling, and laft at Night going to F:JA in a Glafs of the Infufion, againft Poyfon, th4f Bitings of Mad Dogs, or other Venomous Creatte-s, to prevent, and alfo to cure the Infe&ion of the Plague or any Peftilential Difcafe^ it comforts a cold and weak Stomach, reftoring the Tone thereof where depraved or hurt, and has all the Virtues of

Cataplafm to the Teffides', it wS their Swelling, difcuffingall hardnefs and

XV. *The Spirituous Tin&ure*. It is good againft Coldnefs, pains and weaknefs of the H^ad, Brain, and Nerves, lengthens the Sight, Hops Defluxions of Rheum, into the Eyes, and L^eUent againft the Megrim from a cold Caufe, Vertigo, Cams, Lethargy> T^y £^{onvul}fions, and other like Dififfeftions of the Nerves, Brain, and Womb, it warms and lengthens the Stomach, caufes a good Appetite, expels Wind, and gives eafe in Cramps, Griplings of the Bowels, Colicks, and the Difcafe call^t *St. A*ms * Dofe half a Spoonful in a Glafs of Wine Morning, Noon, and Night.

XVI. *The Acid Tindure.* There are but few things more excellent against the Infection of the Plague, whether it is taken as a Prophylactick, or a Curative-, indeed in all Pestilential Distempers it does Wonders, for it destroys the Poyson and Malignity- in its Root, and for the same reason it is good against the Bitings of Mad Dogs, Serpents, or any other Venomous Creature ^ it is good against Nau-feuise of the Stomach > and stops Vomiting, when scarcely any thing else will prevail. Dose for many drops as may make the Vehicle pleaskntly lharp, to be often repeated in the day,

XVII. *The Oily Tinsure.* Taken inwardly to ten, twelve, or fifteen drops, or more, in a Glass of White Port Wine, it provokes Urine, expels Stones, Sand, Gravel, or other Tartarous Matter in the Reins, Ureters and Bladder-, and cures also all cold, moist fleepy, and Paralytick Diseases of the Head, Brain, and Nerves. Outwardly anointed upon the Joints it cures the Gout, and well anointed upon the Back Bone twice a day, viz. Morning and Evening, as also upon the parts affected, it cures Cramps, Convulsions, and Fallies, and those kind of troublesome Pains, vulgarly called a Rheumatism.

XVIII. *The Spirit.* It is a Noble and Generous Cordial, cheers the Heart, revives the Spirits, and strengthens Universal Nature-, it is good against Fainting and Swooning Fits, Hypochondriack Melancholy, and other pipeases of like kind. Dose a Spoonful, now and then upon occasion*

XIX. *The Oil Distilled.* Being given from six drops to twelve in any proper Vehicle, it cures, the Colick almost to a Miracle* it strengthens the Stomach and all the other Viscera, expels Wind, and prevails against a Tenasmus-. It is an excellent thing to be taken Morning and Night for some time, by those who are afflicted with the Palfie, or any inward Convulsions, and is of singular use, being outwardly applied to the parts affected with the same Disease, and gives ease in the Gout proceeding from a cold Cause^ anointed likewise upon parts affected with a Rheumatism, proceeding from cold, it cures it.

XX. *The Potestates or Powers.* They have all the Virtues of the Juice, Essence, Infusion, Powder, Tinctures, Spirit, and Oil, and are more subtil than any of them^ being inwardly taken they diffuse themselves thro' the whole Body immediately, and being outwardly bathed upon any part, they immediately penetrate, even to the Bone it self ^ yet they are so hot, tho' very hot and subtil, that they will cause Contractions of the Nerves, but on the contrary, if they be applied to any thing of a Contracture, they will in a few times using it cure the same. Dose inwardly from Forty to Eighty, or a Hundred drops, Morning and Night, in any Generous Wine.

XXI. *The Elixir.* This being the Powers exalted, and brought to their utmost perfection, may be laid to have all the lame Virtues in transcendency. They are more Stomack than any of the former preparations, and therefore more proper to restore the Tone of the Viscera, being hurt, and this more especially upon the Cure of a Dropie. Dose Sixty or Eighty drops at a time, (several times in a day) in a Glass of strong and fragrant Wine.

XXII. *The Collyrium.* (Take of the Liquid Juice, clarified Honey, of each equal parts, mix them. It is good against Dimness of the Sight, Films, Cloudiness, Pearls, Bloodshot, and the like, being put into the Eyes Morning and Evening. Being taken inwardly it is good against Coughs, Colds, Hoarseness, (shortness of Breath, difficulty of Breathing, Poyson, pains of the Spleen, and stoppage of Urine.

XXIII. *The Preserve.* The Roots are taken

green and cleaned, then the whole Roots are to be boiled soft in White Port Wine, and put into double refined Sugar, or clarified Honey, and boiled till the Sugar or Honey has penetrated them, and that they are brought to a confidence. The dried* Roots may be preferred also in the same manner, being first steeped till they are soft in White Wine but yet the Preserve of the Green Roots is made to be desired. It is good to remove the coldness of the Viscera, to Warm and comfort a cold and moist Stomach, and cause Excretion where Flegm is lodged in the Lungs;

XXIV. *The Syrup.* Take of the fresh Roots a Pound, being well cleaned bruise them, and steep them three or four days in Vinegar, then extract the Juice and Vinegar with a Press-, to every Pound of which add a Pound and half of clarified Honey, which by gentle boiling bring into a Syrup which is an excellent Peccoral, cleanses the Breast and Lungs of tough Flegm, causing an easy Expectoration-, opens Obstructions of the Stomach, Spleen, and other Bowels, causes a good Appetite and a strong Digestion, and represses a Flux of Humors to the Glan-dulous parts of the Neck, Throat, and Mesentery.

C H A P . C C L X V I

Of F L A G Water,

OR,

Water FLOWERDELUCE;

I. *T^p H E Names. It is called in Greek *ἰρις*, in Latin *Acorus palustris*, *Pseudoiris Dodonæ*, *iris lutea palustris*, *Acorus adulterinus Tragi*, *Acorus foliis Cordi*, *Gefneri* & *Matthioi* *Acorus palustris* *Lobelij* *Gladiolus luteus* in English *Water Hag*, *Water Ylowerdeluce*, *Segg*, and *Scog*.

II. *The Kinds.* Some will have it that there are two Kinds of this Plant, because sometime^ it is found so exceeding large, as four Feet or more high, and sometimes again it is found not to be above a Foot and half high, or two Feet at most ^ but this difference in my Opinion arises only from the differing Qualities and Goodness of the Soil, it growing so exceeding large where the Soil is best, and more diminutive where it is worse, there being otherwise no difference in the Roots, Blades or Leaves, Stalks, Flowers, Cods and Seed, nor yet in the manner and form, of its growing.

III. *The Description.* It has a Root which is *tuberose*^ but longer and slenderer than those of the Garden Flowerdeluces, of a pale brownish Color on the outside, and of an Horfe Ylefh Color on the inside, with many hard fibres springing therefrom \ the whole Root is very Styptic^ and harsh in taste. From this Root spring up Sword like Leaves, like to those of the Garden Kind, (the whole Plant growing almost exactly like to those of the Garden) but that this has much longer and narrower laid green Leaves, joined together in the same fashion* sometimes the Stalk grows to be between four and five Feet high^ sometimes not above two Feet high, or a little more^ according to the Richness or Poorness of the Soil | at the tops of the Stalks come forth Flowers of a perfect yellow Color, and shaped somewhat like unto those of the *flowerdeluce*, with three falling Leaves, and other three arched which cover the

bottoms, but instead of the three upright Leaves, as the *flower de luces* have, this has only three short pieces Hanging in their places, after which, succeed thick and long three square Cods or Heads containing in each part somewhat large and flat Seed; very like to those of the *Garden Verbena*, which are sometimes reddish, purplish, and blackish.

IV. *The Places.* It grows usually in watery Ditches, Ponds, Lakes, and Moorish Grounds, which are often overflowed, or kept wet with Water, as at *Lambeih*, on the *Bank Side* of the *Thames*, and Ditch Sides thereabouts-, also in moist Meadows, low Grounds, Banks of Rivers, and the like: it grows, in vast plenty in the Fens in *Cambridgeshire*, *We of Ely*, *Bedfordshire*, *Lincolnshire*, &c. And altho' it is by nature a Watery Plant, yet it will grow and prosper very well if planted in Gardens.

V. *The Times.* It grows up in the Spring, in *March* and *April*, Flowers in *July*, and the Seed is ripe in *August*.

VI. *The Qualities.* The Root is chiefly used, and is cold and dry in the second degree, Afringing, Repercussive, Traumatick, Anodyne, and Arthritic.

VII. *The Specification.* It is known to bind the Bowels, and stop all Fluxes of Blood or Humors.

VIII. *The Preparations.* You may have therefrom, 1. A Juice. 2. An Ejence, 3. An Infuswn or Decoction in Wine. 4. A Pouder. 5. A Collyrium. 6. A Cataplasim. 7. An Ointment or Balsam. 8. A Distilled Water.

The Virtues.

IX. *The Juice.* Inwardly taken to a Spoonful or two in a Glass of Red Tort Wine it is very aftringent, and stops all Fluxes of the Bowels, whether of Blood or Humors, as also Pissing of Blood, overtopping of the Terms, and other Fluxes of Blood at Mouth, Nose, or other parts, in external Haemorrhages it must be applied with Stuphes to the part.

X. *The Ejence.* It has all the Virtues of the Liquid Juice, but is more effectual, being inwardly

given, one or two Spoonfuls at a time, in any proper Vehicle, but it is to be repeated so often at due intervals of time as need shall require-, It presently stops the overflowing of the Loches of Women in Child-Bed, and strenghtens the Womb, and all the weakened parts.

XI. *The Infuswn or Decoction in Wine.* It has the same Virtues with the Juice and Effence, but is weaker, and therefore must be given in larger quantities, as five or six Ounces twice a day.

XII. *The Pouder.* Given to one Dram, or more, in Wine, it stops all internal Fluxes of Blood, whether in the Lungs, Stomach, Guts, Reins, Bladder, or Womb: outwardly applied also it stops Bleeding, and being strewed upon old, moist, and running Sores, it cleanses, dries up the moisture, and induces their healing: strewed upon a foul Bone it is laid to cleanse it and cover it with Fleth.

XIII. *The Collyrium.* Take of the Distilled Water four Ounces, Red Port Wine two Ounces, of the clarified Juice of the Root one Ounce, mix them. Dropt into sore and watering Eyes it stops the flux of Rheum, dries and heals them, Cloths or Spunges may also be wetted therein and applied upon the Forehead-, it takes away also Clouds, Dimneis, Films, Pearls, and the like.

XIV. *The Cataplasim.* Applied to the Joints in the Gout it eases the Pain, and strenghtens the part afflicted, so that the Disease seldom or never returns any more upon that Foot, it also stops any Flux of Humors upon the part.

XV. *The Ointment or Balsam.* It is used for cleansing of Wounds or Ulcers, to dry, incarnate, and heal, for as it breeds Fleth, so it stops any defluxion of Humors thereupon, hindring the growing of proud Fleth.

XVI. *The Distilled Water.* Dropt into the Eyes it is good against the watering of the Eye, applied to the Forehead in wet Spunges it stops Detentions, and is fomented on hot Tumors and Inflammations of Womens Breasts, as also upon Cancers, and *noli me tangere*, it cools and gives much ease, and this especially if it is mixed with a little *Saccharum Saturni*, and then it prevails against foul and Pungent Ulcers happening in the Privy Parts of Man or Woman, or in any other part of the Body.

CHAPTER CCLXVI.

Of FLAX Manured or Common.

Names. It is called by the *Arabians* Bazarichichen, or Bezerchetan in *Greek* *πρωτομαρα*, *μαρα*, *μαρα*, *μαρα*, and *Line*, which last Name some will have from making Lines of it-, but I take it to be derived from the *Greek* Name.

II. *The Kinds.* Of Flax there are two principal Kinds, viz. 1. *The Manured*, of which we shall Treat in this Chapter. 2. *The Wild Kind*, of which in the next *The Manured*, Garden, or Common Kind, is a singular Plant, (of the Peelings of which they make fine Cloths) and is described as follows:*

III. *The Description.* It has a small fibrous ROOT which perishes every Year, from whence rises up a round pliant Stalk, about a yard high, beset with narrow, long, and soft Leaves, without any order, and is branched on the top into three or four small Branches, each of them bearing two or three fair Blue flowers, made of five round pointed Leaves apiece, with some

some threads in the middle, which being fast round Buttons succeed, which are pointed above, and in which are contained flattish, smooth, shining, brown Seed.

IV- *The Places.* It grows in *England, France, Germany, Italy,* and in most Countries of *Europe,* the Seed being Sown every Year-, it grows in *America* also, as in *Carolina,* where I have known it to grow and flourish very well: it prospers best as Co-

lumella says, in a far, moist, and fruitful Soil; Some, says *Palladius,* Sow it thick in a lean Ground, and to have a fine sort of *Flax.* *Pliny* says that it is to be Sown in Gravelly places, especially in Furrows. Experience has taught us that it grows admirably well in Light, Sandy and Gravelly Grounds, such as *France* abounds with, where it grows in vast plenty, and in other Countries where the Ground is Sandy and Light, as in *Florida.*

V. *The Times.* *Flax* is Sown in the Spring, and Flowers in *June* and *July,* the Seed ripening in the mean Season after it is plucked up, or cut down, as *Pliny Lib. 19. C/p. 1.* says, the Stalks being bound up in small Bundles, are put into Water subject to the heat of the Sun, and have some weighty things laid thereon, that they may the better steep, and they are so long to lye in the Water, till the Rind or Peeling seems to be loosened so as it may easily peel off, then it is taken up and dried in the Sun after which the Peelings are prepared for the Block and Hackle, to make the Fibres thereof very fine; in order for Spinning and Making Cloth.

VI. *The Vitalities.* There is nothing of this Plant used in a Physical way but the Seed only, and that seems to be temperate in respect to heat or coldness, and is Emollient and Laxative, Peccoral and Antipleuritic.

VII. *The Specification.* It is peculiar against Pleurilies, the Piles, and all Contractions of the Nerves and Muscles.

VIII. *The Preparations.* You may have therefrom, 1. *The Seed prepared.* 2. *A Powder of the Seed.* 3. *A Decoction.* 4. *A halfam.* 5. *A Cataplasm.* 6. *An Oil by Expression.* 7. *A Fumigation.*

The Virtues.

IX. *The Seed prepared.* *Galen* says that some parched the Seed, and eat it with Honey for Food, and that others put it into their Bread, but says he *primo Alimentorum,* it troubles the Stomach, is hard of Digestion, and gives not much Nourishment to the Body; but as to the moving of the Belly downwards (says he) I will neither commend nor discommend it, but it in some small measure provokes Urine, which it does best being parched.

X. *The Powder of the Seed.* If it is mixt with an eighth part of Pepper in fine Powder, and made into an Electuary with Honey, and taken to the quantity of a large Nutmeg every Morning fasting, and Night going to Bed, it prevails against Coughs, Colds, Hoarseness, Wheezing, Obstructions of the Lungs, and vehement Catarrhs.

XI. *The Decoction in Wine.* Sweetned with Honey and drunk it eases the Bellyach and Colick, Stitches, and all Inflammations of the Viscera if Raisins are boiled in it it opens (says *Pliny*) the Obstructions of the Lively and if it is applied to any fretting or running Sore it dries it, and stays it from spreading farther.

XII. *The halfam.* If it is made into a Balsam with Rosin, Powder of Myrrh, and some of the Oil by Expression, and applied to Ruptures, or Swellings of the *Scrotum* or Testicles, it cures the one and diffuses the other*, it also diffuses Tumors in any other part of the Body.

XIII. *The Cataplasm.* If it is made with equal parts of Line Seed*, Fenugreek Seed, and Mallows, and applied, it is of good use to mollify and diffuse any Tumor or Hardness in any part of the Body. If it is made with *Sal Nitri* and Fig-Tree Aflie it eases the Pains, and takes away the hardness of the Nerves, Tendons, and Muscles. If it is made with Figs and Wild Cucumber Roots, and applied, it draws forth Splinters, Thorns, Nails, Prickles, A a a 2 Splimeii^

Solinters of Broken Bones, or any other thing flicking in the Flefh. If it is made with Crefles it takes away the ruggednefs of the Nails. If it is made with Olibanum, Myrrh, and Wine, and applied to the Forehead, it helps the Watering of the Eyes. If it is made with Honey, Suet, and Bees Wax, and applied, it helps Struma's, hard Kernels and Swellings under the Ears or Throat* it takes away alfo Spots and Blemifhes of the Skin, Sunburnings, and other Dilcolorings.

XIV. *The Oil by Exprefwn.* It is faid to be a Specifick for curing a Pleurifie, as alfo Stitches, Peripneumonia's, and other exquisite pains of the Ifo-m, giving it to fix or eight Ounces at a time, or more, and repeating the fame at due intervals of time fo long as need requires, it is an excellent thing to anoint with, to mollifie the fhinking and hardnefs of the Nerves, Tendons, or Mufcles, foften any hard Swelling, and to give eafe, and cure the Piles, Chaps of the Fundament to foften the hardnefs thereof; and eafe the pain, it alfo foften the hardnefs of the Mother if it is beaten with Red Rofe Water, or rather with Water, in which Nitre, or *Saccharum Saturni* has been diffolved, and then be applied to Burnings and Scaldings, it cures them, it is good to burn in Lamps, and will burn longer than Oil Olive will, yet it makes much more Smoak and Soot: befides all thefe things, it is of excellent ufe for Painters to make their Drying Oil of, and to mix their Colors with to be applied to Cloth, or Wood, or Stone, Iron, Copper, or Glafs, *tSfc.*

XV. *The Fumigation.* If a Woman fits over the Fumes of the Decoftion of the Seed in Water, or in Water and Vinegar, it foften the hardnefs of the Womb, and eafes the pains of the Mother.

C H A P. CCLXVIII.

Of F L A X Wild.

The Names. It is called in *Greek*, *Aiw* <year : in *Latin*, *Linum fylvefire*, *Linum fylvefire*, and in *Engli/h*, *Wild Flax*.

1. *the Kinds.* There are feveral kinds of this Plant, as, i. *Linum fylvefire Catharticum*, *Linum Anghcum*, Our Engli/h Wild Flax, or Purging Wild Flax, called by the Country People, *Mil-Mountain*. 2. *Linum fylvefire anguifolium floribus albis*, *vel Uruleis*, White Wild Flax. 3. *Linum Jyvenifolium*, Thin or Narrow-leav'd Wild flax. 4. *Linum fylvefire latifolium floribus Caruleis*, Broad-leav'd Wild Flax, blew-flowred. 5. *Linum latifolium floribus Luteis*, Broad-leav'd Flax yellow-flowred. 6. *Cha»i<ehnumperp*, *Linum fylvefire pumilum*, Dwarf Wild Max. 7. *Unum fylvefire vugatius*, The more common Wild Flax.

III The Defcriptions. *The firft*, or Purging Wild Flax has a crooked Root, which is fmall, white and fibrous, which fends forth fometimes one, but moft commonly five, fix or more round Stalks, about eight, ten, or twelve inches high, 4 a brown or reddifh color; every Stalk dividing it felj near the top, or from the middle upwards into many Branches, of a greener color than the lower part of the Stalk. The Leaves are fmall, imooth, and of a green color, of the bignefs of *Lenil* Leaves, and have in the middle one Rib or Nerve, and no more that may be perceived, and grow along on the Stalk, in very

good Order, by couples, one oppofite agairlt another. At the tops of the fmall Branches the Flowers grow, of a white color, confuting of five fmall Leaves apiece, the Nails whereof are yellow. In the infide are placed fmall ihort Chives alfo of a yellow color 5 after which come up little KnCjbs or Buttons, the tops of which, when the Seed is ripe, divide themfelves into five parts, in which is contained fmall, fmooth, flat, ilippery yellow Seed. When the Seed is ripe, the whole Herb perifhes. The Plant is of a bitter Tafte and herby Smell.

IV. *The fecond*, or White Wild Flax, has a Root which is tough and fmall, and grows like, and has Leaves like unto the Manured Flax, but narrower, and growing upon round, bright and jhining Stalks, a foot long, having Flowers like the Manured flax, but of a white color. But this Plant is fom'times found with deep blew Flowers, with Violet colored Flowers, and fometimes with white Flowers, Wreaked with purple Lines.

V. *The third*, or Thin or Narrow leav'd Wild Flax, has a tough /tender Root, with feveral Fibres adjoining to it, which fends forth many Stalks, furnifhedjoith narrow thin Leaves : the Flowers confift of five Leaves apiece, of a light Purple or Flefh color, which do foon fade and fall away. The Stalks are of about a Cubit in height, befet with fmall Leaves, yea leffer than thofe of *Linaria purpurea*. The whole Plant is Very like to the Common Manured flax, but in every refpect leffer .,

VI. *The fourth*, or Broad-leav'd blew-tlowred, has a Root which is great, and lives after Seed-time^ fhooting forth new Stalks, with teooly Leaves on them, and Jo abides all the Winter. This Root fays Gerard, daes continue many Years without Sowing, encreahng by its Koot into many other Stalks, rifing up with many thick, ftiff and hairy* Branches, fometimes with but one, and fometimes with more, a foot, or loot and halt high, and befet with many rough and hairy broad Leaves, (broader than in any of the other forts.) The Stalks towards their tops branch themfelves out, and are befet with fmall Leaves than thofe below. At the tops of the Stalks

do grow many blew flowers, much greater and larger than thole of the Common manured Flax, even as great almost and large as Mallows. Sometimes of a deeper, and ibmetim's of a Paler blew; confitting of five Leaves a piece -, which being paf away, there fucceeds fmall flarp pointed heads (in the green husk which held the flowers) which are full of Seed-, and being ripe, open 2nd (hew the fame, which is flat, and of a blackifh fhining Colour, like Line Seed.

VII. *The Fifth, or Broad leav'd yellow flowred, has a Root* which is thick and crooked, with many Fibres thereat, which perijhes not, but abides many Tears. It Springs forth with many Stalks, about a Cubit high, fomewhat red and jliif, alfo round and of a broivii/? Colour, fet with pretty large and thick Leaves, "not rough and hairy, but fsmooth and hard. The Flowers grow plentifully on the tops of the Stalks, being compofed of five Leaves apiece, and are large, of a fair, fhining, yellow Color, with five threads, coming forth in their middle, having alfo as many fmaller and fhorter hairs. The Seed, is contained in Heads, flatter than in any of the other, and is of a blacker Color, but not fhining like them.*

VIII. *The Sixth, or Dwarf Wild Flax, has a Root, which is fmall and threddy, which fend forth many flender Stalks, of about five, fix, Jeven, eight, or nine Inches high, furnijhed^witk fiveral fmall, long Leaves, aMgrowing on them by Couples. At the tops of the Branches grow the Flowers, which are White, or of a^ale yellow, leffer than thofeof the manured Flax, with yellow Threads in the middle. The Seed is contained in little round, heads, and is fmall. The whole plant is in all things like unto Flax •, but in its Stalks, Leaves and Flowers, and all other parts thereof, it is four times leffer.*

IX. *The ſeyenth, or more Common Wild Flax, has a Root like the manured Kind, and grows alfo like it, but has greater and higher Stalks, more branched at the Tops, and bearing agreaterftock of blew Flovofers on them, with Seed alfo ti^eiōViefātne : J3ut the Seed VefTels will hold or contain the lame, and not break open, when ripe, with the heat of the Sun, as-the manured kind will do.*

X. *The Places.* The firft grows plentifully in the unmanured Inclofures of Hampshire, on Chalky ^{^Dqwn^} Purfleet Hills, in EJJex, as alfo in Wer places of thi Kingdom : Gejner would d have it to ^{^atiffemlleborine} of the Ancients. £ reft grow jir Gravofy Grounds : The fecond Oventh, in well manured Places, as alfo in Gardens and other the like Soils. The fourth and fifth, grow upon Rocks and Cliffs near the Sea-fide. Gerard faw them grow upon the Sea-banks by Lee in EJJex, and in many places in the Ifle of Sheppy: They grow alfo between Queenborough zy ASherland Houfe. The third and fifth, in Borders of Fields, in untilled places, and Hilly Grounds.

XL *The Times.* The firft fprings out of the Ground at the beginning of the Spring, and flowers all the Summer. • All the reft flower thro³ all June, July, and Auguft-, the Seed ripening in the mean time.

XII. *The Qualities, Specifications, Preparations, and Virtues* of the fix latter defcribed Plants, are the fame with thofe of the manured Flax in Chap. 267. aforegoing, and therefore we (hall fay no more of them here •, but come direftly to confider the firft, QiCathartick kind, which is the moft ufeful.

XIII. *The Vitalities.* It is hot and dry, fupposed in the fecond Degree : Stomatick, and Cathartick. How this Herb came to be fo known^s to be taken notice of, Mr. Goodyer fin Johnfon upon

Gerard's Herbal) has given us an account of going to an Apothecaries Shop ac Winchejler mTdampfhire, I faw (fays he) this Herb lying upon the Stall, which I had feen long before, I defired of him to know the Name of it; he told me, it was called Mill Mountain, and that Do&or Lake's Man had given him the name of it, as alfo the Way how his Mafter the Do&or (who was afterwards Bifhop of Bath and Walls) did ufe it.

XIV. *The Virtues and Ufe.* Take a Handful of Mill Mountain, the whole Plane, Leaves, Seeds, Flowers and all, bruife it, and put it into a Pipkin, with a Pint of White Wine, and fet it on hot Embers to Infule all Night, then pour off the clean Wine, and drink it the next Morning falling. This will give eight or ten Stools, and purges and cleanfes the Stomach and Bowels admirably well; And this was the thing, which the did ^{^D f. L ^} always ufed for his Purge.

C H A P . CCLXIX.

Of FLAXWÉÉD NarrowleaVd>

O R,

TOAD-FLAX Narrow leavU

I. *TPHE Names. It is not known to have any X Greek Name, and yet Authors have called it ^CivSihtvov and *oTMeff : \xfLatin, Pseudolinum^ and Linaria: in Englifh, Flaxweed and Toad Wax.

11. *The Kinds.* There are three General Kinds of this Plant, viz. 1. -VevJb'MmrtviovMQy^ Linaria; angujitifolia, narrow leaved Flaxweed, or Toad Flax, of which in this Chapter. 2. Pseudolinum, vel Linaria latifolia, broad leaved Flaxweed, of which, in the next Chapter. 3. Chameslinar^ Linaria pu~
iij. 4;

wita, Linana repens, creeping flaxweed, or Toad Flax, of which in Chapter. 271. following.

III. Of the fir ft of theje General Kinds, there are thefe Specie's following. 1. *Linana Vulgaris-Miras, Pseudolinum BrunfeljiuLoneceri* xA. *Dodonaei, Ojyris, Matthioli, Fi(chfii, Cordi:dxA Lobcliy.Om* Common Flaxweed, or Toad Flax. 2. *LinariaValentina CUijij, hispanicatertiaClufij*, SpanifftFlaxweed of Clujius. 3. *Linana Pannonica major, vel Ojyris alba*, White Flaxweed or Toad Flax. 4. *Linofyris Nipcrorum Lobelij*, Golden Star fashioned Flaxweed, or Toad Flax. 5. *Linaria aurea Tragi*, Golden Flaxweed, or Toad Flax. 6. *Linaria Jive Ojyris, vel Seoparia Itolorum*, Befom Flaxweed, or Toad Flax. 7. *Pseudolinaria montana alba, Anonymus Clufii, Anthylis Montana Lugdunenfis, Linaria adult erina alba*, Baftard Flaxweed, or Toad Flax. 8. *Linaria purpurea*, Purple Flaxweed, or Toad Flax, variable Flaxweed.

IV. The Defcriptions. *The firft, or our Common Flaxweed, has a Root which is fomewhat Woody, and White, efpe daily the main down right one, with many Fibres, abiding many Tears, Jhooting forth Roots every way about, and new Branches every Tear, which fend forth divers fmall, flender, blackifh Stalks, full Jet zwith long and narrow Flax like, blew or afhcolored Leaves, and from the middle of them upwards, repleniflod with a number of pale yellow blowers (of a ftrong unpleafant Scent)having Spurs hanging to them like Larks fpurs * and having a Mouth like to a Frogs Mouth, fuch as are to be feen in Common Antirrhinum, or Snapdragon (of which Flaxweed is faid to be a Kind) which are deeper and yellow withall. After the Flowers are paf away, round Heads come forth, having blackifh flat Seeds. The whole Plant before it comes to Flower, is fo very like to Efula minor that the one is fcarcely known * from the other, but by this Old Verfe : Efula laUefcit -, fine lade Linaria crefcit.*

V. *The fecond, or Spanifh Flaxweed, has a Root like the other, which perifhes not in Winter, but abides for a long time, and by which the Plant multiplies it felf and is increiffed. From the Root fpring up many fmall Stalks, about a Foot high or more, on which grow very plentifully many narrow Leaves of a grey if h or Afhcolor, and at the tops of them, (tore of fmall Flowers, which are of a Whitifh color on the out fide, and more purplifh inwardly ^ but about the gaping Mouth, being of a more yellow color, but yet pale alfo -, the fpur behind being of a purplifh color *, the Seed which fucceds(when it has any, for it feldom bears) is like to the former.*

VI. *The third, or White Flaxweed, has a great, thick and long Root with fome Fibres or Strings adjoining to it, from which rife up many Branches or Stalks very large and pliant, befet towards the top with Flowers, but of a pale, whitifh color, and the inner part of the Mouth is fomewhat more tvide and open than the firft, and the Leaves like to the Common fort. Indeed this is in many things like to our Common kind, but the Leaves hereof are larger, and the Flowers greater, and fewer of a pale yellow, but of a deeper yellow in the Mouth, with fome hairinefs therein.*

VII. *The fourth, or Golden Starfashioned, has a Root compati of many Strings, intangled one within another -, from whence rife up Stalks very ft iff and Woody, befet with Leaves like the Common Linaria at Sett IV. abpve, with Flowers at the tops of the Stalks, of a faint Jhining, yellow color, in form and Jhape fome what like unto Conyza major. This Herb is (talked and leaved like Common Flax, and thought by iome to be the true Ojyris, for which reafon latter Writers have called it by a Compounded*

Name *Linofyris*, it grows to be three Feet or more high, and is in tafte fharp and bitter, having a Clamminefs or Glutinofity with all.

VIII- *The fifth, or Golden Flaxweed, has a great tufted Fibrous Root, from whence rife up many Stalks a Foot and a half high; which are divided towards the tops into many fmall Branches : On the feveral Tops grow Tufts of fmafl Flowers, each little flower being parted into five parts, with a little thread or pebble in the middle ^ fo that it feems full of many golden Hairs or Thrums. The Seed is long and blackifh, and is carried away with the Wind. Fabius Columna has proved this to be the Chryfocome defcribed by Diofcondes, Lib, 4, Cap. 5J.*

IX. *The Sixth, or Befom Flaxweed, has a Root conjiijing of a great number of blackifh Strings fit together, which, with the whole Plant perifhes every Tear. From this Root fpring up moft ufually bp\ one ftraight upright fquare Stalk, three foot m ^ half or more high, (as it grows in our Gardin,) branching itfelf out divers ways-, bearing thereon manjr long, narrow Leaves like our Garden or Matured Flax, very thick fet together, like unto a Bufh, or rather like unto a fair green Cyprefs-tree, growing brogd below, and Spire fahioni upwards, of a very fair green Colour. At the feveral joynts of the Branches, towards the Tops, and among the Leaves, come forth fmall reddifh Flowers, not eafily feen nor much regarded, which turn into fmall round blackifh grey Seed. This Broom Flaxweed, tho' it has no beautiful Flowers-, yet the Curious Plant it in their Gardens, becaufe the green Plant full of Leaves, is very delightful to behold -, being in Italy and other places, planted not only in their Gardens, but alfo m Pots, to furnifh and adorn their Windows ^ and even with us it grows to be fo delectable a green Bufh, that it is thought to be worthy to be enumerated among our Hortary rarities and delights.*

X. Gerard/T ^ that this Befom, or Bufhy Flaxweed // ^ one fmall Stalk, has many Shoots or Branches, making the whole Plant o refemble a Cyprefs-tree, the Branches growing fo handfimely *, very thick and Bufhy,

Bujhy fo that in fame places where it natural^s grows, they make Befoms of it, from whence cameth^r name Scoparia. The Leaves are fmali and narrow, almoit like to the Leaves of *Flax*. The Flowers anⁿ fmali, and of an Herfay,color, growing among th^t Leaves -, it keeps Green, to Winter[^] or Still the Froit^t weather comes, the hardſhipof which it never om^t lives.

XI *The Seventh, or Baftard Flaxweed, has a Root which is White," divided into fever al Branches, and Jffks long, every Tear fending up many Stalks; which are hard, pale, green and Jirakedy growing to be a foot high or more; and upon thefe, without any order, grow many hard, narrow, long Leaves, like thofe of a flax -, at fir ft of a very tart, but afterwards of a bittenjh Tufie.* The tops of the Stalks are branched put into feveral Foot ſtalks, which carry little white Flowers, confifting of five fmali leaves a-piece, lying Star fafhion, with fome threads in the midtt. Thefe being paft away, a fingle five cornered Seed comes forth, containing a white Pith, in a hard Film or Skin.

XII.*The Eighth, or Purple Flaxweed, has a Root which is fmali and thready, perifhing for the moft part every Tear, and ſpringing again of its ownfow-? "& if^l *s fofferred tojhed its Seed, except the hardnefs of the Winter kills it.* From this Root rife up feveral fmali, thick, long, and fomewhat narrowifh Leaves, of a whitifh green Color-, among which rife up divers Stalks of a Cubit height, befet with long iurrow Leaves, like unto thofe of our Common *Yfoxweed* at Setl IV. aforegoing 2 Thefe Stalks towards the Tops are replenifhed with many fmali Flowers of a Purple Color, growing together one above another, fpike fafhion, which are fmali and fomewhat fweet, whilft they are frefh, and formed much like unto our Firft or Common *blaxyoeed*, with a gaping mouth, but they are much imaller, and

want that crooked Spur behind. Sometimes they are of a fad Purple, near unto a Violet Color, and Ibmetimes of a Paler blew Color, having a yellow ſpot in the middle, or gaping place. The Flowers being pail fmali, hard, round heads come forth, in which are contained fmali, flat, and greyilh Seed.

XIII. *The Places.* The firft grows almoft every where thro^s the whole Kingdom, both by the Way fides, as in Meadows, and alib by Hedge fides, and upon the fides of Banks and borders of Fields. The feventh grows on Mountainous places in *Germany* ^ and irhas been found growing Wild in *England*, on the fide of a Chalky Hill, in an Inclofure, on the right hand of the Way as you go from *Dr oxford* to *Poppie Hill* in *Haⁿpfhire*-, all the reft are only nurlt up with us in Gardens.

XIV. *The Times.* They all flower in the Summer Months, from *May* to *Augufi*, and the Seed-is ripe foon after. The eighth, tho^t it often fows it ſelf, yet by reaſon a hard frofty Winter may kill the Seed, it ought to be fown anew every Spring.

XV. *The Qualities.* They are hot and dry in the fecond Degree ^ *Aperitive, Abjierfwe, andDiuretick, Hepatick, Splenetick, and Nephritick, Catbar- tick, Emmenagogick, Sudorifick, and Alexipbarmick**_m

XVI. *The Specification.* They are peculiar againft: the Strangury, Dropfie, Jaundice, and Poyfon.

XVII. *The Preparations.* You may have therefrom, 1. A Juice, 2. An Effence, 3. An Infuſion or Decoction in Wine. 4. A Ponder of the Seed. 5. A diftilled Water from the whole Plant. Of all thefe kinds, the firft i# the moft effectual, and moft ufed.

The Virtues*

XVIII. *The Liquid Juice.* Given to three, or four ſpoonfuls Morning, Noon, and Night in a Glaſe of *White Lisbon* or *Port Wine*, it gives eaſe in the Strangury, powerfully provokes Urine when it is ſtopped by Sand, Gravel or Tartarous matter, and carries off by Piffing the Water in Dropfies. It effe&ually provokes the Terms in Women, and drives forth the Dead Child and After-birth. Put into Foul Ulcers, whether they be Cancerous or Fitulouſ, with Tents rowled therein, or the parts wa(hed therewith, or it being inje&ed into them, cleanfes them throughly from the bottom, and in a ſhort time heals them up fafely. It alfo cleanfes the Skin wonderfully from all forts of filthinefs and deformities, as Spots, Marks, Freckles, Lentils, Yellownefs, tawninefs, Wheals, pimples Scabs, Scurfs, Morpew, Leprofie, and other the like Defoedations.

XIX. *The Effence.* It has all the Virtues of the Liquid Juice, beſides which, it wafhes and cleanfes the Reins and Uretory parts from Stones, Gravel, Sand, and Tartarous Mucilage heaped up in thofe parts-, ^nd taken from two to four Spoonfuls in *White Lisbon* or *Port Wine*, it moves the Belly Downwards, and prevails both againft the Dropfie and Yellow Jaundice. Dropt into the Eyes, it is a certain remedy againft all Heat, Inſlamadons, and Hednefs therein. It opens obſtructions of the Liver and Spleen, purifies the Blood, and is good againft Hypochondriack Melancholy*

XX. *The Infuſion, or Decoſion in Wine.* It has all the Virtues of the Juice and Effence, but weaker in Operation, and therefore muft be, given in larger Dofes, as to fix, feven or eight Ounces. It expels Poyfon, and is good againft the Bitings of Mad Dogs, Serpents, or other venomous Bealts.

XXI. *The Pouder of the Seed.* Given to One Dram with the Liquid Juice or Effence, or Infuſion or Deco&ion as aforeſaid, and continued for feveral days together, it is held to be a fingular Remedy

CHAT. CCLXXI.

0/ FLAXWEED Creeping,

* OR,

TOAD-FLAX Dwarf:

I. ^{af*} HE Nantes. It may be call id in G JL -VtviSfJur tfsrw, in Latin Pj'eudolinum repens; Unarm pumtla: and in &«ll/& ^ t t w / or C r a ^ flaxweed, or TtuJ lNw.

II. Tiv Kinds. Authors mate fix or more kinds, most of UemftrajgETS to us iii England; the chief which we mall take notice of iii this place, are the-three following, vis. i. hinariatwxted repent, The Creeping, or Dwarf, blew, or purple Flaxweed, or Toad Flax. 2. hinaria pitmilla nijp-.inicd, Spanish Dwarf Haxweed, or To^d Flax. This is QfyrisjU-Sylvejlrjs Battkini, wsLthg.Qfyristmnor'Tiibern woman's. 3. hinariaquairifolidjupina, 01 quairijuiu; Alpimi; hinaria Alpirta. Gefneri; LinanatertuiStyriaca. Clujii, Four leav'd Creeping Huxwcd, or blew Mountain Toad Flax.

III. The Defcriptions. The jirji, or Creeping Dwarf, blew, or purple Flaxweed, has it Root which is made up of many tibres, and abides, not ferijbing intheWimer; thts Root fends forth a number of fmall weak Stalks, leaning down to the Ground, jcareely being able to fiartd upright, jet very full and without order, iJth little LeJves like ihoje of manured FJAT, which are very narrow, and AJhcobred, and ere continued up to the tops ojthe Stalks, where they divide them/elves intofevrcalother Branches, whi^ have all of h or Spix.:s of Mowers, -: ry j'mall, ntt<lef J JI • purple color, •with a yet lota Spot in the ••' the in. The Seed is much like to th:it <>i- out Common ;; irrow leav'd kind,tn Cb

IV. The ft 'ax weed, his a K ng under Ground, N from xhich shom M many Wfiani upright, njiag to be about jix Inches or/, ; Oil which *'" tgtow many long and uaiow Leaves, ver,f like Jg> our Common narrow leav'd kind, as wdi for -Jrm as color; fo also the Flowers ut tops or the Stalks, and the Heads and Seed are like the feme, the Flowers being yellow, and the beed Hat and hskifh, only im this; the Leaves, Flowers Seed, ate all of them much lc(i than the laid Common narrow leaved kind, in which confits the difference.

V. The third, or ibui leived creepkig Flaxweed, has a Root which is (mall, or /ender, and tchite, fpreadiug it felf under Ground jiveral nayr, and perifhes not in Winter, but endure! many Years. Horn this Root Jhoet jorr. •nallwe.ik Stalks. of the length oj lying «hv^ on the Ground, .mi feveralh divided into many fmaller branches, even from the bottom; upon which ate" feta great many im;iil, ihort, whitifh green Leaves, very orderly one above another, that is, at form; but two Leaves, at fomethtee, and at others four, not keeping always ex:ifHy to the lame number, efpecially below,they growing more exactly upwards : These Leaves are leffer than thofe oi Common narrow leaved i/axardlnChap. ibq.Sett-A-being thick and ^uicy, growing upon the %m certain ipaces, ibmetimes ttrte, out aiofl iuiialy

sour togetlier. The Hoffers grow atthe tops d Stalks and Brandies, and arc in form like thoi ;lie (Common narrow leaved kind aforementioned,)ut of a molt perfect Violet color .- They are fomet what great, and ltand not fo thick cluttering togetierj the lower lip where it giipes, is of a gold yellow color, to wit, the Spot in the Mouth, the r^ii of the Flower being of a delicate purple blew. Arter the Flowers are patt, come round Heads, which are ibmewhat great and thick, a;d contain within them a Hat blackifh Seed, in two partitions or Cells.

IV. The Plates. The rlrt grows Wild in many places, as upon Stone Walls, gravelly Grounds, barren Fields, and along by Hedge fides. The fecond is a Native of Spain. The third grows upon rhe higher Alps •. with us they are only Nurlt up iii Hardens of the Curious.

VII. The Times. They all Flower from the end of ALiy, to the end of Augufi : The Seed ripening in the mean Seafon.

VIII. The gaalities. Specifications, Preparations, and Virtues are the lame with our Common narrow leav'd Flax-weed in Chap. ity. to which we reta you, and therefore thai! fay no moreof them here.

CHA P. CCLXXII.

Of FLEBANE Greater.

^£ Names. It is catted in Ghek*»K* s A ill Latin Cenysa -, and in Engl'tjh ikbum.

II. The Kinds. We divide it into iour kinds, viz. 1. Conyza major, The greater Flebane. 1. Ct>-nysa minor, The leffer Flebane. |. Comxapumih, Dwarf Flebane. 4. Cmzya palujhis, Water Fle-

cabane true &reat

III. *Of the greater kinds of Flebane, these offer themselves, viz. 1. Conyza Major vera Diofcoridis, The true greater Fleabane of Diofcoridis. 2. Conyza major Montana Germanica, great Mountain Flebane of Germany. 3. Conyza Helenitis me Hit a in c ana, Hoary mullet Flebane, with Elecampane Leaves. 4. Conyza Helenitis foliis laciniatis, Great jagged Flebane. 5. Conyza Helenitis pilosa, Hairy Mullet Flebane. 6. Conyza media, The middle kind of Flebane.*

IV The Descriptions. *The first, or true greater Flebane, has a thick, brig, durable and fibrous Root, which fends forth many Stalks, two or three Feet or more high which are hard, woody, rough, hairy, fat, and of an overworn color. The Leaves grow without order, alternately embrace the Stalks, and are many, long, somewhat narrow, and of a yellowish green color, dented a little about the edges, twice as large as those of the Olive-tree, which are rough or hairy, and very fat or clammy, being as it were befmeared with a fattiness or gumminess, which is much more in hot Countries than it is in this of ours, these Leaves are something like unto those of the Italian Star Wort, but larger, and more pointed at the ends. Towards the tops of the Stalks come forth the flowers, at every joint with the leaves a yellow flower, which is somewhat large, and round, almost like the Flower of Hawkweed or Groundfel, which when it is Ml ripe, turns into Down, and flies away with the Wind. The smell hereof is somewhat strong, but sweet withal, and not unpleasent: It is so glutinous and clammy, that what small thing soever, as Flies, Fleas, &c. (shall happen to fall or light thereon, are held fall and caught and for this reason it was called Flebane not for that it has any quality, of otherwise poisoning or killing them.*

V. *The second, or Great Mountain, has a Fibrous Root which fends forth several round green Stalks, two feet or more-high, but not near so clammy as the former having many long pointed Leaves*

set thereon without order, of a sad, or dark green color, each of which is four or five Inches long, and an Inch and half broad. The Flowers are yellow, somewhat larger than the other, every one tending at the tops of the Branches, upon a long Stalk, in the same manner as the former do, viz. with a Pale or Border of Leaves, and many small thrums in the middle, which pass into Down, and are carried away with the Wind, as the former are. Note. There is another of this sort with longer leaves, and lesser flowers

VI. *The third, or Hoary Mullet Fleabane, with Elecampane Leaves, has a Root which is composed of many black Strings or Fibres, by which it takes fast hold of the Ground, which fends up several long, and somewhat broad Leaves, almost in fashion like to Foxglove Leaves, but that these are hoary or grey on the upper side, and of a brownish green on the under side, herein somewhat like to the Leaves of Rha Helenii folio, or Bastard Rhubarb with Elecampane Leaves. The Leaves are very Hoary also, the Plant rising to be two or three Feet high, let with the like Leaves as grow below, but smaller and smaller as they grow towards the tops, where many Flowers stand together, like unto the former Flebanes, and much greater than those of Gromwel, which turn into Down, and fly away with the Wind. The whole Plant is somewhat clammy, yet much less than the first, and much sweeter than it, smelling much like Honey.*

VII. *The fourth or Great Jagged Flebane, has a bulky Fibrous Root, from which arise thick, crested, and hollow Stalks, divided towards the tops, into several Branches. The Leaves which encompass the Stalk, are deeply gashed or cut in on the edges, being of a very considerable length, and broad in respect to that length, all of them extended to a sharp point. The Flowers are Star fashion, of a yellow color, turn into Down, and fly away with the Wind.*

The whole Plan: is covered over with a soft and tender Down, and smells somewhat like Money.

VIII. The fifth, or Hairy Mullet Fleabane, has a hairy Fibrous Root like the last, but in its Stalks. Leaves and. Flowers is fo like the third, aforegoing, that there is no other difference to befoigid, but that in both Leaves and Stalks, besides the hoariness, this is much more hairy and rough than it, which causes it to be a differing kind from it.

IX. The sixth, or Middle kind, has a Root which is pretty large and Fibrous, from whence arises a branched Stalk of about a Foot and half high; encompassed at certain paces, with thick, rough greyish, green Leaves. At the tops of the Branches grow pretty fair yellow Flowers, of the largeness of a little Marigold, which being faded away, turn into Down, and are carried away with the lightest.

X. The Places. The first grows in Syria and Clufius found it near Lisbon, and in divers parts of Spain, but with us it grows only in Gardens. The second on Mountainous places in Germany, England, &c. as also in Gardens: Johannes Thalius found it in Hircynia Sylva in Saxony, and we in many places of our own Country, as near Hampstead, &c. The third, fourth, and fifth, are found upon the Hills and some Hilly places in our own Land. The sixth is found growing in moist places about Rivers and Ponds sides, &c. and has been found in St. James's Park, Tuttle Fields, &c.

XL The Times. They all flower in the Months of June, July, and August, some earlier, and some later than others, the Seed ripening in the mean season.

XII. The Qualities. Fleabane is hot and dry in the third Degree; it is Aperitive, Absterfive, Diuretick, Nepitick, Hyfterick, and Alexipharmick.

XIII The Specification. It is singular against the Strangury, Jaundice, griping of the Guts, Epilepsy, green Wounds, bitings of Mad Dogs, and all sorts of Venemous Creatures, &c.

XIV. The Preparations. You may prepare therefrom, 1. A Liquid Juice. 2. An Effence. 3. An

Infusion or Decoction in Wine. 4. An Oil by Infolation. 5. A Balsam. 6. A Cataplasme. 7. A Spirituous Tincture. 8. An Oily Tincture.

The Virtues.

XV. The Liquid Juice of Leaves and Flowers. It provokes the Terms in Women, and expels the Dead Child and Afterbirth, it cures the Strangury, for it provokes Urine admirably when it is made by drops, by opening the Passages, and expelling the Morbifick Matter, be it what it will. Dose two or three Spoonfuls, Morning and Night, taken in a Glass of fragrant Wine, or other fit Vehicle.

XVI. The Effence. It has all the former Virtues, besides which it opens all Obstructions of Gall, Liver, Spleen, Reins, and Womb; it is good against the Yellow Jaundice, and the Gripping pains of the Belly, and being taken to three or four Spoonfuls in Vinegar or Wine, it prevails against the Epilepsy or Failing-Sickness, injected up the Womb it brings away both Birth and Afterbirth, being also at the same time taken inwardly: given in Red Port Wine it (tops any Flux of the Belly.

XVII. The Infusion or Decoction in Wine. It has all the Virtues of the Juice and Effence, but must be given in larger quantities, as to four, six or eight Ounces: being given Morning and Evening it admirably warms and strengthens a cold, moist, and weak Stomach, provokes Urine powerfully, and prevails against all sorts of Pains and Grievs of the Womb: if the Decoction is made in Water, it is good for Women to Bath in whose Courses are stopped, as also to ease all sorts of Pains and Grievs of those parts.

XVIII The Oil by Infusion. Anointed on the Head it eases the Headach and Megrims, coming from a cold Cause, anointed all along the Back Bone, on the Stomach, and on the Pulses, it is very effectual to take away the shaking Fits of Agues, and those Tremblings which come from cold.

XIX. The Balsam. It is an extraordinary thing for curing simple green Wounds, it brings to Digestion, cleanses, dries, and heals after a singular manner: anointed on the Hemorrhoids it gives ease in the extremity of Anguish, and in a little time cures them.

XX. The Cataplasme. The green Leaves made into a Pultice, by beating in a Mortar, &c. and applied to any simple green Wound, or Cur, being first well washed or cleansed, heals it in a very short space of time, warms and comforts parts chilled with cold, and applied to the Forehead is a good expedient to cure the Frenzy, so also being applied to the Soles of the Feet, and so applied, it is laid to stop any Flux of the Bowels.

XXI. The Spirituous Tincture. It is good against Vomiting and Nauseousness, expels Wind, and comforts and warms a cold, moist, and weak Stomach: it is good against Poysons, the Bitings of Mad Dogs, Serpents, and all sorts of other Venemous Creatures: it cures all sorts of Fluxes of the Bowels, whether they be of Blood or Humors, and is an extraordinary thing to be taken two, three, or four times a day in any fit Vehicle, (from two to four, or six Drams) by such as are affected with the Palfie.

XXII. The Oily Tincture. This used as the Infolated Oil aforegoing, is much more powerful to warm those parts which are chilled with cold, and to take away the cold and shaking Fits of Agues, as also to cure Tremblings, Numbness of any part, Palfies, Convulsions, Cramps, and the like: anointed on the Piles which are not broken, it presently eases the Pain, dissolves the Tumor, and in two or three times anointing cures them: it is an effectual thing against Punures, Hurts, and Bruises of the

Nerves and Tendons; and given inwardly from ten to twenty or thirty drops, (dropt first into fine White Sugar) mixed with a Glass of White Port Wine, it facilitates the Birth, brings away the Afterbirth, or Dead Child, opens Obstructions of the Reins, Ureters, and Bladder, and brings present Relief in the Strangury, caused by small Stones, Sand, Gravel, or Tartarous Matter lodged in those parts.

CHAP. CCLXXIII.

O/FLEABANE the Lesser.

THE Names. It is called in Greek & οὐλίβα & οὐλίβα in Latin *Conyza minor*, and in English *Fleabane the lesser*.

II The Kinds. It is the second Species of *Fleabane*, and is twofold, viz. i. *Conyza famina Theophrasti*, *Conyza minor vera Dioscoridis*, Pen*, *Clusij Gefneri*, & *alwrum*, The true lesser Fleabane of *Dioscoridis*. % *Conyza caridea acris*, *Tinctorius flor alter Tragi*, *Conyza odorata c<erulæ*, *Erigeron quarturn Dodon<ei*, *Dentelaria Gefneri*, *Conyza muralii*, & *Conyzoides C<erulea Gefneri*, *Conyza ccerulea Tabernamontani* Amellus *Montanus Columns* •, Blew floured Fleabane. There are are some others of this lesser kind, but they are not at all to be met with in England.

III. The Descriptions. *The first, or true small Fleabane, has a Root which is single, small and slender, with a few Fibres thereat, which perishes every Tear. This Root sends forth seldom more than one Stalk, which is about a Foot and half high, sometime not above a Foot, and sometimes not a Foot high, according to the goodness of the Soil it is planted in.* It is somewhat hairy and glutinous, or clammy, as the true greater *Fleabane*, but greener than that great kind. This Stalk is divided into many branches, which are also rough and glutinous. The Leaves are long and narrow •, somewhat like those of *Linnaria*, or *Flaxweed*, but three times left than those of the greater *Fleabane* in Chap. 272. SeS. 4. foregoing, and are hairy and unfitious or clammy alia. With the small Leaves, at the tops of the Branches come forth small pale yellow Flowers, which are lesser, and less shining than in the said greater *Fleabane*, which passing away, the Heads are turned into Down, and are carried away with the Wind, as the others are. This whole Plant smells sweeter than most of the others do, and dies every Year, and raises it self of its own Sowing, or must be new Sown every Year.

IV. *The second, or Blew flowered Fleabane, has a small Fibrous and yellow Root, of a very hot and biting taste, which from its Head sends up several longish Leaves, somewhat like those of the Garden Daijie, but a little writhed: The Stalk is about half a lard high, and set alternately with twinet longish, narrow, and somewhat rough leaves, of a? overworn green colour. Some Authors say, the Stalk grows sometimes to be about two Feet high, brownish at the bottom, and is set here and then up to the top, with longer and narrower Leaves, where it is divided into small and short Branches, on which grow many Flowers one above another in small, longish, scaly green Heads or Husks, composed of many small and narrow, blewith purple Leaves, something white at the ends or tips with a small yellow flat Thrum in the middle 3*

which middle, there arises up several white threads,, whereby each flower, confiding of three colors, White, Purple, and Yellow ^ makes it seem the more delectable to behold. After these Flowers pass away, there comes in those Husks or Heads which held^ them, small, long Seed, lying in the Down, each having some thereof at its Head which together there (when ripe) is blown away with the Wind, if not gathered. The whole Plant is of a sharp taste, but the Root much more, and is nearly as hot as Pepper, of a strong, but not unpleasent smell.

V. *The Places.* The first grows in Syria and Greece, also in Spain near Madrid as *Clusius* says, and in the Woods at Gramants near Mompelier, as both he and *Label* say. The second was found in divers places of the Kingdom of Naples^ in moist Fields which are in the Mountains, as *Columnafays*, as also in Sandy places near the River *Rhofne* by Lions in France, and upon the Alps in Austria as *Clusius* says. It grows upon many Chalky Hills in England, and *Gerard* says, that he in the Company of *George Bowles* and some others found it near Farmingham in Kent, and one *William Broad* found it growing at the Block-house at Gravesend. The first grows with us only in Gardens.

VI. *The Times.* ^ The first Flowers in June and July: the second in August, whole Flowers turn quickly into Down, and are carried away with the

VII. *The Qualities, Specification, Preparation^ and Virtues* are the same with the True greater fleabane in the former Chapter, to which we now refer you •, but with this Observation, that these lesser Fleabanes, are much more efficacious to all the purposes aforementioned ^ and are much more powerful and effectual to help any Flux, or bloody Flux of the Bowels.

VIII. *Not a.* The Root of the Blew flowered, being held in the Mouth, absolutely Cures the Tooth-ach.

CHAP. CCLXXIV^

O/FLEABANE the Dwarf

THE Names. It is called in Greek, Κμ&za *Pumila*, *Chamtconyza*: in English Dwarf Fleabane.

II. *The Kinds.* This is the third Species of Fleabane: And it is twofold, viz. 1. *Conyza Pumila*, *Conyza minor Tragi*, *Matthioli*, *Conyza minima Lobelin* a *Dodonei*, Our Vulgar Dwarf Fleabane. 2. *Conyza minor Rauwolfii*, *Conyza minor Syriaca*, Syrian small Fleabane.

III. *The Descriptions.* *The first, or Vulgar Dwarf Fleabane, has a small and Fibrous Root, from whence arises a branched Stalk, about a Foot high, set with small longish Leaves, somewhat roundish pointed, soft also and woolly, with a Smell not unpleasent as some of those going before.* The Flowers are replenished with many yellow Threads, like to the middle part of Camomii Flowers, or those of Tanfie •, and as the former turn into Down, and are carried away with the Wind

IV. The second, or Small Syrian Fleabane, has a small fibrous Root like the former, whence spring forth many small low Stalks or Branches, about a foot or yow high, whereof but few ft and upright, the most of them leaning or lying down upon the Ground^ and taking Root again in sever al places a* they lie. The Leaves which grow thereon, are final and long, fomewhat like unto the Leaves of the Olive-tree ; They are Hairy, Fat, and Clammy, of a strong Smell, yet something sweet withall. At the Tops of the Stalks, grow the Flowers, which are small and yellow like unto those of the 6rft kind in Chap. 273. Sett. 3. aforegoing^ which when they are ripe, turn into Down, and fly away jwith the Wind, as the others do.

V. The Places. The first grows plentifully in such Places as are Plajhy, or Wet in Winter. The second Rauwolfijus found growing about Tripoly in Syria*, and here is only Nurft up in Gardens.

VI The Times. The foil flowers in July and August, the Seed ripening in the mean Seafon : The second flowers in August, and with us fomethinf alter, if carefully lookt after.

VII. The Vitalities) Specification, Preparations, and Virtues of these are the same with those of the Greater fleabane in Chap. 272. aforegoing \ fo that no more need be said thereof

gor, *Conyza aquatica Gefneri*, *Conyza maxima jer-rati folia Thalii* •, *Lirigua major Dalechampsii*, & *Lugdunenfis* \ *Confolida palustris Tabernamontani*, The Greater, Water or Mar(h Fleabane. 2. *Conyza aquatica minor Thalii* v *hauhirii*, *Conyza palustris minors* The lesser Water or Mar(h Fleabane.

III. The Description. The first, or greater Water Fleabane, has a large Root, replenished with a vast number of Fibres, which send forth hollow and ere fled Stalks, a Yard or more high, having several joints as it were, and branched out towards the top. It bears its leaves in an unordered manner, which are long and narrow, (harp pointed, and dipt about the edges like a Saw ^ hairy, and green on the upper side, and grey or woolly underneath* At the tops of the Stalks and Branches grow many yellow Flowers, pretty large, very like to those of Ragwort, which, when they are ripe, turn into Down, and are quickly carried away with the Wind.

IV. The second, or lesser Water Fleabane, in its Root, Stalks and Flozirs, is much like the former, a* dfo in its manner of growing, saving that it is smaller and lower than that is, and the Leaves are fbetimes much less dented or jagged on the edges \$ and the Flowers likewise Hand not, but One on a Stalk for the most part * which are like the former, also yellow.

V. The Places. They both grow near Water sides, and in Plajhy and Wet Grounds, which are not often dry ; but being planted in Gardens where there is a rich Mould, they prosper very well

VI. The Times. They both of them flower in August and September, and their Seed is ripe not lons; after, and is suddenly carried away wick the Wind.

VII. The Qualities, Specification, IPreparations and Virtues, are the same with those of the Great Fleabane in Chap* 272. aforegoing., to which I refer

CHAP. CCLXXV.

Of FLEABANE Water.

I- " p He Names. It is called in Greek .K*

X «A««, ^ t*«ht : in Lt?/# O/ry^ palustr^ Conyza aquatica, Confolida palustris, and in hnglijb Water Fleabane.

II. The Kinds. This is the fourth Species of fleabane, and is twofold, viz. *Conyza palujtm ma-*

you. Authors say, that this *Water fleabanc* is as effeual and admirable a Wound Herb, as any of those the most admired.

CHAP. CCLXXVI.

Of FLEA W O R

I. ^{A T S} *HE Names.* It is called in *Arabick*, *Bazara X Gitbona*, *Bezer Coihume* : in *Greek* ^{^v} : in *Latin* *Pfyllium*, *Pulicaria*, *C Pulicarherba* : in *Englilh* *fleawort*. This Name is given to it, not because when it is brought green into the Houfe, that it drives away fleas-, but because the Seed thereof is very like to them.

II. *The Kinds.* Authors make four kinds of this Plant ; but because feldom more than three come to our hands, we (hall only describe them. 1. The first of these is called ^{^v} *Pfyllium Vulgare*, *Pulicaria Vulgaris*, *Cynops Tbeophrasti*, Common or ordinary Fleawort. 2. *Pfyllium majussemperVirens*, *Pfyllum alterum Gejneri*; *Pfyllium perenne Gcfnen* 0? *Camerarii*; *Pfyllium Plinianum forte majus radice perenne Lobe Hi*; The great evergreen Fleawort. 3. *Pfyllium Indicumfoliis Crenatis*, *Pfyllium Americanum*, *vel floridianum foliis crenatis*, The Indian or American Fleawort with Rented Leaves. This is *Pfyllium primum Anguillar'e*, and the *Pfyllum verum Diofcoridis* as *Baubinus* thinks.

III. *The Descriptions.* *The first*, or Common Fleawort, has a *Root* which is not long, but *whin*, *hard and Woody*, *perijhing evvy Tear^ and raifing* *self again of its own Seed for many Tears*, if it *suffered to shed it*. *from this Root comes forth* *Stalk about two Feet high or more, full of Joints*, *and fpreading it self out on all fides into many* *branches, almoji from the bottom to the top 5 and at*

*very Joint fiand two fmall, long, and ntfrrovv whi-
ijh green Leaves, fomething hairy.* At the tops of
the Stalks and Branches, ftand feveral fmall, fhort,
ealy or chaffy Heads, out of which come forth,
fmail whitifh, yellow Threads, fuch as *Plantane*
Heads do give, which are the bloomings or flowers.
The Seed is enclosed in thofe Heads, and is fmall,
and fining whilft it is frefh, very like unto Fleas,
both for its color and bignefs, (from whence came
the Name) but turning black when it is old. The
whole Plant is fomewhat whitifh, and hairy; fmel-
l^{ing} a little like *Rofin*.

^{^v} *The fecond*, or Great evergreen Fleawort,
has a long, hard and Woody Root, which penjhes not,
but lives in Winter, keeping its Leaves Green all
bat Seafon, whence came its *Epithite* of *femper vi-*
rens, or never dying. From this Root fpning forth
feveral long and tough Branches, of a Woody fub-
ftance like the former, but that they, as alfo their
Branches are fomewhat greater, longer, and harder,
and do a little more bow down to the Ground.
The Leaves which grows forth at the joints, refem-
ble the former, but are much longer and much nar-
rower. At the tops of the Stalks and Branches, and at
the Joints come forth chaffy Tufts, Handing up?
long foot-ftalks, which are very like to the Ear of the
Alpifti Phalaris, or *Canary Seed*: in which Heads or
Tufts is contained the Seed which is like the former.

V. *The third*, or American Fleawort, has a long
Woody Root with fme fibres, adjoining, which jends
forth a Woody reddifh, rough Stalk, next to the
Ground, growing to be *M>oui** a foot high, and jpreaa-
ing it felf out into divers Branches. The Leaves
ftand at the joints thereof, and are fomewhat long,
narrow pointed at the end, and a little dented in,
rather torn on the edges, and hairy alfo. like the
former. The tops of the Branches are ftoral
with Heads than the former, but of the lame big-
S and faftion, with Flowers growing in the
fame manner, containing within them filming Seed
like to the others.

VI. *The Places.* *The first* grows in *Italy* and
Spain, in Fields, and untilled places, but with us
only in *Gardens*. *The fecond* grows plentifully in
Fields, near the Sea-fhoaror Coaft, as alfo in many
of our *Gardens*. *The third* is a native of the *Indi-*
es, and has been found growing in *Florida*, and in
the *Southern* parts of *Carolina* : From fome parts
of which Continent it was brought into the *Euro***
pean parts of the World.

VII. *The Times.* They all flower with us ^v
June and July, but in their native places all the
Summer long.

VIII. *The Qualities.* The Seed of these Plants
is that which is chiefly ufed in Medicine, and thac
both *Galin* and *Serapio* fay, is cold in the fecond
Degree, but temperate in refped to moietyre or
drynefs. It is Emollient, Lubrificative, Anodyne,
Peaoral, and a little Cathartick. Some Authors
have written that the frequent inward ufe of this
Seed is very dangerous, but it is no otherwife true,
than as it falls out in other great cooling Herbs, as
Houfteeke, *Henbanc*, *Lettice*, *Nightftade*, and the
like, which are all fafe enough, if Wifely and
fittly applied : but Ignorance, Rashnefs; and In-
difcretion, in the application of Medicaments, has
oftentimes done harm, and brought difcredit to thofe
Medicaments which (having been free from any
dangerous effetts) were in all appearance to Wife
Physicians of the greateft Ufe in the Art of Medi-
cine : The fame is to be faid in the ufes of this
Plant, as to its Virtues and Effeds. It is an excel-
lent thing, and without any evil Qualities, if
applied and ufed by a Wife and skilful Phyfi-
cian.

IX. *The Specification.* It is good againft burning Fevers, Inflammations, Hcarlenefs, Pleurify, Hemorrhoids or Piles ; caufes Expe&oration, and quenches the moft vehement Thirft.

X. *The Preparations.* You may have therefrom. 1. A Mucilage of the Seed. 2. An Ointment. 3. The Seed fry ed. 4. A Cataplafm of the Seed. 5. A liquid Juice of the Herb.

The Virtues.

XI. *The Mucilage of the Seed.* It is made with Barley Water, or Damask Rofe Water, or with pun- Spring Water, by a bare Infufion of the Seed in the Water, without bruifing of it, juft as you make μ Mucilage of Clary Seed. If it is made with Barley Water, and is dulcified with Syrup of Damask Rofes or Violets, and fo drank to four, fix or eight Ounces, it opens the Stomach and Bowels, and evacuates downwards grofs Flegm and Melancholy, with O-ther vifcous Humors : but withal it heals the Cor-rofion of the Bowels caufed by hot, fliarp and choleric Humors, or from the over-working of violent Medicines, fuch as Scammony, Rofin of Jallap, Colo-quin-tida, Efula, &c. If it is made with Spring Wa-ter, and dulcified with Syrup of Violets, or Syrup of Corn Poppies, it is good againft all hot burning and malign Fevers and Inflammations of the Vifcera: it cools the Heat, quenches Thirft, and lenifies the Drinefs of the Mouth, Tongue and Throat. It helps alfo the Hoarfenefs of the Voice, and other Difeafes of the Breft and Lungs, caufed by Heat or fait fliarp Humors and the Pleurify or *Peripneumony*, if gi-ven in time. If it is made with Damask Rofe Water and fweetned with Syrup of Red Rofes, it is good againft Heat, Pain and Fluxes of the-Bowels 3 and is a fingular Remedy in a Tenafmus.

XII. *The Ointment.* Take the Tolk of one Egg, Unguent urn Populeon one Ounce, Mucilage of Flea- wort Seed a fufficient quantity ; mix and make all into an Ointment. It is an extraordinary thing if it is applied to the Hemorrhoids or Piles, laying it on a Cloth, and binding it on them. It helps alfo all Inflammations in any part of the Body, and eafes the Pains which are caufed thereby. Applied to the Head and Forehead, it is good againft the Head-ach and Megrim -, and it is good againft all hot Tumors or Breakings out in the Skin, as Blains, Wheals, Pimples, red Pufties in the Face, Pufhes, and the

XIII. *The fryed or parched Seed.* If it is either g^ten, or otherwife reduced to powder, and fo taken, ^1s of excellent Ufe to flop all forts of Fluxes of ^1s and heals the Corrofions of the Bowels, caufed by acrid or fharp and malign Humors, or the ^1s of violent and ^p ^rgers.

The Cataplafm. Made of the Mucilage with ^1s Seed, Oil of Rofes and Vinegar, with a quantity of Rice or Bean flower, it is good Jg^1s of the Joints, and Weaknefs of the lame caufed by the Gout, Sciatica, &c. which Pains 2. ^1s, as alfo Ruptures in young Children, and the bwellng out of the Navel, being applied : it heals alfo fore Nipples and fore Breafte of Women giving Suck.

XV. *The Juice of the Herb.* If it is mixt with a little Honey, and put into the Ears, it helps the Running of them, and kills Worms breeding there. The fame mixt with Hogs Lard, and applied jo corrupt and filthy Ulcers, cools them, removes ^1s Inflammation, eafes the Pain, cleanfes and ^1s them, by repreffing the (harp Humors flowing to them.

C H A P . CCLXXVII.

O / F L I X W E E D ,

Names. It is called in Latin, *Sophia*, *JL* and *Sophia Chirurgorum*, by Gerard >, alfo *Pfaidonafurtiumfylveftre*, and by ibme *Thaliectrum* or *I lialiftrmn*, (tho^3 tiefe two laft are Names which more properly belong to *Meadow Rue* :) fome will have it to be *Sophia Paracelfi*, by which, it is faid, he did fuch Wonders : alfo *Senphium Germanicum Tragi*, *Accipitrina Carfa/pbii*, *Naflurtium Jylveftre tenuifolium divifum Bauhini*, *Eruca Gelatina Italo- rum Lobelii*: in Engliffh, *Flixweed*.

II. ^ The Kinds. Authors make two forts here- of, viz. 1. *Sophia anguftifolia*, Narrow-leav'd Flix- weed. 2. *Sophia I at if oh a*, feroad-leav'd Flixweed -, which yet Gerard thinks may be both but one kind, the Leaf thereof growing fairer and larger according to the Richnefs or Goodnefs of the Soil. Their Defcriptions follow,

III. *The Defcriptions.* The fir ft, ^Narrow- leav'd Flixweed, has a Root which is long and woody, periling every Tear -, yet if it be fuffered to feed, and Jhed its Seed, it will be wonderfully encreafed the next Tear. From this Root it rifes up with a round, fmooth, hard, upright Stalk,, half a yard or two feet high, feldom more, and fpreads it felf into feveral Branches, by which it becomes a beautiful (confidering the Plant) or pleafant kind of Bufh ^ on which Stalk and Branches do grow many Leaves, fan over-worn greyifh green color, finely cut and divided into a number of fine Jaggs, like unto thofe of Roman Wormwood, or fmalleft Leaves of *Coriander*. The Flowers grow upon the Stalk and Branches, Spike fafhion, which are very fmall, and of a dark yellow color -, which being paf'd away, fmall, long Pods fucceed, containing much Seed, which when ripe, is of a yellow color.

IV. *The*

IV. *The second, or Broad-leav'd Flixweed, differs not from the former in its Root, Stalky Branches, Leaves, flowers, Gods or Seed, or in its Height or Manner of Growing, saving, that the leaves of this are broader, in which consists the only Difference.* This was found out by *Tabernmontanus*, or first taken notice of by him, but some Botanists are of Opinion, that the former and this are but one and the same Plant, and have this Difference in the Leaves only accidentally, by growing in some more fertile place: however, *Parkinson* seems to admit of the Difference. They are both of them of a strong and unpleasing Smell, and of a drying Taste.

V. *The Places.* *YUxvoeed* grows in moist places of *England*, almost every where, upon Ash-dungbills, in the Ruins of old Buildings by Highways, and in filthy, obscure, bare and barren places, all amongst Rocks.

VI. *The Times.* It flowers and feeds from the beginning of *June* to the end of *September* the Seed ripening in the mean Season.

VII. *The Qualities.* It is temperate in respect of Heat or Cold, and, dry in the first Degree; Anodyne, Altringent, Vulnerary, Arthritic and Analeptick.

VIII. *The Specification.* It stops Fluxes of all sorts, eases Pains of the Joints, consolidates broken Bones, kills Worms, and heals Ulcers.

IX. *The Preparations.* You may have therefrom, 1. A liquid Juice of the Herb. 2. An Effence of the same. 3. A Decoction in Wine or Smiths-forged Water. 4. An Ointment or half an Ounce. 5. A Cataplasm. 6. A distilled Water. 7. The Seed, or Powder of the Seed.

The Virtues.

X. *The liquid Juice.* Drunk to two or three Ounces in Wine, it kills Worms in the Stomach or Belly and outwardly applied, it kills the Worms, which sometimes breed in filthy and putrid Ulcers.

XI. *The Effence.* Drunk to two or three Ounces mixed with Red Wine, it has the Virtues of the liquid Juice, besides which, it stops the Bloodflux, and all other Fluxes of Blood, and Fluxes of the Belly, and is no less powerful than *Plantain* or *Comfrey* in the aforefaid Cases, as also to consolidate Bones which are broken or out of Joint.

XII. *The Decoction in Smiths-forged Water, or in Wine.* It has all the Virtues of the Juice and Effence, and performs the same Effects, but ought to be given Morning and Evening for some considerable time, and that to the quantity of six or eight Ounces. It may be used as a Diet-drink by all such as have inveterate and putrid Ulcers, running and ill-conditioned Fistulas, for it alters the Habit of the Body, thickens the Juices, and so induces the healing. Fomented upon the Piles, it eases the Pain, and dissolves them.

XIII. *The Ointment or half an Ounce.* It may be made either of the green Herb or the Juice, and is very beneficial to digest, cleanse, incarnate, dry and heal old fretting and eating Ulcers, how foul and malignant soever they be; and is a good thing to be kept always in a Readiness by rich and able People in the Country, for the Use of their poor Neighbours whenever there may be an occasion.

XIV. *The Cataplasm.* Being applied to great Wounds or recent Ulcers, it performs all that the Ointment or Balsam can do. It is good to be applied to Fractures and Joints lately dislocated, for it eases the Pain, abates the Inflammation, prevents the Flux of Humors, and strengthens the Part afflicted.

XV. *The distilled Water.* It participates of the Virtues of the Plant, but in a much meaner degree, having the Virtues of the Juice, Effence and Decoction: but its chief Use is for a Vehicle, to convey those Internals into the Body. It is cooling, drying, binding and healing.

XVI. *The Seed, or Powder thereof.* Given to a Dram in Red Port Wine, or in Smiths-forged Water, it has been found by Experience to be of excellent Use to stop the Bloody-flux, Spitting, Vomiting or Pissing of Blood, as also other Fluxes of the Belly. It is also good against Nauseating and Vomiting.

C H A P. CCLXXXVIII

OF FLOWER GENTLE Great.

OR,

Great VELVET-FLOWER.

The Name. It is called in Greek, *Αμαρανθός*, in Latin, *Amaranthus*, in English, *Flowergentle*, or *Velvet flower*. The Greek is derived from *αμαραντος*, *non marcescens*, vel non fiefcens, from its never fading or waxing old.

II. *The Kinds.* It is divided into two principal kinds, viz. 1. *Amaranthus major*, The great Flowergentle, of which in this Chapter, 2. *Amaranthus parvus*, Flowergentle the less, of which in the following Chapter.

III. Of the greater Flowergentle, there are three sorts, viz. 1. *Amaranthus purpureus major*, The greater Flowergentle, or Velvet-flower. 2. *Amaranthus maximus, coccineus elegans maximus* The greatest Scarlet Flowergentle, or Velvet-flower.

IV. The Description. *The first* or Greater kind, has a Root which is a great Bush of Strings, spreading in the Ground whereby it is strongly rooted, yet perishes every Year after it has given its Seed. From this Root springs forth one thick, tall, crested, brown, red Stalk, four or five feet high, from whence spring many great broad Leaves, like to some of the other following kinds for the Form, but much larger and redder for the most part, especially the lower which branches forth into several parts: from between these Leaves and the Stalks or Branches, as also at the tops of them, hang long spiky, round and somewhat flat Tufts, of a more reddish purple color than the first of the following. [Chapter and divided also into divers parts, wherein when they are full ripe, are to be seen an innumerable company of white Seeds, hanging out among the short Thrums, and do easily fall away with a little touching. Every one of these white Seeds has, as it were, a hole half bored through therein.

V. *The second, or Created Scarlet Flowergentle, has a pretty thick long Root, with some fibres adjoining to it, which sends up one or more very great, icy round, tall Stalk, rather higher and greater than the most ordinary great red Flowergentle, with as large great Leaves on it, or rather greater, but both the Stalks and they are of a fresh yellowish pale green color, with little or no Redness in them at all, (and this is one proper Mark to know this from others, before it comes to flower.) The Flowers stand at the tops of the Stalks and Branches, more spread at the bottom into several parts, the middle being longest, and commonly when it is in the Perfection, hanging down like a Tassel, the other parts, like shorter Spikes, comparing it round, which even for the Proportion, is very beautiful, but much more for the color, which is of a more excellent bright, scarlet red, and which being gathered in the prime, will hold the color a great while before it decays, especially if it is kept from*

the Sun and Wind. The Seed enclosed in these Tufts, is almost as white and finer than the former, yet a little redder, whereby the Difference may be known.

VI. *The Places.* Both these were brought to us first out of the West Indies, the latter from Brazil, or some other parts of America, where they both are much used, especially the Seed. They are all nurs'd up with us in Gardens; but in backward or cold Years, they do not so well thrive, because they love much Heat, yet for the most part they give us every Year ripe Seed.

VII. *The Times.* They bear their spiky Flowers in July and August, and yield their ripe Seed in August or September.

VIII. *The Qualities.* They are temperate in respect to Heat or Cold, and dry in the first Degree; Astringent, Repercuflive, Hyfterick, Arthritick and Antemmenagogick.

IX. *The Specification.* They are peculiar for stopping all sorts of Fluxes, especially Fluxes of Blood.

X. *The Preparations.* You may have therefrom, 1. A Juice or Essence. 2. A Decoction in Red Port Wine. 3. The Seed, or Powder thereof. 4. A Cataplasim of the Leaves,

The Virtues.

XI. *The liquid Juice of the Leaves, or Essence of the same.* I have made many Experiments of the Virtues of this Plant upon several of my Patients, who have been troubled with Fluxes of the Bowels, Bloody-fluxes, Spitting and Pissing of Blood, as also the overflowing of the Terms: I have given the Juice or Essence of the same to three or four Spoonfuls at a time in a Glass of Red Port, or some other proper Vehicle, as Smirns-orge Water, &c. and have found it abundantly to answer my Expectation in the Cure of the aforementioned Diseases, and I am satisfied, that sometimes, and upon some Patients, it has done as much as any Vegetable can do: but I gave it Morning and Night, and sometimes also at Noon, and continued the use thereof for several days.

XII. *The Decoction in Red Port Wine.* It has all the Virtues of the liquid Juice and Essence, but is not full out so efficacious, yet it is somewhat more pleasurable to be taken, and may be given from three to six Ounces at a time, Morning, Noon and Night. Given Clysterwise in any vehement Flux of the Belly, as also in a Bloody-flux, and in a Tenasmus, it stops the same, heals the Guts, and strengthens the Part afflicted: but it ought to be several times repeated, according as the Necessity or Occasion may require.

XIII. *The Seed, or Powder thereof.* It may be given from half a Dram to a Dram at a time, in a Glass of Wine, Morning and Night, against Nauseas or Vomiting, Weakness of the Bowels, Bloody-flux, Hepatick-flux, and all other sorts of Fluxes. If there is any Corrosion of the Guts, it heals it, stops the Flux of Humors to the Part, and restores the Tone thereof, if hurt or depraved.

XIV. *The Cataplasim of the Leaves.* It repercufls Humors, stops Fluxions to any Part, eases Pains, and prevails much against the Gout: but in this last Case it will be so much the better, if an equal quantity of green Comfrey Roots be added and beaten Up with it.

C H A P . CCLXXIX.

Of FLOWER GENTLE Small,

O R,

The Leffer VELVET-FLOWER.

I. Ἰππικὴ Names. It is called in Greek Ἰππικὴ & Ἰππικὴ X & * & : in Latin, *Amaranthus parvus* \ and in English, *The Icjjer Flower gentle*, or *Leffer Velvet-Ylovoer*.

II. *The Kinds.* Authors make four sorts of this leiler kind, viz. i. *Amaranthus purpureus minor*, The leiler purple Flower gentle, or Velvet-flower: some do think this to be *Phlox*, vel *Ylamma Theophrasti*. 7. *Amaranthus Quoccineus minor*, The leffer scarlet Howergentle. 3. *Amaranthus Tricolor*, *Gelgia*, vel *Qelouji Trati*, Variable Flowergentle: this some, as *Spigehus*, think to be *Sophonia Plinii* -, others, that it is *Ibeombroton Plinii* -, but these Suppositions are doubtful. 4. *Amaranthus Spica Carnea*, Carnation Hower gentle, ^Velvet-flower.

UL The Descriptions. *The first*, or Leffer purple Flower gentle, *hcu a Root* consisting of a few thready Strings, which soon perish, as the whole Plant docs, at the first approach of Winter, from this Root a crested Stalk rises up, two feet or more high, purplish at the bottom, but green to the top, which spreads it self forth into many Branches. The Leaves on the Stalk and Branches are somewhat broad at bottom, and sharp-pointed, of a full green color, and oftentimes a little reddish withal, like in Form unto the Leaves of *Elites* (of which this and the rest are accounted Species) or *Small Beets*. The Flowers are long, growing in Spike fashion, loft and as it were gentle Tufts of Hairs, many growing in a nunter together, broad at the bottom, and in all tip at the top, Pyramis or Steelee fashion, of

fo excellent a fhining deep purple color, tending to a Murry, that in the molt excellent colored Velvet a more orient or bright color cannot be seen, and I suppose from this Reason it is that the French give it the Name of out^paffing Velvet. It has no Smell at all, but being bruised, gives the same admirable purple color on Paper, and being gathered in its full Strength and Beauty, will abide a great while (if it is kept in a dry place, out of Wind and Sun) in its full Beauty and Fineness. In these Tufts lye the Seed, scattered up and down, which is finally very black and shining.

IV. *The second*, or Leffer scarlet Flower gentle, has a slender or small fibrous Root, which perishes the sooner, because it is the more tender. The Leaves of this Plant are longer and somewhat narrower than the former: the Stalk grows something higher, bearing its long Tufts at several Leaves, as also at the tops of the Stalk and Branches, many being set together, but separate one from another, and each towing or tending down its Head, like unto a Feather, such as are worn in Gentlemens Caps and Hats, of an excellent Blood-scarlet color. In these Tufts or Heads is contained the Seed, which is black and bright, like the former.

V. *The third*, or Variable Flower gentle, has a slender, knobby, fibrous and perishing Root, like the foregoing, which sends up a Stalk, but it is nothing so high as the former, which spreads it self out into many Branches, even from the Root up to the top thereof. The chiefest Beauty of this Plant consists not in the Flowers, but in the Leaves, the Flowers being small Tufts, growing all along the Stalk, and at the Joints with the Leaves. The Leaves hereof are of the same fashion with the former, and pointed also, but every Leaf is to be seen, parted into green, red and yellow, very orient and freeb, (especially if it comes to its full Perfection, which is in hot and dry Weather) yet not divided all alike, but

in feme Leaves where the red or yellow is, ther will be green, and fo varying, that it becomes pica- iant ro behold ^ the Seed hereof is black and flüiting, and not to be diftinguiflied from the former.

VI. *Gerard* fad that it far exceeded his Skill to defcrie the Beauty and Excellency of thi- fiant, and that a Painter would bē at a iray to depi- ct it in its lively Colors * in few Words (fays he) every Leaf refembles in color the moft fair and beau- tiful Feathers of a Parrot, having a itrripe oi' Red, a line of Yellow, a da(h of White, and a Rib of green color, not eafily in Words to be fet forth, the feveral mixtures of the Colors, which Nature has bellowed hereon, being fo excellent and admirable. *John/on* fays the Leaves are commonly of three col- ors, the lower part next the Stalk is green, the middle red, and the end yellow *, ^ or elfe, the bot- tom being green, the middle part is yellow, and the end red.

VII. *The fourth, or* Carnation Flower Gentle, (which is more rare than all the reft) ha* a Root con- fining of a great many Fibres or Strings, from which rife up very thick fat Stalks, crejied and ftreaked, exceeding fsmooth, and of a fhining red color, zvhich kee in at the Ground to divide themfelves into Branch- es^A upon which do grow many great large Leaves, of a dark green color, tending to rednefs, in ihew like to thofe of the *Red Beet*, ftreaked and daft here and there with red, mixed with green-, the Flowers grow along the Stalks, from the midft there- of, even to the top, in form like *Panicum*, that is, a great number of Chaffie confused Ears thruft hard together, of a deep purple, or rather of a deep blufh, tending to a Carnation color: the form or fhape of this cannot be fo fitly compared to any thing as to the Velvet Head of a Stag, compaft of fuch like foft feeling fibftance, in which is contained the Seed, which is white, round, and bored thro³ the mid- dle.

VIII. *The Places.* All thefe Plants ate Natives of the Eaftern Countries, as *Perfia, Arabia, Syria, Turkey, &c.* from whence they have been brought to us, and here are only nurft up in Gardens.

IX. *The Times.* They Flower, or bear their gal- lant Tufts or Spikes in *Auguft*, and continue Flow- ering until *September*, keeping in fome meafure their vigor, till Froft overtakes them, at what time they perifti. As for the third, or *Variable Flower gentle*, it ought to be Sown in a hot Bed of Horfe Dung, with fome Earth ftrewed thereon, in the end of *March*, and fo ordered as you do *Musk Melons*, and the like.

X. *The Qualities, Specification, Preparations and Virtues,* are the fame with thofe in the former Chap- ter, to which you are referred.

C H A P. CCLXXX.

O / H O W E R o / Conftantinople,

OR,

F L O W E R of Briſtol.

I. ^H *THE Names.* It is called in *Greek* A«»«^{Bv}, *Mvunu* in *Latin* *Lychnis Chalcedonica,* *Lychnis Byzantina, vel ConftantinoVolitana,* in *Engliſh* *Flower of Conftantinople, or Briſtol Flower.*

II. *The Kinds.* It is om of the Kinds oFLychn- nides, or *Campions*, and is twofold, viz. 1. *Lychnis Chalcedonica Flore fimplici miniaio,* Single Nonefuch, or Flower of *Conftantinople,* or *Briſtoi* Flower. 2. *Lychnis Chalcedonica Flore pleno miniato,* Double Nonefuch, or Double Flower of *Conftantinople,* or *Briſtol* Flower.

III. *The Defections.* *Tie fir* \ or Single None- fuch, ba* a Root which is very 'Fibrous or Stringy, faſning it ſelf very ſtrong'y in the Ground, whereby it much increafes itſelf, from whence ſpring up many broad and long green Leaves, among which rife up ſeveral ſtiff, round, hairy, jointed Stalks, three Feet high, with two Leaves at every Joint •, the Flowers ſtand at the tops of them, very many together, in a large Tuft or Umble, confifting of five ſmali long Leaves, broad pointed, and notched in the middle, of a bright red Orange color; which being paft, there come in their places ſmali hard whitH Heads, or Seed Veifels, containing black Seed, like to the Seed of *Sweet Williams*, and having but a ſmali ſmell.

IV. *Of this Single Species there are three other forts, which differ chiefly in the Colors of the Flowers,* viz. 1. *Lychnis Chalcedonica Flore jimp lid albo,* Single *Briſtol* Flower with a White Flower. 2. *Lychnis Chalcedonica Flore fimplici Cameo,* Single None- fuch with a Blufh or Fleſh Color, without variability. 3. *Lychnis Chalcedonica Flore fimplici Verficolor,* Single Nonefuch Variable. This at firft is of a pale Red, after a while it grows paler, and at laft it becomes wholly white * and all theſe diverſities of Flowers it will have to be ſeen at one and the ſame time upon the Stalks.

V. *The ſecond, or* Double Nonefuch, ha£ a Root Fibrous, like the former, and increafes in like man- ner, the Leaves and Stalks being hairy and high, and the Flowers growing in Tufts, altogether like the firſt S'ngle Kind-, but in this confits the chief difference, that this bears a larger Umble or Tuft of Flowers at top of the Stalk, each Flower confifting of three or

four rows of Leaves, of a deeper Orange Color than it, which adds the more Grace to it, but paffes away without bearing Seed, as most other double Flowers do, it is a Glorious Flower, being as Magnificent as it is Beautiful.

VI. *The Places.* They were first brought to us out of *Turky*, and are now Planted in our Gardens, almost every where.

VII. *The Times.* They Flower ail *June* and *July*, but not till the second Year after Pfanted, and continue Flowering for many Years, having a Root full of Life, and endures long, being able to sustain the cold of our Country.

VIII. *The Qualities, Specification, Preparations and Virtues* of these Flowers have never been mentioned by any Author, and therefore we have the Ids to lay of them, but doubtless being Kinds of the *Lychnis*, or *Campion*, they may have the same Virtues, and therefore to *Chap. 90.* foregoing we icier you for the same.

CHAP. CCLXXXL

0 / FLOWERDELUCE
Bulbous Unmatchable.

I. *The Names.* The *Gen* Name of all the *Kind* is in *ArMck Afmeni jum'a* & *Aierfa*, *vtGreekU** in *Latin Iris*, and in *Englilh Flowerdeluce*.

II. *The Kinds.* Of this Plant there are two principal Kinds, viz. 1. *Iris bulbosa*, The bulbous or Onion like Flowerdeluce. 2. *Iris tuber of a*, The tuberous of bunchy Flowerdeluce.

III. *Of the Bulbous Kind* there are several Species, as 1. *Iris bulbosa impar* ^ *five incomparabilis*, The unmatchable bulbous Flowerdeluce, of which in this Chapter. 2. *Iris bulbosa Anglica*, The *Englilh* bulbous Flowerdeluce, of which in *Chap. 282*. 3. *Iris bulbosa lausolia*, The broad Leaved bulbous Flowerdeluce, of which in *Chap. 287*. 4. *Iris bulbosa angustifolia major*, The greater narrow Leav'd bulbous Flowerdeluce, of which in *Chap. 284*. 5. *Iris bulbosa angustifolia minor*, The lesser narrow Leav'd bulbous Flowerdeluce, of which in *Chap. 285*.

IV. *Of the Tuberous Kind* there are these following Species, viz. 1. *Iris tuber of a Chalcedonia*, The *Turkey* tuberous Orrice or Flowerdeluce, of which in *Chap. 286*. 2. *Iris tuberofa alba llorentina*, The *Florentine* white tuberous Orrice ^r Flowerdeluce, of which in *Chap. 287*. 3. *Iris tuberofa latifolia*, The broad Leav'd tuberous Orrice or Flowerdeluce, of which in *Chap. 288*. 4. *Iris tuberofa angustifolia*, The narrow Leav'd tuberous Orrice or Flowerdeluce, of which in *Chap. 289. 290*. 5. *Iris tuberofa pumila major*, *Chamairis major*, The greater Dwarf Orrice dr Flowerdeluce, of which in *Chap. 291*. 6. *Iris tuberofa pumila minor*, *Chamairis minor*. The lesser Dwarf Orrice or Flowerdeluce, of which in *Chap. 292*. 7. *Iris Graminea*^ The Graft Flowerdeluce, of which in *Chap. 293*. 8. *Iris agrid*, *Xyris*, Wild Flowerdeluce, or Stinking Glad-don, of which in *Chap. 294*. 9. *Iris Palustris*, Water Flowerdeluce, or Water Flag, of which we have already Treated in *Chap. 266.* foregoing.

V. *Of the unmatchable Species* there are two kinds viz. 1. *Iris bulbosa prima latifolia Clufij*, Clufins' his first great bulbous Flowerdeluce. 2. *Iris bulbosa Perfica*, The *Perfian* bulbous Flowerdeluce.

VI. *The Descriptions.* The first, or Great bulbous Flowerdeluce, has a reasonable great, round, or Onion like Root, black on its outward Coats, and white lohhin, having many long, thick, white Roots instead of fibres, which make them look like Aphodel Roots. From this Root spring several long 2nd broad Leaves, not stiff, like as all the other, but soft, and greenish on the upper side and whitish underneath, from among which rise up sometimes several small, short, slender Stalks, and sometimes but one, about half a Foot high, bearing at the top one Flower apiece, something like unto a Flowerdeluce, consisting of nine Leaves, of which, those three which stand upright are shorter, and more closed together than in the other kinds of flowerdeluces, the other three which fall down turn up their ends a little, and those three which in other flowerdeluces do cover them at the bottom, stand like the upright Leaves of the other kinds, but are parted into two ends, like unto two small Ears 5 the whole Flower is of a fair Blew, or pale Sky Color in most, with a long stripe in the middle of each of the falling Leaves, and in some white, but more seldom* these Flowers are very sweet of finell.

VII. *The second, or Perfian Flowerdeluce*, has a bulbous, or round Onion like Root, with Leaves somewhat like to the former, but that they are shorter, and a little narrower, the Flower is much of the same fashion with the other, and is of a pale blew ruffetilh Color, each of the three lower falling Leaves are almost wholly of a brown Purple, with a yellow spot in the midft of them, this is a rare Plant, and does not often bear Flowers with us, unless planted in a good Soil, and in a warm place, where it may have much of the preference of the Sun, and be shelter'd from Storms and cold Winds^ which always keep it back.

VIII. *The Places.* The first is a Native of *Spain* and *Portugal*, the second of *Perfia*, but with us they are only nurft up in Gardens, and being very tender Plants, ought to be Houfed in Winter.

IX. *The Times.* The first Flowers with us in *May*, and sometimes sooner, but in *Spain* and *Portugal* it Flowers, as *Clufius* says, in *January* and *February*, the second when it Flowers with us, Flowers also in *April* or *May*.

X. *As to the Qualities, Specification Preparations and Virtues* of these, and all the several Kinds of *Bulbous Flowerdeluces*, Authors have laid nothing nor is any thing extant concerning the same, and therefore in the four next Chapters we shall take no further notice of them, this being said here once for all* their chief use has been, and yet is, to deck up and adorn the Gardens of the Curious.

CHAP. CCLXXXII.

0 / FLOWERDELUCE
Bulbous Engflil.

I. *The Names.* It may be called in *Greek* *V X CoA Cmtos KexTmtKOf, (, *Latin Iris bulbosa Anglica*. In *bulbosa major*, *Iris bulbosa Anglica cerulea*, in *Englilh Blue Englilh bulbous Flowerdeluce*.

II. *The Kinds.* It is one of the greater Kinds of the broad Leav'd bulbous Rooted Plants.

III. *The Description.* The Root of this kind is greater and longer than any of the smaller kinds which

...: it is round, or *Offio*, with divers *brmm* Skins, which fee/ to be repleat tcith long *ThreaJs*, like *limn*, *especi&ll* at the j-- id of the Root, which thing the *fmalier* Kinds. From

Root the Plant Iprings up wrly, (bmerimes ii nusry^ wirii nVe or fix long Leaves, which art ttd, yet narrow in comparison of their length and in refpeft to the other Kinds, aifo of aw: green color, creffed or Itraked on the iackfiJe, ant iiround, beinghollow, like a Trough or Gutrer white all along the infide of the Leaf, and lilunt a the end; from among which rifes up a thick rouna Stalk, aFoorandhalf, or two Feet high, at the t* wTiereof, out of a skinny husk, conies forth one, and fomecimes two Flowers, confifting of nine Leaves apiece, three of which that are turned downwad are larger and broader than the other, having in each of them a yellow fpot, about the middle of the Leaf; other three arc fmill, hollow, ridged, or arch- ed, covering the lower part next the Stalk of thofe tilling Leaves turning up their ends, which are di- vided into two parts; the other three ftand upright ajid are very lmatl at the bottom of them, and broad- ti, towards the top; the whole Flower is of a lair blew Color; after the Flowers are paft, Heads three lqnare come up, which are fomewhat long and lank or loofe, containing within them round yellowifh Seed, which when it is rip, will rattle by the fha- king of the Wind in the'dry Husks.

IV. *the Places.* Label fays that this *Blew broad hraw'd bulbotts Flowerdeluce* grows naturally in the *Weft O\$ England*, whether this be true or no, I know not, but or'this I am certain, that it grows admirably well in our Climate; and as it is a beautirul Flower, fo* hy much Planting it, it is very much en- creafed; and it grows common in moft Country Folks Gardens: it has alfo been found growing in *Spain*, and in *France*, by fuch as have Travelled thro' thofe Countries,

V. *T!>e Times.* It Flowers uitially in the end of *May*, or beginning of *June*, and the Seed is ripe the end of *July*, or in *Augufi*.

VI. *Koia.* *Lsbcl* calls this Plant *liyadntbus* ¥0- rt.:rum Here *Indis*, braufe of its *Hyacinth* Color, but I think without any reafon for the fame; it is truly an *Ins* or *Flowerdeluce*, and is called by fome *Iris bulbofa major*, five *laiifotia*, to difference it from the leffer with narrow Leaves.

tifotie. verfieo/or, The great parry colored bulbous .rdeluce.

III. The *pefcripqons.* The *firji*, or paler or deeper purple great Bulb, AVJ a R vt like the F.;J^ lftth in the former Chapter, nor differs front it in the Leafy the chiefest difference is in the Flowers, which in this are ibtnewiut larger, and in die one of a deep Blew, or V iolet Purpie Color, in the othet of a deep Purple Color, in all other relpeEls it is like to the former *Engljb* • there is alfo another, in all things like to this, laving, chit the Flower is of a pale Blew, or an *Afh* Color.

IV. *The jecond*, or Great Purple Striped, *h.n a purple Elmer*, but with fome Veins or Stripes of & deeper Violet Color, *varieujfy running thro' toe i-* Leaues of the Flower. There is another of this fort, which is of a pale Blew or Am *Cdov*, ftreakel with Lines and Veins of Purple in the Leaves of the Row- ers, fome more, fome lels than *OLhr*. Another al- fo of a Purple Color, like to the firft, bu; rhat round about the yellow fpot in thu middle of each of the three railing Leaves is of a pale Bke or *Afh* Color, the reft of the Leaf remaining *Piu^k*, asths other pans of the Flower are.

V. *The third*, or Great Peach Colored, is more rare than any of the former, and not differing from them in Root, Leaf \ or Flower, but only that the Flower in this is of a pale reidifh Purple Color, com- ingfmctbing near to the *Cvhr* of a Peach *B'ojpm*.

VI. *The fourth*, or Great White, bat a Root not differing from the others, but only greater, it fprngs not up *Jo* early out of the Ground at the Blew ani Purple do^ but about a Month or more after t, the Leaves are fomewhat larger and broader than the others; the Stalk is thicker and mortar, bearing u- fualty two very large and great Flowers, one open- ing a little bclore the other, yet oftentimes both in Flower Together in the end, and of a pale blewifh white Color, which is talk::! a Silver Color while they are in the Bud, and before they are blown o- acn, but tiien of a purer white, yet with an eye or how of the Silver Color remaining in them; the three falling Leaves are very large, having thar yel- low fpot in the middle of them, after the Flowers 3re paft, Heads come forth like unto the *Blew* or *Purple* Kinds, but larger, containing Seed of a red- difti yellow color like them.

VII. *The fifth*, or Great White Striped, is in Root, lafs and Flower, alfo in its manner of groxing, like unto the loft Great White Flowerdeluce, it dif- fers only in the marking of the Flower, bjing vari- ous from it, for this has inrhe White Flower great Veins, Stripes, or Marks, of a Violet Blew, diiper- fed thro' the Leaves of the Flower variouffy, which adds a iiperexcellenr beauty thereto.

VIII. *The fixth*, or Great Party Colored, differs 'ot from the *In ft*, but in the blower, which is of a ehitijh color in the three falling Leaves, having a circle of *Afh* Color about the yellow > fpst, the three ridged Leaves being whitifh, but ridged and edged with chat *Aih* Color, and the three ufright Leaves of a pale blewifh white Color, with fome Veins herein ofablewifh Purple: there are fome of this alt fort, in which more Varieties are to be feiij lian can eafily be exprell, or remembered, which va- iety, it is very probable, might come from rhe Sow- ing of the Seed in differing Soils, as lias been uuly obferved in other Plants.

IX. *The Places.* They are all planted, and grow n our *Englijb* Gardens, where they thrive very- well.

X. *Tfo Times.* They all Flower in the end of t, and in *June*, and the Seed is ripe in *Ju!y* and *Auguff*,

Bulbous narrow Leav'd Greater,

I. > "Tp H E Names. It is called in Greek *la < £ < *

X *Cafm wybwMti uiyato*, in Latin *Iris bulbosa anguifolia major*, and in English *The greater narrow Leaved bulb out Flowerdeluce.* x

II. *The Kinds.* There are Twenty Five several Species, whole Names and Defcriptions follow in order.

III. *The Defcriptions.* i. *Iris bulbosa anguifolia alba Flare majore*, The greater white narrow Leav'd bulbous Flowerdeluce. This has a Root like to the other Kinds, which is a little bigger and rounder in the middle, and in its springing up and manner of growing is much like to the first described in the next Chapter in all its parts, faving, that it is a little larger and higher, both in Leaf, Stalk, and Hower, and much whiter than any of the mixed Kinds which follow, yet not so white as the final Kind in the next Chapter: in these which follow we (hall not make a several and large Defcription to every Kind, for that would be to make often and many repetitions of one and the same thing, for the first of them being once described, (which we have already done) we will to all the following add only the especial differences, either in Leaf or Flower, in Magnitude, Color, or Form, wherein they may vary from that first, or one from another, these being all of the greater Kind.

IV. 2. *Iris bulbosa anguifolia albescens*, *The Milk white narrow Leaved bulboits Flowerdeluce.* Its falling Leaves have a little (hew of yellowness, and fo are the middle ridges of the arched Leaves, but the upright Leaves are more white •, in Root and Leaf it differs not from the first White.

V. 3. *Argent ea* *The Silver Colored narrow Leav'd bulbous Flowerdeluce.* Its falling Leaves are of a yellowish white, like the last, the arched Leaves are whiter, and the upright Leaves of a blewish white, which we call Silver Color, like that of *Silver Weed*, 01 *Wild Tanjie*.

VI. 4. *Albida*, *Whitish*. The falling Leaves are yellowish, and sometimes with a little edge of white about them, and sometimes without, the upright Leaves are whitish, as the arched Leaves are > the ridge yellower.

VII. 5. *Albida labris luteis*, *White with yellow Falls*. The falls are yellow, the upright Leaves white-, all these Flowers are of the same bigness with the first.

VIII. 6. *Albida angustifolia*, *The more narrow White* The Hower is smaller, and almost as white as the first, the lower Leaves are small, and do as it were stand outright, not having scarcely any fall at all, ib that the yellow spot seems to be the whole Leaf, the arched Leaves are not halffo large as in the former, and the upright Leaves bow themselves in the middle, fo that the *ops do as it were meet together.

IX. 7. *Lutea*, *The Tellow*. It is like the form faving, that its falling Leaves are a little more eminent and yellow, with a yellow spot.

X. 8. *Aurea* *fwe hutea hispanica*, *The Golden or Spanijh lellow*. It rises not up fo high as commonly most of the rest do, and is wholly of a Gold yellow Color.

XL 9. *P alii da Lute a*, *The pale Yellow*. It usually rises higher than the former yellow, and is wholly of a pale yellow, but deeper at the ipot.

XIL 10. *Albida lutea*, *Vale Straw Color*, It is like unto the last pale yellow; but that the falling Leaves are whiter than all the rest of the Flower.

XIII. 11. *Verficolor hispanica carulea labris aU bis*, *The Spanijh party colored Blew*. Its falling Leaves are white, the arched Leaves of a whitish Silver color, and the upright Leaves of a fine blewish purple.

XIV. 12. *Labris Camlets*, *The hlew edged*. The falling Leaves will have either an edge of blew, circling the white Leaves, the arched Leaves being a little blewer, and the upright Leaves more purple, or the falls will be almost wholly blew, edged with a blewer color, the arched Leaves pale blew, and the upright Leaves of a purplish blew Violet color.

XV. 13. *Alba pallida*, *A pale White*. The falls are white, the arched Leaves pale white, fo also the upright Leaves \> some are a fair blewish purple: some of them will also have larger Flowers than others* and bear more-, for the first fort, which is ^{them} ? ^ ordinary, feldom bears above one Flower on ^{one} yet sometimes two: and of the others, some will bear two, and three Flowers, others again but one.

XVI. 14. *Cerulea*, *five Purpurea major*, *im greater Purple*. The Stalk is higher. Flower purple? and larger the Stalk of a very reddish purple color, a little above the Ground^ at the foot or bottom of the Leaves and Stalk •, this Flowers with the latter fort of *Flowerdeluces*.

XVII. 15. *Purpurea ferotina*, *The late Purple* * The Flower is wholly purple, except the yellow spot, and Flowers later than sy of the other Purples.

XVIII. }6. *Purpurea rubescens*, *labris ceruleis*, *The reddish Purple with blew falls.* Its upright Leaves are of a reddish purple, and the falling Leaves of a blew color.

XIX. 17. *Purpurea rubescens labris albido camleis* *The reddish Purple with whitish blew falls*. It is of a reddish purple, and its falling Leaves of a whitish blew color, in nothing else differing from the last.

XX. 18. *Purpurea labris luteis*, *The Purple with yellow falls*. Its falling Leaves are of a fair Gold yellow, without any fripe, yet in some there are Veins running thro' the yellow Leaves, and some have an edge of a fad dark color about them^ the upright Leaves in every of these are of a Violet Purple.

XXL 19. *Purpurea labris ex albido caruleo & luteo mixtis*, *Party colored Purple with striped yellow falls*. This is like the last, but that the falling Leaves are of a pale blew and yellow, traversing one the other, and the arched Leaves of a pale purplish color.

XXII. 20. *Subpurpurea labris luteis* *The pale Purple with yellow falls*. Its upright Leaves are of a paler purple •, and the falling Leaves yellow. There is another Species of this, a little differing & 0 and * * * * * Leaves are

XXIII. 21. *bubcarulea labris luteis* *The Party colored blew and yellow*. Its upright Leaves are of a pale blew, and the falling Leaves yellow- There is another of this fort, but of a little paler blew.

XXIV. 22. *Cnmis colons elegantiorcs*, *The fair Tiair colored*. Its upright Leaves are of a fair brownish yellow, or Hair color, and the falling Leaves yellow

XXV. 23. *Alt era obfoletior*, *The dull Hair colored*. It is of the same color with the former, but somewhat deader.

XXVI. 24. *Iris bulbosa Africana*, *The Purple or Murry Barbary bulbous Flowerdeluce*. As to Koot,

Leaf, and Flower, and for its form, it is in all respects like unto the middle sort of these *Flowerdeluces*, only the lowest part of the Leaves and Stalk, for about an Inch next the Ground, are of a reddish color, spotted with many spots, and the whole Flower being of a mean size, is of a deep purplish Red, or Munny color, excepting the yellow spot in the middle of the three falling Leaves; it is a Flower of much beauty.

XXVII. *Fur pure a carulea ohfoleta labrisfuci**, *The dusky Party colored Purple*. This is the greatest of all these narrow *Leav*a Flowerdeluces* in all the parts of it, the Root is greater than any of the other, being thick and short, the Leaves are broader and longer, but of the same color, the Stalk is higher and stronger than any of them, bearing two or three Flowers, which are larger than any of the rest, the falling Leaves are of a dusky yellow, sometimes with Veins and Borders about the Brims of another dun color, having the yellow spot in the middle, the arched Leaves are of a faded purplish yellow, the upright Leaves are of a dull or dusky bluish Purple, and the Heads or Horns for Seed are also greater, as is likewise the Seed.

XXVIII. *The Places*. All these *Flowerdeluces* came originally out of *Spain* and *Portugal*, and with us they are nourished up in Gardens, where they prosper very well.

XXIX. *The Times*. They Flower in *June*, and sometimes continue flowering until *July*, but Flower not commonly so early as the *Latifolia*, or *broad Leaf'd Kinds*, they are soon spoiled with Wet in flowering.

CHAP. CCLXXXV.

O / F L O W E R D E L U C E
Bulbous narrow Leav'd Small.

I. * - p *HE Names*. It is called in *Greek* $\tau\epsilon\kappa\omega\kappa\iota$ *JL ifot wtyvKM yAKeynez** in *Latin* *Iris bulbosa anguifolia*, *minor*, in *English* *The lesser narrow Leaved bulbous Flowerdeluce*.

II. *The Kinds*. There are but three several Species of this sort taken notice of by Authors, viz. 1. *Iris bulbosa anguifolia alba minor*. The small white narrow Leav'd bulbous Flowerdeluce. 2. *Iris bulbosa anguifolia mauritanica ferotina flava minor*. The lesser yellow late narrow Leav'd bulbous Flowerdeluce of *Barbary*. 3. *Iris bulbosa anguifolia Ctrulea, five Purpureaprxcox minor LuJitanica, The Portugal small early Purple, or Blew narrow Leav'd bulbous Flowerdeluce*.

III. *The Descriptions*. *Thejirji*, or small white narrow Leav'd bulbous Flowerdeluce, *ha* a Root which is smaller and Shorter than those of the Latifolia, and without any Hairs or Threads, covered with brown thin Skins, and more plentiful in yielding an increase,* its Flower is smaller than the first Kind of the former Chapter, it springs out of the Earth always before Winter, which afterwards breaks forth into four or five small and narrow Leaves, a Foot or more long, of a whitish green on the inside, which is hollow and channelled, and of a bluish green color on the outside, and round withal* the Stalk is longer and slenderer than those of the *Latifolia*, with some shorter Leaves upon it, at the top whereof,

out of shorter skinny Leaves, come forth one or two Flowers, smaller, shorter, and rounder than the Flowers of the last of the *broad Leaf'd*, yet made after the same proportion, with nine Leaves, three falling downwards, with a yellow spot in the middle, other three made long, made like a long arch, which cover the lower part, next the Stalk of those falling Leaves, and turn up at the ends of them, where they are divided into two parts, the other three stand upright, between each of the three falling Leaves, being somewhat long and narrow the Flower is wholly of a pure white color, (having the yellow spots) yet in some having a show of blue throughout, and in others towards the bottom of the three upright Leaves: after the Rows are past, many long Cods or Seed Vessels rise up, as there were Flowers, which are longer and smaller than in the last of the *broad Leaf'd*, and a little bending, like a Coronet, with three round squares, and round pointed, also, which dividing it self (when the Seed is ripe) into three parts, do then fix several Cells or places, wherein is contained such like round reddish yellow Seeds as those of the last *Latifolia*, but something smaller.

IV. *The second or lesser yellow late narrow Leaf'd, is a smaller Plant, or Dwarf Kind, brought from the farther parts of Barbary, near the Sea, like unto the yellow greater narrow Leaf'd, viz. the Ninth and Tenth of the former Chapter*, but that this is smaller and lower, and instead of upright Leaves, has small short Leaves like Hairs; it Flowers very late, after all others have yielded their ripe Seed.

V. *The third, or small early Purple Portugal, is smaller in all its parts than the alba pallida of Sect XIII. of the former Chapter*, the Stalk is slenderer, and not so high, bearing at the top one or two small Flowers, all wholly of a fair bluish Purple, with a yellow spot in the middle of every one of the falling Leaves.

VI. *The Places*. These, also all of them, came first to us from *Spain* and *Portugal*, but are here nursed up in Gardens, where they thrive very well.

VII. *The Times*. The first Flowers in *June*, and sometimes in *July*, but not so early as the former *broad Leaf'd Kinds*. The second Flowers very late, after most of the others, and the third usually Flowers very early, even with the first *bulbous i lower deluces*.

VIII. *Nota*. It is possible that there may be many more Kinds or Differences of these *bulbous Flowerdeluces*, which may arise from the different goodness of the Seed, also from the Soil, and the time and manner of Sowing it, as many have observed from their own experience, every Year showing forth some variety which was never seen before.

Tuberous Great Turkey,

O R,

FLAG FLOWERDELUCÉ,

I. * - T * *HE Names*. It is called in *Greek* $\tau\epsilon\kappa\omega\kappa\iota$ *L x***** (uifrv, in Latin Iris tuberosa Cbulceiomca major* in *English* *The great Turkey tuberous flowerdeluce*.

II. TAF

CHAP. CCLXXXVII.

0 / FLOWER DELUGE
White Florentine,

OR,

FLORENTINE ORRICE,

ii. •The Kinds, This is the first of the *Tuberous* fins, of which there are two special Kinds, viz. i. *Iris Chalcedoniens five Sufiana major*, The great Turkey Flowerdeluce. 2. *Iris Chalcedonica, five Sufiana minor*, The lesser Turkey Flowerdeluce, This latter, the' it is called *minor*, or *leffer*, yet it is only fo in respect to the first *great Kind*, but it is *mags* or *major*, in respect of the *little Kinds*, which hereafter follow.

III. The Descriptions. *The first, or Great Turkey* Flowerdeluce, *ha* a Root which is brown on the outside, and is very thick and tuber oits, as all others of this*fort of Garden Kinds are.* From this Root spring forth several Heads of long and broad fresh green Leaves, yet not so broad as many others of those which follow, oije folded within another at the bottom, as all others of these *Flowerdeluces* are, from the middle of some one of these Heads, (for every Head of Leaves bears not a Flower) rises up a round stiff Stalk, about two Feet high, at the top whereof itands one Flower, (it has not yet been observed to bear two) the largest almost, but the most excellent of all the rest, consisting of nine Leaves, like the others which follow, but of the color almost of a Snakes Skin, tis fo variously spotted-, the three lower falling Leaves are very large, of a deep or dark purple color, almost black, full of greyish spots, frnkes and lines thro' the whole Leaves, with black Thrum or Freez in the midft of each of them, the three arched Leaves which cover them are of the same daik purple color, yet a little paler at the sides, the upper Leaves are very large, and of the same color with the lower Leaves, but a little more lively and fresh, being speckled and fraked with whiter spots and lines, which Leaves being laid in Water, will tinge the Water of a Violet color, and if a little Alum be put therein, and then they be wrung or pressed out, and the Juice of these Leaves is dried in the shade, it will become a color almost as deep as Indico, and may serve for Shadows in the Art of Limning-, the Flower has no smell which can be perceived, but is only commendable for its beauty and the rarity thereof^ it seldom bears Seed in our Climate, but when it does, it is contained in great Heads or Cods, being brownish and round, but not so flat as in the other Kinds which follow.

IV. *The second, or Lesser Turkey Kind, differs little from the former*, the Leaf is of a more yellowish green color, the Flowers are neither so large nor so fair, nor the spots and marks so perfpicuous, nor the Color of that lively

V. *The Places.* By some part of the Name, it seems that they might first come from *Sufis* in *Perfia* into *Turky*, bwt from *Turky* they were first brought to us -, they grow and thrive very well in our Gardens.

VI. *The Times.* They Flower most commonly in *May*, before any of the other Species.

VII. As to their *Qualities, Specification, Preparations and Virtues*, see them declared at large in *Chap.*- 288. following: And here is to be noted that all the *Tuberose Flowerdeluces* (except the *Florentine*, commonly called *Florentine Orrice*) more especially those which have the Blew or Purple Flower, have one and the same Virtues^ and that our *Blew Flowerdeluce* exceeds them all

I. *nHE Names.* It is called in *Greek* *lw w- JL *PISSA* *Assw* : in *Latin* *Iris Tuberosa alba*, *Irk tuberosa Florentina*, *Iris alba Florentina* : in *English* *White Flowerdeluce*, *Florentine Flowerdeluce*^ *Florentine White flowerdeluce*, *White Orrice*, and *Florentine Orrice*.

II. *The Kinds.* It is threefold, viz. 1. *Iris alba Florentina*, The White Flowerdeluce, or Florentine Orrice, which is the principal kind, and that of which the *weet Orrice Powder* is made. 2. *Iris Flore Pallido Florentina*, The yellowish White, or Straw colored Florentine Orrice. 3. *his alba major Verficolor*, The White party colored Flowerdeluce.

III. The descriptions. *The first, ^ Great White* Florentine Flowerdeluce, *ha* a Root which is Tuberosa* or *knobby, thick, and tuberous, and is covered with a brown rind within the Ground with long white Fibrēs or Strings.* From this Root rise up many Heads of very broad, and flat long Leaves, enclosing or folding one within another at the bottom, and after a little space divided one from another towards the top, thin edged on both sides, like a two edged Sword, and thicker in the middle. From the middle of some of these Heads of Leaves, rises up a round stiff Stalk, two or three Feet high, bearing at the top one, two, or three large Flowers, which break out of several Husks or Skins, consisting of nine Leaves apiece, as all the other *Flowerdeluces* do, and of a fair white color, having in the middle of each of the three falling Leaves a small long yellow Freez or Thrum, as is most usual in all the kinds of the following *Flowerdeluces*, both of the greater and smaller sorts. After the Flowers are past, thick short Cods or Pods come forth filled with Seed which is red, roundish, and flat

IV. *The second, or yellowish White* *hinit* *Roots, Leaves, Stalks, Flowers, Seed, and manner of growing very * like unto the former, or true Florentine Orrice* > and differs in nothing from it? but in the color of the Flowers, this being

V. *The third, or White* *Root* *not so* *knobby* *as the former* *Florentine*, *but* *of* *a* *little* *more* *knobby* *and* *is* *covered* *with* *a* *thin* *white* *rind* *within* *the* *ground* *with* *long* *white* *fibrēs* *or* *strings* *From* *this* *root* *rise* *up* *many* *heads* *of* *very* *broad* *and* *flat* *long* *leaves* *enclosing* *or* *folding* *one* *within* *another* *at* *the* *bottom* *and* *after* *a* *little* *space* *divided* *one* *from* *another* *towards* *the* *top* *thin* *edged* *on* *both* *sides* *like* *a* *two* *edged* *sword* *and* *thicker* *in* *the* *middle* *From* *the* *middle* *of* *some* *of* *these* *heads* *of* *leaves* *rises* *up* *a* *round* *stiff* *stalk* *two* *or* *three* *feet* *high* *bearing* *at* *the* *top* *one* *two* *or* *three* *large* *flowers* *which* *break* *out* *of* *several* *husks* *or* *skins* *consisting* *of* *nine* *leaves* *apiece* *as* *all* *the* *other* *flowerdeluces* *do* *and* *of* *a* *fair* *white* *color* *having* *in* *the* *middle* *of* *each* *of* *the* *three* *falling* *leaves* *a* *small* *long* *yellow* *freez* *or* *thrum* *as* *is* *most* *usual* *in* *all* *the* *kinds* *of* *the* *following* *flowerdeluces* *both* *of* *the* *greater* *and* *smaller* *sorts* *After* *the* *flowers* *are* *past* *thick* *short* *cods* *or* *Pods* *come* *forth* *filled* *with* *seed* *which* *is* *red* *roundish* *and* *flat*

VI. *The Places.* The Name shews the Original place from whence it came to us. but the best comes

comes from *Illyria in Greece* : Here we only Nurfe it up in *Gardens*, where it flouiiflies as well as any of the *Blew or Purple Kinds*.

VII. *The Tunef*. They flower in *April, May, and June*, according as care is taken of them.

VIII. *The Qualities*. The *Illynck Orrice* is accounted the belt, but the *Roots* of both that and the *Florentine* are ufed, and the latter being molt common, bears away the Bell in its Name. It is hot and dry in the iécond Degree, incides, attenuates, expectorates, digefts, opens, mollifies, abfterges, and is Pe&oral.

IX. *The Specification*. It is good againft Tartarous Mucilage in the Brest and Lungs, Coughs, Afthma's, Itinking Breath.

X. *The Preparations*. You may prepare from the Root (for nothing elfe of the Plant isufed) I. A *Pouder*. 2. *Species Diaireos fimplicis*, A *Species*. 3. *An Elettuary fimple*. 4. *Diaireos Salomoni*, Electuary of Orrice Roots compound- 5. *An Extrail*. 6. *A Spirituous Tintture*. 7. *An Acid Tinture*.

The Virtues.

XL *The Pouder*, commonly called *Orrice' Pouder*. It is ufed outwardly in making perfumes, and in ftoet Pouder for the Hair •, alfo in Compositions of *Damask Pouders* and *Cyprefs Pouders*. The Root it felf is many times chewed in the Mouth, by fuch who have a Stinking Breathy by which means it draws forth much Rheum, Flegm, and ill digefted Humors, which' caufe the Breath to finell Strong. However the fimple Pouder is given for the lame purpofe, from half a Dram to a Dram every Morning failing, and every Night going to Bed, mixed with a fufficient Quantity of double refined Sugar, and fo fwallowed, and wafhed down with a Gbf of *White Lisbon* or *Port Wine*. It opens •obftru&ions of the Womb, provokes the Terms, expels Wind, eafes gripings of the Belly, and pains of the Stomach.

XII. *Species Diaireos Jimplices* Pouder of Orrice Root fimple. See it in our *Pharmacopeia Londinenfis*, Lib. 4. Chap. 21. Sett. 10. It is good againft Afthma's, breathing obftrufed, Colds, Coughs, Hoarfnefs, Wheezing, Phthifick, fhortnefs of Breath, Pain of the Stomach, etc. Dofe from half a Dram to two Drams.

XIII. *The Elettuary*. It is made of the fimple Pouder at Sett. 11. one part mixed with Clarified Honey two parts. It has all the Virtues of the *Species Diaireos fimplicis* aforenamed, befides which, it caufes an admirable expectation, and withal keeps the Body foluble^ it cleanfes the Lungs, and heals Ulcers there, expels Wind, gives eafe in the Colick, by opening the Bowels, and prevails againft a tinking# Breath, Dofe half an Ounce or more, Morning and Evening, drinking a Glafs of White *FornVine* after it.

XIV. *Diaireos Salomoni*, Eleltuary of Orrice Root compound. See it in our *Pharmacopeia Londinenfis* Lib. 4. Chap. 22. Sett. 51. It is a very W_r¹ P₅^{oral} good againft Afthma's, belching up Wind, Coughs, Colds, Hoarfnefs, Wheezing, Obftruthons of the Lungs, Ulcers of the Lungs, fpitting of Blood and matter : It cleanfes thofe parts, dries, and heals them • is good againft Colicks, Wind, gripings of the Bowels, Worms in Children, pain of the Stomach, weaknefs thereof, and Want of appetite. Dofe from half an Ounce to sn Ounce, two or three times a day, drinking a Cijjis of *Hippocras* or generous Wine after it.

XV. *The Ext raft*. It is given from half a Dram to a Dram in a Glafs of *White Port Wine*, *Canary*, *Mdlhi^L Sh?rry^ ox Madera Wine*, as allb in *Mead*

or *Metheglin*. It has all the Virtues of the Simple and Compound Pouders and Ele&uaries, but is more powerful and effe&ual to all the purpofes and intentions there fpecified. It warms and comforts a cold moift and depraved Stomach, ftrengthenf the Appetite, caufes a good digeftidn, and powerfully opens obftrutions of the Lungs, Liver and Spleen.

XVI. *The Spirituous Twtture*. It reftores the tone of the Stomach and other Vifcera to a Miracle j and ftrengthenf the Bowels upon the Cure of a Dropfie, making them able to refill the return of the Difeafe, and fo to prevent a Relapfe. It is a fingular good thing againft a Leucophlegmatia, wearinefs of the Body, Lazineis, fainting and fwooning Fits, and the Scurvy in a cold habit of Body. Defe two Drams, to three or more, in any proper and fpecefick Vehicle, Morning, Noon, and Night.

XVII. *The Acid Tintture*. It is highly deobftru&ive and antifcorbutick, good againft all forts of Fevers which proceed from the corruption of the Juices, and putrefaftion of the Humors •, and therefore is very prevalent againft the Plague, and all forts of Peftilential and malignant Fevers, for that it ftrikes againft their Root and Eflence. It is as well Preservative as Curative 5 and by reafon, that it fo powerfully refills putridity, and cleanfes, it becomes an extraordinary remedy againft a ftinking Breath, yea, tho' it has been of many years Handing. It incides tough Flegni, diflblves it, and expels all the evil Juices of the Stomachy and other Vifcera, is good againft Stone, Gravel, Sand, and Tartarous Mucilage in the Reins, Ureters and Bladder. Dofe fo many drops as to make the Liquor pleafantly fharp, and may be taken in all that the Patient drinks.

XVII. *The Oily Tintture*. Anointed upon the parts affe&ed, it is good againft Cramps, Convulfions, Tremblings of the Limbs, Niimbnefs, Palfies, and all forts of Pains and Aches proceeding from a Cold caufe. Given Clifterwife to one Dram or more, it gives eafe in Colicks, Tortions of the Bowels, Stone, &c.

Of F L O W E R D E L U C E

Tuberous broad leaved,

OR,

FLAG F L O W E R D E L U C E

broad leaved.

I. H_T* HE Names. It is called in *Greek* *te* v~ X /uafk TKCLTV<PVKX* ; in *Latin* *Iris tuberosa latifolia* : and in *Englilh* *BrOad leaved Tuberous flowerdeluce*. Some of the *Greeks* call it 'lei*, *quaffifacra*, for which reafon fome have given it the name of *Confecratrix*, but is rather Called *Iris à ctejUs Arcks fimilitudine, quamflores ejus representant*, from the Rainbow, whofe diverfity of Colors, the Flower thereof doth imitate. Some have called it fit*. *dix marifca*, becaufe it is excellent againft the *Piles* : and fome have called it *Naronica*^ from the River *Naron*, becaufe by its Banks and Shore it grows in great plenty. Some have made a difference between *Iris* and *Ireos*, according to the *Lutin Verfe*, *Iris purpuream flore?n gerit^ Ireos album*: making *Iris* to fignihé the *Blew Flovoerdeluce* •, and *Ireos* the *White Flowerduce*^ or *Florentine Orrice* * but this was purely a miftake in the Poet: However

now, when Physicians write *Iris*, the Common *Blew* or *Purple Flowerdeluce* is intended; but when *Imt*, they mean and intend the *Florentine Or rice*.

II. *The Kinds*. There are fourteen several kinds of this Broad leaved Tuberos, blew or purple Flowerdeluce, viz. i. *Iris purpurea, five vulgaris*, The Common blew, or purple Flowerdeluce. 2. *Iris purpurea pallidior verficoltfr*, The various colored paler purple Flowerdeluce. x. *Iris cxrulea labris purpureis*, The blew Flowerdeluce with purple italks. 4. *Iris Dalmatica ?najor*, The great *Dalmatian* flowerdeluce. 5. *Iris Afuitica Ccerulea*, The *Blew Afian*. 6. *Iris Afatica pur pure a*, The *Purple Afian*. 7. *Iris Damafcena*, The *Damafco Iris*. 1. 1. *ns biflora Lufitanica*, The *Portugal double flowering*. 9. *Iris purpurea verficolor major Camerarii*, The great variable *Purple*. 10. *Iris purpurea verficolor minor*, The *tefler variable Purple*. n. *Iris purpurea altera minus fuliginea*, Another *Purple leifmoakie*. 12. *Iris Ccerulea verficolor*, The *Blew variable*. 13. *Iris lute a variegata*, The *Yellow variable*. 14. *Ins lute a labriis purpureis palladis*, The *Yellow with pale purple Lips*, or falls.

III. *The Defcriptions*. *The firft*, or *Common blew* or *purple Flowerdeluce*, has a *Tuberos Root*, and differs little or nothing from the *Great Turkey kind* neither in its *Root, Leaf or Flower*, nor in its *manner or form of growing*, only that the *Leaves* of this are not so large as some of the kinds are, and the *Flower* itself is of a deep purple, or violet Color, and sometimes a little declining to redness, in some particular places.

IV. *The second*, or *Various colored, paler Purple*, has *Flowers* of fitch a pale Purple color, as that they come near unto a *Blew*, and sometimes it will have *Veins* or *Stripes* of a deeper blew or purple, and sometimes of an *Afhcolor*, running thro' all the higher and lower *Leaves*.

V. *The third*, or *Blew with Purple falls*, is another kind much like unto the former, but this is more purple in the falls, and more pale in the upright *Leaves*.

VI. *The fourth*, or *Great Dalmatian*, has its *Roots and Leaves* as large and broad as any of the *Flowerdeluces* whatsoever: Its *Stalk and Flower* do equal its other parts in proportion, having that the color of the *Flowers* is differing, this being of a fair Watchet or pale blew color wholly, with the yellow Thrum down the middle of the *Flower* or falling *Leaves*, as before is laid to be *Common* to all *Flowerdeluces*. In all its other parts, it differs little, save only, that it is observed to have a small shew of a purplish red about the bottom of the green *Leaves*.

VII. *The fifth*, or *Blew Afian*, is in largeness of *Leaves* like unto the *Dalmatian*, but bears a greater *flore* of *Flowers* on several *Branches*, which are of a deeper blew color, and the arched *Laves*, whitifl on the side, and purplish on the *Ridges*, but in other parts like unto it.

VIII. *The sixth*, or *Purple Afian*, is nearly like to the former, but that the *Leaves* of this are a little narrower, and its *Flowers* a little more Purple, especially the upper *Leaves*.

IX. *The seventh*, or *Damafco Flowerdeluce*, is altogether like to the *Flowerdeluce* of *Afia*, excepting that it has some white *Veins* in its upright *Leaves*.

X. *The eighth*, or *Portugal double flowering*, is very like the first kind of this *Chapter*, but that it is not so large in its *Leaves*, nor in its *Flowers*: It sometimes flowers twice in a *Year*, viz. in the *Spring*, and in the *Autumn* but this double flowering is not often, unless the *Soil* in which it grows is very good, the *Scituation* proper, and the *Seasons* warm and produce: But the *Flowers* of this have a better and sweeter *Smell* than the first kind, and they are of a *Purple* or *Violet* Color, and come out of a purplish *Skin* or *Hpsk*.

XI. *The ninth*, or *Great variable Purple*, has very broad *Leaves* like unto the *Leaves* of the first kind, and in this *Chapter*, and so is (the *Flower* also, but differing in *Color*): For the three lower *Leaves*, are of a deep Purple, tending to redness: The three arched *Leaves*, are of the color of the upper *Leaves*, and the three upper *Leaves*, are of a pale color, tending to yellowness, shadowed over with a smoky purplish color, except the *ridges* of the arched *Leaves*, which are of a more lively Purple.

XII. *The tenth*, or *leffer variable Purple*, differs not in any thing from the last, but only that it has narrower green *Leaves*, and smaller and narrower *Flowers*, otherwise if they be both compared together, the *Colors* will not seem to varie at all one from another.

XIII. *The eleventh*, or other *Purple* less smoky, comes something near unto the twelfth *Kinds*, whose *Husks*, from whence the *Flowers* do flie forth, have purple *Veins* in them, and so have the falling purplish *Leaves*, and the three upright *Leaves* are not so dull or smoky, yet of a dull purple Color.

XIV. *The twelfth*, or *Blew variable*, has its *Leaves* of the same largeness with the leffer *Variable*, at *SeEl*. 12. above, and its *Flowers* are as diverse marked: for some have the falling *Leaves* blew at the edges, and whitifl at the bottom of the arched *Leaves*, which are of a yellowish white; and the upright *Leaves* are of a whitifl blew, with yellowish edges. Some again are of a darker blew, with brownish *Spots* in them. And some are of so pale a *Blew*, that it may well be called an *Afhcolor*. Some also there are whose upright *Leaves* are of a fair pale blew, with yellowish edges, and the falling *Leaves* are parted into two colors, sometimes equally in halves, each side differing from the other in color; and sometimes one

Leaf only is in that manner, and sometimes with a various colored Lift in them; in the other parts both of Flower and Leaf*, it is like to the said lesser variable Purple.

XV. *The thirteenth, or Yellow Variable, has a* ^{hij} th ^{fi} ^{d.} ^{dl} *which grows somewhat more slender and long, under ground, and of a darker color than many of the others*: This Plant loses its Leaves in Winter, which is contrary to all the former *Flovoerdeluces*, so that its Root remains under Ground, without any appearance of Leaves upon it: But in the beginning of the Spring, it shoots out fair broad Leaves, falling downwards at their points or ends, but shorter many times than any of the former, and its Stalk in like manner, not rising much above a Foot or fifteen Inches high, on which are set two or three large flowers, whose three falling Leaves are of a reddish purple color: The three Leaves which stand upright are of a smoky yellow the three arched Leaves, having their Ridges of a pale color, inclining to purple, have their sides or edges of the former smoky yellow color, with some purplish Veins at the feet or bottoms of all the *Lewes*.

XVI. *The fourteenth, or Yellow, with pale purple lips, or falls, has its three upright Leaves of a pretty fair yellow, and stand more upright, not bowing down, as most of the others do, the three falling Leaves are purple with pale edges.* Some of these have their green Leaves partly colored, white and green, more or less, and so are the husks of the flowers. The three* arched Leaves are yellow, as the upright Leaves are, with purplish Veins at bottom. Some have both upright and arched Leaves, of so pale a yellow, that we may in a manner call it a Straw color, but yellow at the bottom with purple Veins, and the falling Leaves are purple, with ^{hij} th ^{fi} ^{d.} ^{dl} *in them.*

XVII. *The Places.* They are all Nurft up, and grow in the ^{of} ⁷ ^{il} ^{the} ^{Garden} ^{*} of *thriffts*, with us in *England*, but grow also in many other Nations and Countries, according as their several Titles declare, as in *Turky, Hungary Dalmatta, Illyria, Spain, Portugal, France, &c.*

XVIII. *The Times.* They flower, some in *April*, some in *May*, some in *June*, and the Seed ripens not many Weeks after.

XIX. *The Vitalities.* These with the *Turkey* foregoing, and all the left following are laid to be of one and the same Quality, Property and Effect: when green and full of Juice, they are hot and dry almost in the fourth Degree: but when they are dry, they are then hot and dry in the third Degree, and will yet in some measure burn the mouth and throat of such as Chew them. They are Aperitive, Inciding, Digestive, Absterfive, and Diuretick, Stomacktick, Pectoral and Hyfterick, Cathartick, Emetick and Emmenagogick. They are said to offend the Stomach, and to cause Blood to be voided, if given in too great a Dose, and to weak Persons. Of all these Plants, the first in this Chapter is thought to be most effectual, and of the same the Root is that which is chiefly used. It is not safe to be given to Women with Child, because it forcibly brings down the Courses, and is apt to cause Miscarriage. And when exhibited, it ought to be given with good Correctives, as Mastick, Juice of Liquorice, Extract of Juniper Berries, &c.

XX. *The Specification.* It is famous in Curing the Scurvy, Dropfie, Jaundice and Gout.

XXI. *The Preparations.* You may prepare therefrom, viz. from the Root, 1. A *Liquid Juice*. 2. An *Effence*. 3. An *Infusion*. 4. A *Decoffion*. 5. A *Syrup*. 6. A *Powder*. 7. An *Elettuary Simple*. 8. An *Elettuary Compound*. 9. An *Oil*, viz. *Oleum Irinum*. 10. A *Balsam*. 11. A *Cataplasim*. 12. A *Peifary*. 13. A *Spirituus Tincture*. 14. An *Acid Tincture*. 15. An *Oily Tincture*. 16. A *Saline Tincture*.

The Virtues.

XXII. *The Liquid Juice.* Taken from one to three Spoonfuls (according to Age and Strength; mixt with a little Honey, and a Glass of Ale or Wine, it purges and cleanses the Stomach of thick and tough Flegm, and (harp Cholera, which are said by Authors to be the causes of Agues and Fevers. It Cures the Jaundice and Dropfie also (for which it is a famous thing) by evacuating the Humors which cause those Diseases, both upwards and downwards. And because it does somewhat bite upon the Stomach, it is not to be given without being corrected with Honey, Spicknard, and aromatick Spices, applied to the Piles, it eases them.

XXIII. *The Effence.* Being taken from one, to three or four Spoonfuls in any proper Vehicle, it performs all the Liquid Juice can do, besides which, it eases the pains and torments of the Bowels, or gripings of the Belly and Hypochonders, evacuates Melancholy, and takes away the shaking Fits of Agues; opens obstructions of the Liver, Spleen, and Womb, kills Worms in the Stomach and Intestines; expels the Stone, Gravel, Sand, or Tartarous matter out of the Reins and Bladder, gives ease and restores in Cramps, Convulsions, and Pallesies, which come from cold and moist Humors, by its Anodyne and healing property, whereby it warms and comforts the parts affected, and prevails against simple Ghonorrhoea: It provokes the Terms in Women, and brings away both Birth and After-Birth.

XXIV. *The Infusion in Wine.* It has the Virtues of the Juice and Effence, but much inferior in Efficacy: it prevails against the bitings and stings of Venemous Creatures, repulses Vapors in Women, and is good against Fits of the Mother: it opens obstructions of the Viscera, and cleanses the Stomach.

XXV. *The Decoction in Wine.* If it is taken to fix Ounces, it provokes Urine, gives ease in the C olick, produces the Terms, used as an Errhine, adding to one part of the Decoction, three parts of the liquid Juice, it purges the Head admirably of Flegm, and tough viscid Humors, and bathed upon the Hemorrhoids or Piles, it gives much ease and dissolves them. The Decoction made with Water and Vinegar, and so drank it is a remedy against the bitings of Mad Dogs and Serpents, and the stings of Venemous Creatures.

XXVI. *The Syrup.* It has the Virtues of the Juice, Effence, Infusion and Decoction, but acts more weakly by reason of its being so loaded with Sugar, and therefore may be given from one Ounce to two Ounces or more; but as a Peccoral and Bechick, it is more proper, because it causes a better expectoration, cleansing the Lungs of the Tartarous matter lodging in them. If an Ounce of the Syrup is mixed with four Ounces of the Decoction in Wine, and it be used as a Gargle for the Mouth, it eases the Toothach, cures Ulcers in the Mouth and Throat, and abolishes a stinking Breath.

XXVII. *The Powder.* It has the Virtues of the Juice, Effence, Decoction and Syrup, but acts not with so much facility and speed. Used as an Errhine up the Noftrils, it purges and cleanses the head of Cold, gross and viscid Humors, and cures vehement and inveterate Headachs, tho' of many Years Handing. Taken inwardly from a Scruple to a Dram or more, according to Age and Strength, it purges Pituitous and Watery humors out of the Body, both by Vomit and Stool, expels the Jaundice, and powerfully evacuates the Morbifick cause of the Dropfie, Scurvy and Gout.* Applied to Ulcers or Wounds, it cleanses, incarnates, dries, and heals them, and where eating Ulcers have been, which have made the Bone bare of Fleish, it breeds Fleish there, covers the Bone therewith, and causes it so to grow up, as to fill the hollownes of the Ulcer again. It is also very good, to cleanse, resolve the Callus, incarnate, fill up with Fleish, and heal Fistula's, old malign Ulcers and Cankers, which are difficult and hard robe Cured.

XXVIII. *The Eletuary Simple.* Take Powder of *Blew hlowerdeluce* Roots, three Ounces: Juice of the Roots, Clarified Honey, of each two Ounces, mix them. Dose, from two Drams to five or more in the Morning fasting, it works both upwards and downward, and evacuates Flegm, Cholera, Melancholy and Watery Humors, and by that means prevails against the Diopfie in an especial manner, as also against the Jaundice, Scurvy, Green-sicknes, Kings Evil and Gout. It also kills Worms in Stomach and Belly.

XXIX. *The Eletuary Compound.* It is thus made. Take Powder of the Root four Ounces: Powder of *Qalanga*, *Soldanella*, or *Sea bindweed*, two Ounces: Powders of *Galanga* and *Zedoary*, of each some Ounce., *Cloves* and *Cinnamon*, of each half an Ounce: Juice of the Roots, Clarified Honey, of each twelve Ounces, mix them for an Eletuary. It is made for the Cure of the Dropfie, being taken to half an Ounce or more every Morning fasting, or according as the strength of the Patient can bear it. It works also upwards and downwards, cleansing the whole Man of all superfluous Humors.

XXX. *Oleum Irinum*, or the Oil. I do not mean here the Compound Oil, called *Oleum Irinum* in our *Pharmacopœia Londinensis*, Lib. 5. Chap. 2. *Seff.* 49. for that is the Oil of the *Florentine Orrue Root*, but I mean an Oil made of the Flowers and Roots of the *Blew flowerdeluce* in this Chapter, which is thus done. Take Roots of the

Blew Flowerdeluce three Pounds, bruise them well: Choice Oil Olive, Pound twelve, Juice of the Roots, Pound three: mix and boil them till they are Crisp, then press out; repeat the boiling with fresh Roots in like manner, and repeat it the third time: Strain it out, and add to the Oil Flowers of the *Blew Flowerdeluce* a Pound and half, mix and infolte, or digest in a warm Sand furnace for six or eight Weeks, fit irring all with a Spatula once a day, after which, fit rain out the clear Oil, by a gentle Expression, and keep it for use. It is an effectual thing to warm and comfort feeble and weakened parts, Joints, Nerves, Tendons, and Muscles afflicted with Cold and moist Humors softens hard Tumors, and gives ease in the Gout and Sciatica: It dissolves, dissolves and wastes hard and Kernelly swellings in any part of the Body tho' Scrophulous, or proceeding from the Kings Evil: It softens the hardness of the Spleen and Womb, resolves Cramps and Convulsions of the Nerves and Tendons, warming, comforting and helping their Extension: The hinder parts of the Head and Vertebro of the Neck being anointed therewith it prevails against Catarrhs: and the forehead and Temples of the Head being anointed therewith, it eases Megrims and Pains of the Head proceeding from a cold Cause. Anointed into the Ears, it helps against pains and noise in them and anointed two, three or four times a day upon the Fundament and Hemorrhoidal Veins, gives present ease and relief as to the Piles.

XXXI. *The half am.* It has all the virtues of the Oil, but is more powerful in Curing green Wounds, old Ulcers and Fistula's: For it powerfully digests, cleanses, incarnates, dries and heals, and raises up Fleish after a very admirable manner in Ulcers that are very hollow. Applied to the Gout, it presently gives ease, and in short time after Cures it* and after a singular manner softens hard Tumors which happen in the fleshy parts.

XXXII. *The Cataplasim.* If it is made of the green Roots (being beaten, and applied) it gives ease in the Gout and Sciatica, and in some few applications is said to Cure them. Another *Cataplasim* Take of the Powder of the Root, two Ounces, Nutmegs, Dill Seed in Powder, of each one Ounce: Saffron two Drams: Extract of Juniper Berries, enough to make it into a *Cataplasim*. This applied to the Scrotum of Testides, tho' vehemently Tumified or swelled by a deluxion of Humors, gives present ease to the Pain, and in a short time dissolves the Tumor. A *Cataplasim* of the simple green Root, being applied to the Face or other parts of the Skin, as Neck, Arms, Hands, Feet, which are Tanned or Sun burnt, or are affected with Scurff Morpew, black or blew Marks, or Scans, or other deformities, it takes them away, and clears the Skin: but they who use it had need to take heed, that they use it not too strong, nor let it lie on too long, but rather wash it off again with fair Water, within two or three hours after it is applied. But it is better after the Root is beaten to a Pulp to tie it up in a fine thin Linaen Cloth, and to lay it for a day and a night in fair Water, or Damask Rose Water, and then with this Water, you may wet or moisten the Skin of the Face, Neck, Breasts and Hands, which are deformed as aforesaid, which is to be applied, so long as need requires but this Water you must also take heed of that you use it not too strong, OV.

XXXIII. *The Peffary.* It is made either of the solid green Root, or the Root beaten to a Mass, and so made up with Honey. This being put up into the Womb or Body, brings forth the Dead Child, much more does it facilitate the Birth and forcibly draws forth the Afterbirth,

XXXIV. *The*

XXXIV. *The Spirituous tinSure.* It expels Wind and is good againft the Coltck, gripings of the Guts, and obftru&ions of the Vilcera. it provokes the Terms in Women, ftrenghens the Storiach and Womb, and CorreQs thofecold and crude Juices which breed the Scurvy, Gout, Jaundice, and King's Evil: Dole, one Spoonful or two, firrt in the Morning fading, and laft at Night, in a Glafs of White Port Wine.

XXXV. *The Acid Tinfurc.* It ftrenghens the Stomach, kaufes a good Appetite and Digeftion, and powerfully opens all manner of Obftru&ions whatsoever. It Cures the Scurvy radically 5 and as it opens in a fpecial manner the Urinary Paffages, fo it* carries off the Morbifick Caufe of the Dropfie by Urine : Dofe, fo much as to make the Liquor pleafantly fharp, three; four, or more times a day.

XXXVI. *The Oily TinSure.* Given to thirty or forty Drqps in a large Glafs of White Port or Liffon Wine, to a Woman in Labour, it not only haftens, but facilitates the Delivery. Outwardly anointed Morning and Night upon any parts affected with Rheumatick Pains from a cold Caufe, or with a Numbnefs, Trembling, Palfie, Cramps, or Convulfion, it gives relief in a fhort time, and in fame reafonable time afterwards a Cure. It is alfo good againft the Itch, Tettars, Ring-worms and the like.

XXXVII. *The Saline TinSure.* Its ufe is wholly External, and is applied to Scurffs, Morpew, Leprofie, Sunburnings, Tannings, Freckles, Lentills, Pimples, yellownefs of the Skin, and other like deflations thereof * being applied Morning and Evening for fome confiderable time*

CHAP. CCLXXXIX.
Of FLOWERDELUCE
Tuberoijs Narfow-leav'd, Greater.

I. *Hp HE Names.* It is called in *Greek*, **iexi* ^ X **£&< TMb < pvKM iufyv. in *Lätw*, *Iris tuberosa* ^
angustifolia major: in *Englijb* ^ *The greater narrow-leav'd tuberos Flowerdeluce.*

II. *The Kinds.* There are four kinds hereof, viz.
1. *Iris angustifolia aurea Tripolitana* ^ **The Tripoli** golden or yellow narrow-leav'd Flowerdeluce. 2. **Im** *angustifolia ctrulea major* ^ **The greater blew garrow-leav'd.** 3. *Iris angustifoliapurpurea marina*, ^ **The Sea purple narrow-leav'd.** 4. *Iris angustifolia purpurea vericolor*, **The variable purple narrow-leav'd.**

j III. *The Defcriptions.* *Tbefirji*, or *Tripoli* gol-
^ " ^ W - leav'd, has a Root which is long and
Olaçziñ like unto the reft which follow, but greater
and juller: from whence fpring up Leaves a Yard
long, or thereabouts, and an Inch or more broad,
of a fad green color, but not fhining. The Stalk
nie's up to be four or five Feet high, being *ound
and ftrong, but not very thick, tearing at the top
two or three long and narrow Gold-yellow colored
i; lowers, of the fafhion of the *Bulbous flowerde-*
*we*** as the next to be defcribed is, without any
Mixture or Variation therein. The Heads for Seed
are three-fquare, containing within them many fiat
crneied Seeds. The Length of the Leaves of this
riant, compared with their Breadth, makes me call

it a *Narrow-leav'd Flowerdeluce* *, and yet, as it is broader than fome of the aforegoing *Broad-leav'd*, and broader than any of the following *Narrow-leav'd*, the Length of them makes them feem narrow *, for which Reafon I thought good to let its place be in the firft of this *Clajjis*.

IV. *The fecond, or Greater blew Narrow-leav'd*, has a fmall tuberos Root, blackijh and hard, Spreading into many long He ads ^ and more clojely growing or matting together: from which rife up Leaves which are very long and narrow, of a whitifh green color, but neither fo long nor fo broad as the laft, yet broader, thicker OTd liffier than any of the reft with narrow Leaves which follow. The Stalk rifes fometimes no higher than the Leaves, and fometimes a little higher, bearing at its top divers Flowers, fuceffively flowering one after another, and are like unto the Flowers of the *Bulbous Flowerdeluces*, but of a lighter blew color, and fometimes deeper- After the Flowers are paf, fix cornered Heads rife up, which open into three parts, in which is contained almoft round brown Seed.

V. *The third, or Sea purple Narrow-leav'd*, hat its Root and Seed like the former: from which fpring up many narrow hard Leaves, as long as the laft, and of a dark green color, which fmell a little ftrong. The Stalk bears two or three Flowers, like the former, but fomewhat lefs, and of a dark purple or Violet color.

VI. *The fourth, or Variable purple Narrow-leav'd*, has Roots and Seed not differing from the former Sea purple. The Leaves of this are alfo like thofe of that *Sea kind*, and do fmell a little ftrong, like them. The Flowers are differing, in that the upper Leaves are wholly Purple or Violet, and the lower Leaves have white Veins and purple, running one among another.

VII. *The PJaces.* The Titles (hew their feveral places of Growth, but with us they are only nurft up in Gardens: the *Sea kind* is found originally in *Spain*.

VIII. *The Times.* They flowr in April and May

M. iy, and the Seed ripens ibme Months afterwards.

IX. *The Qualities, Specification, Preparations and Virtues*, are the fame with thofe of the *Broad-leav'd tuberous Flowerdeluces* in Chap. 288. aforegoing.

C H A P . CCXC.

Of FLOWERDELUCE
Tuberous Narrow-leav'd, Smaller.

I. *The Names*. It is called in *Greek*, "λεε* **>*&'- JL /M^€^VAAH^#JC^TIE58: in *Latin*, *Irk tuber of a angustifolia minor*: in *Engliffh*, *The lejfer narrow-leaved tuberous Flowerdeluce*.

II. *The Kinds*. There are three feveral Species hereof, viz. 1. *Iris angustifolia minor Pannonica, vericolor Clufii*, The Hungarian fmall variable Flowerdeluce of Clufius. 2. *Iris angustifolia flore duplici Ctrulea*, The blew double-flowered narrow-leav'd Flowerdeluce. 3. *Iris angustifolia alba minor Clufii*, The Hungarian fmall white Flowerdeluce.

III. *The Defcriptions*. *The firft, or Hungarian fmall Variable, has a Root which is black and fmall, growing thicker and clofer together than any other, and frongly fanned in the Ground, with a number of hard fibrous Roots*. It fprings up with feveral fmall Tufts of Leaves, very long, narrow and green, growing thick together, especially if it abides any time in a place : among which rife up many long round Stalks, higher than the Leaves, bearing two, three or four fmall Flowers, one above another, like the former, but fmaller, and of great Beauty. The lower Leaves are variably ftriped with white and purple, without any Thrum or Fringe at all. The tipper Leaves are of a fine blewifh purple or *Violet* color: and of the fame color are the arched Leaves, yet having the edges a little paler. The Heads for Seed are fmalier, and not fo comered as others, but contains Seed much like to them, which are alfo fmaller.

IV. *The fecond, or Blew double-flowered, differs not in Root or Leaf from the Greater blew Narrow-leav'd in cap. 289; Jeff. 4. juft aforegoing, but only in this, that the Leaves of this grow thicker together, and that the Flowers of this kind are as it were double, with many Leaves confufedly fet together, without any diftinQ: parts of a Flowerdeluce, and of a fair blew color, with many white Veins and Lines or Stroaks running in the Leaves*. Oftentimes the Stalk of Fluwers has but two or three fmall Flowers, diftin&ly fet together, rifing as it were out of one Husk.

V. *The third, or Hungarian fmall White, differs but little from the firft of this Chapter, fave, that the Leaf is of a little paler green, and the Flower is of a fair whitifh color, with fome purple, which ihews it felf only at the bottom of the Leaves*.

VI. *The Pfces*. The original Place of thefe is *Hungary*: with us, they are only nurft up in Gardens.

VII. *The Times*. They all flower in the Spring, and their Seed is ripe in the Summer Months,

VIII. *The Qualities, Specification, Preparations and Virtues* of thefe, are the fame with thofe of the *Emd-leav'd tukrom Flowerdeluce* in Chap. 288. a-

foregoing *, but thefe are not fo efficacious as thofe be.

C H A P . CCXCL

Of FLOWERDELUCE
Dwarf Greater.

I. *The Names*. It is called in *Greek*, "λεε* **>*&'- X *J* *v*v*% vaviifK piifav: in *Latin* *Chamairis major, Iris pumila major*: in *Engliffh*, *Dwarf Flowerdeluce the Greater*.

II. *The Kinds*. Of the *Dwarf Flower deluce* s there are three principal kinds, viz. 1. *The Greater* of which we (hall fpeak in this Chapter. 2. *The Leffer*, of which we (hall difcourfe in the Chapter following.

III. Of the *Greater Dwarf kind*, there are three Species, viz. 1. *Cham*iris latifolia alba major*, The greater white Dwarf Flowerdeluce. 2. *Chautin[^] latifolia purpurea major*, The greater Purple Dwarf Flowerdeluce. 3. *Chamairis latifolia purpurea m<> jor altera*, Another greater purple Flowerdeluce.

IV. *The Defcriptions*. *The firft, or Greater white Dwarf, has a Root which is finally according to the Proportion of the Plant above Ground, but made after the fafhion of the Greater kinds, with tuberous pieces fpreading from the fides, and jtrong Fibres or Strings, whereby they are fajined in the Ground. This Dwarf Flowerdeluce has its Leaves as broad as fome of the Leffer kinds aforegoing, but not lhorter: the Stalk is very fhort, nor above fix or feven Inches high, bearing moft commonly but one Flower, feldom two, which are in fome of a pure white color, in others paler, or fomewhat yellowifh thro' the whole Flower, except the yellow Freez or Thrum in the middle of every one of the falling Leaves. After jthe Flowers are paf, come forth great Heads, containing round pale Seed*.

V. *The fecond, or Greater purple Dwarf, has no Difference either in Root, Leaf or Form of the Flower from the former Dwarf kind, but only in the Color of the Flower, which in fome is of a very deep purple or black Violet purple, both the Tops and the Falls*. In others the *Violet* purple is more lively and in fome the upper Leaves are blew, and the lower Leaves purple, yet all of them have that yellow Freez or Thrum in the middle of the falling Leaves, which the other kinds have.

VI. *The third, ar Other great purple dwarf Flowerdeluce has the Flowers purple, like the former almoft, and may be reckoned, for the Smallnefs and Shortnefs of the Stalk, the very next Species to the laft *, but in this the Fflowers and Leaves are as large as any of the former kinds of Flowerdeluces*.

VII. *The Places*. Authors have faid nothing of their name places; but without doubt they may grow in *Greece*, elfe *Dwfcorides* had not difcourfed of them. *US the are nurft Up in Gard*ns, **

VIII. *The Times*. They come up in *February* and *March*, flower in *e *Spring Months*, and the Seed is ripe in *Auguft*.

IX. *The Specification, Preparations and Virtues* are the fame with thofe of the *Common blew Flowerdeluce* in Chap. 288. aforegoing, as *Dodontus, Pempt. 2. lib. ^ .cap. ^ in thefe words* fecms to inculcate: *Facultate autem & Vinibus, hē arq: Ins aens & impenfa calida ejf, aliiqje Iridibusjmilis.*

C H A P . CCXCIL

O f F L O W E R D E L U G E
Dwarf Lefler.

I. **T**HE Names. It is called in Greek* *ἰριόλα*
X I ^ X ^ T I ^ J \$ 'let. *vAvn UTTWV; in Latin, *Iris pu-*
mila minor, *Cham&irh minor* : in Englif), Dwarf
Flowerdeluce the leffer.

II. *The Kinds*. There are feven kinds of thefe
lefler Dwarfs, viz. 1. *Chamiris latifolia aWa mi-*
nor, The lefler white broad-leav'd Dwarf Hower-
deluce. 2. *Chamiris latifolia minor Straminea*, The
lefler Straw-colored Dwarf. 3. *Cbamairis latifolia*
minor purpurea, The lefler purple Dwaif. 4. *Gba-*
mxi rh latifolia minor fuave rubens, The lefler blufh-
colored Dwarf. 5. *Chamairis latifolia minor lute*
a verficolor, The lefler yellow variable Dwarf. 6.
Chamairis latifolia minor carulea verficolor, The
lefler blew variable Dwarf. 7. *Chamairis Marina*
purpurea, The purple Sea Dwarf Flowerdeluce.

III. *The Defcriptions*. *The firft*, or Lefler white
Dwarf, has a fmall tuberous Root \$ from which
Leaves, for the moft part fomewhat fmaller, narrow-
er and Shorter than the former, faring forth. The
Stalk with its Flowers upon it fcarceljr rifes up a-
bove the Leaves, fo that in moft of them it may rather
be called a Foot-ftalk, (fuch as the *Saffron-*
Rowers have) and therefore may be faid to be
*w/o# without Stalks. The Flowers are like unto
the firft defcribed in the laft Chapter, of a whitifh
color, with 3. few purplifh Lines at the bottom of
the upper Leaves, with a Lift of Green in the fall-
ing Leaves.

IV. *The fecond*, or Lefler Straw-colored Dwarf,
is in Roots, Leaves, Stalks^ Flowers,, and Manner
of Growing very like the laft^ excepting, that the
Flowers thereof are of a pale yellow, called a Straw
color, with whitifh Stripes and Veins in the falling
Leaves, and purplifh Lines at the bottom of the
upper Leaves.

V. *The third*, or Lefler purple, differs not much
from the laft in its Form, Substance and Manner* of
Growing -, the chief Difference confifts moftly in the
Color of the Flower, which is of a deep Violet pur-
ple, fometimes paler, and fometimes fo deep, that it
jcems' almoft black : and fometimes the falling
Leaves are purplifh, and the upper Leaves blew *,
and fome of thefe have a fweet Smell, and fome
have none : alfo fome of them are of a fine pale
blew color throughout the whole Flower.

VI. *The fourth*, or Lefler blufh-color'd, has its
falling Leaves of a reddifh color, and the Thrums
blew : the upper and arched Leaves, of a fine pale
red, or Flefh color, called a blufh color : in all o-
ther things it differs nothing, and fmells very little,
or not at all.

VII. *The fifth*, or Letter yellow Variable, has its
falling Leaves yellowifh, with purple Lines from the
middle downwards -, fometimes of a deeper, and fome-
times of a paler color, and white Thrums in the mid-
Ale: the upper Leaves are alfo of a yellowifh color,
with purple Lines in them: fometimes the yellow
color is paler, and the Lines in both the upper and
lower Leaves of a dull or dead purple color.

III. *The fixth*, or Lefler blew Variable, has the
upper Leaves of its llower of a blewifh yellow, fpo-
ted zwith purple in the broad part, and at the bottom
very narrow. The falling Leaves are fspread over

with pale purplifh Lines, and a fmailflew of blew
about the brims or edges. The Thrum is yellow at
the bottom, and blewifh" above. The arched Leaves
are of a blewifh white, being a little deeper on the
ridge : fometimes the upper Leaves are of a paler
blew, rather whitifh, with the yellow -, and both
thefe have no Smell at all.

IX. *Thefeventh*, or Purple Sea Dwarfj is like
unto the Narrow-leav'd Sea Flowerdeluce in Chap.
289. Sect. 5. aforegoing, in its Root, Leaf and Flow-
er, having no other Difference, but in the Smallnefs
and Lownefs of its Growth, being of the fame pur-
ple color with it.

X. *The Places*. They are only nurft up with us
in Gardens. The Sea kind have been found origi-
nally in Spain, France and other Southern Shoars.

XI. *The Times*. They flower in April and May,
and the Seed is ripe in July.

XII. *The Qualities, Specification, Preparations*
and Virtues^ are the lame with the Blew Flowerde-
luce in Chap. 288. aforegoing.

C H A P . CCXCIII.

O / F L O W E R D E L U C E
Grafts, or Narrow-leav'd.

I. **T**HE Names. It is called in Greek, *Xa^af/lef*
X *ισqMAw* ; in Latin, *Chamairis anguftifolia*,
and *Iris pumila anguftifolia* : in EngUJh, *Narrow-*
leaved Dwarf Flowerdeluce, or *Grafts Flowerdeluce*.

II. *The Kinds*. There are two fpecial kinds
hereof, viz. 1. *Chdm^eiris anguftifolia Major*, The
greater Narrow-leav'd or Grafts Flowerdeluce. 2.
Chamairis anguftifolia minor, The lefler Narrow-
leav'd or Grafts Flowerdeluce.

III. *The Defcriptions*. *The firft*, or Greatcf
Grafts or Narrow-leav'd, has Roots fmall, black and
hard, growing thick together, faftned in the Ground
with fmall blackifh hard Fibres or Strings, which
Uarcely fhoot again, if the Root^is removed. From
this Root fpring forth many long and narrow dark
green Leaves, not fo ftiff as fome of the former
Smaller Dwarfs in the laft Chapter, but pliant, aid
bending their ends down again : from among which
rife up feveral Stalks, bearing at the top two or
three fweet Flowers, as fmall as any of them fet
down before, of a reddifh purple color, with whi-
tifh yellow and purple Strakes down the middle of
the falling Leaves. The arched Leaves are of a
Horfe Flefh color all along the edges, and purple on
the ridges and tips which turn up again. Under
thefe appear three brown Aglets, like unto Birds
Tongues. The three upper Leaves are fmall and
narrow, of a perfect Purple or Violet color. The
Heads for Seed have fharper and harder cornered
edges than the former ^ and the Seeds are lbmething
greyifh, like thofe in the laft Chapter.

IV. *Thefecond*, or Lefler Grafts or Narrow^eav'd,
is in Roots, Leaves and Flowers Jo^like the Lift de-
fenbed, that it is not to be diftinguifhed therefrom,
but only by its Smallnefs and Lownefs; in which it
is confiderably lefs, and by which it only differs.

V. *The Places*. Thefe grow in feveral Southern
Climates of the World, but are only Garden Plants
with us.

VI. *The Times*. They flower fometimes in April,
and

and ibmetimes in *May*, according to the Warmth or Coldness of the Season.

VII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Blew Flowerdeluce* in *Chap. 288.* aforegoing, to which you are referred.

CHAP - CCXCIV,

Of FLOWERDELUCE Wild,

OR,

Stinking GLADWIN.

I. *The Names.* It is called in *Greek*, & * > \$ X "W 7PcM, fy&yeta: in *Latin*, *Xyris*, *Iris a-greftis*, *Spatula*, or *Spathula Fcctida*, (for *Spatha* is taken for *Gladium*, a *Sword* :) in *English*, *Gladiol*, *Gladdon*, *Gladwin*, and *Stinking Gladdon* and *Stinking Gladwin*.

II. *The Kinds.* It is the last kind of the *Flowerdeluce*, being the *Wild fort*, and a singular Species, called by the *Arabians*, *Çaforas*, by *Theophrastus*, *lêi <aye** *Iris agria*, and is the *Gladiolus Tragi*; but so called by a Mistake, unless he had laid *Gladiolus Fcctidus*.

III. *The Description.* *The Root*, while it is young, is but *Jhall*, and full of *Strings*, but being grown older, it grows greater, and in *Form* like unto *FlowerdeluceRw*, but reddish without, and within within, very *Jharp* and hot in *Tajie*, and of as ill a *Smell* as the *Leaves*. From this *Root* rise up several *Leaves*, very like those of an *Iris* or *Flower-*

deluce, but that they are sharp-edged on both sides, and thicker in the middle, of a deeper green color, narrower, (harper-pointed, and of a strong ill Scent, if they are bruised between the Fingers. In the middle rises up a pretty strong Stalk, three Feet high at least, bearing three or four Flowers at the top, made somewhat like the Flowers of the *Iris* or *Flowerdeluce*, with three upright Leaves, of a dead purplish Ash color, having some Veins discolored in them; tho' other three do not fall down, nor are the other three small ones so arched, nor do they cover the lower Leaves as those of the *Garden Flowerdeluce* do, but stand loose or asunder from them. The Flowers being pale, there come up hard Coats or Husks, three-square, opening wide into three parts when they are ripe, in which are contained reddish Seed, which being perfectly ripe and dry, become black.

IV. *The Places.* It grows in upland Grounds, as well as in moist places, in Woods and shady Groves, as also by the Sea side in many places of this Land -, and it is also nurtured up in many Countries in Gardens.

V. *The Times.* It flowers not until *July*, and sometimes in *August* and the Seed is ripe in *August* or *September*; yet the Husks, after they are ripe, and do open themselves, will hold their Seeds within them for two or three Months, and not die them*.

VI. *The Qualities.* The Root is chiefly used, and it is hot and dry in the third Degree: it is *Aperitive*, *Absterfive* and *Astringent*, *Hyfterick*, *Flat-mick*, *Emmenagogick* and *Cathartick*.

VII. *The Specification.* It is peculiarly effectual against the *Strangury*, *Obstruction* of the *Courfes*, and *Kings-evil*.

VIII. *The Preparations.* You may have therefrom, 1. A *Juice of the Roots*. 2. An *Effence*. 3. A *Decoction in Wine*. 4. A *Infusion in Ale of Wine*. 5. A *Vinegar*. 6. A *Powder of the Root*. 7. A *Powder of the Seed*. 8. A *Cataplasm*. 9. A *Juice of the Leaves*. 10. A *Peffary*.

The Virtues.

IX. *The Juice of the Root.* It purges *Choler* and *Flegm*, both upwards and downwards in weak *Stomachs* and ill *Habits of Body*, cleansing those Parts very well. Snuffed up the *Nose*, it causeth *Sneezing*, and clears the *Head* from much viscid *Water*, *Flegm* and *Puffs*. Rubbed upon places-troubled with the *Itch*, it is said to cure it.

X. *The Effence.* It has the *Virtues* of the liquid *Juice*, but more powerful, and given inwardly two or three Spoonfuls in a Glass of *White Lisbon Wine*, it provokes the *Terms* in *Women*, but it ought not to be given to *fucal* as are with *Child* for of causing *Abortion* or *Miscarriage*.

XI. *The Decoction in Wine.* It purges *Choler* and *Flegm*, as the *Juice* and *Effence*; provokes the *Terms*, and has all the other Properties but operates much more weakly, and therefore is more fit for the weaker Constitutions. It is good for such as are troubled with *Cramps* or *Convulsions*, *Gout*, *Sciatica* and the like, and gives ease to such as are affected with *Crick*, *Griping of the Guts*, &c.

XII. *The Infusion in White Port Wine or Ale.* It has the *Virtues* of the *Juice* and *Effence*, but works much more weakly. It is good against *Gripings* of the *Bowels*, *Crick*, *Strangury*, and all sorts of *Obstructions* of *Urine*, occasioned from *Sand*, *Gravel*, *tartarous Matter* obstructing the *Reins* and *Bladder*.

XIII. *The Vinegar.* Taken to four or six Ounces

or

Chap. 295. "Englijb 'Herbs.

or more, it is gently Emerick, and cures Agues, Fe
- Spleen, &c.

XIV. *The Voider of the Root.* Snuffed up th
Nofrtiis, it is a very good Errhtne to purge tin
tleii and Bain of cold, moid aid pituttous Hu
>rs, drawing them from thena; in great quanti
∴ Taken inwardly to ens Dram in White *Port*
or *Lisbon Wine*, it helps such as are troubled wicl
Cramps and ConvuUions, Gouts, Sciatica's, griping
ruti= hitlie Belly, Strangury, Meat, Pain and Stop-
page of Urine. It is given with much profit to fuel
< have had long Fluxes thro' the Acrimony of il
Hamors, Which it (lays, after it has firft purged and
cleanfed the Bowels.

XV. *The lender of the Seed.* Given from ha!
a Dram to a Dram in White *Port Wine*, it helps
'he Strangury, and caufes them to Piii ptefently
which before could not. If it is taken with Vine
gar, it diffoh'es the Hardnds and Swelling of rto
Spleen, and prevails agaiiift Hypochondriack Melan
choly.

XVI. *The Cataplafm.* If it is made up into a
Pultife with *Great Uniory Root*, Honey and Verdi
grife, and applied, it is good againft all Wounds of
the Head, and draws forth Splinters, Thorns, bro
ken Bond, or any other thing flicking in the Flefh
and that without pain. If the Root is made into
a Cataplaim by boiling in Vinegar, and be laid up
on any Tumor or Swelling, ir very effe&ually dif
folves or confumes it, yea even thofe Tumors of
the Neck and Throat called the King's Evil.

XVII. *The Juice of the Leaves.* It is good a-
gainft Scabs, Itch, Tectars, Ringworms, Scurf,
Morphew, Tanning, Sunburning, Yellownefs of the
rSkin, Leprolie, and other like deformities there-
of!

IVIII. *the fejfary.* Being made of the Root
or of the Juke arid Ponder of the Root 5 and put np
into the Womb, it brings down the Terms in Wo-
tien where they have been long ftopt 5 but you
nmit have a care that it be not ufed to a Woman
With Child, becaufe it may caufe Abortion.

CHAP. CCXCV.

Of FLUELLINs

OR,

Female SPEEDWELL.

T^his Name*. It is called in *Greek* **
by the *Arabian* [^] *Atbin* : in *Latin*, *Elatine*,
Femna, *FuchftL* *Iftattbioli*. *Cameraril*

lowers, bat a *Rwr* which *x fmall an&ihrc&iy*, *ta**
ing bold of the uppcrfitrc.ee of the Earth.
t fpreaii ir felfs f^om whence rife Stalks or
ranches wirh Leaves thereon which differ but
rtle from the laft, but that the Leaves are not *ib*
nudi cornered about the edges, and kfs pointed
e

aiio, in ihtJioocor loweit part of them : The Flow-[^]ers are almoit all Blew, with ibme iinall matter of Whiie in them, which being palt away, fmall pouches or Seed Veffels fuceid, not unlike the for-

VI. *The Places.* They grow upon Banks and Borders of Fields, in Sandy Grounds and Woods almoit every where-, as alfo in Cornfields, and in Borders about them, and in other fertile Grounds, as about *South fleet* in *Kent* in great abundance- at *Buckworth* alfo, *Hamerton* and *Richwerfworth*, in *Huntingonshire*, and in feveral other places, both there and eliewhere.

VII. *The Times.* They all flower about *May Jane* and *July*, and the whole Plant is Withered by the beginning of *September*.

VIII. *The Vitalities.* *Fluellin* is Temperate in refpeft to heat or coldnefs, drynefs or moifture : is Cleanfing, Afringent, Incarnative, Vulnerary, Stomattick, Hepatick, Alexipharmick and Reftorative. *

IX. *The Specification.* It ftops Fluxes of all forts, whether of the Blood or Humors, whether of the Bowels, or defluxions upon any part ^ it heals alfo old Ulcers, eating Cankers, Pocky eruptions and the like.

X. *The Preparations.* You may prepare from this Herb, 1. *A Liquid Juice.* 2. *An EJJence.* 3. *A Decoftion in Water or Wine.* 4. *A Balfam.* 5. *A Cataplafm.*

The Virtues.

XL *The Liquid Juice.* Given to three or four Spoonfuls at a time Morning and Evening in a Glafs of Red Port Wine, it itops defluxions from the Head, alfo other defluxions upon any particular part, all fluxes of Blood or Humors, as a *Diarrhoea*, *Dyfteria*, *Lienteria*, *Hepatick Flux*, and the overflowing of the Courfes in Women.

XII. *The EJjence.* It has all the former Virtpes, but more efficacious : It Hops all forts of Bleeding, whether at the Nofe, or Spitting, Vomitting or Pitting of Blood •, alfo fluxes of Blood from any other parts, caufed by the cutting or breaking of a Vein •, and is a fingular good thing againft Contu- lions whether inward or outward, itrenghening aod consolidating the parts which are hurt-, and it is no lefs effe&nal being ufed Dietetically to cleanfe, dry, and heal old Ulcers which are foul, fretting and eating * and outwardly being applied to dry, conglutinate and heal any fimple green Wound. It is of fingular ufe againft the *French Fox*, and all fretting and eating Cankers proceeding from the fame 5 fo that fcarcely any other Vegetable comes up to the height of its excellency in this Cafe. *Pena* gives a relation of one whofe Nofe was almoft confumed with an eating Canker (I fuppofe proceeding from the *French Pox*) which was by the Phyicians order to have been cut off, to preferve the reft of his Face and Body, now ready to fall into a [*Pocky*] Leprofie •, a fimple Barber being in Company, and hearing of it, delired that he might firft make tryal of an Herb which he had feen his Matter ufe in like Cafe^ it was granted, and he ufed only the Juice and Decoftion of this Herb, giving of them inwardly, and applied the Herb outwardly By this only means he recovered the Patient, and not only Cured the: [*PocAyJ* eating Ulcer of his Nofe, but alfo the [*IPockJ* Scabbinefs or Leprofie of his whole Body, which he was now fallen into, and by this alone means became perfectly well.

XIII. *The Decoftion in Wine or Water.* It has aU the Virtues of the Juice and Effence, but lefs efficacious, and therefore ought to be given in treble or quadruple quantity, two or three times a day.

XIV. *The halfm.* It is no ways inferior to any Balfam made of any of the Vulnerary Herbs, it digefts, cleanfes, incarnates, dries, and heals old Ulcers, putrid, fretting and eating Sores, and Cures at once or twice dreffing any fimple green Wound, in what part of the Body fo ever.

^ *J^h e gata Plafm* •. It is made of the green Herb, bruiied and mixed with Barly Flower •, being applied to watering Eyes, occafioned by defluxions from die Heads, where there is Heat and Inflammation withal, it very much helps them, and ftops all other Defluxions of Humors, upon any other part whatfoever, wherethere is Pain, Diflocation, Weaknefs, Wound, or Ulcer, &c.

XVI. *An*

111. The Descriptions. *The first, or greater Male Fool-ftones, has a double round Tuberos Root like a pair of Maris flones, from whence rife up five or fix broad and frnooth long Leaves, like to those of Uillies, having black Spots on their upper fides.* The Stalk also has ibme thereon, which compafs it at bottom, but fmaller: The Flowers grow in a Spike, which are fmall and purple, each of them having an open hood, or helmet higheit, with two fmall Leaves like Ears, Itanding upright at the fides of them, the Belly which is lowelt is whiter, having on the backfide a crooked heel or Horn. The whole Flower is Sweet, and very plealant to behold.

IV⁷. *The feconl, or Other Fool-ftones with spotted Leaves, ha* tefticles like the other, but not fo large, nor fo round, from which fpring up five, fix, or more heaves, not altogether fo large an the former, but lying on the Ground, and spotted in the fame manner, but Jomewhat rounder pointed.* The Stalk of this grows bigger than the other -, and the Flowers are not unlike the fame for the form, but of a more blewifh purple color, with a fpur behind.

V. *The third, or Male Fool-ftones not spotted, has a pair of Tefticles like those befonging, from whence fpring up a Stalk and Leaves which are large, and very like the laft, but not spotted.* The Flowers are either of a deeper, or of a paler purple color, or fbmewhat Blulh, or altogether White. The Belly which hangs down, is fometimes spotted with purple Spots, and fometimes it has none, more epecially in these Flowers which are all White.

VI. *The fourth, & Female Fool-ftones, ha* a double Tejhculous Root, from whence fpring up fix or feven leaves, which are leffer and narrower than those of the Male kind, and Ribbed almoft like unto Ribwort Plantane, lying on the Ground, and fome of them lifting themselves up higher, encompassing the Stalk, which is fhorter, than those of the Male fort. The Flowers at top of the Stalk, have gaping or open hoods-like the former, but the Ears on each fide ftand not upright, but lie fo dole thereon, that they are hardly difcerned, with a heel behind them as the others have. This is either of a dark Violet purple color, the middle part whiter and spotted, or of a pale Red, whose Stalk is fhorter, and Leaves leffer, or elfe of a fearictRed -, the fearlet Head being thick and (hort, and the Flowers fmaller.*

VII. *The fifths or Small Fool-ftones with spotted Leaves, has a double Tejlliculous Root like the others, from whence fpring up two or three fmall, long ipotted Leaves, with a Stalk in the middle of them, which they feem to encompass, those up higher being much fmaller than they. The Flowers are purple, spotted, and very finely ftriped.*

VIII. *The fixth, or Mdlr Neapolitan Fool-ftones, has a pair of Tefticles which are round, but much longer than the other kinds^ from which fpring up fix, feven or more Leaves, the length of ones Hand, and an Inch broad, of a pale fresh green Color, waived about the edges, and at their bottoms encompassing the Stalk.* The Stalk is about a Foot high, more or Ids, and at its top has a fpiked buff of Flowers, which are Red before they open, and of a fair blu(h color being blown. They are in form like to the others before the hood or helmet opens, having fmall Leaves like Ears on the fides, with ihort Arms as It were hanging down by the Body, the lower parts of which are furnifit as it were with Thighs and Legs, the Feet being cut off. From this form of the Flowers being fo much in the ihape of a Man, came the Name *Anthrophora*.

IX. *Of this laft fort there is also a female kind,*

which bait a like Root and Stalk, fave that it is higher. The Leaves are larger but not broader than the laft, fspread on the Ground, with fome fmaller on the Stalk. The ipike of Flowers is not fo great, nor fo thick; but the Flower it felf is like the laft in ihape, but of a pale color, spotted very thick, as fmall as Sand, having the hedof greenifh with purple edges.

X. *The places.* The first five grow for themoft part in Fields, and by Wood fides in many places of *England-*, but the two laft are Natives of *Italy*: however they are all of them nurft up here with us in *Gardens*.

XL *The Times.* The all flower in *May*, as the rest of the *Orchides* do.

XII. *The Vitalities, Specification^ Preparations, and Virtues,* are the fame with those of *Cynoforchis* or *Dog-Jiones* in *Chap. 226.* aforegoing, to which we fhall refer you.

G H A P. CCXCVIII.

Off OX STONES.

T^his Plant is called in *Gr^i* *Nams* *εφ2«e«3w*, in *Latin* *Orchis Serapias* *IV-fuiculus Vulpinus*, and in *English* *Fox Stones*.

II. *The Kinds.* There are many forts of *Fox Stones*, as *i- Orchis Serapias Bifolia latifima*, The great *Twablade Fox Stones*. *\. Orchis Serapias latifoha alter*, Hungarian *llwablacd Fox Stones*. *j. Orchis Sphegodes major*, The great *Bumble Bee Orchis* or *Fox Stones*. *4. Orchis Myodes maior*, The *pater HeQ Fly FloV*, *5. Orclis kZSfctes*, frog *Orchis* or *Frog Flower*. *6. Orchis Arachmtis*, The *Spider Flower*. *7. Orchis Pycodes Herbacei colons^* The green *Butterfly Orchis*. *8. Orchis Ornithophora folio maculofo*. The *White or Purple Birds Flower*. *9. Orchis Macrophyllus Column^* Long *Leav'd Fox Stones* of *Columna*. There are many other *Kinds of Fox Stones*, but these are the chief.

III. *The Defcriptions.* *The first, or Greatest Twablade Fox Stones, has Roots or Tefticles which are great and fomewhat kng, like unto longijh Tur-neps,* from whence two very large Leaves only fpring up, not much less than those of the *White Hellebo*, with several Veins running through them, green on the upper fide and paler underneath, hnrft^ⁿ;TM, withal? the Stalk rifes to be a *Foit* and *£?* five fquare, with a few Leaves or Skins therein-clofing it as it were about, the Flowers grow in a fpiked Head, like unto others, but great *Ld large!* being either *Purple*, spotted with *White*, or wholly *White*.

IV. *W^f Hungarian Twablade Fox Srones, this in its Roots, Stalks, Leaves, and Flcxner, is very like the former-* but fomewhat lower, and leffer, both in Leaves. Stalks, and Flowers the which are fometimes both *Purple* and spotted, and fometimes *White*, as the former is.

V. *The third, or Great Bumble Bee Orchis or Fox Stones. This hat Teftidcs less than the former, and rounder, from whence fpring five or fix long narrow Leaves, Ribbed, like Ribwort Plantane, yet a little less;* the Stalk is about *Nine or Ten Inches* high, bearing five or fix Flowers at the head thereof, the form of which is fomewhat like to a *Bumble Bee,* or *Drone Bee*, as it is commonly called, having

ving fome few fmall whitifh Purple Leaves, lib: Wings, above,, and a brownifh Belly or Body be- low.

VI. *The fourth, 4r Greater Flefh Fly Fox Stones, hat Tejiicles like the other Kinds, from whence fpring up three or four fomewhat broad and long fmooth green Leaves next the Ground* the Stalk rifes about five or fix Inches high, with a few large Flowers fet at top, refembling a great Flefli Fly, made of four Leaves^ three above, and one long one below.*

VII. *The fifth, or Frog Orchis, or Fox Stones, has a pair of Tejiicles large, and fome thing long, with a String or Strings at the bottom part thereof*^ from this Root fpring two or more broad and ftiort Leaves below, but narrower and longer as they grow up higher on the Stalk, at the top of which grow feveral yellowifh Flowers, refembling the Bodies of Frogs, with the Head and fore parts greenifh, from whence it took the Appellation.*

VIII. *John/on on Gerard gives U8 another of the Frog Kind, which he calls Serapias Batrachitis al- t*ra, or another Frog Orchis -, this has a Rootfhaped between the Orchis rotunda ^Palmata, it grows to the height of the former^ with fhort Leaves encom- pajjing the Stalk at their fitting on* the Flowers grow on a Spiked Head, and refemble a Frogs with their long Leaves, but if you look upon them in a- nother manner, they will then fomething refemble little Flies, for which reafon Lobel calls it as well Myodes as Batrachites.*

IX. *Thefixth, or "Spider Flower, ha* for its Root * pair of roundTefticles, from whence Springs forth a Stalk much about the height of the frog Orchis *, upon which grow fix, eight or more Leaves, being more in number than grow upon the Stalk of the "Og kind, they are all narrower and longer. At the top of the Stalk come forth three or four Flow- ers, refembling a Spider in the round Belly, and the fmail Neck or partition, between it and the top Wings.*

X. *The feventh, or Green Butter-fly, ba* bulbed Tejiicles a little pointed at Boitom-, from whence fpring up feveral large, Imooth, green Lêaves next the Ground, and others fmall ind longer upon the Stalk. The Flowers are many and great, refembling Butter-flies, with their Wings fspread a- broad, of a kind of Grafs green color, with a Spur behind.*

XL *The eighth, or White or Purple Birds Flowed ha* a large pair of round left ides, but a little pointed at Bottom ^ from whence fpring up four, fix ' or more Leaves, which are fomething lafge, and for the moftpart Checkered or Spotted (for there is much diverfity herein-, fome having broad, large and pointed-, others narrower, leffer, and rounder pointed Leaves:) there are feveral other Leaves which grow upon the Stalk, which feem to enclufe or embrace it -, being long, fpdtted alfo and (harp pointed. The Flowers grow towards the top of the Stalk, Spike fafhion\$ which ate large, and like the laft, with a Spur allb behind them^ fome of them are all White, others are Purple, and fomebetween both, of a purplifh White.*

XII. *The ninth, or Long leav'd Fox-ftones, has ufually but one found Tefticle (the other as it ?nay feem, being decayed and gone) with fome Fibres with at head, and on the fides, which is not ufual in ny of the other Orchides. from this Root riles up a Stalk about three Feet high, having two very long Leaves at bottom, but of an unequal length j: thofe which grow next on the Stalk are much long- er, fome being a Foot and half long, and very narrow ^ but thofe up higher are fhorter and broader. At the top of the Stalk grow the Flowers fpikeda- fliion for a Foot in length, each of which ftandslike a crofs hollow Pipe, having abroad and long beard thereat, of a fine blufh Color, with a more purplifh Leaf like a Tongue, hanging down, broad above; ind fmall below.*

XIII. *The Places. Thefe grow not all of them in one kind of Soil or Ground, for fome are found*

Wood Lands, some in Clay Grounds, some in fertile Fields, other some in Barren places, dry and Sandy Soils, and some of them in a low, humid or moist Earth."

XIV. *The Uses.* These all Flower from almost the middle of April, until the end of May.

XV. *The Qualities, Specification, Preparations, and Virtues* of these Fox-(tones, see in Chap. 226. before past, these having the same properties with those Cynoscerchis or Dog-tones there treated of.

C H A P. CCLXXXIX-

Of FOX GLOVE Garden,

O R,

FOXFINGER, Garden-

I. *The Names.* This Plant was wholly unknown to the Ancient Greeks and Latins, so far as we know, for which reason it has no Greek Name, nor yet any Latin Name but what is very Modern and royal. Some of the latter Writers have called it *Digitalis*, which is the most common Name, and first so called as some think by *Fuchs*, others call it *Alcima*, and *Damafonium* \$ *Traçus* calls it *Campanula Sylvestris*: *Dalechamps* upon *Pliny*, thinks it to be *Viola Calathiana Plinii*: in English it is called Fox Glove, and Fox Finger; also Finger Wort.

II. *The Kinds.* There are two general kinds, viz. 1. *Digitalis Hortensis*, *Digitalis Sativa*, Garden Fox Glove, of which we treat (God willing) in this Chapter. 2. *Digitalis Sylvestris*, *Digitalis agrestis*, *Digitalis vulgaris*, Common Field Fox Glove, or Finger Wort, of which in the next Chapter.

III. Of the Garden kind there are seven (properly but six) several Species, viz. 1. *Digitalis maxima Ferruginea*, Dun or Rust colored Fox-glove, or Finger-wort. 2. *Digitalis major flore carneo*, Bluff-colored Fox-glove. 3. *Digitalis media flore luteo rubente*, Orange-tawney Fox-glove. 4. *Digitalis major alba*, The Greater white Fox-glove. 5. *Digitalis minor alba*, The Lesser white Fox-glove. 6. *Digitalis major lutea flore amplo*, The great yellow Fox-glove. 7. *Digitalis minor lutea palida*^ The small pale yellow Fox-glove.

IV. *The Descriptions.* The first^ or Dun or Rust colored Fox-glove, has a Root which is fibrous or stringy, (like that of the Common or Field kind) which does usually perish^ or seldom out-live its giving Seed. From this Root spring up Leaves which are long and large, of a greyish green color, finely cut or dented about the edges. Among which comes up a tall strong Stalk, which, when it is full grown, and with ripe Seed thereon, has been found to be seven Feet at least in height, on which grow almost an innumerable company (respecting the great abundance) of Flowers, nothing so large as the Common or field kind, and of a brown or yellowish dun color, *with a long Lip at every Flower. They being passed away, then comes the Seed, much like the Common kind, but in smaller Heads.

V. *The second*, or Bluff-colored, has Roots, Stalks, Leaves and blowers, much like to the Common Field kind, but all less. The Leaves are reasonable large, but*not full put so large as the Common, The

Flowers are alfb considerably smaller than the Yield fort, and of a bluish color,

VI. *The third*, or Orange Tawney, has a fibrous Root, which perishes always after bearing Seed, which is usually the second Tear of its springing up. This Fox-glove is none of the Greatest kinds, nor yet is it any of the Smallest, but a Medium between both* Its Leaves are in some Proportion correspondent to the Lesser yellow, but not so large as the Lesser white. The Flowers are long and narrow, almost as large as the last White, but nothing so large as the first White, and of a fair yellowish brown color, as if the yellow was overshadowed with a reddish color, and is that we usually call an Orange-tawney color. The Seed of this is very like the former.

VII. *The fourth*^ or Greater White Fox-Glove, is in Root, Stalk, Leaves, flowers, and Seed, a* also in the manner of growing^ so like to the Common Field Kind, that it can scarcely be distinguished from it, except in the fresher greenness and largeness of the Leaves, the Flowers are as large as those of the said Common Kind, but they differ in Color, for as those are Purple, these are wholly White, without any spot in them* in the Seed and all other things they agree.

VIII. *The fifth*, or Lesser White, has a Fibrous Root, enduring as to others do, the Leaves are like unto the last deferred, but not altogether so long or large, a* of a darker green Color; the Stalk grows not so high; not being full three Feet^ the Flowers are pure white; fashioned like unto the former, but not so great or large, as all other things alike; the Seed is also like the last.

IX. *The sixth*^ or Yellow, has a Root which is greater at the Head, and more woody than any of the rest, with many smaller Fibres, spreading themselves in the Ground, and abides almost a* well as our Common Purple Kind; the Leaves of this are in form somewhat like unto the Common Kind, but not altogether so large, the Stalk grows to be three or four Feet high, on which grow many long, hollow, pendulous Floweis, in shape like unto the Common Yield Purple, but somewhat shorter, and more large and open at the brims, of a fair yellow Color, in which are long Threads, as in the others.

X. *The seventh*, or Small pale Yellow, has a Root which is fibrous, or stringy, but durable, and seldom perishes with the hardness of the extreme frost, it has somewhat short, broad, smooth, and dark green Leaves, knipt or dented about the edges very finely, the Stalk is two Feet high, beset with such like Leaves, but lesser^ the Flowers are more in number than in any of the rest, except the first and greatest, and grow along the upper part of the Stalk, being long and hollow, like the other, but very small, and of a pale yellow Color, almost white.

Greater White. are Strangers to us, but are all of them cherished in our Gardens; the said Greater White Kind has been often found growing wild in many places of England, and generally among, or hard by the Common Held Purple Kind in the next Chapter.

XII. *The Times.** They flower in June and July ^ and some in August, the Seed becoming ripe quickly after.

XIII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Field purple kind in Chap. 300. next following, to which you are referred.

CHAP. CCC.

O/FOX GLOVE Common,
or Field.

O R,

FINGER-WORT Wild or Ordinary.

I. Hp *HE Names*. It has no *Greek Name* as a-
forefaid, nor any ancient *Latin Name*, as
being unknown to any of the ancient *Greeks* or
Latins : But our modern Authors have called it
Digitalis ; which we render in *Englijh*, *Fox Glove*,
or *Fox Finger*, or *Finger Wort*.

II. *The Kinds*. This is the fecond Species, be-
ing the common ordinary, or Field kind, *Cafalpi-
nm* calls it *Virga Regia major flore purpureo*, alfo
Aifma w&Damafonium^ and *htula Paftorisl* *Trag-
ma* calls it *Campanula Sylvefiris flore purpureo*.
Columna thinks it to be the *Ephemeron* of *Diofcori-
des*. And *Dalechampius* upon *Pliny* will have it to
be *Viola Calatbiana Plinii*, as is faid before in the
former Chapter ^ but it is generally called *Digitalis*
purpurea vulgaris, Common purple Fox Glove.

III. *The Defcription*. *Its Root confif of man-
y husky Fibres, and fome greater Strings among
than n from whence fpring up many long and broad
Leaves, lying upon the Ground, dented about the
edges a little foft or Woolly^ and of a kind of a
grey grew color* : Among which rife up feveral
Stalks fometimes, and very often but one, bearing
much Leaves thereon from the bottom to the middle,
from whence to the top it is replenifhed with large,
and long, hollow, reddifh purple Flowers, a little
more long and eminent at the lower Edge, with
fome white Spots within them, one above anothe-

and with fome fhiall green Leaves at every one,
but all of them turning their Heads one way, and
hanging downwards, having fome Threads alfo in
the middle ^ from whence rife round Heads, point-
ed fharp at the ends, which contain within them
small brown Seed. The Flower has no fmell, but
the Leaves have a bitter hot talle.

IV. *The Places*. It grows in dry Sandy Ground
or the molt part, and as well on the higher as
lower places, under hedge fides, almoft in every
Bounty of this Kingdom. There is alfo a *White Wild
Wort*, defcribed in the former Chapter at *Setf*. VII.
which does grow naturally about *Landfdale* and
Uraven, in a Field called *Qragge Clofe* in the North
of *England*, alfo by *Colchejter* in *Ejflex*, and near
Wixeter in the Welt of *England*, and in feveral o-
ther places : Yet this Wild *White kind* is alfo nurit
up in *Gardens*, as in the former Chapter we have
declared.

V. *The Times*. They Flower and Flourifh in
June and *July*, but feldom before *July* ; and the
Seed is Ripe in *Auguft*.

VI. *The Qualities*. *Fox Glove* is hot and dry at
leaf in the fecond Degrée, Sulphureous and Saline,
Aperitive, Abfterfive, Altringent, Digestive and
Vulnerary : PeSoral, Hepatick and Arthritick^ Erne-
tick, Cathartick, and Analeptick.

VII. *The Specification*. It Cures Confumptions,
King's Evil, Green-ficknefs and Falling-fickneisj
alfo Wounds, old Sores and running Ulcers.

VIII. *The Preparations*. You may have there-
from, I. A *Liquid Juice*. 2. An *Ejfence*. 3. A *Sy-
rup*. 4. A *Decoffion* or *Infufion*. 5. An *Ointment* or
Balfam. 6. A *Cataplafm*.

The Virtues.

IX. *The Liquid Juice*. It purges and cleanfes
the Lungs, Stomach and Bowels, but ought to be
given not in too great a quantity, becaufe of its vio-
lent Operation. It may be given from three Spoon-
fuls to Six, in Mead or White Port Wine, accord-
ing to Age and Strength * it works frongly both
upwards and downwards, and prevails againft the
Scurvy, Dropfie, Jaundice, Gout, and Rhumatifm *
and is found by experience to be an excellent thing
againft the King's Evil. Outwardly applied, k
heals any frefh or green Wound, the Leaves being
bruifed and applied thereto alfo. It is frequently
ufed in old and putrid Sofes to cleanfe them, dry
up their moifture, and caufe a fpeedy healing.

X. *The Ejfence*. It has all the Virtues of the
Juice, and more excellent for the fame purpoies and
intentions, befides which it rarifies or attenuates
thick tough Flegm, and vifcous Humors, after
the Lungs, Brelt and Stomach : It cleanfes and
purges the Body both upwards and downwards,
freeing it both from Vifcous and Watery humors :
It opens Obifru&ions of Liver, Spleen, Gall and
Womb, and refifts thofe Difcafes occafioned thereby.
And by late Experience, it has been found effe&ual
againft the Falling-ficknefs, for that divers have
been abfolutely Cured thereby. Dofe from two to
fix Spoonfuls or more, according to Age and Strength
in the Morning falling, to be given in any proper
Vehicle.

XI. *The Syrup, or Rob of the Juice of the Herb
and Flowers made with Honey*. It is a Specifick
which tranfcends all ocher Vegetable Medicaments
for the Cure of Confumptions ^ cleaning and heal-
ing after an admirable manner Ulcers of the Lungs.
It opens the Obftru&ions of all the Vifcera, cleanfes,
carries off, or expels the recrements of the Humors,
by which means the daily Nutriment may be con-
veyed

veytxl to all the Parts of the Body. It may be given Morning and Night, four or five Spoonfuls at a time, according to Age and Strength : some advise three Spoonfuls to be given in the Morning falling in Mead, as much at Ten in the Morning, three Spoonfuls at Four in the Afternoon, and lally, as much at going to Bed. This Medicine has redored (where the Patient has not been past Cure) beyond all Expectation. It cures a Phthifick or Inflammation of the Lungs, when all other Medicines have failed, and the Sick esteemed past Cure. It opens the Brett and Lungs, frees them from tough Hegg, cleanses the Ulcer, and heals it, when all other Remedies aft without Effect. I have known it do Wonders, and speak here from a long Experience. Persons in deep Consumptions, and given over by all Physicians, have by the Use of this Syrup or Rob been strangely recovered, and so perfectly reftored as to grow fat again. I commend it as a secret, and it ought to be kept as a Treasure. These few Lines concerning this Medicament alone are worth ten times the Price of the whole Book. I am very confident of it, the deplorable wafted Patient, who has been long languishing in an inveterate and tedious Consumption, or a Phthifis, if they make use hereof, will give me Thanks for this Notice, whilst they may have Reason enough to Curse even the Memories of Quacking Blood-suckers, If sue-makers, and Blister-drawers, who, as they may have possibly drained them of a fair part of their Estate and Treasures, would, by a Continuance under their Hands, (for all their specious Methods of Cure) have fool'd them out of their Lives too. But here is to be noted, That this Syrup ought chiefly or only to be made of the Flowers.

XII. *The Infufwn or Decoſion.* They have the Virtues of the Juice, Effence and Syrup, but much less efficacious, and therefore are to be given in a larger Dose. They powerfully open Obstructions of the Viscera, and may be given Dietetically in the Cure of Consumptions, Kings-evil, Ulcers, Fistulas, &c.

XIII. *The Ointment or Balsam.* The Ointment is laid to be one of the best Remedies for a scabby Head that is : it is also good against Pimples, Tetters, Ringworms, Scuff, Itch, or other Scabiness and Breakings out in any Part of the Body. The Balsam is an excellent Vulnerary, curing simple Wounds at once or twice dressing : it also digests, cleanses, incarnates, dries and heals old and putrid Ulcers, fretting and eating Sores, and such as proceed from the Kings-evil.

XIV. *The Cataplasim.* The Flowers being stamp'd together with fresh Butter or Hogs-Lard, and so made into a Pultice, and applied to any Part affected with the Kings-evil, it has been found by manifold Experience to be very available for the Cure of that Disease. If the Flowers cannot be had, you may use the Leaves in like manner, or make them into an Ointment with Hogs-Lard and Beef-Suet ; this will work the same, tho' not altogether so powerfully as that made with the Flowers.

XV. *The discutive Cataplasim.* Take Fox-glove Flowers, or Leaves, if the Flowers are not to be had, a pound, Oat-meal a pint ; boil the Oat-meal Soft in a Sufficient quantity of running Water, then add the Fox-glove, and boil to a Confidence. This applied warm Morning and Evening to a Contusion in a Womans Leg, where the Tumor made it four times as big' as the sound Leg, being also in great Anguish, and full of Pain, it eased the Pain, dissolved the Tumor, and in a little time did the Cure ; but afterwards a (lengthening Cerecloth was applied, to perfect it.

C H A P . CCCI.

O / F O X T A I L ,

O R,

FOXTAIL-GRASS.

THE Names. It is called in Greek, *ἄλοπευρος* : in Latin *Alopecuros* *Cauda vulpi**, *Lugdunensis* calls it *Gramen tomentofum Alopecuros* vew Plinii and Theophrasii: in English, *Foxtail-grafs*.

IL the Kinds. Authors make three several sorts hereof, w.s. i. *Stelephuros Plini*, *Gramen Alopecuros vera Flinii*, *Alopecuros genuind*, and *genuina Theophrasii*, The true Foxtail-grafs. 2. *Alopecuros Dodonai*, *Alopecuros altera Anghca & Flandnca*, Another Foxtail-grafs English and Flemish, so called by Label, because he found it both in England and Flanders. 3. *Alopecuros maxima Anglica Lobe Hi*, The greatest English Foxtail-grafs.

III. The Description. *The first, or True Foxtail-grafs, be* a Small Root made of a few Fibres, which perishes every Year.* This Root sends up two or three, or more, soft hoary Stalks about a Foot high, with small, long and narrow soft Leaves on them, as hoary as the Stalks, on which stand soft, woolly or hoary Heads, somewhat long and round, beset round with soft Hairs, of a pale straw color, resembling a Foxes Tail from whence it took its Name.

IV. *The second, or Other Foxtail-grafs, hat much alike fibrous Root, with Stalks and Leaves much like to the former, saving, that they are longer, the Stalks growing higher. The Heads also are shorter*
and

Kinder, and nothing fo woolly or hoary as the

(Treat *English Fox tails*
Grafs)

V. The third, or Greateft English Foxtail-grafs, has a fibrom Root, from whence Spring tyWg*; bout half a Tard or mo Feet bigb, having fometimes fZ argc Lcivus, like unto *Wheat*, but larger, fet ,rtheJoints and bearing at their topsgreat, large, fittfffl woolly Hlds, like the fiitt, but that Set mS S^ and longer, and this is, whether the Stalk is higher or lower.

VI V W«w The firft grows naturally in fevsral'places about *Mompelkr*; but we have "in our Gardens only tor Curiofity. The fecond *Lobel* tound growing Wild in both *EtftaivA Hinders*. The third *Label* found in the *Wef of England*, between *Portsmouth mi the IJle ofWight*.

VII. *The Times*. They ficuiifh with their Heads in *June, July and Augft*.

VIII. As to theii *Qualities*, 8rc. this is fiid by Authors, That no Medical Property or Virtue has been found in any of them; but they are many times ufed to be worn as an Ornament or Toy on Womens Hats, Hair, or Heads.

C H A P . CCCH.

Of F R O G - B I T ,

Smalleft Water LILLY.

It is called in *Greek*, kj^tm : in *Latin*, *Morjrn Rant*, and *phaa winimn*, . and *alba minima* : in *Englijh** *J/r*, and *Smulleji Water Lilly*.

II *V)e Kinds*. It is a (ingular Plant, and the my leaft.ofthe *WhiteWattrLiliks*. Scnx would liave it to be one of the Kinds of PW««rf, but it is no fuch thing, but ot the Kir.d of MfewLife

III *The Description*. *Frog-bit* has a Root which is long and narrow, full of Juice, looking more than the *Red Root* *Grass*, and is sometimes a

..... thei Joinb of this Root, or Heads of Strings fpring forth feveral fmall round weaves, thick and full of Juice, very like to the *Leffer White Water Lilly*, but much leftt, or the Leaves of *Wall Pennywrt*: from among which rift odier Stalks, bearing on each Head one fmall white Flower, conGfting of three fmall and round pointed Leaves, with a certain yellow Thrum or Threads in the middle. This in all its parts more nearly re-fembles the *Leffer White Water Lilly* than any *Pond-weed*, of which fome have made it a Species _

IV, *The Places*. *Gerard* Jars it is found floating or fwimming almoft in every Ditch Pond, Pool, or ftanding Water i in all the Ditches about *St. Gsorges Fields*, aid m the Ditches by the *Thames Jdi* near *Lambeth Marjb*, and in ten thoufand other places of this Land.

V *The Times*. It flourifhes and flowers the molt part' of all the Year -, but it commonly begins to Rower in *May*, and fo continues on tor lome Months s and the Seed is ripening in the mean Sea-

° VI *The Qualities*. It is cold and moift in the fecond Degree j Anodyne, Relative and Arthn-

cic VII. *The Specification*. It is peculiar againft *Antho-nies-fire*, ikammations, and the Gout in a hot Conllitution of Body.

VIII. *The Preparations*. You may have there-fom, i. A liquid Juice, t. An Ejfettee. % An Ointment. 4. A Cataplafm.

Tlx Virtues.

I IX. *The liquid Juice*. It is very coolirfj, and v bates Inflaniroations. Bathed upon an Eryiipelas, 1 Fff ami

and wee Cloths dipt in the lame, it rakes away the Sharpness and Heat thereof, and in a little time cures it. It is also good against sharp Humors breaking out in the Head, and prevails against scabbiness, Scurf, Morphew, Pimples, Sun-burning, Tanning, Yellowness of the Skin, and other like Deformities.

X. *The Effence.* It has ail the Virtues of the liquid Juice, besides which, it may be given inwardly two or three Spoonfuls at a time in a Glafs of Wine and Water against any malign or burning Fever, The Whey or PoHet-drink made by turning Milk with it, has the same Effect. This Effence bathed upon the Head, for an extream Head-ach, a riling from a hot Cause, gives Relief, and by continuing the Use thereof for some time, effects the Cure.

XL *The Ointment.* Being anointed upon any Part afflicted with vehement Pain, from a violent hot Cause, it eases it. It also allays Inflammations; in any Part of the Body, and anointed upon the Back-bone, it eases the Pain, tho' never so extream. I have applied it to Parts extremely affected with the Gout, and it has given present ease, and in a short time after abated the Tumor.

XII. *The Cataplasm.* Applied to any simple and recent Bruise, it dissolves the Tumor, hinders the Afflux of Humors to the Part, and in a little time after cures it; also applied to any old and running Ulcer, and bound to also above the Ulcer, it hinders the Defluxion, cleanses and dries, and in a great measure contributes to its healing. It also gives present Relief in the Cough, being duly applied Morning and Evening for some considerable time. Applied to the Forehead, it hinders Defluxions upon the Eyes, and eases the Megrim, and other Pains of the Head.

C H A-P. CCCIII.

Of FRIERS COWLE,
OR,
WAKE ROBIN Hooded.

I. *Names.* It is called in Greek, *Αριον*, in Latin, *Arijarum*, *Arifaris*, and *Arif*; in English, *friers Cowle*, *Hooded Aron*, or *Hooded Cuckoepoint*, or *Wake Robin*.

II. *The Kinds.* It is of the Family or Stock of the Arons, and is twofold, viz. I. *Arif arum latifolium*, Broad-leav'd Friers Cowle. 2. *Arif arum longifolium*, vel *angustifolium*, Long-leav'd or Narrow-leav'd Friers Cowle. *Qalechampm* upon *Pliny* calls the *hat ifolium*, *Callx alterum genus Plinii* * but *Tragus* thirds it to be rather the *Arum Dioscoridis*, which is indeed a Miltake.

III. *The Description.* The first, or Broad-leav'd, has a Root which is somewhat round and white, and is encreased mostly by Offsets. It grows in all things like unto the Aron, having divers fair green Leaves, whose middle Rib on the upper Side, as also some other of the Veins, are some times white and somewhat thicker and rounder-pointed than those of Aron. The middle Stalk bearing the Flower (which is a crooked or bending Hose at the top, with a finall crooked whitish Pettle in the middle riling out of it) is spotted with red Spots, **TMA A*Z**

not fully so high as the Leaves, which are nothing so (hard in Taste as those of *Aron* or *Wake Robin*, and do always spring up in the end of Autumn, abiding green through the Winter. After the Husk of the Flower is fall, and the green Leaves withered and gone, which, will be in the Summer, then the Uerries do appear on the tops of the Stalks, green at the first, and of a yellowish red when they are ripe, which abide until the Frosts cause them to wither, and the green Leaves begin again to appear.

IV. *The second, or Narrow-leav'd, has a Root which is round and white, smaller than the first, and encreased by Offsets, tho' not in so plentiful a manner. The Leaves of this Plant are very long,*

and very narrow, not rising so high as the former, but rather lying on the Ground. It seldom bears any Fruit or Hole, but when it does, it is whitish, small and long, with a very long and small reddish Pettle in the middle, like unto a long Worm, scarce rising above the Ground *, and the Berries which follow are white, and not red.

V. The ? laces. These Plants are Natives of Italy, and are found especially in Tuscany, about Rome, and in Dalmatia, as Ahguillara says: they also grow in Spain and Portugal: but in England they are only nurtured up in Gardens, where they thrive very well.

VI. The Times. They both shoot forth their green Leaves in Autumn, presently after the first have pulled down the Stalks with the Fruit, and abide green all the Winter, withering in Summer, before which their Husks appear.

VII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Dragons or Dragon-worts in Chap. 229. foregoing, so that we need say no more thereof here.

II. The Kinds. There are three principal kinds hereof, (if the last fort may be accounted a kind thereof) viz. 1. *Fumaria Anglica*, English Fumitory, of which in this Chapter. 2. *Fumaria Indie a, vel Virginiana*, American or Virginian Fumitory, of which in the next Chapter*. 3. *fumaria bulbofa vel tuber of a, Radix cava*, Hollow-root, of which in Its place.

III. Of Our English Fumitory, there are these following Species, viz. 1. *Fumaria vulgar is, Capnos vulgar is Lobelii* ^ *Fumaria pur pur ea*, Common or Purple Fumitory. 2. *Fumaria tenuifolia, Fumaria minor*, The fine-leaved, or lesser Fumitory. 3. *Fumaria latifolia alba, & alba claviculata, Capnos Lobelii* ^ *Fumaria alt era Dodonxi, Capnos phragmites Gefneri, Corydalis, & Corydalion albrum*, White broad-leaved Fumitory, or Climbing Fumitory. 4. *Fuvianalutea, £? lutea Montana Lobelii, Fumaria Coridalis Matthioli, Fumaria Montana Gefneri* iff *Tdbernmoritani, Corydalis Anguillar & Carrier ani* ^ *Split vuU go Cefalpini, Split Ulyrica, iff lieberba Sclavonica alioram*, Yellow or Mountain Fumitory.

CHAP. CCCIV.

Of FUMITORY Common-

I. THE Names. It is called in Greek, &*** *V. *} X vjwv* *Fumulw* ^ j£ y&wviTK, *quafi, Fumus, Vapor, Nidor* *, from whence the Latins called it, *Fumaria* and *Fungus Terra*: in English, *fumitory* and *Fumitory*. * The Arabians call it, *Scheiteregi*. This Herb being of a whitish blew color, as Smoak is, it appears to those who behold it at a distance, as if the Earth was all in a *Fume* or *Smoak* -, and from hence (as it is supposed) came the Name.

IV. The Descriptions. The first, or Common purple Fumitory, has a Root which is yellow, small, and not very long, full of Juice while it is green, but quickly perishing after it has given ripe Seed. This Plant is a tender iappy Herb, having Stalks which are square, slender and weak, with many little Knots or Joints, from whence many Branches spring forth, two or three Feet long, leaning downwards on all sides, so that they scarcely grow up from the Ground, without propping, but for the most part grow fidelong. The Leaves grow from the Branches upon long Foot-ftalks, which are tender and brittle, and are finely cut or jagged, somewhat like to those of *Coriander*, being of a whitish, or rather blewish Sea green color. At the tops of the Branches stand many small Flowers, as it were, in a long Spike, one above another, as it were, in Clusters, made like little Birds, of a reddish purplish color, with white Bellies: after which come small round Husks, containing small blackish Seed. Note,

F f f a That;

That in the; Corn-fields *olQntwff* this bears white Howers. And *John/on* upon *Grard* fays, That it is fometimes found with purple *Violcl*-colored Flowers. There is alfo a *Braader-leav'd* of this tand, not differing from the former Defcription. Sec the firft Figure in this Chapter.

V. *The feconi, or Fme-leavM Fumitory, has a Rent jmall and white, but like the former; from y[print forth Stalks or Branches, not fa long Hrji, but (landing more upright, being Jlender endjqu&rt. The lower Leaves ate very like to thotS of the other fumitory, and of the kme color, but Im.iller ••, Itut thofe which grow above upon the Stalk are fmaller, and finer cut in; and the higher, the finer and fmaller, the tiigheit being as fmall as J eaneJ, or Southernwood, or Camoail Leaves. The flowers grow in the fame manner which the other do, but rJther in greater plenty, or more together, of a deeper reddUh purple, mixed with white and yellow 5 which hang pafled away, Husks or Cod fuced, containing the Seed, which is much life th^t jof the k'ommoit or Purple kind.*

VI. *"Die third, or White Broad-leav'd, has a Em which is fmall and long, white, and growing deep in to the Ground, abiding all the Winter, and fhooting forth nem Branches (sifter the old are perifhei) e-very Tear. From this Root rife up fmall flendei Stalks, not ftrong enough to fjtain themfetves, bui citdiiug hold by certain Tendrels which it fends forth at the ends of ths fmaller Branches of any thing which ifands nigh unto it, whether Hedges,*

or large ftrong Herbs, it climbs up, am fpreads it felfout many ways, with (everal Stalks offmatl Leaves, let two or three, or more together, not dtnted or divided on the edges at all, but (harp pointed at their ends, of a Wewith green color, ve jv like unto the Cowmen Vunnatory. At the topi

ife of the final! Brandies come forth manj imall whfcifli Flowers, tipt with blufh, fettogethe ii rliiing like the former, made like fmall, fora Koilow Husks w Bdl-flowers, ending in fix Una

oirts : after whicli come fmall Seed, contained in Snail broad Husks or Cods.

VII. *The fourth or Yellow or Mountain Fumitory, has a Root which is comPofid of many white, flenier long h'ibrcs or Strings, bujbing thick together^ which perijhet_m & the Roots of the Common Fumitory do, but abides many Tears, fhooting forth new Stalfo every Seafort, after the old Snes ere periflied. This Telkw kind grows like rhe other*

mitoncs,

*mitonic*s, about a Foot and half high, with man^r: Leaves, like unto the *Common purple kind*, or lik^e to thofe of *Fumaria bulbofa*, or *Radix cava*, or *Hoi-low-root*, but Irmller, and of the fame blewifh green color with them. The Flowers are yellow, and 11. flme places white, and grow at the tops of th^e: Branches, like the other, in form of little Birds, a^s: *Manhiolits* lets them forth, both by his Defcription and Figure: but *Lobel* and *Lugdunenfis* fay they are Star-fafhion, like unto the *Chelidonium minus*, o^r: *Pile-wort* -, and yet both of them give *Matthiolu*: his Figure, with the Rowers of *Common Fumitory*: like little Birds, and not Star-fafhion, like thofe o^r: *Pile-wort*. After the Flowers are paf^t, fmall Horn^e: come forth, or long Pods or Cods, lik^e to the *Che Momum majus* or *Radix cava*, but letter •, in which are contained fmall, whitilh green Seed, fomewhat round and tattifli.

VIII. *The Places*. The firft grows as well in Corn-fields, almoft every where, as in Gardens alfo -, and that with white Flowers in the Corn-fields in *Cornwall*: it grows in *Barley-fields*, and among O-ther Grain; alfo in Vineyards, and other manured places. The fecond grows in many places in *Spain*, and about *Mompelier*, and other places oi *France*. The third grows by Hedge-fides, and among Bufhes in feveral places of *Brabant* in the *Low Countries*, and about *Frontignana* and *Mompelier* in *France*, it is found about *Naples* with a yellow Flower, as fome report: and *Gerard* fays thefe fecond and third kinds grow Wild in a Corn-field between *Charleton* and *Greenwich* •, and very probably may be found in feveral other parts of this Kingdom. The fourth grows in hilly and mountainous places in *Italy*, as on the Hills of *Apulia* and *Calabria*, in the Kingdota of *Naples*, and in *Illyria*, and feveral other places: but with us it grows in Gardens.

IX. *The Times*. The firft three flower from the beginning of *May*, and continue flowering thro' all the Summer Months -, and their Seed ripens in the mean Seafon. But the fourth or *Tellow kind* begins to flower much later, viz. not till *Auguft*, and its Seed ripens quickly after. This is alfo to be noted, That if you would gather *Fumitory* to dry or diftil, it ought to be done whiltt it is in flowering, and alfo in the prime of that time.

X. *The Qualities*. *Fumitory* is cold and dry in the firft Degree •, Aperitive, Abfterfive, Cofmetick and Diuretick ^ Pectoral, Hepatick, Splenetick and Nephritick •, a little Cathartick and Alexipharmick.

XL *The Specification*. It is fingular againft all forts of Scabs, Itch, Whifls, Pimples, Pufhes, Scurff, Morphew, Tettars, Ringworms, Herpes and other Defoliations of the Skin, arifing from fait and fharp Humors. It provokes Urine, helps the Strangury, and opens all Obftrufions of the Vifcera.

XII. *The Preparations*^ You may have therefrom, 1. A liquid Juice. 2. An Effence. 3. A Syrup. 4. A Decoffion in Water or Wine. 5. A Ponder of the dried Herb. 6. A Collyrium. 7. A Cdtaplafm. 8. d diJulled Water. 9. A Spirituous Tinthtre. 10. An Acid Tintture. 11. A Saline Tintture. i 2- A louder of the Seed.

The Virtues.

XIII. *The liquid Juice*. It ottens, cleanfes and ftrengthenes, being taken four or five Spoonfuls at a time in the Morning falling, mixt with a Glafs of White Port Wine. It pujges a little downwards, but more efpeciall^y mixed with an Infufion of *Sena* in Wine. It ^pens all Obftru&ions of the

Stomach, Liver, Spleen, Reins and Womb ^ purities the Blood from fait, cholerick or vifcous Humors, which are the caufe of Pimples, Wheals^ Pufhes, Tettars, Ringworms, Scurff, Morphew, Scabs, Itch, Leprofy, and the like Breakings out^ After purging, it ftrengthenes all the Vifcera, not leaving any evil Quality behind it.

YAM. The Effence. It has all the former Virtues, but more efficacious, and is accounted a moft fait Remedy againft ail the Difcafes arifing from the aforefaid Humprs, as alfo from adult Cholera and Melancholy, or from Obftru&ions, which are the caufe of cholerick and putrid Fevers, the Jaundice, Strangury or Stoppage of Urine thro' Gravel, Sand or vifcous Matter, all which it expels in abundance. Dofe five or fix Spoonfuls in White Wine or clarified Whey.

XV. *The Syrup*. Whether tpade of the Juice or green Herb, has all the Virtues of the Juice and Effence, but is weaker in Operation, and therefore ought to be given mixt with a fufficient quantity of Syrup of *Damask Refes*, or Syrup of *Peach Bloffoms*, or Tinfure oi *Sena*, &c. fo given, it not only opens all Obftru&ions, but is very effe&ual againft the Jaundice, Droply and Gout •, and is a moft fingular thing againft Hypochondriack Melancholy in any Perfon whatfoever.

XVI. *The Decoffion in Water or Wine*. It has the Virtues of all the former Preparations, but is much weaker, and may be given in a Morning fait, ing to fix or eight Ounces. If the Stomach is cold and weak, the Decoffion ought to be made in Wine. It is an excellent thing againft the Strangury, whether in Old or Young, and effectually cleanfes the Reins and Urinary Parts.

XVII. *The Pouder of the dried Herb*. A Dram of it being mixed with half a Dram of the Pouder of *Efu/a* Root, and given in five or fix Spoonfuls of the Effence or Juice, caufes Vomiting and cleanfes the Stomach and Bowels, both upwards and down^ wards, of cold, vifcous and tough Humors •, and effe&ually carries off watery Humors from all Parts of the Body •, and has been found very effectual againft the Dropfy, Scurvy, Jaundice, Gout and Rheufflatifm.: but becaufe this Medicine ftirs up much Wind, it may be good to correft it with a few drops of Oil of *Anife* or *fennel* Seed, or with the Pouder of the fame.

XVIII. *The Collyrium*. *Take of the Juice or Effence of Fumitory three Ounces, diftilled Water of Fumitory, Honey, of each one Ounce, mix them*. It is an excellent thing againft fore, inflamed, running and watery Eyes. A fore Mouth and Throat alfo being gargled therewith, it heals them. Dropt into the Eyes, it clears the Sight, and takes away the Rednefs and other Defe&ts in them. If the Juice is mixed in equal parts with Juice of *Sharp-pointed Docks* and Wine Vinegar, and a contaminated Skin be wafhed therewith, it cures it of all forts of Scabs^ Itch, Wheals, Pimples, Pufhes, Scurff, Morphew, &c. whether in the Face or Hands, ox in any other Part of the Body.

XIX. *The Cataplafm*. It is an excellent thing being applied to fimple and recent Contufions, diffuffing the Tumor, and hindering a farther Afflux of Humors to the Part: and being applied to any Defoedation of the Skin, it cleanfes it, removes it, and quickly cures the fame. Applied to the Gout in Hands or Feet, it eafes the Pain, and hinders the farther Afflux of Humors to the Part.

XX. *The dijiilled Water*. It has the Virtues of the Juice, OV. but very much Weaker, and may be ufed as a *Vehiculum*, to convey any of the other Preparations in, down into the Body. *Tragus* fays it conduces much againft the Plague, being taken with

with good Venice Treacle, driving forth the Malig- nity by Sweat. If the distilled Water be thus good in this Cafe, doubtles the Effence muit much tranicend it.

XXI. *The Spirit 1107/s Tinnfure.* It is good againft the Plague or Pestilence, as also againit all malign and Pcftilential Fevers, as Spotted Fever, Purples., Calenture CV. and is an excellent thing againft the Colick and Griping of the Guts, whether in Young or Old. Dofe two or three Drams in Canary or o- xherfit Vehicle.

XXII. *The Acid Tinflure.* It is an e&cellent Antilprbutick, good againit Vapors, Fits of the Mother, Hypochondriack Melancholy, and all thofe fait and (harp Humors which caufe fiery Eruptions in the Skin. It corrects Crudities, firengthens the Stomach, caufes a good Appetite and a ittoift Di- geftion. It is to be given in all the Patient drinks, whether Ale, Beer or Wine, fo many drops at a time as may give the Liquor a grateful or pleafant A T M) r \ and ib to be continued for fome time.

XXIII. *The Saline TinSure.* It cures Scabs, Itch, Pimples, Scurff, Morphew, Leprofy, and o- ther like Breakings out in the Skin, only by bathing or well wafhing the Parts affected therewith, as hot as can be conveniently endured, and continuing the Lotion for fome confiderable time.

XXIV. *The Pouder of the Seed.* It is fronger than the Pouder of the Herb, and is prevalent a- gainft the Dropfy, being given daily with about ten or twelve Grains oiScammony in Pouder ; but the fimple Pouder of the Seed being given to a Dram at a time for a Month together, every Morning fading, and laft at Night going to Bed, (in any fit Vehicle) it is laid to cure fuch as are Melancholy: I believe, being given in an Infufion of Sena, it may do Wonders of that kind.

Stalk, which freads it felf out into feveral winged Leaves, two let together at a Joint, and variously divided, and fo finally, that they almoft reemble Juniper Leaves, of a blewilh green color. The Flowers have feveral colors in them, but fupposed of fome to be but white : and the whole Plant is almoft without either Tafte or Smell.

V. *The Places.* The firft grows in Virginia, and the back-parts thereof, called Canada : I found it alfo in feveral parts of South Carolina. The fecond grows in America, in the Southern Provinces of Carolina^ in the up-land Country" towards the Moun- tains,

VI. *The Times.* They flower from May during molt of the Summer Months, and the Seed ripens in the mean Sealb.

VII. *The Qualities, Specification, Preparations and Virtues,* are the fame with the Common purple Fu- mitory in the former Chapter, to which I refer you : but jrteis i s ^ b z noted. That of thefe American kinds, the firft is by much the more powerful • and as the whole Plant of this firft American fort is much bitterer than the firft or Common purple kind in the former Chapter, or indeed than any of the other ferts there defcribed, fo it is alfo by iuch the more effectual.

C H A P . CCCV.

Of FUMITORY American.

I. *HE Names. It is called in Greeks $\Sigma\mu\mu\iota\tau\iota$. X 'hAx.'* : in hat in, *Fumaria Indica, Fumaria Americana:* in English, *American Fumitory.*

II. *The Kinds.* It is the fecond general Species of *Fumitory*, and contains the two following kinds, viz. 1. *Fumaria ftiquoja Americana, Fumaria femper virens Americana,* Indian or American *Fumitory* Codded. 2. *ymaria tuberofa Americana^* Indian or American tubbrous Fijfnitory.

III. f he DefaiptkMis. *The firft, or* Codded In- dian, *has a Root which is thick and fibrous^ from whence riffs up a Stalk to be about a Foot high or more : the Leaves are like the Common purple kind /:] the former Chapter, but larger, and enduring green all the Winter.* The Flowers grow Spike- fation on to the top of the Stalk, formed like to thofe of the *Radix cava* or *Hollow-root*, whofe Bel- lies are Bluih, and Mouths of a Gold color or paler yellow * which being paffed away, long Pods or Cods come forth, which are almoft round, and in which is contained the Seed, which is round, flat- tiih and yellowifli.

IV. *The fecond, or Tuberos American, has Root which conjjjis of two [olid round' parts, like 'left ides, with feveral' fmdl fibres Springing there- from, as well from their tops as fides and bottoms.* From between thefe Tubers or Tefticles rites up a

Of FUSS-BALLS,

P U C K - F I S T S . ,

I. np H E Names. It is called in Greek, $\Sigma\mu\mu\iota\tau\iota$ ill hatin, Caput, pi Capita Terr^ Tuber, pi Tubera Terrs*

Terris, Fungus Ovatus, Pezict Plinii, Lupi Cre'pints : in *Englijh, Yufs-balls*, and *Puck-fifis*, and *Fift-balls*, taken from the *German Word, Fift, quod Crepitumjgnificat*.

II. *The Kinds*. This is a fingular Plant* of the kind, and differs from the *Earth-balls* in *Chap. 238*. aforegoing very much -, for they have a folid Substance or Pulp *, whereas these are fluffed with nothing but Dull

III. *The Description*. They are round Balls, growing in the Ground, without any Appearance of Root or Stem, and are of several sizes, some of the Bigness of a Ball or Balloon, some as big, Or a large Cannon. Shot, or a young Child's Head, more or less, they seem to be very round, smooth and whitish at their first rising, but grow in time to be of a dusky color, cracking in several places on the outside. These, while they are young and white, Children and School-boys, commonly in Sport, fling one at another -, but when they come to their full Bigness and Ripeness, they contain within their Skin nothing but a fine, soft, brown, dry Duft or Pouder, which, upon breaking of the Ball, is apt to fly all about.

IV. *The Places*. They grow in Vineyards plentifully, and in many dry Meadows and Fields, in several parts of this Kingdom: I have formerly found them in several Fields between *White Chappel* and *Bromly*, also in Fields near to *Stepney*, and other places adjacent.

V. *The Times*. Their growing time is in *March, April* and *May*, and they come to their just Magnitude and Maturity in *June, July* and *August*, after which, with much Wet, they rot and decay.

VI. *The Qualities*. It seems to be temperate in respect to Heat or Coldness, and dry in the second Degree.

VII. *The Specification*. It fetches Blood, dries up Fluxions and the Humidities of running Ulcers.

VIII. *The Preparations*. You may have therefrom, I. A Pouder. 2; Pledgets made of the Balls*

The Virtues.

ik. *The Pouder*, Being ftrewed thick and in good quantity upon any bleeding Wound, it stops the Blood presently : and being ftrewed upon any old moist Sore or running Ulcer, it dries up the Humidities of the said Sore or Ulcer *, and being used for some time, it stops the Defluxion. If any of it should get into the Eyes, it would vehemently molest them, and possibly endanger the making the Party Blind : it cures also Callings and Kibed Heel*.

X. Pledgets made of the Balls. It is to be tyed round with Thready and then pressed hard together in a Screw-Press, letting it lye there for some few days. This, when it comes to be imposed upon a Wound, it again dilates it self, and puts a stop to the Haemorrhage or Flux of Blood. Than this, there is scarcely any thing to be named which can more powerfully and certainly do it -, for it being of a Nature extremely dry and drying, as it will no way admit of the flowing forth of the Blood, (which those Medicaments do which are naturally moist, and therefore are less useful in Handling of Blood) so it will likewise subside and stick fast to the Vessels. Applied also to moist *Zhd* running Sores, and to Ulcers with an Afflux of Humors, it dries up the Humidity,, and in a short time puts a stop to the Fluxion.

C H A P - CCCVIL

0/ G A R L I C K Gard&v

I/Tp *HE Names*. It is called by the

JL *Chaum*, and *Cairin* : in *Greek*, *ivyAv*: in *Latin* *Allium* *, and in *Englijh* *Garlick*.

II. *The Kinds*. There are several Kinds of this Plant, viz. *Allium Hortenje*, Garden Garlick, of which in this Chapter. 2. *Allium Anguinum*, *fen Viperinwn*, Vipers Garlick, of which in *Chap. 308*. 3. *Scorodoprassum*, Turkey, Mountain or Leek Garlick, of which in *Chap. 309*. 4. *Allium Sylvestre*, Wild or Gow Garlick, of which in *Chap. ?TO*; 5. *Moly*, Onion Garlick. 6. *Allium Latifolium Urfinum*, & *Anguinum*, Ramfons, or Bears and Snakes Garlick -, of which two last in their proper places.

III. *Of the Garden fort*. There are two Species, viz. *Allium Hortenje commune*, Common Garden Garlick. 2. *Allium Hortenje Minus*, The lesser Garden Garlick*

IV. *The Descriptions*. The first, Greater or Common Garden kind, has a bulbous Root, which is covered with very thin Skins or Films, of a White and Purplish color, and consists of many Cloves, separated one from another, under which in the ground below, grows a Tassel of Thready fibres; these Cloves are of a very strong Smell and Taste, very much exceeding Onions or Leeks, and serve to set again for a new encrease. From this Root spring up long green Leaves, almost like unto Onions, but much larger or broader, not hollow at all, as those of Onions are, but solid like those of Leeks. Among these Leaves rises up a Stalk, at the end of the second or third Year, about three Feet high, on the

top of which does grow, a Tuſe of purplith Flowers^a not much unlike thoſe of Onions or Leeks, covered with a white Skin •, in which being broken, when it is Ripe, there is found round, black Seed, like to that of Leeks.

F. *Ifoffitwd*, or leſſer Garden kind, in its Root, *K* and its Stalk, Leaves, and manner *ch* referable* the former greater and. : but the Cloves of the Roots are fmaller and reader₅ and the Flower is of a more dark or duſky Color than the firſt above deſcribed.

IK in *v* / *f* *v* > They both Stow in Gardens with us in *hnglaxd*: But the letter has been found to grow Wild in ſome places of *Frame zcAGertna*.

III. *The Times.* They are ſeldom ſown of Seed, but the 0*** are planted in *November* and *December*, and ſometimes in *February* and *March*. They **Howet in the Summer Months, as June and July** •, and the Seed is ripe in *Augull*, or ſome flort time ^{atte r} the flowering.

r *Qualities.* It is hot and dry in the fourth Degree: Aperitive, Abſterſive, Attraaive, Carminative, Digeſſive, Difcuffive, Anodvn, and oppurative. It is Stomatick, Peaoral, Nephnick and Arthritick: Ptarmick, Emmenagogicfebudonfick, and Alexipharmick.

IX. *The Specification.* It is good againſt Plague, roylon, and biting of all ſorts of venomous Creatures, k Cures Coughs, Afthma's, Strangury, Dropfie and Gout, and powerfully provokes the Terms in Women.

X. *The Preparations.* You may prepare therefrom: 1. A *Uquid Juice*. 2. An *Effence*. 3. An *Ittjuſion* or *hecoſion*: 4. An *Oil by Coition* or *Injola-Ti Jr'* An *Omtim*ent. 6. A *Cataplafm*. 7. A *Milled Water*. 8. An *AcidTtnSure*: 9. A *ſaline Tinture*. 10. An *Oily TinQure*. 11. A *Spirit*. 12. An *tiixir*.

The VertueSo

XL *The Liquid Juice.* Being fnuft up the Noſtrils, it is an excellent Errhine, and purges the Head and Brain admirably, freeing it from cold; raw, pituitous and viſcous Humors •, is good againſt the Lethargy, and eafes all pains of the Head proceeding from a cold and moiſt Cauſe. A Spoonful or two, being taken inwardly in a Glaſs of White Port Wine, it kills Worms in the Bodies of Man, Woman or Child, Dropt into the Ears, it eafes their Pains, and ripens and breaks Apoftemations therein.

XII. *The Effence** It has all the Virtues of the Liquid Jiice, beſides which, it provokes Urine, and the Terms in Women y and being given to two or three Spoonfuls in a Glaſs of Wine, or ſome of its own diftilled Water, it prevails againſt the bitings of Mad Dogs, Rattle Snakes^a Vipers, Spiders, the flinging of Scorpions, &c. fortifying the Heart againſt the Poyſon, and expelling it by Sweating. It expels groſs, raw, tough and viſcous Humors out of the Stomach, Lungs, Bowels and other Viſcera: It expels Wind^a opens all Obſtru&ions of Lungs, Liver, Spleen, Womb and Reins -, provokes Urine powerfully, helps againſt the Strangury, carries of the Watery Humors which cauſe them. It expels Poyſon which has been taken inwardly in Meat, Drink or Wine, for in its own nature, it refills all manner of Poyſons- It clears the Voice, takes away Hoarfenefs, Cures an old Cough, and is of excel* lent uſe againſt Afthma's, ftiortneſs of Breath, difficulty of breathing, cauſing an expectoration of the Morbifick Matter. Held in the Mouth, it is good againſt the Toothach, and dropt into the Ears, it helps againſt Deafneſs, and difficulty of hearing. It is good againſt the Plague or Peſtilence, Spotted, and all other Malign or reſtitential Diſeaſes: Facilitates the delivery of Women in Child-birth, forces away the Dead Child, and drives forth the After-birth.

XIII. *The Infuſion or Deco&on, in Wine, Water\ Broth or Milk.* It has all the former Virtues both of Juice and Effence, but leſs efficacious or powerful, and therefore ought to be given to five, iix, or eight Ounces at a time, and that two or three times a day, according as you fee the occaſion may require.

XIV. *The Oil by CoQion.* It is healing and comforting, and therefore may be applied to all cold and moiſt affeaions of any part •as Pains, Aches, Lamenefs, Numbneſs, beſides which, it corroborates or ſtrengthens the Tone of the part, making it able to reſiſt any Fluxion of humors: »Anointed on the Head in a Megrim or Cephaloea, from a cold Cauſe, it gives much relief.

XV. *The Ointment.* It has all the Virtues of the former Oil, and being mixed with *Sulphur* and *Rofin in fine Pouders*, and applied to putrid and corrupt Ulcers which breed Worms, it kills them, it diſſolves frumous Swellings, draws forth the evil humors in Fiftula's, and cauſes them to heal •, and anointed upon Loufie Heads, it kills Lice and Nits^a and if affeſted with a Scab or Scald, it dries up the moiſt Humors, and in a little time heals it: It is alſo good againſt Scurff, Dandrifft and falling of the Hair-, eafes Pains from a cold Cauſe, and gives relief in the Gout.

XVI. *The Cataplafm made of the green Root.* Being immediately applied to the biting of a Mad Dog or of a Rattle Snake, Viper, Slow Worm, or other Serpent, the flinging of Scorpions, or of any Venomous Creature, it infallibly attra&ls to, and draws forth all the Poyſon or Venom -, and this it does

does so powerfully by reason of its Vehement attractive force, that it perfectly frees the Patient from all manner of Danger. But this will be the more effectually done, if at the same time, the Patient being laid in his Bed takes also a large Dose of the Juice or Effence and Sweats upon it. Laid upon a Gout or Sciatica, from what Cause soever, and often renewed, as occasion requires, it draws forth the whole Morbifick Cause and Effence of the Disease -, in which Distempers it performs more than most other Vegetables, - reputed the most efficacious •, it not only eases the Pain at present, but if it has made any steps to the Stomach, or has indeed affected it, it recalls back the Humor, and draws it forth thro' the Pores of the Skin. Applied to any place in which there is any Prick, Splinter, Thorn, Bullet, Shot, bits of broken Bones, it powerfully loosens them, attracts and draws them forth. Being applied to any Plague Sore, Bubo, Phlegmon, or other Tumor which is possible to come to Suppuration, it adds Heat, bringing on the Maturation, to Admiration •, and after it is broken, being yet applied, it draws forth all the Malignity and Poifon of the Plague in a Pefential Bubo, and in other Apofteris, the putrid and other offending Matter which replenis them.

XVII. *The iffilled Water.* It has the Virtues of the Juice, Effence and Decoction, but in a much inferior degree, and therefore may be used as a *Vehiculum* to convey those Medicines in, to such Perifions, and in such Confitutions where Wine would be too hot. But as this Water is drawn off from a Very hot, subtil and spirituous Root, full of a volatile Salt, so it contains more of Life, Flame and Spirit in it, than is in most other simple and cold distilled Waters. • •

XVIII. *The Acid Tincture.* This is more powerfully against the Plague and all pefential and contagious Distempers than any of the former internal Preparations for this destroys the Effence of the Poifon and Malignity in its Root; and is of great Force and Efficacy against the Bitings of Serpents, mad Dogs, and other venomous Creatures. Dose fixty Drops at a time, two or three times a day, in any proper Vehicle.

XIX. *The Oily Tincture.* Anointed upon any Part full of Aches or Pains from a cold and moist Cause, it gives present ease: it is also good against the Wounds or Punfures of the Nerves and Tendons, for it presently eases the Pain, prevents Convulfions, and induces a speedy Cure. Anointed down the Back-bone, and upon the Parts affected with Trembling, Numbness, Palfies and Convulfions, it suddenly gives Relief, and in a short time after a perfect Cure, if the Medicine is well rubbed into the Parts afflicted for almost half an hour, twice a day, and is continued in like manner for some considerable time, provided the Inveteracy of the Disease, Weakness, and great Age of the Patient hinders not. *

XX. *The Saline Tincture.* It is good against Worms in the Skin, Freckles, Pimples, and other Breakings out: it kills Lice and Nits in the Head and Hair •, and is singular against Tettars, Ringworms, Herpes, Scabbiness, Scuff, Morpew, Black and Blewness of the Skin left after Contufions, the Leprofy, running Ulcers of the Head, commonly called a Scald Head, and all other Manginess whatsoever, the Parts affected being well bathed therewith twice a day.

XXI. *The Spirit.* It is very subtil and full of volatile Particles ^ of extraordinary Use against fainting and swooning Hyfterick Fits, Vapors, Obftrufions of the Lungs, Coughs, Colds, Surfeitings, Colicks and Convulfions of the Bowels: it expels

Wind, eases Gripping, heals Excoriations of the Guts, and very much facilitates the Delivery of Women in Labor, forcing away both Birth and After-birth. Dose from two Drams to four in any fit Vehicle.

XXII. *The Elixir.* It has all the Virtues of the Spirit, but more subtil and powerful to all the same Intentions -, and may be given twice a day, viz. Morning and Night, or thrice a day, according as the Case may require. Dose half an Ounce, more or less, in any proper Vehicle. It is said to be a Specifick against Jaundice and Dropfy •, as also against an inveterate Wheezing and Hoarfness.

C H A P . CCCVttl.

Of G A R L I C K Vipers.

This Name. It is called in *Greek*, ¹O*w*fc ² \$ *OticifKoyJbv*: in *Latin*, *Ophiofcorodum*, *Allium Anguinum* ^ *Allium Viperinum* : in *Englijb* *Vipers Garlick*.

II. *The Kinds.* It is the second Species of *Garlick*, and is a singular Plant of the kind ^ called by some Authors, *Scorodopraffum convoluto Capite*, *Leek Garlick*, with a bulbed and twining Head.

III. *The Description.* It has a great and white¹ Root, confifing of many Cloves, much like to Garden Garlick, which smell less strong than Garlick, or partaking somewhat of Leeks, whence came the latter Name of *Scorodopraffum*, at *Diofcorides* says. From this Root springs up a Stalk, three or four Feet high, and sometimes higher ^ according as the Soil is in Goodness: it has also many Leaves, larger much than those of *Common Garden Garlick*, and almost like those of *Leeks*, which grow from the bottom of the Stalk to the middle thereof, having a Smell between that of *Leeks* and that of *Garlick*. The rest of the Stalk is naked, green, smooth and almost (hining, having at the top thereof a large Head, composed of many Bulbs, (not much unlike to the *Indian Moly*) covered with a whitish thin Skin, ending in a long green Point, which grows above it, growing smaller and finaller to the end; which Skin, by the Growth of the Bulbs, being broken, they (hew themselves at the first of a purplish color, but afterwards, as they grow riper, of a whitish color •, among which are also some Flowers. The Head, with the top of the Stalk, at the first, does wind or twine it self so, that in some fort it represents a Viper, Snake or Serpent -, which, when the Bulbs grow to Ripeness, does by little and little untwine it self again, and bears its Head upright.

IV. *The Places.* It grows with us only in Gardens, and is the *Allium Sat hum vel Hortense Dicfcoridk*, and the *Scorodopraxum fecundum Cluju*: it is more ready to part into Cloves than the *Common Garden Garlick* and by planting the same, it is encreased.

V. *The Times.* It flowers in *June* and *July*, and the Seed ripens not long after.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the *Common Garlick*

O R,

Turkey or Mountain G A R L I C K .

I. *T^pHE Names. It is called in Greek, ~~.....~~
 X ^aw : in Latin ^Seorodoprafum y and in
 E.g. Lack Garlick, Turkey Garlick, and Moun-
 tain Garlick.

II. The Kinds, There are three forts hereof, viz.
 i. Seorodoprafum majm, Greater Leek Garlick, or
 Turkey Garlick. 2. Seorodoprafum ?nagnum, feu
 primum Clufii, veUlterum Lobe'ti, The Great Leek
 Garlick, or Turkey Garlick. 3. Seorodoprafum mi-
 nus, The lefler Leek-leav'd Garlick -, but this is
 called by Parkinlon, Great Turkey Garlick.

III. The Defcriptions. The firfl^ or Greater Leek
 GarRck, ka* a bulbous Root, of the Bigne's of a
 great Onion * from whence rife long and broad
 heaves like thofe of Leeks, but much greater and
 longer^ embracing or clapping about a great thick
 Stalky^ ofi and full of Juice, bigger than a Man's
 finger, and bare towards the top y upon which is fet
 a great Head, larger than a Tennrfe-Ball, cdvered
 zoith a Skin, after the manner of .an Onion. This
 Skin, when it comes to Perfec&ion, breaks and dif-
 covers a great multitude of Flowers, which are vfi-
 tith: they being, pafit, black Seeds follow, inclofed
 in* a triangularlusk. The whole Plant finelc very
 fffong, ^like unto Garlick, and is in (hew a Leek.
 upon which it was called Seorodoprafum, Garlick^
 Leek, or Leek Garlick, participating both of the
 Garlick and Leek, or rather a degenerate Gar lieL
 growtt ouM) Form,

IV. Thefecond, or Great Leek Garlick, has a great
 white bulbous Root, and almoft tranfparent, at leaft
 fining, fe'ldom giving Off-fets^ for Encreafe. From
 this Root (hoot forth feveral great long Leaves,
 much bigger than the Common Garlick, and after fe-
 veral Years abiding, there fprings up a great long
 Stalk, three or four Feet high, with fome lelier
 Leaves thereon, and is naked from the middle up to
 the top, where it bears a large Tuft of Howets,
 enclofed at firft in a thin Skin, and of a paler color
 than thofe of Homer's Mofy, or rather whitilh:
 which being palTed away, three-fquare Husks, with
 blackifh Seed, like the other, fucceed.

V. The third, or Leffer Leek Garlick, 2w a Root
 which is fet about with longer and J...
 which are enclofed in brownifh Skins, ...
 fealy. The Leaves and Flowers are alike, ...
 ler than Garlick : and the whole Plant is lelier
 all the parts than the former.

VI. The Places. They are Natives of T...
 and grow about Conftantinople -, but with u...
 erow^ and are nurft up in Gardens only.

VII. The Times. They flower in June ana
 and perfect their Seed not long after, or in

Of G A R L I C K Crows,

O R,

Wild G A R L I C K .

I. *T^pHE Names. It is called in Greek, ^...

X ^aw : in Latin, Alliumfyl-
 veftre, AU'tum fylveftre tenuifolium : in Englijb,
 Wild Garlck, and Crows Garlick*

II. The Kinds. It is the fourth Species of Gar-
 lick afore-mentioned in Cbap. 307. Seff. 2. Parkix-
 fon makes two feveral kinds hereof, viz. 1. Alliuwn
 fylveftre d-urifolium, Hard-leav'd Crow Garlick. 2.
 AMum fylveftre Uvifolium^ Soft-leav'd CroW Gar-
 lick.

III. The Defcriptions. The firft^ ^ Hard-leav'd,
 has a Root with a fmall Bulb or round Head, long
 withal, and covered with three feveral Coats or Peel-
 ings, being white on the out fide, not bigger than a
 fmall EaDe-Nut, without any Cloves at all, having
 at the bottom thereof a Knot of Fibres or Strings.
 From this Root fpring up fmall, hard, tough Leaves,
 almoft like unto Rufixs, fsmooth, and hollow with-
 in ; among which grows up a naked Stalk, round,
 folid, hard and flippery or fsmooth, bearing on the
 top thereof a Tuft of purplilh Rowers, which be-
 ing gone, fmall blackifh Seed follows, made up in a
 round Clutter, like fmall Kernels, having the Smell

IV. The fecond, or Soft-leav'd, has a long round
 Roof

Root, inloape like the former, but of the three feveral Coats, the outwardmojl is reddifh, and is encreafed by Qff-fets, yet is not parted into Cloves, as the Garden Garlick is., The Plant is of fuch a ftrong Garlick-Smell, that the Milk of Cows which feed thereof will tafte of it. From this Root fpring up feveral narrow Leaves, and long, like *Grafs*, fofter than the former, and nothing near fo fliff[^] and among thefe Leaves rife up one or two flender bare Stalks, not fo hard and fuffas the firft, but bearing at their tops, like Tufts of purplifh Flowers, and blackifh Seed,

V. *The Places.* *Crow Garlick* grows in fertile Paftures thro' all *England*: *Gerard* found it plentifully in Fields on the backfide of *Iflington* near *London*: and I found it in feveral places by the Way-fide, in thofe Fields or Paftures beyond *Iflington*, leading to the *Boarded-River*, or *Hornfey-Wood*.

VI. *The Times.* They fpring up in *April* and *May* -, flower in *June* and *July*, and their Seed is ripe in *Auguft*.

VII. *The Qualities, Specification, Preparations and Virtues* of thefe, are the fame with thofe of the *Common Garden Garlick* in *Chap. 307.* aforegoing: but *Galen* fays, That *Crow Garlick* is ftronger, and of more Force than the *Garden*. I can fay little to this Opinion of *Galen's* ^h, but this I know, That being bruifed and infufed in *White Lisbon* or *Port Wine*, and being drank, it provokes *Urine* powerfully, gives prefent Eafe in the *Strangury*, and is laid to break the *Stone*, and drive it out *, but this is to be underftood when it is made of a friable gritty Subftance, not when it is hard and folid, like a *Flint*. The Leaves of both forts are gathered and cut or ftript[^]nd eaten by feveral People for Sawce, as we eat green Sawce made with *Sorrel*: and fome People, which love *Garlick* or ftrong *Onions*, will eat their Roots in *April* and *May*, with frefh *Butter* and *Bread*, or new *Cheefe*, juft as we eat young *Onions* in the *Spring*.

major *Concava*, Great *Concave* oiⁱ4ollow *Gentian*, or *Englifh Gentian*. There are three other Species of *Great Gentians*, as, *flore albo*, *White-flowered* ^ *t'lore pallido puridato*, *Pale yellow-fpotted* ^ *Flore cruleo*, *Blew-flowered* y all which differ nothing in *Root*, *Stalk*, *Leai*^ *Magnitude* or *Manner* of *Growing* from the firft *Purple kind*, but only in the *Color* of the *Flowers* «, but by reafon they are not fo ufually found in our *Gardens* as the other kinds, we (hall fay no more of them in this place.

IV. *The Defcriptions.* *The jirft*, or *Great purple Gentian*, is very like to the next *Great yellow Gentian* in moji things, having a great, thick, brownifh *yellow Root*, divided into two or three great *Branches*, with great fibres adjoining to them, but a little more hard and woody, of a very bitter *Tafte*^ like the other *Gentians*, which fend forth at the feveral *Heads* thereof many fair, broad, three-ribbed[^] dark, green, fhining heaves, fo like unto the following, that it is fomewhat hard to dijtinguifh them: many of thefe *Heads* among the *Leaves*^hoot forth thick and ftrong *Stalks*, three or four *Feet* high, with feveral *Joints* on them^ and two *Leaves* at them, one againft another: towards the tops where* of come forth the *Flowers*, encompassing the *Stalks* at two or three of the uppermoft *Joints*, with two *Leaves* apiece under them, like as in the following, which are not laid open *Star-fafhion*, like the *Tellow*, but keep clofe and hollow, the brims being only divided into fix or more round parts, of a purple color, but paler at the bottom, where they are fpotted with purple *Spots* on the infide, having ib many yellowifh *Threads* in the middle as the *Flower* has corners, ftanding about a long, green, forked *Head*, which growing ripe, is the *Seed-Veffel*, and contains therein fuch like flat brownifh *Seed* as in the *Tellow kind*^ but Ibewhat lefs,

CHAP. CCCXL

Of GENTIAN Great,

OR,

Great FELWORT.

¹. TT ? ^ *Names.* This Plant is called in *Ara-*
A bick, *Gentiana feu Genthiana*: in *Greek*,
TM Latin, *Gentiana*, and in *Englifh*, *Bald-*
money Baldmoyne, *Bitterwurt*, *Felwort*, and *Genti-*
an^ It was called *Gentian* from *Gentius*, King of
fe* fas the firft Finder of it out, and the
firft Who ufed it in *Phyick*, and fo called it *Genti-*
ana, after his own Name.

II. *The Kinds.* There are two generic* Species of this Plant, viz. 1. !«*«,* ^f *Gentiana magnusvei major*, The great or Greater *Gentian*, of which in this Chapter. 1. u_m^ ^^ *Gentiana parva vel minor*, The lefler *Gentian*, of which in the next Chapter.

^ III. *The Kinds* of the *Greater*. 1. *Gentianq vyjor flore purpureo*, Great purple *Gentian*. 2. *Gentiana major flore flavo*, Great *Gentian* with a yellow Flower. 3. *Gentiana major folio Afclepiadis*, Great *Swallow-wort Gentian*. 4. *Gentiana*

V. *ibe* *Jecond*, or Great Gentian with a yellow Flower, ha* a Root which is great, thick and long, yellow, and very bitter. From this Root rises up at first a long^ round and -pointed Head of Leaves, doing one another, which, after opening themselves, lye upon the Ground, and are fur, long and broad, fomewhat plaited or ribbed, like unto the heaves of White Hellebor, but not so fairly or eminently plaited, nor so stiff but rather resembling the heaves of * Great Plantane : from among which rises up a stiff round Stalk, three Feet or more high, and full of Joints, having two such Leaves, but narrower, and smaller at every Joint, so encompassing the Stalk at their lower ends, that they will almost hold Water, if it falls upon them. From the middle of the Stalk to the top it is garnished with many Coronets or Rundles of Flowers, with two such green Leaves likewise at every Joint, and wherein the Flowers do stand, which are yellow, and when laid open like Stars, rising out of foall greenish Husks, with some Threads in their middle, but having no Smell at all, yet fitly to behold, as well for the Order as for the Height and Proportion of the Plant. The Seed is brown and Hat, contained in round Heads, fomewhat like unto the Seed of the *Intillary* or *Chequered Diffodil*, but browner.

VI. *The third*, or Great Swallow-wort Gentian, has Roots, but they are nothing so large as the former, but are yellow, small and long, of the Bigness of a Man's Thumb : from this Root spring forth many Stalks, about two feet high, on which grow many fair, pale, green leaves, set by couples, with three Ribs in every one of them, resembling fomewhat the heaves of *Alclepias* or Swallow-wort, which is broad at bottom and sharp at the point. The Flowers grow at the several Joints of the Stalks from the middle upwards, two or three together, which are long and hollow, like unto a *Bell-flower*, ending in five Corners, or pointed Leaves, and folded before they are open, as the Flowers of the *Bindweeds* are, of a fair blew color, sometimes deeper, and sometimes paler. The Heads or Seed-Vessels have two Points

IX Horns at the top, and contain within them flat greyish Seed, like unto the former, but lesser.

VII. *The fourth*, or Great Concave Gentian, or English Gentian, has many long tough Roots, differing hither and thither under the upper Crust of the Earth, with some few Fibres adjoining thereto, from which spring immediately a fat thick Stalk, jointed, or kneed by certain Diijances, set at every Knot or Joint with one leaf, and sometimes more, keeping no certain number: which Leaves do at the first enclose the Stalk round about, being one whole and entire Leaf, without any Incisure at all, as it were a hollow Trunk, which, after it is come to its full Growth, breaks on one side or other, where it is thinnest, tenderest and weakest, and becomes a flat ribbed Leaf, like unto the *Great yellow Gentian* or *Plantane* aforegoing. The Flowers come forth from the Bofoms of the upper Leaves, set upon tender Foot-stalks, in shape like those of the *Small Bindweed*, or rather the Flowers of *Soapwort*, of a yellowish color, and toucht about the brims with a little light Carnation, which being pad away, the following, contained in little Cods or Seed-Vessels.

VIII. *The Places*. The first three grow on mountainous places in *Germany*, but with us, are only nurst up in Gardens, of which the second or *Yellow-flowered* is the most usual or common. The fourth or *English kind*, Gerard says he found in a small Grove of a Wood, called the *Spinie*, near to *hickbarrow*, a small Village in *Northamptonshire*.

IX. *The Times*. All the first three flower for the most part in *June*, and in part of *July*, bringing forth their Seed in *August*. The fourth springs out of the Ground in *April*, flowers in the end of *July* and beginning of *August*, and perfects its Seed in the end of that Month, or beginning of *Septem-ber*.

X. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Small Gentians* in the next Chapter, and thither we refer you.

G H A P- CCCXII.

OF GENTIAN Small,

OR,

Small FELWORT.

THE Names. It is called in *Greek*, *Γεντιανή* ; in *Lat* in, *Gentiana minor*, *Jive Gentianella*, *Am* English, *Small* or *heffer Gentian*, or the *heffer Yelwort*.

II. *The Kinds*. There are three generick kinds hereof, viz. 1. *Gentiana minor*, *feu Gentianella vernalis*^ The Spring Gentian. 2. *Gentiana minor*, *feu Gentianella aetiva*, Small Summer Gentian. 3. *Gentiana minor*, *feu Gentianella autumnalis*, Small Autumn Gentian. Of each of these three generick kinds, there are several Species, all of which it is not our Business to declare in this Work, and therefore we shall only discourse of so many of them as either grow Wild with us, or are to be met withal in our Gardens, and that in the following order.

III. *The various Species*. Of the first or Spring kind, we have these, viz. 1. *Gentianella verna la* tifolia*, Broad-leav'd Gentian of the Spring. 2. *Gentiana verna angulifolia*^ Narrow-leav'd Gentian of

the Spring. 3. *Gentianella minor Verna*, Thefmaller Spring Gentian. Of the *Simmer Kind* we have thefe, viz. 4. *Gentiana minor Cruciata*, alfo *Cruciata*, Crofswort, alfo the leffer Oofswort Gentian. 5. *Gentiana minor, feu Gentianella c&ruka punUata Vennti*, Pennys blew fpotted Gentian. 6. *Gentiana Anglic a pallida ptmflis iifinUa*, An *Englifh Gentian*, which we here place among the fmaller *Gentians*, tho' *Clufim* has enumerated it among the *Greater Gentians*, but according to its magnitude, it cannot be faid to be either a *Great* or a *Small Gentian*, but a *medium* between them both, as is that alfo of *Pena*, but being both *Summer Gentians*, we thought good to put them both in this Claflis. Of the *Autumn Kinds* we have thefe, vi*. 7- *Pteumonanthe, Gentiana Autumnnalis*, Calathian Violet, or Autumn Gentian. 8. *Gentianella Autumnnalis Centaure<e minor is folijs, Gentianella fugax minor Gerardi*, Autumn Gentian with *Small Centory* Leaves, Baftard or Dwarf Autumn Gentian of Gerard. 9. *Gentiana fugax Clufij, Gentiana decima Clufij*, Small Autumn Gentian, fimply fo called.

IV. The Defcriptions. *Thefirft, or Broad Leav'd Gentian of the Spring, has a Jrmall yellowoifh creeping Yibroits Root, from which fpring up Leaves pretty large and greën, broader than thofe of the Third Kind following, being about two Inches long, and one Inch broad, and fomewhat round pointed, with three Veins or Ribs running through them, as the others have -, the Stalk riling from the middle of thefe Leaves grows about four Inches high, or fomewhat better, with a fmall Leaf or two thereon, bearing at the head or top thereof a large Husk, fuftainedby two fmall and long Leaves, from the middle of which fhoots forth a very large and great hollow blew Flower, ending in five fmall points.*

V. *Thefecond, or Narrow Leav'd Spring Gentian, %as a Root which is long aniflender, fpreading it felf much under the Ground, and of a yellowifh color, from which fpring many Heads of feveral fmall, long, and narrow Leaves Jet together, fomewhat longer than the next which follows •, from Ihme of thefe Heads, which Flower not in one and the lame Year, thofe Flowering the Year following which Flowered not the Year before, and thofe which Flowered the Year before not Flowering again the next Year after) rifes up a fmall ilender Stalk, fomewhat higher than the' former, bearing thereon two fuch like fmail Leaves at a Joint, and at the top one Flower, for the molt part, (feldom more, unlefs the Stalk is branched) much fmaller than the laft, narrow, long, and hollow, like a Hofe or Husk, of one entire Leaf at the lower part, but ending above in five Corners, or fmall pointed Leaves, laid open like a Star, having fmall pieces of Leaves, like, as it were, Ears, fet at the bottom of the divifions of them, both of them ot a perfeß blew color, but not fo deep as the former, having a white Line in the middle of each of them, and the Ground, 01; bottom of the Flower, with a few threads tending about a fmall head not to be feen until the Flower be almoft or fully pafß., unlefs one open it, which, after it is ripe, or full blown, is fmall and long, containing very fmall brownifh Seed.*

VI. *The third, or Smaller Spring Gentian, hat a Root confifting of fmal\ long, pde yeuow Strings, which fhoot forth here and there divers heads of Leaves, and thereby increafes reasonably well, if it grows in a fit place, or is nurft up in good Ground, (otherwife it will fcarcely grow with all the Care and diligence imaginable. jFrom this Root fpring feveral fmall hard green Leaves, lying upon the Ground, as it were in Heads or Tufts, fomewhat broad below, and pointed at the end, with five Vein* or Ribs*

therein, as confpicuous as in the former *Gentians*•* among which rifes up a fmall fhort Stalk, with fome fmaller Leaves thereon, at the top whereof ftands one fair, large, hollow Flower, made Bell fafhiont, with wide open Brims, and ending in five Corners or Divifions, of the molt excellent deep blew color that pm be feen in any Flower, with fome white fpots in the bottom on the infide-, after the Flower is pafß, long and round Pods or Cods do appear, fill which are contained fmall blackifh Seed •, the whole Plant is bitter, but not fo ftrong by much as the former.

VII. *The fourth, or Qrofswort Gentian, has Roots which are fmall and whitifh, difpering themfelves many ways in the Ground, of as bitter at aft e almojl as the reft. From this Root rifes up many Branches, which lye upon the Earth, fcarcely lifting themfelves upright, and are full of Joints, at which grow ufually two Leaves, one oppofite unto another, in manner of a Crols, from whence it took its Name, in fhape very like unto *Saponaria*, or *Soapwort*, but fhorter, and of a darker green color ^ at the tops of the Stalks ftand many Flowers thick thrufted together, almoft like *Sweet Williams*, and likewise at the next Joint underneath, every one of them Itanding in a dark green Husk, and confifting of five fmall Leaves, the points or ends of which only appear above the Husks in which they ftand, and are hardly to be feen, but that they are of a fine pale blew color, and that many grow together; the Seed is fmall and brown, hard, and fomewhat like unto the Seed of the *Marian Violet*, or *Coventry Bells*.*

VIII. *The fifth, or Pennys blew fpotted Gentian, has a Root which is fmall andyelloio, with many Fibres adjoining to it, from which fprings up a jointed Stalk about half a yard high, fomewhat reddifh towards the bottom next to the Root, with two Leaves, like to the Great Gentian, fet at each Joint, but much fmaller, and with more Veins or Ribs therein than it, ftanding each upon a reddifh Footfhlk, greater below than thofe above, where they do in a manner enco?vpLijs the Stalk. From the middle of the Stalk upwards come forth the Flowers at the Joints, with the Leaves,*

on both sides of the Stalk, three for the most part Handing together, except the uppermost of all, where they stand five together, each of them with a short Footstalk under them, consisting of five small sharp pointed Leaves, spread like a Star, of a pale blue color, finely spotted, with many small black specks on the inside, having a small umbone in the middle, and five small Threads tipped with yellow standing about it} the Seed, which follows the Flowers, is small, and enclosed in such Heads or Husks as the *Gentians* usually have.

IX. The sixth, or Engliffi Gentian, has, according to Clufius, a small Root, replenished with a few fibres or Strings, of a yellowish color, from which rises a round stiff Stalk, or Stalks, firm and solid, somewhat reddish at bottom, and jointed or kneed, somewhat like unto Crosswort Gentian, the Leaves broad, smooth, and full of Ribs or Sinews, set about the Stalk by couples, one opposite against another; the Flowers grow upon small slender Stalks, composed of five slender blueish Leaves, very curiously spotted, with many black Spots and small little Lines, having in the middle five small Claves, which falling away, give Seed small like band.

X. The seventh, or Autumn Gentian, called the Calathian Violet, has a Root which is small, long, and manifold, running down for the most part deeper into the Ground than most of the former, which Gerard says perishes after it has perfected its Seed, springing up again from the falling of its Seed, which is « misjake, and is retitled by Parkinson, for the Root is truly astringent, and somewhat creeping, (the deep in the Earth) and living Root, abiding after Seed time, and not perishing as the rest*, it rises up sometimes with more and sometimes with fewer Stalks, sometimes they also rise higher, as to be two Feet high, and sometimes not above a Foot high, according to the Fertility of the Soil, of a brownish green color, having many long and narrow dark green Leaves, set by couples on them up to the tops, which seldom branch forth, but bear every

one of them a reasonable large Flower, which is hollow, and larger than any other of the *Autumnals*, and is in most of a very deep blueish purple color, but in some a little paler, and ending in five points or corners.

Small Autumn Gentian
Calathian Violet,
Or
Autumn Bell Flower,

XL The eighth or Autumn Gentian with small Century Leaves, has a Root which is small, striking down into the Ground, with several Fibres adjoining to it, from which spring up several Stalks, not a Foot high, divided into several small Branches on which stand two small Leaves together, as is usual in all the Gentians, very like unto those of the Lesser Century, which are not so long as the former, a little broader and of a whiter green color; at the tops of the Stalks and Branches grow several Orient Blue Flowers, not so large as those of the last described, but set in small long Husks, halfway rising up above the tops of the Stalks. Comes small Seed in long horned Cods or Vessels.

XII. The ninth, or Small Autumn Gentian, is properly so called but a Root like the former, but a little larger, which sends up a pretty stiff round Stalk of a Spangh, or something more, which at certain places is set with such Leaves as the last described, but larger, and out of the bottoms of these Leaves, from the bottom to the top of the Stalk, spring forth little footstalks, which usually carry three Flowers apiece, two set one against another, and the third upon a Stalk somewhat higher, and sometimes there comes forth a single flower at the Root of these Footstalks; the Flowers in their shape or form, magnitude, and color, are like to those in the last described, as also their Seed and Seed Vessels the manner of the growing of this is very well represented by the *Gentiana major Flore cerulea*, mentioned in Chap. in. Sect. 3. foregoing, having, that that is very large, and this is very small, and of the perishing Kind.

XIII. *The Places.* The first grows upon the *Alps*, near *Switzerland*, as *Bauhinm* says, the second grows on the Mountains of *Savoy*, but neither of them grow wild in *England*, being only nurft vp in Gardens •, the third grows upon the Hills of *Auftria* and *Hungary*, *Gerard* says he found it on *Salisbury* Plane, as also in some places in *Suffex*, and likewise near *St. Albans* \ The fourth, or *Cr ofsvoot Gentian*, grows in a Pasture at the West End of *Little Rayne* in *Ejflex*, on the North side of the Way leading from *Braintree* to *Much-Dunmovo*, and in the Horse way by the fame Glofe: The fifth, *Pesna* says, grows upon *Bockmet*, a Hill of *Switzerland*, and in several places on the *Alps*, with us only in Gardens: The sixth is an *Englijh* Plant, which was found by Mr. *Hesket*, (a Gentleman very skilful in Botonology) in the North parts of *England*, viz. in *Lancafhire*, but the exact place where he met with it is not named: The seventh, or *Calathian Violet*, grows in many places of *Germany*, and other parts beyond the Seas •, it grows also in several places of *England*, as near *Lcngfield*, by *Gravefend*, near *Greenhiith* and *Cobham* in *Kent*, and in the Fields belonging to the Houfe formerly Sir *Percival Harts*, at *Lellingftone* in *Kent*, and in a Chalk Pit, hard by a Paper Mill, not far from *Dartford* in *Kent*, in the West Country also in several places, and that as well in wet Grounds as dry •, *Johnfon* upon *Gerard* says, that he found it once on a Wet Moorish Ground, two or three Miles on this side *Cafter*, in a place called *Nett/eton More*, in *Lincolnfhire*: The eighth, or *Autumn Gentian* with *Small Century* Leaves, grows in *Kent* in several places, as about *Southfleet* and *Long field*, upon the Downs, as also upon *Barton Hills* in *Bedfordshire*, upon a piece of waste Chalky Ground, as you go out of *Duiftrfble* way towards *Gorkambury*, and not far from the Ruines of the old City *verulam*, near *St. Albans*: The ninth is found at the Chalk Dale near *Dartford* in *Kent*, in *Water dovon* Forest in *Suffex*, in the way leading from *Charlezwood's* Lodge to the Lord *Abergavenie* ** Houfe, called *£-ridge Houfe*, by a Brook side there, also on a Heath by *Colebrook*, near *London*, and in the way turning off from *Salisbury* Plane to the Earl of *Pembroke* ^ Houfe at *Wilton*, and upon a Chalky Bank between *Gorkambury* and *St. Albans*.

XIV. *The Times.* As to the times of Flowering, they are in part declared in the Section of the Kinds, the two first Flower in *April*, and the third in *May*, if they Flower at any other time it is but casual •, and their Leaves abiding green all the Winter, they increafe at the Root, and may be easily parted ^ the fourth Flowers in *June* and *July*, the fifth Flowers in *July* and *Auguft*, and not before, the Seed growing ripe soon after, which shedding themselves continue their Kinds, but will scarcely endure Transplantation, or rise of the Seed sown in the Garden, as *Lamaraum* and others have observed, the seventh Howers not until about the end of *Auguft*, and in *September*, in which time this Noble Flower is in all its bravery • The eighth and ninth Flower also from the end of *Auguft*, and continue Flowering to the latter end of *Offober*.

XV. *The Qualities.* All the *Gentians*, both the *Greater* and the *Smaller*, are said to be of one Property, and to have the fame Qualities and Virtues, but the *Greater* are more used with us in Physick than the *Smaller*-, but in places where the *Greater* are not to be gotten, and where the *Smaller* are in plenty, the *Lesser* may very well be used in their stead. *Gentian* is hot and dry in the end of the second degree, Aperitive, Absorptive, Afringent, Carminative, Diuretick, and Traumatick, bromatick, Hepatick, Splenetick, Nephritick, and Hyfterick, Sudorifick, Alexipharmick, and Analeptick-

XVI. *The Specification.* It is a peculiar thing against the Plague, Poyfon, malign Difeases, and all sorts of Agues and Fevers whatibevgr, and is a famous thing for the Cure of Wounds and Ulcers of all kinds*

XVII. *The Preparations.* You may have therefrom 1. A Juice of the Herb, and also of the Root. 2. An Effence of the Herb, or rather Root. 3. An Infuswn of the Herb. 4. A Decoffion of the Root. 5. A Pouder of the Root. 6. A Pejffary of the Root. 7. A Distilled Water of the Herb and Root. 8. A Spirituous Tintfure of the Root. 9. An Acid Tintfure of the Root. 10. An Oily Tintfure of the Root. 11* A Saline Tintfure of the Root. 12. An Ointment or Balsam of the Root.

The Virtues.

XVIII. *The Liquid Juice of the Root.* It is good against the Stinging or Bitings of Hornets, Scorpions, Vipers, Rattle-Snakes, Mad Dogs, or other Venomous Creatures, taken Morning and Evening, two Ounces at a time, in a Glass of Wine, for a Week together-, but in case of the Bitings of Mad Dogs, it ought to be taken for a whole Month round ^ till the Moon has perfected her revolution, at what time the Poyfon for the most part exerts it self, and commonly kills the Patient, and therefore for security sake, it ought to be taken one whole Lunar revolution * the Wound also ought to be kept open all that time, and for the three or four first days nothing but Cloves of raw Garlick a little bruied ought to be applied to it, the Wound it self being wash'd every time with the Juice of *Gentian*, because by this means the Poyfon of the Mad Dog, or of any Viper or Serpent will be drawn forth.

XIX. *The Juice of the Herb.* It is given very often to Cattel to drink, to free them from the Bots and Worms, and many other Difeases •, as also when they begin to swell, being Poyibned by any Venomous thing, which they often lick up with the Grasse ^ as also when any poyfonous or hurtful Creature has bitten a Cow by the Udder, or any other tender part, which presently thereupon swells, and puts the Creature to pain, making them forbear their Meat, with this Juice the place bitten is then to be bathed several times, and five or six Spoonfuls of the Juice to be given inwardly, mixed with a Pint of Ale, by this means the poor Beast is quickly cured, and restored to its Health.

XX. *The Effence of the Root.* It has all the Virtues of the Juices before going, being used in the same manner; besides which, being taken from one Ounce to two Ounces, or more, Morning and Night in Generous Wine, it opens all sorts of Obstructions of Liver, Spleen, Gall ^ Reins, and Womb, and is profitable for such as are Liver-grown, as the Vulgar call it, or have any Scirrhus breeding there, because the long and constant taking hereof waxes away those Humors which cause the fame-, it gives ease in the most vehement pains of the Stomach, is good for such who cannot relish their Meat, have a dejected Appetite, and a bad Digestion -, it is good likewise against piercing pains of the Sides, Stitches, or the like* it is good for such who are bruised by Blows or Falls, dissolving the congealed Blood, and easing the pain-, the same is also very effectual against all sorts of Agues, being taken to three or four Ounces, three Hours before the coming of the Fit, in a Decoction of the same Root-, it opens Obstructions of the Womb, provokes the Terms, facilitates the Delivery of Women in Travail, and brings away the Afterbirth; it is effectual against the Strangury, and brings away Sand, Gravel, or Tartarous Matter obstructing the Urinary Passages, and is laid

t.) be very good for such as have a Rupture, or are Jsurfen-tic is good against Coughs, Colds, Hoarfeneis, Wheeling thortnefs of Breach, or any difficulty of Breathing, being made into a Syrup with Honey, and lb taken ^ V is good against the Yellow Jaundice, expels Wind, and is available against all Dileafes proceeding of Cold, whether inward or outward, and as Galen fays, it is molt effectual where there is any need to attenuate or make thin thick Flegm, or grots and tartarous Humors-, it cleans filthy running Sores, and putrid Ulcers, carrying oiFthe peccant Humors, and freeing the parts afte&ed from any Difeafesafetting them-, dropt into the Eyes it takes away inflammation and rednefs, and clears them from Films growing on them,

XXI. *The Infufion of the Herb or Root.* It has the former Virtues, but much weaker, and may be given Morning and Night for the fame purposes from four Punces to eight, sweetned with Sugar or Honey_h it is a very good thing for those forts of Agues which come by obitru&ions of Humors, or putrifaction of the Blood.

XXII. *The Decoffion of the Root in Wine or Water.* It has all the Virtues of the Juice and Effence, but much lets effectual, and may be given from three Ounces to fix Morning and Night, being ufed Dicitetically for fome time, in the Cure of old running Sores, putrid Ulcers, and inveterate or rebellious Fiftula's, &c. It is more powerful for the Cure of Agues than the Infufion of the Herb, tho^s less powerful than the Effence-, it heals all Wounds which are fresh, by washing them therewith, and this more Specially, "it is made with Win^o;_h it is good also to wash therewith all forts of foul, putrid or rotten Ulcers, yea, tho' they be hollow, or Fiftulous, running, and fretting, or Cancrous, for it mightily cleanses and dries, and heals also^ and taken inwardly for fome time, it very much prevails against the Kings-Evil, ipeedily and certainly healing those Ulcers up.

XXIII. *The PouJer of the Root.* It has all the Virtues of Juice, Eitence, and Deco&ion, but operates not with that celerity or speed which they do^ it may be given from half a Dram to a Dram every Morning taitirig, and every Night at Bed time, in some convenient Vehicle, and to be continued for some considerable time, as the reason of the thing, or occasion may require* if it is taken, with a small addition of MyKh, of Rue, or Pepper, it is the more powerful against the Stinging of Scorpions, or Bitings of Serpents or Mad Dogs, the Wound being kept open with Vinegar and Salt Water, and drest, with the application of *Gar lick*, which draws the Venom or Poyion out the molt powerfully of all Vegetables: Outwardly applied to foul, putrid, or rotten Sores and Ulcers, it powerfully deterges, or cleanses, and dries them, causing them ipeedily to heal: Mixt with Honey, and taken in the Morning tating, and at the usual Medical Hours, it opens Obfrutitions of the Lungs, and causes eafie expectoration of thick tough flegm, and other grofs Humors*, it provokes the Terms, and expels the Dead Child and Afterbirth, and is indeed a singular thing for killing Worms in the Belly and Stomach.

XXIV. *The PeJary.* It is made of the folid Root, either green or dry. Being put up into the Womb, and kept there, it induces a flux of the Terms, by opening the Mouth of the Womb, it also attra&s in the Birth, and brings away the Child, whether alive or Dead, and also clears the Womb of the Afterbirth.

XXV. *The DiJilled Water of Herb and Root.* It has the Virtues of the Infufion or Decoffion, but not io efficacious or powerful: Authors fay, that being drank, it has teen often proved to cure in a won-

derful manner all forts of Agues generated of the putrifaction of the Blood and Humors, to kill Worms in the Belly, and to cleanse the Skin from all forts of Spots, Freckles, Morphew, and other Defceda* tions whatioever, it being often, viz, five or six times a day bathed therewith.

XXVI. *The Spirit HO its Tinffure of the Root.* It is profitable against the Yellow Jaundice, ftrengthens and fortifies the Stomach, prevails against the Colick, and other grievous and vehement pains of the Stomach and Belly_h it warms, comforts, and ftrengthens a cold and moiit Liver, occasioned by long Sicknefs, or bad Diet, and is of good use for such who are in a pining Confumption^ the Hemorrhoids or Piles being bathed herewith it comforts the part, gives ease in the pain, and difcusses the Tumor or Swelling-, it is good against Cramps and Convulfions, being often bathed upon the part affe&ed, and prevails against Fainting and Swooning Fits, being inwardly given in any fit Vehicle from one Dram to three. at time of the Paroxyfm.

^ J " " , h* Acid TinSure. It is one of the g₁rea^?o Sto^ogaticks in *Rerun JSTaura*, for it opens the Obfrutiaions of the Stomach, incides and difcolves Flegm, and all forts of thick, tough viscus and tartarous Humors adhering to the Tunicles thereof, cleanses it of all its Fzculencies, warms and comforts it, restores its Tone, being hurt or depraved, and after a singular manner causes a good Appetite and a strong Digeition, and being constantly taken, it is one of the most absolute Cures that is for the Rickets in Children ^ it cures Afthma's, causing a free respiration or breathing, and takes away Hoarfenefs, Wheefings, &c. Dole is fo many drops as to make the Vehicle pleasantly sharp, and it is to be given in all that the Patient drinks, whether Ale Beer or Wine, and that while they use it they ought to drink nothing without it.

XXVIII. *The Oily TinHure.* Inwardly taken from ten drops to twenty or thirty, first dropt into Sugar, and then mm with any fit Vehicle, it is of excellent use against the Colick, and pains in the Stomach, proceeding from Wind_h it opens Obfrutiaions of the Relns and Ureters, and expels small Stones, Gravel, Sand, and other Tartarous Substances, which cause the Strangury. - It is a singular thing against the Paliy and convulsions of the Vilceia, being inwardly taken as aforeiaid, and morning and night anointed well upon the parts affe&ed, as also alone down the Back Bone: It is good also against num£ nefs of Limbs, Trembling of any of the Body, weaknefs of the Joints, and ^{the cause of} self proceeding from a cold Cause.

XXIX. *The Saline Tinffure.* Being used upon the place, it is good against the ^{the cause of} of Venomous creatures, for it attraks ^ V T T " S & of the Part it efs k ^ ^ ^ f a " r m singular manner, opens the Pores of the Skk di P cufles contufions, being applied ^{& * S T M} of Fomentation, and cleanses the ftr u i u of other parts from spots, freckles ^{the hands} TM* ing, yellowneß, black and ^{the hands} by ^{the hands} by

XXX. *Fbe'Omtmm or halfam.* It is an extraordinary Vulnerar>, healing simple Wounds at once or mice Dreffing. It also heats Wounds and Punaures of the Nerves and Tendons. It is likewise an excellent thing against all running Sores, old and inveterate Ulcers, putrid or malign Fiftula's, for in ^{the hands} i^c potentially digests, cleanses, incarnates if need be, dries and admirably heals -, and in the other it takes away the Callous, &c. and in both ftrengthens the part, being much weakened through the length or continuance of the Difeafe.

C H A P. CCCXIII

Of GERMANDER Garden.

I Names. It is called in Arabick, *Chamedrys*, in Greek, *medrius*, *Idaniedrys* and *Kemadriut*; in Latin, *Triaxago*, *Trijago*, *Herba februm*, *iebrifuga*, (from the Effects) and *Cbanudrys*, *Quercula minor*, *bumilis* aut *parva quercus*, a *folwrum fimilitudo*; in English, *Germander*.

fl. 17; * iOWx. There are many Varieties of this Plant, moil of which grow in other Countries, and are unknown in England: we make only four generick kinds, viz. 1. *Xapafgvf 3p* & i Chamadrys jativa*, Garden Germander, of which in this Chapter. 2. *Xrpei^vf * > <*, Cham&drys fylvefris*, Wild Germander, of which in Chap. 314. 5. *Xaucufyvt <hv- <exw, ^vKexov^ Teucrium*, *^uercula major*, Tree Germander, of which in Chap. 315. 4. *itapafgvc IKU- JSJ**, *^ tov^f 2S>Acr*, *Scordium*, *Chamadrys aquatica*, Water Germander, of which in Chap. 316- following.

III. *The Garden kinds.* Of this there are many Species defcribed in Authors, we fhall only enumerate two, which are common with us in our Gardens, viz. 1. *Chamxdrysfativavulgaris^ Cbamrfdrys vulgaris*, and *Cham&drys mas*, *febrifuga*, *Triaxago*, and *Tnjjago minor*, The common Germander, or Lefler Garden Germander. 2. *Cbamxdrys major*, *Triaxago*, and *Tnjjago major*, The greater Germander.

IV. The Defcriptions. *The jbfj*, or Small Garden Germander, has a Root compafed of divers Sprigs, and vanoujly difperjed with many Strings, Jhooting forth a great way round about, and quickly over* Spreading a Ground, Springing up again in many places. From this Root rifes up a little ftraight stalk, about a Span long, and fometimes longer, nearly a Foot in Height; (but *ParkinSon* fays it

fprings up with feveral Stalks) which are woody and hard, like unto a little *Shrub*, which is afterwards divided into very many little fmall Branches. Upon thefe Stalks and Branches grow fmall Leaves, almoft round, and a little indented about the edges, lefler than the Leaves of the following *Great Germander*. The Flowers grow at the tops, and alfo near the Leaves on the upper parts of the Sprigs, of a deeper purple col or than the following, and oftentimes tending to Blewneis.

V. *An Observation.* This Herb was in former times much ufed, and is yet (till ufed in feveral Places, to hedge up. or border Beds in Gardens, becaufe it will grow thick, and may be alfo kept in fome Form and Proportion with cutting, and that the Cuttings are much ufed as a firewing Herb for Houfes, Flores and Chimney-hearths, being pretty, and fweet withal, for which Reafon it is much affected: but this is to be taken notice o\ That it will often die, and grow out of Form -, and beides that, the Stalks will grow too great and hard, and fubby, and the Roots, by far (hooting under Ground, will, upon a little continuance thereof fpread into many places within the Knot, which, if they be not continually pluckt up, will fpoil the whole Knot it felf -, and therefore oace in three or four Years at moft, it muft be taken up and new Set, or elfe it will grow too rank and cumberfom.

VI. *The Second, or Greater Germander, has a Root which is more bujhy with fibres, and creeps lefs than the former; from this Root rifes up greater and harder Square Stalks, twelve, fifteen or eighteen Inches high, Spreading into Several Branches from the very bottom; on which grow two Leaves at a Joint, ibmewhat larger than thofe of the Ordinary or Common kind juft before defcribed, and more dented about the edges, green above, and fomewhat greyifh underneath. The Flowers ftand in a long fpiky Head, and are larger than the former, gaping like them, and of a paler purple color.*

VII. *The Places.* They are both found growing Wild in Germany, and in many other Countries, as *CluSttx* laith -, but with us, they are only found in Gardens.

VIII. *The Times.* They flower in June or July, and the Seed is repened in jonie little time after.

IX. *The Qualities.* Germander is hot and dry in the third Degree, and more (harp and bitter than *Teucrium*, as *Diofcondes* fays: it is highly Aperitive, Incifive, Abfterfive, Altringent, Cephalick, Neurotick, Stomack, PeEtoral, Hepatick, Splenetick, Arthritick, Alexipharmick and Analeptick.

X. *The Specification.* It cures all forts of Agues and Fevers, and is principal againft the Plague or Peftilence: it is good againft Difeafes of the Lungs ^ flops ail forts of Fluxes of the Bowels, and is a certain Remedy for the Gout.

XI. *The Preparations.* You may have herefrom, 1. A liquid Juice. 2. An EJJence. 3. An Infufion. 4. A Decoffion. 5. A Syrup. 6. A Ponder of the Herb. 7. An Ointment or halfam. 8. A Cataplafm. 9. A Spirituous Tinfure. 10. An Acid Tincture. 11. An Oily TinSure. 12. A Saline Tinture. 13. A Spirit oS the Herb. 14. A Powder of the Seed.

The Virtues.

XII. *The liquid Juice.* If it is mixt with Honey and fo taken, it is good againft Coughs and Colds, Hoarfenefs, Wheezings, Shortnefs of Breath, and vains of the Spleen. It is profitable for fuch whofe Spleens are become hard, and fuch as have the Strangury, or make their Water difficultly, * and helps

H h h

helps chofe who ate falling into a Dropfy, being taken in the beginning of the Difeafe. Dofe two, three or four Spoonfuls Morning and Night.

XIII. *The Effente*. It has all the former Virtues, beſides which, it opens Obſtructions of the Stomach, Liver, Spleen, Reins and Womb; provokes the Terms in Women, and helps to expel the dead Child, and the After-birth. If it is mixt with Vinegar, and lb taken, it does waſte or confume the Spleen, and is very equal againſt all forts of Poiſons, chiefly the Bitings of Serpents and mad Dogs, tiled outwardly with Honey, it deariés old and running Sores and putrid Ulcers, hindering their ſpreading and eating: and fo mixed with Honey and put into the Eyes, it helps their running and watering, and removes the Dimneſs of Sight. Taken inwardly, three or four Spoonfuls at a time, it is good againſt Pains and Stitches of the Side, Colicks, and other the like Diſaffections. It cures alſo *Ionian* and *Quartan* Agues, being taken every day in the Morning falling, and on the day of the firſt, three hours before the Fit comes: and Experience has found it a molt effectual Remedy againſt the Plague it feif.

XIV. *The Infuſion*. It has the Virtues of the Juice and Effence, but not full out fo effeual: it prevails againſt Difeales of the Brain, continual pins of the Head, Melancholy, Epilepfy, Cams, Lethargy and Dulneſs of Spirits, Palſies, Convulſions, &c. Dofe fix Ounces Morning, Noon and Night.

XV. *Decoction*. It has the Virtues of the Juice, Effence and Infuſion, but is ſomething more efficacious than the Infuſion, but not fo pleaſant to be drank by the Patient, becauſe it taſtes ſtronger, &c. given to fix Ounces or more, as the Decoction is given. Put into the Ears, it kills Worms in them, and alſo kills Worms in the belly, fo alſo the Juice and Effence. A Decoction of the Herb or Root rather, made in Wine, and taken for ſixty days continually, four hours before Meat, is a certain Remedy for the Gout.

XVI. *Syrup*. *Durantes* makes a Syrup for me bpleen after this manner: Take *Germander*, *Ground Pine*, *Qeterach*, *Madder*, of each a Handful; *Wijons ſtoned* an Ounce; *Bark of Caper-roots*, *Roots of bmaſhge*, *Elecampane*, *Blew t lower deluce*, Or *rice Liquortce*, of each half an Ounce; *Bark of Tamaris* *K Cyperus*, *Seeds of Anife*, *fennel*, *Stallage*, of each two Drams; boil all in a ſuffcient quantity of

Water, and make a Syrup, aromatizing it

of *Pon/Cnxamon-zvater*. The Dofe is four Ounces every Morning fattening. It is good alſo againſt Coughs, Colds, Athma and other tempers of the Lungs, as alſo againſt the Colick, Stitches in the Side, &c.

XVII. *The- Voider of the Herb*. It has the Virtues of the Juice, but more aſtringent, being very good to ſtop all manner of Fluxes, whether of the Belly or of Blood; as alſo the Courſes in Women, and to ſtop Vomiting, being given from half a Dram to a Dram and half, in Vinegar or any other proper Vehicle.

XVIII. *The Pouſer of the Seed*. It may be given from half a Dram to a Dram and half in a Glaſs of White Port Wine, for ſome days, and fo taken, it expels Choler by the Urinary Mages, and is profitable againſt the Yellow Jaundice: it alſo comforts the Stomach, and ſtrengthens all the Viſcera, tho' under long Weakneſſes.

XIX. *The Ointment or half am*. It heals ſimple green Wounds in a ſhock time, and being applied to foul running Sores, and old putrid Ulcers, it di-

gelt them, cleanſes, incarnates, dries, and quickly neals them up. Applied to the Gout, it eafes the Pain in twenty four hours time; and by the conſtant Life of it afterwards, in a ſhort time cures it, and that fo perfe&ly, as to return no more again upon that Baſis.

XX. *The Catap/ajm*: Being beaten and boiled in Vinegar, and brought to a Confiftence with a littler Leaven, and lb applied to the Stomach, it flops and cures all thoſe Vomiting which ariſe from hot and cholerick Cauſes: and applied to the Forehead and Temples in caſe of an Haemorrhage or Bleeding at Noſe, it preſently ſtopſ it.

XXI. *The Spirituous Tincture*. It warms and comforts a cold Stomach, and fo ſtrengthens it, as to cauſe a good Appetite and a ſtrong Digefion. It is cordial and excellent good againſt fainting and ſwooning Fits, Fits of the Mother, and a vehement Sickneſs at Heart, which it eafes almoſt in a moment. It expels Wind powerfully, and gives eaſe in the Colick; and is a fingular thing in refitting even the Violence of Convulſions. Dofe two Drams.

XXII. *The Acid Tincture*. It is fo powerful art. Opener of all Obſtructions of the Stomach and other Viſcera, that there are but few other things which equal it. It cures and prevents the Rickets in Children; is powerful againſt a Cachexia in Virgins and other young People, and a fingular thing againſt the Green-ſickneſs in young Women. It excites a good Appetite where it is languid or is wanting; incides, diſſolves and expels thick, tough, viſcous Flegm, and other tartarous Humors lodged in the Stomach and Bowels, cauſing Tortions, Grippings, Colicks, &c. let it be given Dietetically in all that the Patient drinks, whether Ale, Beer or Wine, lo many Drops at a time as may give the Vehicle a pleaſant Acidity, continuing its Uſe as long as nee-

XXIII. *The Oily Tincture*. Outwardly bathed upon any Part, or Parts affected with Laments, Numbneſs, Trembling, Palſy, Convulſions, Cramps, from a cold Cauſe, as alſo upon Pundures of the Nerves or tendons, it in a ſhort time gives eaſe, and by Continuation of the ſame, (doing it Morning and Night) in no long time a perfect Cure, it eafes Pains upon the Shin-bones, as alſo Pains in the Joints, the Gout and Rheumatifm; and is an excellent thing to be bathed upon any Part which has contraaed any Weakneſs by the long Continuance of any Difeafe: But in Palſies and Convulſions it is to be noted, That the Back-bone muſt alſo be anointed with the ſame in like manner, twice a day, rubbing it very well in.

XXIV. *The Saline Tincture*. Inwardly given from one Dram to two in a Glaſs of White Port Wine, it opens Obſtructions of the Urinary Paſſages, and provokes Urine powerfully, expelling Gravel, Sand, and filmy or viſcous Matter, which flops the Urine and cauſes Pain. Bathed upon a recent and ſimple Contuſion, it hinders the Aggregation of Humors, diſſolves thoſe which are preſent, and quickly cures the ſame, taking away alſo the Blackneſs and Blewneſs thereof. It is alſo good againſt Pimples, treckteg, Sun-burning, Tanning, Yellowneſs, Scurff, Morphey, and other like Breakings out of the Skin.

XXV. *The Spirit from the Herb*. It is highly Stomatick and Cordial, good againſt all Difeaſes of the Head, Brain, Nerves, Heart and Vitals, comforting the Parts affected, refitting the malign Vapors which oppreſs the Spirits, and reviving the univerſal Man. Dofe from one to two Drams, either alone or in a Glaſs of choice and generous Wine, as oft as occaſion requires, viz. in fainting, ſwooning, &c.

C H A P . CCCXIV.

Of GERMANDER Wild.

I. THE Names. It is called in Greek, **κλυσία*. X fgt *εγα**: in Latin, *Chamadrys fylvefris*. in English, Wild Germander.

II. The Kinds. This is twofold, viz. 1. *Clusia fylvefris Clusii*, *Chamadrys spuria fylvefris*, *Obamdryis vulgaris fcemina Fuchii*, *Turnen*, *Lorn-cen*, *Lugdunenfis*, *Pfeudochamadrys Thalii*, *Teucrium pratense Lobelii*, Common Wild Germander. 2. *Chamadrys angustifolia*, *Chamndrys spuria minor angustifolia Baubini*, who takes it to be the third Variety of the fourth kind of *Clusim* his *Teucrium*, Narrow-leavM Wild Germander.

III. The Description. The firll, or Common Wild Germander, has a Root which is small and thready, which sends forth several fauare upright stalks, yet sometimes a little bending, having two Leaves set at each Joint, one againft another, the lower ones fomewhat large, and almoft round, yet pointed at the ends, and dented about the edges, but fmaller as they grow up higher. The tops of the Stalks are fpiked with feveral blew Flowers, fet about them ^{ma} _{le} of four fmaU round Leayes ^{^^}

with a litte white Eye in the middle, fmall-pointed, and fome Threads alfo ^{*} after which fucceed fmali flat Pouches, containing _{ma} _n _s _e _c _d.

IV. The fecond, or Narrow-leav'd Wild Germander, has a Root which is blackijh, hard and fibrous or Jmngy, from which fpng feveral round reddijh ^{^ol}ks, fomewhat rough, hard and hairy, about an aand Breadth or fomewhat more high, and bending downwards, whofe lower Leaves are fomewhat long and broad, round at the ends, and not dented at all about the edges, but thofe which grow up higher

upon the Stalks, are fhorter and narrower poiniei alfo at the ends, and ihpt about tie edges. The Flowers grow towards the tops ot the Stalks, Spike-fafhion, being either of a pale blew color or blufm made of four Leaves, like* the ocher, having aiio like Heads and Seed.

V. The Places. The firft grows almoft in every Meadow thro' the Land, as alfo by Ditches and Hedge fides: Gerard fays it grows in many places about London, in Meadows and fertile Fields, and in every place wherefoever I have travelled (fays h[^]) in England. The other grows in like places, but is nothing near fo common.

VI. The Times. They flower and flourifh from the end of May to the latter end of Auguft.

VII. The Vitalities, Specification[^] Preparations[^] and Virtues, are the fame with thofe of the Common Garden Germander in the former Chapter, and thither I refer you.

C H A P . CCCXV.

Of GERMANDER Tree.

I. THE Names. It is called in Greek, *Τειρωβ*; A in Latin, *Teucrium*, (a *Teucro invent ore, tefte Plinio*) alfo *§uercula major*, and in English, Tree Germander.

II. The Kinds. There are three kinds hereof which grow in our Gardens, viz. 1. *Teucrium marts vulgare*, *Teucrium Matthioli*, *Lobe Hi*, & *alwrum*, *Teucrium vulgare fruticans Clusii*, *Chamadrys alterum*, feu *ajfurgens Dodonti*, Common or vulgar Tree Germander. 2. *Teucrium Creticum Clusii*, *Teucrium Creticum incanum Bauhini*, Tree German-

der of Candia. 3. *Teucrium Byticum*, *Teucrium fruticans Bo-ticum Clufii*, *Lugdunenfis*, *Tabernmontarii*, *aliorum*, *Teucrium Vcrigrinum folio fynuofe Bauhini*, Spanifh Tree Germander.

III. The Defcriptions. *The firft, or Common Tree Germander, has a Root which is fomewhat woody, fprending it felf about, with many Strings and blackifh fibres adjoining to them, from this Root fpring up hard, woody brittle Stalks, (growing much like a little Shrub) a Foot or two, and fometimes a Yard high, where Care is taken of it, and it is preferred and defended from the Injuries of the Winters. Thefe Stalks branch themfelves forth on all fides, from the very bottom, bearing always Leaves by couples, fmaller, fmooth and thicker than thofe of Germander, of a dark fhining green color on the upper fide, and greyifh underneath, and dnted alfo about the edges, like them. The Flowers which are gaping, ftand about the tops of the Branches, Spike-fafhion, one above another, of a pale whitifh color, as Clufius fays, but of a purple, as Lobe/ fays, of both which colors it has been oft feen bearing -, but the Flowers are fomewhat larger than thofe of Germander, and without any Hood above, having a few Threads Handing forth. The feed is fmaller, blackifh and round, contained in fmall round, but pointed Husks. The whole Plant is of a fine, pleafant, but weak Smell, yet fomewhat ftronger, if it is a little bruifed, holding the Stalks and green Leaves continually, if it is not expofed to the Sharpnefs of the Winter Seafon.*

IV. *The fecond, or Cretian Tree Germander, has a Root like the former, and Springs up and grows like a little Shrub -, it rifes up with fuch like woody Stalks, and brittle, as the other, but fomething mailer and whiter -, on which do grow juch like Leaves, and in the fame manner, but fomething leffer^ lefs green and fhining above, and more hoary underneath, two always fet at a Joint, one oppofite to the other : with the Leaves towards the tops, come forth five or fix Flowers, ftanding in a Husk, like unto the other, but a little lefs, and of a purple color, which being paff away, fmaller round feed follows like to the former. The whole Plant is a little fweeter than that firft defcribed.*

V. *The third, or Spanifh Tree Germander, has a woody Root, branching it felf forth under Ground, with many Fibres adjoining to it, from whence rifes up a fhubby Plant, growing fometimes to be three or four Feet high, and many times lower. It rifes up for the moft part but with one woody Stalky which is of a greyifh color, and divides it felf into feveral Arms or Branches, but fewer than that of Candy, two always fet at a Joint. The Leaves likewife ftand two together, fomething greater, and waved a little at the edges, of a fad green color above, but not fhining, and more hoary underneath. The Flowers ftand at the Joints with the Leaves, towards the tops of the Stalks, of a white color, without any Hood above, and with feveral Threads in the middle, the lower Leaves hanging downwards. The Scent hereof is lefs odoriferous or fweet, and the Talt is more bitter than the former, but abides with its Stalks and Leaves thereon, green, like the reft, but requires a little more Care for its Winter-Security in our Country.*

VI. *The Places.* They all grow with us in Gardens, where they flourifh very well, and delight to grow in rough ftoney places, which are mountainous and expofed to the Air and Sun. The fecond was brought to us from *Candia*, the third from *Spain* and therefore are not fo hardy Plants as the firft of them.

VII. *The Times.* Thefe *Tree Germanders* flower fomewhat later than the other *Germanders* do, viz. in *July* and *Augujl* -, and the Seed is ripe in fome little time after.

VIII. *The Qualities, Specification, Preparations and Virtues,* are the fame with thofe of the *Common Germander* in *Chap. 313.* foregoing, to which we refer you.

IX. *An Obfervation,* It is to be noted, That *Galen* makes *Tree Germander* to be hot in the fecond Degree, and dry in the third, to be of thin parts, and inciding alfo, whereby, he fays, it is helpful for the Spleen. *Diofcorides* fays it is ufed either green or dry, and is good to confume the Spleen, being inwardly and outwardly, applied, it is alfo ufed againft the Stinging or Biting of poyfonous Creatures,

CHAP. CCCXVI.

Of GERMANDER Water,

O R,

SCORDIUM.

I. >-p *HE frames.* It is called in *Greek*, $\Sigma\sigma\kappa\delta\iota\upsilon\mu$ -

X some call it $\text{At}\omega\text{f}\omega\text{i}$ ^ (from the ftrong Smelly) and it may alfo be called $\text{X}\alpha\text{p}\alpha\text{c}\text{f}\text{y}\text{t}\omega\text{f}\&$ in *Latin*, *Scordium*, *Trixago paluftriz*, and *Trijjago paluftriz Chamadrys aquatica* : in *Englifh*, *Water Germander* \ *Gar lick Germander* \ and *Scordium*.

The True Scordiunt, or Water Germander*

II. *The Kinds.* *Tabernmontanus* makes two kinds hereof, viz. a *Leffer* and a *Greater*. 1. *Scordium legitimum*, *Scordium minus*, *Scordium verum*, *Trixago paluftris minor*, The leffer Scordium, The true Scordium, or *Water Germander*, 2. *Scordium*

?najas, *Scordotis Plinii*, *Scordium alterum*, *Scordotis legitimum Plinii*, The Greater Scordium, having Leaves almost as large as *Bavom*. I know that *John-Jon* and *Parkin/on* will scarcely allow of this *Greater kind*, and make no Difference between them, but only in respect to the place of its Growth, making it to be either *Greater* or *Leffer*, according as the Soil is either richer and fatter, or poorer and more lean ^h but doubtless they weremiftaken, for the two differing Species are manifest.

III. The Descriptions. *The first?*, which is the Smaller kind, and is the True Scordium or Water Germander, has a small Root, full of white Strings or fibres, spreading in the Ground, and creeping round about ₅ from whence Jhoot forth fever al weak, square, hairy Branches, which take Root in fever al places, a* they lye, and spread ^ by which means it much increafes. Upon these Stalks or Branches grow many Leaves, two always at a Joint, which are something larger and longer than the Leaves of *Garden Germander*, of a fad or dark green color, whereon there is yet a (hew of Hoarinefe, fomewhat foft in handling, full of Veins, and dented about the edges, of a Scent fomewhat ftrong, and refembling *Garlick*, whence came the *Greek* and *Latin* Name. The Flowers are small, red and gaping, or of a purple color, like the Flowers of dead *Nettles*, and stand at the Joints with the Leaves, towards the tops of the Branches*

IV. The second, or Greater Scordium, or Water Germander, has a small long Root, and very fibrem, creeping deep into the Ground, and far about abiding long, and not perijhing every Tear •, from which many square, white, hairy Stalks or Branches spring forth, some rising up higher, and others dwarf like, keeping nearer the Ground. Upon these Stalks or Branches grow Leaves, two at a Joint, broader and rounder than the former *Scordium*, and all of a hoaxy white, being fomewhat like unto the Leaves of

Horehound or *Water Mint*, and almost as large as those of *Bazvm*. From the middle of the Stalks upwards, towards their tops, come forth the Flowers, (landing as it were in along spiky Head, with Leaves at the bottoms of Husks or (hort Foot-ftalks. These Flowers are of a pale purplish color, almost white, like unto *horehound*, gaping, and very like to those of dead *Nettles* -, which being pulled away, there follows small, round, black Seed. The whole Plant smells of *Garlick* as much as the former, or *True Scordium* -, and thereby it is known to be of the kind, tho³ the Leaves, by being larger, do somewhat differ.

V. The Places. The first grows in man}* wet Grounds, and by Water-fides in many places of *England*. *Diofcorides* says, That it grows as well on Hills as by Water-fides *, and it will flourish well, if it is tranplanted into a Garden : *Camerarius* says, That it is found to be stronger and (harper which grows on high Grounds, than that which grows on low and moist places. It grows near to *Oxenford*, by *Ruley*, on both fides of the Water -, and in a Meadow by *Abington*, called *Neitford*: also in great plenty in the Isle of *Ely*, and in a Meadow by *Uarwood* in *Lancafhire*, and in several other places. The other grows also in low and moist places, but is not fb generally to be found as the first is : in *Candia* the People gather it promifcuoufly with the first fort.

VI. The Times. They flower in *June*, *July* and *Auguft*, in which Months it is best to gather it and keep it dry : it perifties not in Winter, but only loofes the Stalks, the Root fending up fresh againft in Summer.

VII. The Qualities. *Germander* is hot and dry in the second Degree : it is Aperitive, Abfterfive, Afringent, Carminative, Digeftive, Diuretick, Anodyne and Traumatick ^h Cephalic*, Neurotick, Stomatick, Cordial, Hepatick, Nephritick, Sudorifick and Alexipharmick.

VIII. The Specification. It is a counter Poifon againft all Poifons and Infections of Contagious and Epidemick Difcafes, as Stingings or Bitings of Serpents, mad Dogs, &c. all forts of malign Fevers, the Meafles, Small-Pox, Purples, Spotted Fever and Calenture, as also the Plague or Pestilence it self: it is an efpecial Help againft the Strangury, and provokes the Terms in Women.

IX. The Preparations. You may prepare here* of, viz. 1. A liquid Juice. 2. An EJJence. % An Infufion in Wine, or Vecottion. 4. A Syrup. 5. A Powder. 6. An Ektuary. 7. Diafcordium. 8. An Ointment or Balfam. 9. A Cataplafm. 10. A diftilled Water. 11. A Spirituous Tinfure. 12. An AcidTinture* 13. An Oily Tinfure. 14. A Spirit. 1\$. An Elixir. The Herb is only ufeful

The Virtues.

% > the liquid Juice. It is a little (harp and penetrating, and fo is effe&ual to provoke Urine, and give ease in the Strangury. It opens Obftruftions of the Womb, and provokes the Terms in Women, facilitates the Birth, and brings away the After-birth. It is good againft the Bitings or Stingings of Vipers, Rattle Snakes, and other Serpents, mad Dogs, Scorpions, Hornets, OV. and refills all other deadly Poifons. Dofe two, three or four-Spoonfulls in the diftilled Water of the fame, or in any other fit or proper Vehicle, Morning and Night, to be continued for fome time.

XL The EJJence. It has all the former Virtues, and may be given in like manner in the lame Dofe: and as it is a counter Poifon, fo it refills all contagious

gious and inelious Difeafes, even when Epidemical, as Meafles, Small-Pox, Spotted Fever, Purples, the Plague alfo, and ail Pettilential Diftempers. It is given with good Succes before the Fits of Agues, to divert or hinder the Accets, and to drive them away : in this Cafe it may be given to four, five or fix Ounces. It is a moft Certain Remedy to kill Worms in Old or Young, whether in the Stomach or Belly. And by reafon of its Abfterfive and Sanative Properties, it is an excellent thing to be ufed Dietetically againft the Poifon and Malignity of the *French-Vox*, and to clear the Patient of the Reliques of the fame. It powerfully provokes Sweat, and therefore is good againft the Plague, digests Humors, diffolves and difcufles Swellings *, and is an excellent thing for fuch who are hurt by Blows, Falls or Bruifes, where fome inward Veflel may be broken, to difolve, difperfe and expel the congealed Blood, and to confolidate the Vein -, and becaufe of its Conglutinating Property, it is good for fuch as are troubled with any Rupture or Biirtennefs, this being daily drunk inwardly, and the Herb applied outwardly.

XII. *The Infufwn in Wine, or DecoUion.* Thefe have both of them the Virtues of the Juice and Effence, but in a much lefs degree, for which Reafon they ought to be taken in a much larger Dofe, and to be of te»er repeated. They are good againft the gnawing Pains of the Stomach, as alfo Pains of the Sides and Pleura : and if they are made in Red Wine, are very profitable againft the Bloody-flux and all other Fluxes of the Belly.

XIII. *The Syrup.* It has the Virtues of the Infufion and Deco&ion, and is available againft an old Cough, Hoarfenefs, Wheezing and Shortnefs of Breath : it opens Obftru&ions of the Lungs, and helps to expe&torate tough Flegm and other vifcous Humors out of thofe Parts. Mixt with the Powder oi^ *Scordium*, and applied to foul and putrid Ulcers, it abterges them, dries, and very much contributes to their healing.

XIV. *The Pouder.* It has the Virtues of the Juice, Effence, Infufion and Deco&ion, but operates not fo fpeedily, and may be given in any convenient Vehicle, as in the diftilled Water, Infufion, Deco&ion or Syrup of the fame Herb, from half a Dram to a Dram. It facilitates the Labor, provokes the Terms, opens Obftru&ions of the Urinary Veffels, is good againft Ruptures, is an excellent counter-Poifon, kills Worms, and prevails powerfully againft the Bloody-flux, more efpecially if it is mixt with Powder of *Torment il-VLoois* a third-part. ^ It is very good for moift running Sores and Ulcers in the Legs or other Parts, to cleanfe and dry them, and caufe them fpeedily to heal.

XV. *The Ele&uary.* It is made of the *Pouder of Scordium a Pound mixed with three Pounds of the Rob of Juice of Creffes made with Honey adding at the end, Rofin in fine Pouder half a Pound.* It is a noble Ele&uary for the Lungs *, it not only cures Afthma's, Coughs, Colds, Wheezing, *Cfc.* but alfo heals Ulcers of the Lungs, helping to expe&urate the rotten and putrid Matter from thence. Dofe one Ounce Morning and Night.

XVI. *Dia&cordium.* It is a compound Confe&it or Ele&uary in our *Pharmacopeia Londinenfis, lib. 4. cap. 22 felt. 19.* It was compofed by *Fracafiorim*, and inferted there for its great Virtues and general life. It is given againft Plague, Poifon, malign Fevers, Fluxes of ail forts, Catarrhs, Vomiting, Coughs, Watchings, Afthma's, Pleurifies, Con&umptions, Whites and Reds in Women, &c. Dofe from one to two Drams at Night going to Bed, and as much in the Morning failing, as the Occafion may require : and it may be given to Children from a

Scruple to half a Dram, in any convenient Vehicle. It is thus made : *Take Scordium in fine pouder one Ounce ^ fine Bole an Ounce and half-, Terra Lemnia, Biftort, Cinnamon, Caffid Lignea, Dittany of Creet, Gentian, Tormentil, (all thefe in fine pouder) Gum Arabick, Galbanum, Storax Caldmita, bf each half an Ounce, Ginger, long Pepper, Seeds of Sorrel, of each two Drams in fine pouder ^ Opium a Dram and half-, Canary eight Ounces-, Sugar of Rofes a Pound, clarified Honey two Pounds and half: mix and make an Ele&uary according to Art.* The *Opium* in this Prefcript is much too little, being to the whole Compo&ition only as 1. to 310. which is an inconfiderable Proportion. Should *Opium* one Ounce be the Proportion, it would yet be but as 1. to 58. which is ftill confiderably too little, where any Effets from the *Opium* are expe&ed.

XVII. *The Ointment or Balfam.* They are, excellent Wound-Medicaments, and cure fimple green Wounds at two or three times dreffing. If to every Pound of the Balfam three Ounces of the Powder of *Scordium* be added, and one Ounce of Powder of *Tobacco*, it will be one of the beft Topicks for digefting, cleanfing, incarnating, drying and healing any running old Sore, putrid Ulcer or Fiftula, in what Part of the Body foever.

XVIII. *The Cataplafm.* If it is made of the dried Herb mixed with Honey, and applied to fimple green Wounds, it heals them. If it is applied to foul and putrid Ulcers, it cleanfes, dries and heals them. If it is applied to Excrefcencies in the Flefh, as Wens, and the like, it repercu&es the Matter, hinders them from e&creafing, and prevails againft them fo as to difcufs or difperfe them. Applied to the Gout, it eafes the Pains thereof

XIX. *The diplied Water.* It is Cordial and Alexipharmick, and is good againft fainting and swooning Fits, Sicknefs at Heart, caufed by any malign or pettilential Mia&mata or Vapors, *Cfc.* but it is chiefly ufed as a Vehicle, to convey the other Preparations of this Herb into the Body.

XX. *The Spirituous Tincture.* It is highly Cordial, good againft all the Delinquims of the Spirits, Faintings, cold SwQats, Weaknels, Poifons and poifonous Vapors, Sicknefs at Heart, Agues, &c. and has all the Virtues of the Juice and Effence, but is to be given in a much leffer Dofe, viz. from one to three Drams, in fome fit Vehicle.

XXI. *The Acid Tincture.* There are but few things in the whole Republick of Medicine, which are fo powerful againft the Plague and all Pettilential Poifon, as this Medicament is, becaufe it ftrikes at the Root of the Malignity and Venom, u. it is in its Principle and Effence. It not only cures the Plague and all Pettilential Difeafes, but it So a noble Prophylaaick* or Preferver from ^ Contagion and rneafion. I commend it againft the Spotted Fever, the Purples, Calenture, all burning and Vapors, Bittles, Snake Bites, if mad * Dogs, Scorpions, VI. R. d S. k S. i. m. g. W. e. f. f. e. % cau. if wifely given, and in a due or fit Dofe, it will do more in an Hoit than many other Medicines will do in a Week : it is to be given in all that the Patient drinks, whether Ale, Beer, Wine, Poflet* drink, Grewel or Broth, and fo many Drops at a time as to make it pleafantly flap, refembling the Acidity of a *Limon*. It is a noble Medicine, and OT & V i? K 7 n, ^ s in a Keadinefs by one. #

XXII. *The Oily Injure.* Anointed on the Back-Bone, and upon the Parts affea&ed, Morning and Night, it is an excellent thing againft Numbnefs, Trembling of the Limbs, Palfies, Convulfions, OV. it is alfo of extraordinary Ufe, being applied to Pun&ures of the Nerves or Tendons, for it prefently eafes the Pain, abates the Tumor, prevents Con-

vulfions, and induces the Cure almoft to a Miracle. Inwardly given from twelve to thirty Drops, being dropt into Sugar, and fo mixt with any proper Vehicle, it has not only all the Virtues of the Juice and Effence, but after a fingular manner opens Obftructions of the Reins and Womb, provokes Urine, eafes the Strangury, and forces away Stones, Gravel, Sand, Tartar/or any other Foeculency refiding in thole Parts. It alfo provokes the Terms in Women, facilitates the Labor, but brings away alfo the After-birth, and prevents After-pains, &c.

XXIII. *The Spirit.* It is one of the greateft Cordials in the World, it chears the Heart, revives the Spirits, ftrengthenes the *Archeus*, and prevails againft fainting Fits, Swooning, Vapors, Fits of the Mother, Convulfions, Palfies, Lethargies, and all other like Difeafes proceeding from Cold and Moifture, or from any poifonous or venene Caufe. It is alib a Prefervative from the Infe&ion of the Plague. The Dofe is from one Dram to two or three, in any fit Vehicle.

XXIV. *The Elixir.* It has all the Virtues of the liquid Juice, Effence, Tin&ures and Spirit exalted, and may be given from one Dram to two, either in a Glafe of generous Wine in a Morning fafting, as a Prophylactick againft the Plague, or at any other time, when need requires it, as in any fainting Fit, or Paroxyfm, to Women in Labor, and to fuch as labor under any prefent Sicknefs at Heart. Tis an excellent Cordial, and an Antidote againft all manner of Poifon and Infe&ion.

G H A P. CCCXVII.

0/GILLIFLOWER the Greateft,
OR,
Carnation GILLIFLOWER.

I. *Tr HE Names.* This Plant, as it was unknown to the *Greeks*, fo it has no *Greek* Name allotted it ^ but it is called in *Latin*, *Caryophyllus hortenfis* h, the Epithite is added, to diftinguifh it from *Caryophyllus Indicus*, the *Indian Spice* called *Cloves* ^ thefe in the Garden being fo called in fome refpea from their Smell, it in fome meafure being like to that of .the *Indian Spice* ; and in another refpeft from the Form, the Flower it felf, in its lower part, being very like to the *Indian Clove*: in *Englijh* we call it, *Gilliflower* (*quafi July-flower*, from its flowering in the Month of *July*;) but if we will aflign it a *Greek* Name, we may call it K<dvku* or ϞΔ<ε<ar<phyHts *hortenfis*, and fo it is diftinguifhed from K<V<KKOV hMh, *The Indian Clove* or *Spice*.

II. ^ *The Kinds.* Of the *Gilliflower s* there are three generic^ kinds, viz. 1. *Caryophyllus bortenfis rubrum*, The deep Blood-red Clove-Gilliflower, of which we have already treated in Chap. 139. foregoing. 2. *Caryophyllus bortenfis maximus*, The greateft Gilliflower or *Carnation* Plant, of which in this Chapter* 3. *Caryophyllus bortenfis major*, The greater Gilliflower* called fimply by the Name of *Gilliflower*, of which there are feveral Species, which fhall be treated of (God willing) in Chap. 318. following. The generick Defcription of thefe two latter, fee in Chap; 139- feft. 5 and 6.

III. *The Kinds of Carnations.* Of the *Greateft Gilliflower* or *Carnations*, there are many kinds :

Authors account about twenty lèveral Species, which, becaufe of the immediate Repetition, we fhall forbear to name here, but give you them each in their own order, as we fhall now defcribe them.

IV. The Defcriptions. , i. *Caryophyllus maximus, diffus, Uulo rubro varius, The grey Hub.* It has as great Leaves as the *Old Carnation*, (defcribed in *Cap. 139. feff. 5-*) and as deeply jagged on the edges; it has a great high Stalk, whereon ftand the Flowers, of a deep red color, friped and fpeckled very clofe together, with a darkifh white color.

V. 2. *Caryophyllus maximus, i. e. Hub ruber non variatus, The red Hulo.* It is a fair large Flower, of a Stamel color, deeply jagged, as the former, and grows very gallantly, without any fpot at all in it, fo that it feems to be but a *Stamel Gilliflower*^ faving, that it is much greater.

VI. 3. *Caryophyllz/s maximus ditm Hub cruleo purpureus^ The blew Hub.* It is a goodly fair Flower, being of a fair purplifh Murry color, admirably Marbled with White, but fo finally to be difcerned, that it feems only Purple, it has To much the Maffery in it *, it refembles the *brazil*^ but that it is much bigger.

VII. 4. *Caryophyllus maximus iiUusGrimeb, five Princeps, The Grimelo^ or Prince.* It is a fair Flower alfo, as large as any Cryltal, or larger, being of a fair Crimlbn Color, equally for the molt part friped with White, or rather more White than Red, thro' every Leaf from the bottom, and grows beautifully.

VIII. %. *Caryophyllus maximus Incarnadinus Alb us, The White Carnation, or Delicate.* It is a goodly delightful fair Flower when in its Pride and Perfection, that is, when it is both Marbled and Flaked, or friped and fpeckled with White, upon an Incarnate Crimfon Color, being a very fweet and delicate flower, but abides not conftant, changing oftentimes fo have no Flakes or Strakes of White, but Marbled or Speckled wholly,

IX. 6. *Caryophyllus mtfximus Incarnadinus Gallicus*, The trench Carnation. It is very like to the White Carnation, but that it has more Specks or Spots, and fewer Stripes or Flakes of White in the Red, which has the Mattery of, the White.

X- 7. *Caryophyllus maximus Incarnadinus Granis*, The Ground Carnation. It is almost like to the Grand or Old English Carnation described in Chap. J 39. Sect. 5. foregoing, it is a thick Flower, but spreads not its Leaves abroad as others do, having the middle standing higher than the outward Leaves, and turning up their brims or edges, and is a lad Flower, with few Specks or Stripes in it\$ it is very subjeft to break its Husk or Pods, fo that the Flower seldom comes fair and right; the green Leaves are as great as the Hub, or Lumbard Red.

XI. 8. *Caryophyllus maximus Cryftallinus*, The Cryftal, or Oyjalline. It is a very delicate Flower when it is well marked, but it is inconstant in the marks, being sometimes more striped with White and Crimfon Red, and sometimes left, or little or nothing at all, and changing sometimes to be wholly red, or wholly bluish.

XII. 9. *Caryophyllus maximus* The Striped Carnation. It is a very thick Flower, and its Husk or Pod is very hard, and its Leaves are very large and green, and its Flowers are very large and double, and its Colour is a mixture of Red and White, and its Scent is very sweet.

XIII. 10. *Caryophyllus maximus Anglicus*, The great English Carnation, or Old Carnation. It is already described at large in Chap. 139. Sect. 5. foregoing of this Book, and is the very Head and Principal, as well as the greatest and largest of all the Carnations that are yet known, and to the place now cited I refer you the Description of this is general, and ferves to all the nineteen afore enumerated.

XIV. The Vlases. These all of them are only Garden Plants, and therefore are under the constant care of Curious and Diligent Florists, they are many times nurfed up in Pots, that they may be removed out of the cold.

XV. The Times. They Flower about the end of June, and through all July, unless the Season is very hot >.but if the Weather is temperate, they sometimes continue Flowering till the end of August, or later.

XVI. The Qualities, Specification, Preparations, and Virtues, are the same with those of the Clove-gilliflower, of which we have Treated at large in Chap. 139. from Sett. 9. to Sett. 20. and to that we refer you.

The red Savoy. It is like the *Incarnadinus ruber*, of the Flower is without the mixture of the Sunpeck, and fo abides long, and fo gives off from the Aft or Mother Plant, will give off Flowers again.

XVII. *Caryophyllus maximus Oxofordensis*, The Oxoford Carnation. It is like to the French Carnation, but its Colour is a fadder red, fo finely Marbled with White, and the Red having the Mattery, it is a very fad Flower, not having any Peasallinit.

XVIII. *Caryophyllus maximus Regius Jive Britannicæ*, The Kings Carnation, or Ordinary Carnation. It is a Kafoiable great Flower, deeply jagged, and very imally ftriped and ipecked on the Leaves of the Flower, in this is very large.

XIX. *Caryophyllus maximus* It is a very large Flower, and almost as big as the Purple is fad, and its Colour is Purple, and its Scent is very sweet.

might be said to be the same, but greater, several have taken this flower to be the Grand Pere but the difference will manifestly appear in the description of the next Flower.

X. *Caryophyllus maximus diSus Camberfynn*, The yimberfwe. It is a fair great Flower, red colored and well marked or ftriped with White, somewhat like unto a Savoy, as some say, but that the Red is not Crimfon, as the Savoy is, or something like to the Dainty, as others say, but not fo gallant and lweet a form; the Leaves of the Flowers are many, cluttering together, without any due form of

XI. *Caryophyllus maximus diSus Gran Yere*, the Grand Pere. It is a fair great Flower, and lweet enough for the form, but of no great beauty for Color, because, although it is ftriped Red and White, like the Queens Gilliflower, yet the Red is fo lad, that it takes away all the pleafantness of the Flower.

XXII. 19. *Caryophyllus maximus Longobardicus ruber*, The great Lombard red. It is a great fad red Flower, fo double and thick of Leaves, that it moff commonly breaks its Husk or Pod, and seldom ftrives or gives one Flower of twenty perfect Blades or green Leaves are as large as the Hub.

XXIII. 20. *Caryophyllus maximus Anglicus*, The great English Carnation, or Old Carnation. It is already described at large in Chap. 139. Sect. 5. foregoing of this Book, and is the very Head and Principal, as well as the greatest and largest of all the Carnations that are yet known, and to the place now cited I refer you the Description of this is general, and ferves to all the nineteen afore enumerated.

XXIV. The Vlases. These all of them are only Garden Plants, and therefore are under the constant care of Curious and Diligent Florists, they are many times nurfed up in Pots, that they may be removed out of the cold.

XXV. The Times. They Flower about the end of June, and through all July, unless the Season is very hot >.but if the Weather is temperate, they sometimes continue Flowering till the end of August, or later.

XXVI. The Qualities, Specification, Preparations, and Virtues, are the same with those of the Clove-gilliflower, of which we have Treated at large in Chap. 139. from Sett. 9. to Sett. 20. and to that we refer you.

CHAP. CCCXVIII.

OF GILLIFLOWER the greater,

OR,

GILLIFLOWER finply focalled.

The Gre[^]SZ 4? ^L^&O

the Greeks, though from the Latin feme a Greek Name (and very proper in the Language) may easily be derived, we call it in Latin *Caryophyllus hortensis major*; I know that in Chap. 139. Sett. 3. foregoing we have called this Gillflower *Ctryophyllus* counting the Great Carnation in the felt Chapter to be the Greater Cilliflower, viz. *Caryophyllus Hortensis major*, it follows from the reason of the Name, that this being a leffer Gil-

Chap 318 -- Tingtijb Herbs

Uflower than that, that it may very well be called *Caryophyllus Hortensis minor*, but if we allow the *Uordination* in the former Chapter to be *Caryophyllus Hortensis maximus*, then it follows from the same reason, that this must be called *Caryophyllus Hortensis major*, as aforementioned, and in Greek it may be called *ilatriw Mov fater t«ie>v> The Greater Garden Clove, or Greater Gilliflower.*

II. *The Kinds.* Of the *Gilliflower* there are alfp many Kinds. Authors account about Thirty Four feveral Species, which, becaufe of their great number, and the immediate after repetition of their Names, we fhall forbear to enumerate them here, and give you their feveral Appellations, juft going before their fingular Defcriptions, and that in the following order.

the

Gilliflower.

III. *The Defcriptions.* i. *Caryophyllus Hortensis major Flore pkno miniato, The yellowijb red Gilliflower,* called alfo *Caryophyllus Silefiacus, The Silefian Gilliflower,* but it has been now fo long Planted in England, that it is become perfectly a Native of our own Country, fee its Defcription at large In Chap. 139. Se&. 6. aforegoing, which is alfo a general Defcription to all the following enumerated in this Chapter.

IV. 2. *Caryophyllus major Wejlmofterienfis, The gallant, or Weftminfter.* Some would make this flower to be two, one bigger than the other, others again make it but one, it (hews at firft blowing open of the Flower, to be of a reafonable Size and beauty, but after it has flood blown fome time it hews fmaller and thinner, it is of a bright red Color, much ftriped and fpeckled with White.

V. 3. *Caryophyllus major Britolienfis Purpureus, The Britol Blew or Purple.* It has large green Leaves, fo large, that it would feem to bring forth a greater Flower than it doth, yet the Flower is of an indifferant Size, and very like unto the *Ordinary Grafiado Gillifloer,* ftriped and flaked in the fame manner, but that the White of this is purer than that, a Purple is more light, and tending to a Blew; this however does not abide conftant, but changes into a Blifflor

VI. 4. *Caryophyllus major Bnjliolenfis Came us- The Bnjfol Blufh.* It is very like the laft both in Leaf and Flower, the Color only (hews the difference, which feldom varies, to be spotted, or to change its Color.

VII. 5. *Caryophyllus major Cantij, The fair one of Kent, or Ruffling Robin.* It is a very beautiful Flower, and almoft as large as the *White Carnation,* the Flower is white, thick powdered with Purple, in which the White has the Maftery by much, which makes it fo much the more pleafant and delectable.

VIII. 6. *Caryophyllus Silefiacus magnus, Caryophyllus fulvus magnus, The great Tawney.* It is for form of growing, in Leaf and Flower altogether like unto the *Ordinary Tawncy,* the Flower only, becaufe it is the faireft and greateft, makes the difference, as alfo that it is of a deep Scarlet Color.

IX. 7. *Caryophyllus fulvus variability The variable Tawney.* There are feveral Tawnies, fome lighter fome fadder, either lefs or more double, fo as they are fcarcely to be numbred, all rifing from lowing the Seed of fome of them, befides the diversity of other Colors, both fimple and mixed, every Year and place yielding fome variety not feen before, which I leave to curious Spectators to give proper Names to, as they fhall fee fit.

X. 8. *Caryophyllus major Carneus variabilk, The variable Blufh colored.* Of this there are many forrs, as the deep Blufh, the pale Blufh, the Infants Blufh, the great Blufh, and the Blufh inclining to a Red, but the great Blufh is the faireft and molt double of all the other Bluffies, of which there are many, both fingle and double.

XI. 9. *Caryophyllus Ruber variabilk, The variable Red.* Of Reds there are fome varieties, but not fo many as of the other Colors, for as they are moft dead or deep Reds, and very few of a bright Red, or Stamel Color, fo neither Purple nor White rife from this Seed, that any one has obferved; they are either fingle, like Pinks, either ftriped or fpeckled, or more double, ftriped and fpeckled variably.

XII. 10. *Caryophyllus Heroind, dilius Ecgans, The Lady, called the Beautiful or Koble.* This may compare for Beauty with moft of the *Gilliflowers,* the Flower is very neat and fine, tho' fmall, with a fine fmall jag, and of a fine white color on the under fide of all the Leaves, as alfo all the whole jag for a pretty compafs, and the bottom or middle part of the Flower on the upper fide alfo, but each Leaf is of a fine bright pale red color on the upper fide, from the edge to the middle, which mixture is wonderfully delectable.

XIII. 11. *Caryophyllus major Regineus, The Queens Gilliflower.* It is a reafonable fair Flower; altho' very common, and is ftriped Red and White, fome great and fome fmall, with long ftripes.

XIV. 12. *Caryophyllus major Carneus, The Blufh Gilliflower.* It differs not much from the Red colored, or Stamel, as to its magnitude or form, but only in the color of the Flower, which is Blufh.

XV. 13. *Caryophyllus Alb us Londinenfis optimus major, The greater and beft London White Gilliflower.* It is admirable to look upon, grows upright, and very double; the blades grow upright alfo, not crawling on the Ground.

XVI. 14. *Caryophyllus Albus Londinenfis vulgure, The common White London Gilliflower.* This is greater and whiter than the *Common White Gilliflower,* and is indeed wholly of ojie color.

XVII. 15. *Caryophyllus major Dorobornienfis Ruber, The Red Dover.* It is a reafonable large *Gilliflower,* and conftant, being of a fair Red, thick powdered with white fpofts, and hews fomething like the *Ground Carnation.*

XVIII. 16. *Caryophyllus major Dobornienfis D-*

lutus, Jive Albus, The Light, 0 White Dover.* It is for form and all other things more beautiful or delectable than the former •, the color of the Flower is Bluff, thick spotted with very small spots, that it seems all grey, and is very delightful to look on.

XIX. 17. *Caryophyllus major Brafilienjis, The hrafilC'//i[flower.* It is but of a middle size, being of a faded purple color, thick powdered and speckled with White, the Purple therein is the chief, which makes it (hew the fadder, it is unconfant, varying much, and often to be all purple •, the green Leaves lye matting on the Ground.

XX. 18. *Caryophyllus Rofeus rotundus, The round Gdhflower.* It is of the Kindred of the Tawnies, being raised from the Seed of some of them, yet it is a different sort from all others, in that its Leaves are round, without any jag at all upon the edges, of a hnehtamel full color, without any spot or frake therein, very like unto a small Rose, or rather much like unto the *Red Rofe Campion*, both for form, color, and roundness, but larger for its size.

a X y P K 20, Caryophyllus Silejiacus firiatuS, The Jimped Iawney. It is either greater or lesser, deeper or lighter in its Flowers, there being above twenty varieties of them, all striped with smaller or larger [stripes, or equally divided, of a deeper or lighter color-, and some also for the (hape or form will be more neat, close and round, others more loose and unequal

r X y P K 20, Caryophyllus Silejiacus punttatus, The Jpec kled Tawney. It is of divers sorts, some bigger, some less, some more and some less spotted than others, usually it is of a deep Scarlet, speckled or spotted with White, having also some stripes among

Y v m A and some more striped than others.

•• AAIH. 21. *Caryophyllus major Elegans, The Delicate or Dele fable.* It is a noble fine Flower, altho' it be not great, and for the smallness and thinness of the Flower, being red, so finely marked, striped and speckled, that for the liveliness of the Colors, it becomes[^] delectable to the Eye, and much to be dehed, being inferior to very few Gilliflowers.

XXIV. 22. *Caryophyllus major Granatenjis, The Granado Gilliflower.* It is Purple and White, flaked and striped very much[^] this is also much fubje& to change Purple: there is of this Kind a greater and a lesser, besides the greatest, which is formerly described.

XXV. 23. *Caryophyllus Silcificus Plutnatus, Tlie Feathered Tawney.* This is more rare to meet with than many of the others, it is most usually a fair large Flower, and double, equalling the *Lumbard Red* in its perfection, the Color hereof is commonly a Scarlet, a little deeper or paler, very curiously Feathered, and Streamed with White thro' the whole Leaf

XXVI. 24. *Caryophyllus Silejiacus Marmor amulans, The Marbled Tawney.* This has not so many varieties as the Striped, but is of as great beauty, and as delectable as it, or more, the Flowers are greater or smaller, deeper or lighter colored one than another, and the Veins or Marks more conspicuous, or more frequent in some than in others[^] but the most beautiful of all is the *Princefs* following.

XXVII. 25. *Heroina ilarum Rudolphi ImperatorK The Princejs.* This is the greatest and fairest of all these sorts of Variable Tawnies, or Seed Flowers, being as large fully as the *Prince* or *Cryjial*, or [something greater, (tending comly and round, not pole or ihaken, or breaking the Pod or Husk, as some other sorts will, the marking of the Flowers is¹⁸ V¹ thi\$ manner, it is of a Stamel Color, striped and marbled. with white Stripes and Veins quite thro' every Leaf; which are as deeply jagged as the *Hub*, sometimes it has more Red than White, and

sometimes more White than Red, and sometimes so equally matched or marked, that you cannot discern which is most} yet which of these has the predominance, the Flower is still very beautiful and delightful to behold.

XXVIII. 26. *Caryophyllus Silejiacus affulofm, The flaked Tawney.* This is another diversity of these variable or mixt colored Flowers, being of a pale reddish color, flaked with White, not always down right, but oftentimes athwart the Leaves, some more or less than others, the marking of them is much like the *Cryjial*, these also, as well as the others, will be greater or smaller, and of greater or lesser beauty than others.

XXIX. 27. *Caryophyllus Turcicus, The Turkey Gilliflower.* This is but a small Flower, but 0% great delight, by reason of the well marking of the Flower, being most equally striped with Red and White.

XXX. 28. *Caryophyllus purpureo caruleUs, The blew Gilliflower.* This is neither very double nor very great, yet round and handsome, with a deep jag at the edge, and is of an exceeding deep Purple Color, tending to a Tawney, it differs from all other sorts, in that the Leaf is as green as Grapes, and the Stalks many times Red or Purple-, by the green Leaves it may be known in the Winter as well as in the Summer.

XXXI. 29. *Caryophyllus Cambrenjis Poole, Toe Cambrey, or Poole flower.* It grows naturally upon the Rocks, near *Cogjhot Cajile*, in the *Ile of Wight*, is a small Flower, but very delectable to the Eye, because of the sweet and beautiful proportion thereof, it is of a bright pale Red, thick speckled, and very small, with White, so that it seems to be but one color, the Leaves of the Flower are but finally jagged about, and it keeps constant to its form. . .

XXXII. 30. *Caryophyllus Perjico Vidlaceus, ibe Gredeline Gilliflower.* It is a very neat and handsome Flower, of the bigness of the *Red Clove-Gilliflower*, of a fine pale reddish Purple, or Peach Color, inclining to a Blew or Violet, which is that Color which is usually called a Gredeline Color •, it has no affinity with either Purple[^] *Granado*[^] Or P^{*}-geant.

XXXIII. 31. *Caryophyllus Pegma dilutor, The light or pale Pageant.* It is a Flower of a middle size, very pleaisant to behold, and is both constant and beautiful, if it was not so common, it would be much more valued than it is[^] the Flower is of a pale bright Purple, thick powdered, and very equally, with White, which has the Mastery, and makes it[^] much the more pleaisant and graceful.

XXXIV. 32. *Caryophyllus Purpureus major & minor, The Purple Gilliflower greater and lesser.* The Stalk of it is so (lender, and the Leaves upon it so many and thick, that it lyes and trails on the Ground, the greatest is almost as large as the *Cry* (hi, but not so double[^] the lesser has a smaller Flower.

XXXV. 33. *Caryophyllus Pegma faturator, The fad or deep colored Pageant.* It is the same with the former in Set. 33. foregoing as to its form and bigness, the difference is chiefly in the Color, for the Purple in this is the chief, which makes it so fad, that it resembles the *Brafil* for color, but not so large as it by half

XXXVI. 34. *Caryophyllus ruber major & minor, The Stamel Gilliflower greater and lesser.* It is well known, almost to every Body and differs little from the *Common Red Clovegilliflower*, but only in its being of a brighter or light red color of this Kind there is both a greater and a lesser.

XXXVII. *The Places.* These all grow in the Gardens of Industrious Florists in many

Kingdom, and are to be found in the Flower Gardens of most other parts of Europe.

XXXVIII. *The Times.* They begin to Flower about the end of June, and keep on Flowering thro^u all July and August, and many times thro^u all Septemberⁿ even almost to the latter end of October, if the Weather is mild.

XXXIX. *The Qualities, Specification, Preparations and. Virtues,* are the same with those of the Clovegillflower in Chap. 139. from Sept. 9. to Sept. 20. to which I refer youⁿ but these wanting that wonderful deep Red, cannot give so admirable a Tincture to a Syrup, as the Clovegillflower can do, and therefore (tho' full as Cordial, yet) are less used in Physick.

XL. *Not a.* It is said by our Moderns, that none of these Flowers were in the least known to the Ancients, and yet some will have them to be the *Cantabrica Plinij*, others to be the *Iphium Theophrasti*, mentioned in *Lib. 6. Cap. 6.* and 7, among his Garden and Summer Flowers, others to be his *Dios Anthos*, or *Flos Jovis*, mentioned in the former and other placesⁿ we will not determine the Controversie, but leave every one to his Conjectures.

GL ADDON Stinking. See FLOWER-DELUCE Wild Chap. 294.
GLADIOLUS. See CORN-FLAG Chap. 154.

C H A P. CCCXIX.

Of GOATS-BEARD,
OR,
NOON-FLOWER.

I. *THE Names.* It is called In Greek ΤΑΤΤΩV, X *) t&wvy*** in Latin *Tragopogon*, *Barba Hirci*, *Barbula Hirci*, also reⁿrrⁿ, *Barba Senk*, in English *Goats-Beard*, *Noon-Flower*, *Noon-Tide*, *Joffphs Flower*, and *Star of Jerufalem*.

II. *The Kinds.* There are several Kinds hereof, viz. 1. *Tragopogon luteum*, Garden Yellow Goats-Beard. 2. *Tragopogon purpureum*, Purple Goats-Beard. 3. *Tragopogon luteum angujifolium*, Common Goats-Beard with narrow Leaves. 4. *Tragopogon Flore cadruleo*, Blew Goats-Beard. 5. *Tragopogon Apuluⁿ fuave rubens*, *Tragopogon Americanum*, American or Rose colored Goats-Beard. There are five or six other Kinds, but not being found growing in our Country, or in our Gardens, nor in any of our American Plantations, we (hall here pass them by.

III. *The Descriptions.* *The first*, *r Garden Yellow Goats-Beard, *hat a Root which is long and round, somewhat like unto a Parsney, but far smaller, blackish on the outside and white within, which being broken yields a milky Juice, at all the rest of the Plant does, and of a very good and pleafant tap;* from which Root rises up a Stalk, or Stalks, of two or three Feet high, smooth and hollow, bearing many long and narrow Leaves, broader at the bottom, and (harper at the end, with a ridge down the back of the Leaf, and of a pale green color, the higher these Leaves grow on the Stalks, the smaller and shorter they are, and at the tops on every Branch growⁿ a great double yellow Flower, like almost to the flower of a *Dandelion*, which turns into a head,

floured with Down, and long whitish Seed therein having on the head of every one some part of the Down, which (if neglected) is carried away with the Wind.

IV. *The feconi, or Purple Goats-Beard, hat a Root which is long and Jingle, (much like to the former) with some few Threads thereto adjoining, which perishes when it has perfected its Seed, yielding a great quantity of a milky Juice when it is cut or broken, at does all the rest of the Plant **, from whence rises a hollow Stalk, or Stalks, smooth, and of a whitish green color, which spreads itself out into other Branches, on which Stalks and Branches do grow long Leaves, crested down the middle with a swelling Rib, and (harped pointed, yielding a milky Juice when it is broken, and are in shape like those of *Garlick* * from the bottom of which Leaves small tender Stalks spring forth, set with the like Leaves, but lesserⁿ the Flowers grow at the tops of the Stalks, consisting of a number of Purple Leaves, dashed over, as it were, with a little yellow duft, set about with nine or ten sharp pointed green Leavesⁿ the whole Flower resembles a Star when it is spread abroad, for it fluts itself at Twelve of the Clock, and hews not its open face until the next days Sun doth make it spread itselfⁿ or open again, for which reason it was called *Noon-flower*ⁿ and by some *go to Bed at Noon*: when these Flowers are come to their full maturity, they grow into a Downy Head, like those of *Dandelion*, which is carried away with the Windⁿ the Seed is long, having at its upper end some small portion of that downy matter fastned to it.

V. *The third, or Common Goats-Beard with narrow Leaves, is very much like to the first Yellow Kind, it hat a thick Root full of a milky Sap, from which rises up many heads spread upon the Ground, very long, narrowⁿ thin, and like unto those of Grals, having, that they are thicker and grofferⁿ from among which rise up tender Stalks, on the tops of*

which do it and lair double yellow Flowers, like to the first afore described, but lesser, the whole Plant yields a milky Juice, as the others do it perfishes also as the others do, after it has perfected its Seed, indeed it is very much like to the former *Tellow Kind*, but that it is not so great, nor rises so high, has much narrower Leaves, even like to *Grafs*, and almost as long, but not so manifold, the Flower only differing in its magnitude, as afore said.

VI. *The fourth, or Blew Goats-Beard, has a Root which is long, and not very great, perfishing, a* foorn m it has a* horn Seed, fpinging up again of the falling Seed, and jo remaining green all Winter, and Flowering the next Tear following*, From this Root rises up a Stalk greater and stronger than that of *Scorzonerca*, or *Vipers-Grafs*, it is replenished with long, narrow, and somewhat hollow, whitish green Leaves, with a white Line down the middle of every one, on the upper side at the top of the Stalk grows a great long Head or Husk, composed of nine or ten long narrow Leaves, the (harp points or ends of which rise up above the Flower in the middle, which is thick and double, somewhat broad and large spread, of a bluish Ash Color, with some whitish Threads among them, (hutting or cloving it self within the green Husk every day at Noon, (for so long time as the Flowers continue) and not opening again until the next Morning-, after the Flower is past, the Head or Husk, the Seed being near ripe, opens it self, the long Leaves thereof, which clove not before now, falling down round about the Stalk, and (hewing the Seed, (landing at the first clove together, and the Down at the top of them, but after a while it spreads it self round, and if not gathered, will be carried away with the Wind-, the Seed is long, round, and rough, like the Seed of *Vipers-Grafs*, but greater and blacker.

VII. *The fifth, or American, or Rose colored Goats-Beard, has a Root which is long and slender, and is the smallest Root of all the Goats-Beards, white downwards, and somewhat hard, but more reddish at the top, which ends forth many long and narrow Leaves, like unto Grafs, with a white Line in the middle of them, smooth and soft if you stroak them upwards, but as rough as Barley Leaves stroaking them downwards, and broadest at their joining to the Stalk, the Stalk is about two Feet high, scarcely dividing it self into any Branches, but bears at the top one great and large head, (which is great in respect to the Plant) parted into eight long Leaves or Beards, in the middle of which is the Flower, consisting often or twelve Leaves, of a pale purple, or rather of a bluish color, near unto a Damask Rose, having several blackish blew Threads in the middle, with a mealy duft upon them, which being past, the Head or Husk grows somewhat narrow, with a long Neck, containing within it the Seed, which is not fashioned into a round Globe like form with Down at the heads of the several Seeds, as in all the former, but it has five longer and greater Seeds on the outside, with little or no Down at the ends of them, and some lesser Seeds in the middle, which have a little Down on their heads, being yellowish and smooth, but the least of all others.*

VIII. *An Observation*. These *Goats-Beards* are very like to the *Scorzonerds*, or *Vipers-Grafs* in their outward form and manner of growing, and therefore are *Species ejusdem generis*, but the *Tragopogon*, or *Goats-Beard*, is the Genus or Standard, and the *Scorzonerds* are *Species* of the *General Kind*, but herein they chiefly differ, that whereas all the sorts of *Tragopogon's* are Annual Plants, - perishing every year, after they have born their Seed-, it is certain that all the sorts of *towards* are Perenni-

Plants, enduring after Seed time for many Years, as in their proper place we (hall hereafter at large declare.

IX. *The Places*. The first and third grow in Gardens with us, but are also found wild in many places of this Land, *Oerard* says they grow in Meadows and Fertile Pastures in most places of *England*, they grow plentifully in most of the Fields about *London*, as at *Ill'mgton*, and in the Meadows by *Redriff*, *Deptford*, and *Putney*, and in divers other places -, the third is found in Meadows (as afore said) about *London*, and many other places of the Kingdom, but not so plentifully as the first Kind-, the second, or *Purple Kind*, came to us from *Italy*, where it is said to grow wild, it has also been found growing wild in some parts, of *Lancashire*, on the Banks of the River *Chalder*, near to the Houfe formerly the *Lady Heskiths*, two Miles from *Whaley*, but it is now Sown in Gardens almost every where, for the beauty of the Flowers, the fourth, or *Blew Kind*, came to us also out of *Italy*, where it is supposed to grow wild, but with us is only nurft up in Gardens, for its pleafant Flowers, the fifth Kind is found growing on the Hills in *Naples*, as *Columna* reports, and I have found it growing wild in several parts of *Florida*, but with us in *England* it is purely a Garden Plant.

X. *The Times*. They all of them Flower from the latter end of *May* thro' all *June* and *July*, and the Seed comes to perfection in the mean time, being ripe in *July* and *August*.

XI. *The Qualities*. *Goats-Beard* is temperate in respect of heat or cold, driness or moisture, a little Afringent, Stomatick, Hepatick, Alexipharmick, and Analeptick.

XII. *The Specification*. They are all Restoratives in Consumptions, and expel Gravel from the Reins and Bladder.

XIII. *The Preparations*. You may have therefrom, 1. *The boiled Roots, or Roots raw*. 2. *AD*^m c ojt ion*. 3. *A distilled Water from the Root*. 4. *Sanguis, or Blood* ? *Root*, there being no other part of the Plant more :

The Virtues.

XIV. *The Root it self* The Roots of any of the Kinds being boiled, but more especially of the first *Tellow Kind*, and of the third also, and dressed as *Parfneps*, are much more delicate and pleafant to the Taste in eating, they comfort the Stomach, are good against Heart-burnings, strengthen the whole Body, and restore in Consumptions -, the Roots of the *Tellow Kind* are many times eaten raw, as a Sallet, being diced, and so eaten with Pepper Salt and Vinegar, by which means the Stomach is also strengthened, and they are restored which are going into a Consumption, or are become Spare and Lean by long Sickness, the *Tellow Kinds* are chiefly used as *Parfneps*, and for Salleting, the other Kinds are not altogether so fit for that purpose, being more bitter, afringent, and absterfive, having a more cleansing and binding quality than the others have, and therefore are mostly used in a Medicinal way, the *Tellow Kinds* make a pleafant Diftill of Food, far surpassing the *Parfnep*.

XV. *The Decoction*. It is good against the pain of the Stomach, and to expel the malignity of the Plague, and all sorts of Pestilential Diseases, it prevails against Heartburnings, and a dejected Appetite, inciting and stirring it up-, and it is good also against Affections of the Breast, Liver, Reins, Ureters and Bladder, expelling Sand, Gravel, Stone, and Tartarous Matter from those parts, for which the *Italians* call it *Saffi Frica*, Break-Stone.

XVI. *The Diftilled Water.* *Tragus* fays it is the moft prefent Remedy that is, to help or break inward Apoftems, and to give Relief in the Pleurifie, and other Pains and Stiches in the Sides, to help the Heartburn, ftrengthen the Stomach, and fir up Appetite.

XVII. *Sanguis*, or, *The Blood of the Roots.* It is made as that of *Satyrion*, *Parfnep*, *Comfrey*, &c. and has all the Virtues of the boiled Root, Decoction, or Diftilled Water-, it is indeed a moft excellent thing to reftore fuch as are in deep Confumptions, being confantly taken Morning, Noon, and Night, for fome confiderable time, with Milk warm from the Cow, and fometiraes with a Glafe of Generous Wine.

C H A P . CCCXX.

Of G O A T S-R U E,

OR,

G O A T S-H E R B,

I. *APHENAMES.* It is an Herb which was unknown to the *Greeks*, but is called by the *Latins Galega*, and *Ruta Capraria*, fome have erroneoufly called it *Gralega*, and *Yracaflorius* called it *Urba Gallica* and fome only *Capraria*, (from the Goats eating it) fome call it *Thorina*, or *Taurina*, *Sarracena* and *Capragina* alfo *Giarga*, as *Bravavolits* faith, and by us in *Englijh Goats-Rue*.

II. *The Kinds.* There are two Kinds of this Plant, viz. I. *Galega vulgaris*, *Ruta Capraria vulgaris*, Our Common Goats-Rue. 2. *Galega Montana Dalechampi Lugdunensis*, Mountain Goats-Rue.

The Defcriptions. The firft or Common s-Kue, has a Root which is white and Woody

spreading well in the Ground, and abiding fever[^] Tears; from this Root come forth many round hard Stalks, four or five Feet high, on which grow one above another at several Joints, long winged Leaves? viz. many fmaller Leaves fet on each fide of a middle Rib, which Leaves are fmall, yet fomewhat broad and long, and (harp pointed at the ends, and fmooth on the edges, without any dents, fomewhat like unto the Leaves of *Vetches* or *Tares*, and of a feint green color-, at the tops of the Stalks ftand many fmall Leguminous Flowers, one above another, of a pale blewifh purple color, and in fome Plants purely whits, which being pafst awny, fmall round Pods or Cods come in their places, about an Inch and half long, a little bunched out in fome places, but nothing fo much as the *Orobrys*, or *Bitter Vetch*, in which lye three, four, or five pale Seeds, like unto thofe of the *Vetch* or *Tare*.

IV. *The fecond, or Mountain Kind, has a Root which is Jomewhat great and blacky fending forth very long Strings, whereby it Roots its Jelf deep in the Ground* ^ from which feveral round hard Stalks fhoot forth, but nothing fo high as the former, on which grow fuch like winged Leaves at every Joint, but broader, and thicker fet together, fmooth alfo on the edges, but having the middle Rib of every Leaf railed up a little high-, at the tops of the Stalks ftand divers fuch like Flowers as the former, but all on one fide, of a pale color, tending to yellow, which afterwards yield fmall long blackifh Pods, in which lye fmall fiatifli Seed, like to *Lentils*,

V. *The Places.* The firft grows comftionly wild by the Way fides of moilt fields and Meadows in *Ialy*, *Savoy*, and other Southern Climates ^ it is alfo found growing wild in *England*, as in the Meadows by *Linton* in *Cambridgfhire*: the fecond grows on the tops of Mountains, where any Planes are found j and I am informed by a very good Botanift, that he has met with it upon fome of the Mountains in *Wales*.

VI. *The Times.* They Flower about the latter end of *June*, and thro^s all *July*, and the Seed is ripe in *Auguft*.

VII. *The Qualities.* It is temperate in refpect of heat and cold, drinefs and moiiture ^ it is Aperitive, Abfterfive, and Carminative, Cephalick, Neurotick, Stomatick^l, and Cardiack, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It cures all forts of Poyfons, whether inwardly taken, or outwardly received, by the Bitings of Serpents, as *Vipers*, *Rattle-Snakes*, or other venomous Creatures ^ or impreffed by Contagion, as that of the *Plague*, *Spotted Fever*, or any other kind of *Peftilential Diftemper*.

IX. *The Preparations.* You may have therefrom, I. A Sallet of the Herb. 2. A Liquid Juice, 3.* An E(fence. 4. An Infufion or Dec oil ion in Wine or Water. 5. An Eleffuary. 6. A Cataplajm. 7. A Diftilled Water. 8. An Acid TinSure. 9. An Oily Tintture. 10. A Spirituous Tintture.

The Virtues.

X. *The Sallet*, The Herb it felf is eaten, being boiled with *Fleifh*, as we ufe to boil and eat *Cabbage* and *Colewvts* -, it is alfo eaten as boiled *Spinage* ^ and other Sal lets, with *Pepper*, *Salt*, *Vinegar* and *Oil* ^ and being fo eaten, it is laid to be excellent againft all forts of Poyfons, and the malignity or inletioij of the *Plague* or *Peltilence*, or the Bitings of venomous Creatures, &c.

XI. *The Liquid Juice*, It is effe&ual againft the Biting of *Vipers*, *Rattlesnakes*, or other Serpents, Bitings of *Mad Dwgs*, the Stinging of *Scorpions*,

or

or the Poyfon of other venomous Creatures-, it is also effectual against Vegetable Poyfons, as also the malignity of the Plague, or Pestilence it self, and the infection of other Pestilential or Contagious Diseases, as Purples, Measles, Small Pox, Spotted Fever, and Calenture-, against all these Diseases it is admirable, for it both preserves from the infection, and perfectly cures such as are infected; Dose two or three Spoonfuls every Morning falling in a Glass of Generous Wine, and as much at Night going to Bed, by way of prevention; but for Cure, it ought to be given in *Angelica* Water, in the fame, or larger Dose, according to the Age and Condition of the Patient, and to be repeated as often as the exigency or vehemency of the Disease requires. This Juice given also in a Morning falling, kills Worms in Children. or Elder People, and cures the Falling-bickness if given before it grows too old and strong upon the Patient: when it is given in the Plague, 6c Bittings of Mad Dogs, Vipers, &c. the Patients ought to be in their Naked Bed, and made to Sweat thereupon for two or three Hours or more together.

XII. *The Effence.* It has all the Virtues of the Liquid Juice, but acts more speedily and powerfully, it expels the Poyfon and Malignity by Perspiration, and so defends the Heart and Vital Powers. It is an extraordinary thing to cleanse, dry, and heal green Wounds, as also old and running Ulcers, putrid sores, and virulent Fistula's, destroying the malignity, hindring their eating and spreading, and detaching the Principal Parts and Vital Powers from danger; it is a singular good Cordial, suppresses Vapors, relieves Melancholy, is good against Tremblings and Convulsions, prevails against Swooning Fits, revives the Spirits, and cheers the Heart, preventing it from Palpitations, and other illnesses which oppress it, Dose one or two Spoonfuls in a Glass of Canary, or other fit Vehicle.

XIII. *The Infusion or Decottion in Wine or Water.* Either of them may be given in all the Cafes in which the Juice or Effence are given in, but as they are much weaker in their Effects, so they must be given in much greater Dose, as from a Quarter of a Pint to Half a Pint, and also to be oftener repeated, as the necessity may require.

XIV. *The Electuary.* Take *ladder of Goats-Rue* *Jour Vunces* / *Cedoary in Powder* *Contra-yerva*, *Virginia Snake-root*, all in fine Powder, of each one Ounce *Saffron*, *Cocbenele*, of each two Drams, *Rob of Goats-Rue* twenty Ounces, mix and make an Electuary. It is good against all sorts of Poyfons, both Vegetable and Animal, as also against the Plague, and all other infectious Diseases, and has indeed all the Virtues of the *Liquid Effence* and *Juice**, Dele from one dram to two Drams, in any proper Vehicle.

XV. *The Cataplastm.* It is made of the bruised Herb, fried or made hot with Vinegar, and then brought to a consistence with Mithridate and Powder of Bay Berries, adding also a little Aloes in fine Powder applied to the Region of the Heart, it is good against the infection of the Plague, and other malign Diseases applied to the Navel, and over the whole *Abdomen*, it eases the Cholick, and is very effectual to kill Worms in Children-, applied to, and bound pretty hard upon the Pulses of the Wrists, it is good against remitting Fevers, and cures Agues of all sorts, hindring their return-, applied to putrid and malign Ulcers if it cleanses them, destroys the malignity, (tops the flux of Humors, dries them, and in a very great measure induces their healing) applied to Gangrenes it stops their proceeding,

XVI. *The Distilled Water.* It has the Virtues of the Juice and Effence, but in a much lower degree and therefore must be given in a much larger Dose; however it is used &c. *d. Ythiculim* to convey the for-

mer Preparation in, where the Physician shall judge Wine to be too hot; to nice and delicate Palates the Distilled Water is oftner given than either Juice or Effence.

XVII. *The Acid Tincture.* It has all the Virtues of the Juice and Effence, whether inwardly taken, or outwardly applied-, it is a Specifick against the Plague, as also against all other Malign and Pestilential Diseases, and cures the most violent burning Fevers in a very short time, taking away the violence of their burning heat in the space of an Hour, Dose for many drops as to make the Vehicle pleasantly sharp, and to be given in all that the Patient drinks.

XVIII. *The Oily Tincture.* It is good against the Bittings of Venomous Creatures, being taken from ten to twenty drops in any proper Vehicle ^ it is also good against Convulsions, Palfies, Lameness, Numbness, Tremblings, weakness of the extrem parts, Gripings of the Bowels, Wind, Stone, Gravel, Sand, and Tartarous Matter obstructing the Urinary parts, as also against the Colick, Gout in Hands, Arms, Hips, Knees, or Feet, being inwardly taken, and outwardly applied to the parts affected, as the Skillful Physician shall direct-, in the Palfie, besides giving it inwardly, and applying it to the afflicted parts, it ought also to be anointed upon the Back Bone every Morning and Evening.

XIX. *The Spirituous Tincture.* It has all the Virtues of the Juice, Effence, and Electuary, and as it is finer and more Spirituous, so it is more subtil and penetrating, and when dulcified with double refined Sugar, more pleasant to be taken, and a more delicate Cordial, and therefore more fit to be given to the more curious and nice Palates*, it may be taken a Spoonful or more at a time, (as you may see convenient) either alone by it self, or mixt with some other Vehicle, as Canary, White Lisbon, or other like Generous Wines -, it is indeed an excellent thing against Sickness at Heart, as also against Fainting and Swooning Fits, it is indeed good against all cold and moist Diseases of the Head, Brain, Nerves, Joints, Bowels, Reins, and Womb* it rectifies and enlivens the depauperated Juices, revives the Spirits, tho' never so much oppressed, and gives relief in the most profound Melancholy -, it is good against a Vertigo, and Megrim, and is excellent against a Coma, Coma, and Lethargy, or where the Patient is inclined to Sleepiness and Prowfiness-, and if it is given with a few drops of the Acid Tincture, it suppresses Vapors, and effectually cures Fits of the Mother.

CHAP. CCCXXI.

Of GOATS-STONES,

OR,

HARES-STONES.

THE Names. This Plant is called in *Greek*, *Tragorchis* & *Tragorchis* : in *Latin*, *Tragorchis*, *Tefticulus*, *Uircinus*, *Scincophora*, and *Or chitfour odes* : in *Eng-*

11. *The Kws.* There are two principal kinds hereof, viz. 1. *Tragorchis maf*, *Tefticulus* *Mircinus*, *Scincophora ma**, The Male Goats-Stones. 2. *Tragorchis foemina*, *Scincophora foemina*. The female Goats-stones- These *Onhides* are thus named

only becaufe they have a foul ftrong Scene, like that of the Goat, but alfo that moft of them have long Tails, like Beards, hanging down from them.

III. Of the *Male kind*, which is the *Greater Goats-ftones*, there are two Species, viz. 1. *Tragorchis ma* maxima*. The greatelt Male Goats-ftones. 2. *Tragorchis mas magna*, *Tragorchis vulgar is magna*. The common great Goats-ftones.

IV. Of the *Female kind*, which is the *Leffer Goats-ftones*, there are three Species, viz. 1. *Tragorchis fcemina minor*, *Tragorchis minor vcrior*, The true leffer Goats-ftones. 2. *Tragorchis Batavica Cluffii*, *Tragorchis minor Batavica*, The Dutch Goats-ftones, or *HafeS-ftones*. 3. *Tragorchis minor Aufriaca*, *Tragorchis alt era purpurea*, Auftrian Goats-ftones, Goats-ftones With purple Flowers.

V. The Defcriptions. *T]e firft, or Greatelt Male Goats-ftones, has Rdots confifting of two Teficles, like to other Orchides, but greater, from whence rife up Leaves, lying upon the Ground, which are broad, large, and ribbed in fome fort like to our Plantane, but fomewhat fhorter.* From among thefe Leaves grows up a Stalk, about half a yard high, fet with fuch like great Leaves, but growing a little narrower as they grow higher, growing up even to the top of the Stalk by equal Difances. The Bufh of Flowers grows at top of the Stalk in Spike-fafhion: the Flowers are fmall and flat, open, and wholly of a purple color, fet in a Row, and in an excellent Order _h each Flower has a long crooked Thread or String proceeding from its middle part, and hanging down, which twine themfelves one in another, like to the fmall Tendrils of the *Vine*, or rather the Laces or Strings which grow upon the Herb *Savory*: both the Hood and the Tail are fpotted, and have a ftrong Scent.

VL. *xcfe feconi* or Common great Goats-ftones, *h»*4ax>uble tuberous or teficulouſ Root, like the for*

mer, Javing that theTefick? are fome thing lefs ^ from whence jpring up Leaves, like to thofe of the Garden Lilly, with a Stalk a foot or more long, wrapped about, even to the Tuft of the Flowers with thofe kinds ofLeaves: the Flowers which grow in this Bufh, (hoot forth in a Spike Form, and are very fmall, in Form like to a Lizard, becaufe of the twilted or writhen Tails, and fpotted Heads. Every one of thefe fmall Flowers is at firft like a round clofe Husk, of the Bigneſs of a Pea; which, when it opens, there comes out of it a little, long and tender Spur or Tail, white towards the fetting of it to the Flower _h the reft fpotted with red Dallies, having upon each fide a fmall thing adjoining unro it, like to a Leg or Foot: the reft of the fa id Tail is twitted crookedly about, and hangs downwards. The Leaves of this fort are indeed longer and narrower than the former _h the Flowers are fmall, whiter, and fpotted with reddiſh Spots, and the Tails are more twining. The whole Plant is as ftrong as the firft, and has a rank, (linking Smell or Savor, like the Smell of a Goat, from whence this, as well as the former and all the following, have derived their Names,

VII. *The third, or True leffer Goats-ftones, has its Root or Teficles much lefs than either of the former, with fever al narrower and long Leaves (a little ribbed) riling from the fame, which do as it were encloſe a Jingle Stalk, which is alfo encloſed about with like but fmallier Leaves, to the beginning of the fpiked Head of Flowers? Thefe Leaves are much lefs than thofe of the two firft defcribed, and the Flowers are without Spurs or Tails, and fomewhat like in Shape to thofe Inſe&s called Sows or Wood Lice for their Proportion -, and they are fomewhat of a browniſh color. Gerard ſays, That the Flowers much refemble our common Fleſh Flies. The Smell of the whole Plant does much more refemble the rank Smell of a Goat, than any of the other kinds,*

Viii. *the fourth* or Dutch Goats-fiones, is a very flinty Plant, not much above a Span long or in Height, having a small testiarious Root, like the last: from which rises up a Stalk eight or nine Inches high, having three or four Leaves encompassing it. The top of the Stalk ends in a small spiked Head of Flowers, of a fine purplish red color on the inside, and paler without, having a Belly or Lip hanging down, which is terminated in three-flort and equal parts.

IX. *The fifth*, or Auftrian Goats-fiones, has, like all the former, a testicular Root, which sends forth Lilly like Leaves, of a pale green color, with Come fmailer about the Stalk, which is about a Span high: towards the top it has a spiked Head of Flowers, which are either of a whitish or pale color, without any Spots, or else purple, with some purple Leaves under them, each of which is hooded and eared, with a hanging Belly, notched as it were at the bottom. The whole Plant smells of a rank Goat like Smell, for which Reason it is Brought into the Claffis or Rank with the four former.

X. *The Vlases*. All the forts grow chiefly in fat Clay Grounds, and are seldom to be found in any other Soil. The fourth has been found not only in England, but also in Holland, about the Hague; as also in other Parts, about their Sea-Coasts. The last is a Native of Auftria, and not to be found with us, except in the gardens of the most exact Florists.

XL *The Times*. They flower in May and June, when other kinds of Orchides flower.

XII. *The Qualities, Specification, Preparations and Virtues*, see the fame with the Cyngfor chide s 01 bogs-Rones- in Chap. 226. foregoing, so that no more need be said thereof in this place: but *Lugdunenfis* from *Dofontus* says, That the Roots of these *Orclndes* are preferable to all others.

C H A P . CCCXXXIc
Of GOLD-LOCKS,
O R,
GOLDEN-TUFTS.

I. *np HE Names*. It is called in Greek, *Xf v*: JL in Latin, *Chryfocome*, and *Coma aurea* -5 and in English, *Gold-locks*, or *Golden-tufts*.

II. *T7f IC/WJ*. Authors make several forts hereof, but the following three are chief, viz. i. *Cbryfocome verior*, *Coma aurea Diofcoridis*^ The true Gold-locks of Diofcorides. 2. *Chryfocome lutea*, *Coma aurea*, ff> *Amaranthus luteus Lobelii* & *fuchfi* Yellow Tufts, or *Ceffidony*. 3. *Chryfocome peregrina fecunda Clufii*; *Chryfocome Cretica alt era*, Wild Gold-tufts. The first of these is doubtless the True *Chryfocome of Diofcorides* and *Pliny* •, but is called by several other Names by later Authors, as, *Linaria aurea Tragi*, *Linaria auftriacae Camerarii*, *Ofyris auftriacae Clufii*, *Linfyris imperorum Lobelii*^C^u.

III. *The Defections*. *The first*, or True Gold-locks of Diofcorides, has a Root which is hard and woody, at its Head shooting forth many blackish fibres into the Ground, from this Root spring forth many hard round Stalks, half a Yard high, somewhat thick set, but unorderedly, with narrow, long, green Leaves up to the tops, where they branch forth into

divers small Sprigs, with finaller and shorter Leaves thereon than on thole below, and bearing round Heads of Flowers, composed of Gold-yellow Threads, rising from the middle of a few green Leaves, which are as a Husk to each of them, and abiding a long time in Flower, and also in their full Beauty^ but *Columna* says these Flowers last not full out a Month, at the end of which time, fading, they turn into Down, which, with the small yellow Seed, of a greyish color, flies away with the Wind. The Stalks die and perish yearly, and new ones rise up again in the Spring.

IV. *The second*, or Yellow Tufts, or *Cassidony*, has a small and black Root, with some fibres adjoining to it - from which spring up one or more Stalks, eight or nine Inches in Height, spread cut into several hoary Branches, with long and narrow whitish Leaves, dispersedly growing, thereon, up to their tops, where the flowers appear in Umbles, each Branch bearing a large Tuft of Tealy, yellow Flowers, like a loaf? or sparfed Umble, keeping their color long before they wither, and being gathered in a fit time, when they are in their Perfection, will so abide, and be kept a long time after. The Seed is red, smaller than that of *Marjoram*, and (harper. The whole Plant is of a strong sweet Smell, and very plea^

V. *The third*, or Wild Gold-tufts, has a long, small, slender Root, black and woody, with a pretty many fibres adjoining thereto, from whence Springs up S^TM^ but one Stalk, and sometimes more, growing up to be about half a Yard high, with an hoary Down, having f^TM^ long, narrow Leaves, which are more near together, green on the upper side, and hoary underneath, at the tops grow small Branches, bearing one or two tealy long Heads of yellow Flowers, somewhat like to those of 5^W//>, and consisting of many Threads or Threads. The

woolly Leaf of this Plant refembles *Gnaphalium vulgare*, but chat it is fomewhat broader in the midtlei The Flowers grow cluttering together upon the tops of the Branches, of a yellow color, and almoft like thole of *Maudlin*, as aforefaid.

VI. Note T. Thefe Plants are known alfo by the Name of *Golden Flower Gentle* ^ and by reafon of the long continuance of its Flower in Perf&ion, they are alfo called (but more efpecially the firft and fecond,) *Tellow Everlasting*, and *Flower Ever-lajjing*, alfo *Flower Never-fading* ^ becaufe it fcarce-ly feems to die.

VII Note 2. *John/on* upon *Gerard* has another fort of our fecond kind, *having a long /ender Root, very full of small Fibres : from the Head of which Root jp ring forth three, four, or more Stalks, a Foot or more in Height, which are all of them (almoft up to the tops) very well replenifhed with long, white, downy Leaves, like the former, faving that they are fomeiohat broader. The Flowers are longer, but in larger Umbles, every ways greater, and feem to be of a morefhining Gold color. Thefe Flowers being gathered alfo in their Beauty and Perfetiion, will be cf as long Continuance, and carry their Glory to a* late a Date as thofe at Sett. A. aforegoing.* Whether this be any differing Specie^ from that fecond kind aforementioned, I can hardly determine, they being fo very much like one another, and feem to me to differ chiefly in their Magnitude, which may probably be from the differing Goodnels of the Soil in which they may be found growing •, which felf-fame Difference (from the fame Reaibn) may be obfer-ved in many other Plants, which Authors will never admit to be various Species or Kinds of the fame Plant,

VIII. ^e Places. They grow in moft untilld places of *Greece*, *Spain* and *Italy* h in Meadows where the Soil is barren -, as alfo about the Banks of Rivers. The firft grows not only in *Greece* <fw&

Italy, but alfo in feveral places of *Germany*, in moift, fandy Borders of unmanured Fields, i& *Tragus* fays They are all Strangers in *England*, and only grow with us in Gardens, being nurft up by the Curious. The fecond and fourth grow in *Candy* and *Spain*. The third *Qlufius* found in *Spain* and *Portugal*, and *Lobe/about Mompelic* in *France*.

IX. *The Times*. Tho^ thefe Plants in their native Countries may flower earlier than in our colder Climes, as in *April* or *May* •, with us in our Gardens they flower much later, viz. not till *July* and *Auguft*, and fometimes later (till).

X. *The Qualities*. They are hot and dry in the latter end of the fecond Degree, or beginning of the third •, are both Aperitive and Altringent, h Pe&oral, Hyfterick and Nephritick, and alfo Alexipharmick.

XI. *The Specification*. They provoke the Terms, and forc| away the After-birth ^ refill Poyfon, and prevail againft Convulfions.

XII. *The Preparations*. You may have therefrom, 1. *The Herb it felf* 2. *A Decoffion of the Herb and Flowers in Wine*, 3. *A Pouder of the dried Flowers*. 4. *A hath of the Herb and Flowers*.

The Virtues.

XIII. *The Herb it felf*. It is ufed to be laid in Chefts and Wardrobes, to preferve Garments from Moths and Worms.

XIV. *The Decoffion of the Herb and Flowers in Wine*. Being drunk to fix or eight Ounces once or twice a day, it is faid ro expel all forts of Poyfons, help Cramps, Convulfions and Ruptures, diflblve congealed Blood in the Thorax and Bowels, provoke the Terms in Women, and expel the After-birth.

XV. *The Pouder of the Flowers*. It may be given to two Drams in any convenient Vehicle, as in the *Tin&ure of Catechu* made in Water, or in Red Port Wine, or in a Mixture of Wine and Water. This being taken firft in the Morning failing, and laft at Night going to Bed, it thickens a thin Rheum, prevails againft Coughs and Colds, and flops Catarrhs, or Diffillations of Rheum down the Throat, which fometimes is faid to fall upon the Lungs.

XVI. *The Bath made of the Herb and Flowers^ either in Water or Wine*. It is good to fit over the warm Fumes thereof, for fo it opens Obftrufions of the Womb, and eafes Pains thereof: it gives eafe alfo in the Piles, caufing them to be difcuffed : it eafes them alfo who are afflicted with Pain in the Reins \ gives eafe in the Sciatica, and is very effectual to draw down Vapors, and prevent Fits of the Mother.

CHAP. CCCXXXIII

Of GOLDEN-ROD.

I. **T**HE Names. This is that which is fuppofed to be the *Aspidewv*, *Plinii*: and is called in *Latin*, *Virga aurea*, (becaufe the Stalks being reddifh, make the bufhy tops of Flowers feem as if they were of a Gold-yellow -.) and in *Englijh* it is called, *Golden-Rod*.

II. *The Kinds*. There are three feveral forts of this Plant, viz. 1. *Virga aurea vulgaris*, *Virga aurea angujifolia*, Our common ordinary Golden Rod, which is the *Virga aurea Villanovam*, and is with
K k k . Leaves

Leaves unihpt or imooth on the edges. 2. *Virga aurea jnliis jénatis Camerariia*, Golden-Rod with dented Leaves. 3. *Virga aurea Americana*, Golden-Rod of America, which is not very much unlike to the fecom kind.

III The Defcriptions. *The first, or Common Golden-Rod, ba* a Root confining of a Bunch of very fmall Fibres, which run not deep into the Ground, but abide all the Tear therein. From this Root fpring tip feveral fmall, round, brownijh Stalks, half a Tard or two Feet high, (but higher, if ñ grows in a fat Soil, or in a Garden well manured)* having upon them many narrow and long dark green Leaves, very feldom with any dents about the edges, and as feldom with any Strakes or white Spots upon them ^ and yet fometimes, and in fome places, they are fo to be found, divided at the tops into iome fmall Branches, with feveral fmall yellow Flowers on every one of them, which are turned one way, and not looking fundry ways at once ^ which being ripe, do turn into Down, and are carried away with the Wind : the old Stalks die away and perifh every Year, and new ones fpring up every Spring following.

IV. *The fecond, or Golden-Rod with dented Leaves, has a Root like the other, fmall, and compared of many Strings or Threads -, from which rife up Stdks, cu in the other, not fo high a* the former, but full as great.* The Leaves are fmall and thin, but broader and ihorter than thole of the aforegoing, fmooth, iharp-pointed, and dented about the edges, like a Saw, of a hot and harfli Taftè in the Throat, being chewed in the Mouth s which Leaves grow upon a fair reddifh Foot-ftalk. The Branches bear fuch like Flowers as the firft, facing one fide of their Stalks, as the former does. Theie growing at the tops, are of a Gold-yellow color, from whence the Plant took its Name. The Flowers being paffed away, the Heads turn into Down, and are carried away with the Wind, as the other are.

V. *The third, or American Golden-Rod, has a hoot not much unlike to the former, compofed of a*

Bunch of Fibres or Strings, which abide under Ground all Winter in the fame manner^ loofing all its old Stalks. From this Root fpring up Leaves as large as thofe of the laft, before it runs up to Stalk, being long, but not very broad, yet broadest in the middle, and very fharp-pointed at the ends, and a little dented about the edges, yet not fo much as the fecond -, they grow upon Foot-ftalks, and are of a dark green color. The Stalk or Stalks are a little hairy, rifing higher than the laft, not above a foot and half high at moft, beating on their various tops yellow Flowers, of a Gold-yellow color, facing all on one fide, as the others do -, which being palled away, turn into Downy Heads, and are earned away with the Wind, as all the others are. This Plant is fo like to the fecond, that the Figure of that may very well ferve for this, without any conliderable Error.

VI. *The Places.* The firft grows plentifully enough in feveral places of *England*, in open places of Woods and Copfes, both in moist and dry Grounds. It grows plentifully in *UmpfedrWaoJL* near unto the Gate which leads out of the Wood to *Kentijh-Town*, not far from *London* h in a Wood by *Rayleigh* in *Effex*, near to a Houfe formerly Mr *Leonard's*, dwelling upon *Daws-Heath* h alfo m *Southfleet*, and in *Swainfcomb-Wood* near to *Gravefenl*. The fecond alfo grows in many places of this Land, but not fo plentifully as the former : it is to be found in fome places in *HampftedAVood*, but more fparingly than the former. The lalt* has been brought to us from *America* ^ but from what parts of the Continent, is not known. It grows with us in Gardens.

VII. *The Times.* The firft flowers later than the fecond, but they both flower and flourifh in *July* and *Auguft*. The *American* kind flowers indeed very late in the Year.

VIII. *The Qualities.* *Golden-Rod* is hot HA dry in the fecond Degree h Aperitive, Abfterfive, Atldfligent, Diuretick and Traumatick or Vulneral ^ Neurotick,

Neurotick, Stomatick, Nephritick and Analeptick.

IX. *The Specification.* It is one of the most noble Wound-Herbs, cures Wounds and Ulcers after an admirable manner, provokes Urine, prevails against the Stone and Gravel in the Reins and Bladder \$ Hops Fluxes of Blood in the Lungs, Bowels, Reins or Womb, and is prevalent in curing all sorts of Ruptures.

X. *The Preparations.* You may have therefrom, 1. A Juice. 2. An Effence. 3. A Decoction in Wine. 4. A Powder. 5. An Ointment. 6. A Balsam 7. A Cataplasm.

The Virtues.

XL *The liquid Juice.* It is of good Use to be given against Sand, Gravel, Stone or tartarous Matter in the Reins, Ureters or Bladder, for it provokes Urine in abundance, and so forces away that tartarous Matter which engenders the Stone or Gravel in the Urinary Parts, and causes Sand and Gravel to be voided with the Urine. Dose from two to four Spoonfuls, Morning, Noon and Night, in a Glass of White Port Wine, or other fit Vehicle.

XII *The Effence.* It has all the Virtues of the liquid Juice ^ it also evacuates all raw and tough viscous or tlegmatic Humors, carrying them off by Urine. It is very effectual against all inward Bruises, as also to be outwardly applied to the same. It stops Bleeding in any Part of the Body ; and is an excellent thing for the Cure of Wounds. It stops the overflowing of the Terms in Women, the Flux of the Whites, and heals the Bowels in a Diarrhea, Dysentery, Lientery or Hepatic Flux. It stops Catarrhs, and a Flux of Humors falling down upon any Part of the Body ^ and it is prevalent in curing all sorts of Ruptures in Man or Woman, this being drunk inwardly, and the Cataplasm outwardly applied. It is one of the most sovereign of all Wound-Herbs ; and therefore the Effence thereof, for the curing of Wounds inward or outward, will do as much as any other can : green Wounds, it quickly cures them * and old Sores and Ulcers, it digests, cleanses, dries, and speedily induces their healing, drying up, flopping, or removing that Moisture and Flux of Humors which hinders their Cure. Dose two, three or four Spoonfuls in Wine, or any other proper Liquor.

XIII. *The Decoction in Wine.* It is made of either green or dried Herb : it has all the Virtues of the Juice and Effence, saving that it is not so powerful -, and therefore may be given from four to eight Ounces, dulcified with a little white Sugar, and that Morning and Night. It is an excellent thing to wash filthy, foul and running Sores or Ulcers with, and makes a good Lotion for Sores and Ulcers in the Mouth and Throat, or Privy Parts of Man or Woman: and being often used, it is said to fatten loose Teeth.

XIV. *The Powder of the Herb.* Given to one or two Drams in Red Wine, it stops all inward Bleedings 5 as also all sorts of Fluxes of the Bowels. Strewed upon old, moist Ulcers and running Sores, it cleanses and dries them, strengthens the Part, and if need be, incarnates them, and heals them.

XV. *The Ointment.* It is made as all other Ointments are made, but before it is quite cold, you are to mix with every Pound of the Ointment, two Ounce* of the Powder of the Herb, or an Ounce and half of Tobacco in fine Powder. It is a famous Vulnerary Juring green Wounds in a very short time : and a r Filtula's, old and inveterate Ulcers, and m*V;sn running Sores, it brings them (if need be) W Digestion, cleanses, incarnates, dries and heals

them after an admirable manner, and so strengthens the Part, as to hinder the future Afflux of Humors. It is not inferior to any other Vulnerary Ointment.

XVI. *The Balsam.* It has all the Virtues of the Ointment, but more powerfully cleanses and heals : it ripens Apoplems, and is effectual against Ruptures, being externally applied, and renewed as often as need requires. It is, also a very excellent thing to heal Wounds and Ulcers of the Head, being applied.

XVII. *The Cataplasm.* It is made of the green Herb, with some Powder of the same, and a little Red Wine. Outwardly applied, it stops Bleeding, as also the Afflux of Humors upon any Part. It strengthens weak Limbs, and is profitable, being applied to Ruptures.

G H A P. CCCXXIV.

Of GOLD of PLEASURE ;

OR,

OIL Y--SEED:

I. >~p H E Names. It is called in *Greeks* *Myagv* and *JL* and *pvelvetov* ^ alfb ^^J^v^v^ as *Dioscorides* lays : in *Latin* ^ *Myagrum* ^ *Myagrium* and *Melampyrum*, and in *Engli/b* ^ *Gold of Pleasure* ^ and *Oily-Seed*.

II. *The Kinds.* Authors make about seven kinds hereof, but four of them not being to be met with in *England* ^ or in any of Our *American English Plantations* ^ that I know of, I (shall say nothing of them in this place : of the other three which grow with us,

us, two, ot diem only are properly catted by this
Nc!~ ~ "the third is called, *CameTina* and *Englijb*
Ti , and under the Title of *Ivor/nfeed Eng-*
=y meet with it, which is its proper place.
..u, .. , which we (hall handle in this Chapter,
are. i. *Myagrum Sativum*^ Garden Gold of Pleafure,
and this is (aid to be the *Myagrwn verum Diofcori-*
dis. 2. *Myagrum fylveftre*, *Pfeudomyagrum*, Wild
Gold of Pleafure, or Wild Oily-feed. There is a
great Conteft in Authors about the Names of thefe
Plants, which is both troublefome and unprofitable
to be read * and therefore, being of no Ufe to us,
I (hall wholly decline it.

III. The Defcriptions. *Thejrfi*^GardenGold,
has & Root which is fmall and long, perfifing every
Year after Seed-time: from this Root rtes up one or
more upright round Stalks, about two feet high, Jet
with feveral long and fomewhat narrow leaves, of a
wh'tijh green color, and fomewhat deeply dented a-
bout the edges, or deeply waved, compajfing them at
the bottom. The Stalk or Stalks are fpread from
the middle upwards into feveral Branches, bearing
at their tops very fmall yellow Flowers * which be-
ing fallen, there fucceed in their places fmall flat
Seed-Veffels, containing within them Seed, which,
when ripe, is of a Gold-yellow color, fomewhat
long in Form, fmall, and very fat or oily.

IV. *The fecond, or Wild Gold, ha* a fmall long*
Root, with fome Fibres or Strings adjoining to it,
from whence fprings up but one Stalk, which is round,
and nearly half à lard high, and is fet about with
long and fomewhat narrow Leaves, much refembling
thofe of Woad, but longer and fmaller pointed,
broad at the bottom, where they compafs the Stalk
about, with a point end flicking out on each fide,
fhooting forth many Branches from the very bottom
aimoft, at the tops of the Stalk and Branches come
forth divers whitfli Flowers, very like unto thofe
of Flaxy which being paffed away, fmall round
Heads rilé up, with a fmall Point at the top, very
like in Fafhion to the former, and full of fmall yel-
lowifti Seed, like unto that of Crejfes, exceeding
bitter when it is green or fre(h^ (as the green Herb
alfo is) but when dry, fweet in Tafte, without any
Acrimony, and very fat and oily.

V. *The Places.* The firft grows in fome places
of *Italy* Wild, but yet both they and we do fow it
in Gardens for Pleafure, and in Fields for the Seeds
fake, out of which is preffed an Oil, which ferves
the Poor to Eat, and the Rich for Lamps, and ferves
alfo, with frong Lye of Pot Allies, to make Soap
withal, for which laft Purpofe, in *Germany* they
fow many whole Fields therewith. The fecond is
frequent in *Germany*, molt ufually in all their *Flax*
'Grounds, which being in Stalk like it, (tho^s not of
that Ufe) is accounted a Weed, and caft away, ex-
cept of fuch as fave the Seed, to give to fmall Birds,
when it is ripe. This Seed, whilft green, is bitter
beyond Expreffion; but being ripe and dry, it loofes
its Bitternefs, and becomes very fweet and pleafant,
and is very acceptable to fmall Birds, as Larks, Lin-
nets, Finches, &c. to feed on: alfo by Expreffion,
it yields as fweet an Oil as the former.

VI. *The Times.* They flower in the latter end of
May, and thro³ *June* and *July*, and in *Auguft* , and
the Seed is ripe in *Auguft* and *September*.

VII. *The Qualitrs.* Thefe Plants are hot and dry
in the third Degree ^ the Oil is only hot in the firft
and rather moift than dry. The Oil is alfo Difcuti-
five, Emollient and Emplaflick V Ano'dyn, Arthritick
and Analectick.

Y^h . f^r & r^{ion}. It is peculiar to cure the
ack, and help the Contraftion of the Nerves.

IX. *The Preparations.* You may have therefrom,
T. *The Decoffion of the Herb and Seed*. 3. *The Seed*
it felf. 3. *The Oil of the Seed by Expreffion*.

*The Virtue?**

X. *The Decoffion of the Herb or Seed, or both, in*
Wine or Water. Sweetned with Honey, it is good
for thofe who are troubled with the Cough, Short-
nefs of Breath, Wheezing, Difficulty of Breathing,
the Pleurify or hard Scirrhus Swellings of the Liven
It lenifies the Roughnefs or Hoarfeneis of the Throat
and Voice, making it clear and eafy. The Decoc-
tion in Water is good for Women to lit in, wfoie
Wotnhs arc hard or fwoln, and to bringdown their
Courfes when ftopt 5 as alfo to wafh their Heads
with, who are troubled with Scurff, Dandriff, Mor-
pnew or dry Scabs.

XL *The Seed it felf.* If it is bruifed and taken
in an Egg, it flops Vomiting, and encreafes Seed:
fo alfo the Pouder of the Herb. If the Seed is uled
in Bread, it makes it fweet and pleafant, and gives
it a good Relifh.

XII. *The Oil of the Seed by Expreffwn.* Ufed in
Clyfters, it loofens, the Belly, and is good againft
the Colick: taken in by the -Mouth, it is very fat,
and not very eafy of Digeftion, (being eaten as Oil
Olive) except by Rufficks, and fuch as are accu-
Homed to ^t. It yields a grofs Nourilment, re-
fiores in Confumptions, and quickly makes fat and
flefhy. 11 is good againft Coughs, Hoarfenefs, Short-
nefs of Breath, and pleurifies or Stitches in the Side,
being given from one or two Ounces, to four, fix or
eight. It breeds Flefh and encreafes Seed ^ and is
of great Ufe to anoint the Face or Hands, or any O-
ther Part of the Body, to cleanfe the Skin, and to
take away Sun-burnings, Morphew, Fje^kles, Spots,
Scars, or any other Defcedation of the !Skin. It is
good alfo againft Burnings with Fire, or Scalding
with Water, and caufes an Extention or Relaxation
of thofe Nerves or Sinews which are hard, con-
tra&ed, or *fhxunt* up.

CHAP. CCCXXV.

Of GOOSE-FOOT,

O R,

ARACH Wild, Broad-leavU

I. Hp *HE Names.* It is called in *Greek*, Α^ρα^χη^ς
X **&ri 9rA*7v>/AA», \$ XM'QTW ; in *Latin* *Atri-*
plex fyhejlrlk lauffolia, *Pes Anferis* V *anferinus*,
Chcnopodium Gerardi # *Tabernamontani* h and in
Englijh, *Broad-leaved Wild Arach*, or *Goofe-foot*.

II. *The Kinds.* *Gerard* makes two forts of this
Plant, viz. 1. *Pes anferinus vulgark*, The common
Goofe-foot^ 2. *Pes anferinus laciniator*, The more
jagged or divided Goolé-foot.

III. The Defcriptions. *The firft* or Common
Goofe-foot, *has a pretty long Root, 'divided into fe-*
veral Arms or Branches, befides a great many fmall
Fibres or Strings, from whence rifes up a Stalk, a
Cubit high or more, fomewhat chamfered, and bran-
ched out on every fide. The Leaves are broad, fenooth,
(harp-pointed and fhining, having feveral dee&Cuts
about the edges, not much unlike to a Goofe-fé^N
at the tops of the Branches are long Spikes of Flo^N

ers, which are small, and sometimes inclining to a reddish color. The Seed is small, and grows in Clusters, according to the Disposition of the Spikes, being very like the Seed of other *Wild Arches**

IV. *The second, or more jagged Goose-foot, has a Root almost like the other, but more fibrous, from whence rises up a Stalk, replenished with Branches and leaves, not much differing from the Common, leaving that the Leaves are (harper cut, and more divided * and the Flowers and Seed (which grow in a spiked Form) are much smaller: the whole Color also of the Plant, is of a darker green.*

V. *The Places.* They grow plentifully in fat, moist and (linking places, as upon Dung-hills, and % Highway-fides.

VI. *The Times.* They spring up and flourish in the Spring Months -, flower in June and July, and their Seed is ripe soon after.

VII. *The Realities:* They are cold and moist in the third Degree: Anodyne or something Narcotick, Kopercuffive, Arthritick, -and (as some Authors think) Deleterious, or Wfipk, I suppose, because *it is certainly (as ft) to kill Swine*

VIII. *Use-Specification.* It certainly cures *Ignis facer* or Ant}gnies-fire, and gives ease in the Gout.

IX. *lotpreparations.* *You may have therefrom, 1. A liquid Juice. 2. An Ointment. 3. A Cata* pldijm.

The Virtues.

X. *The Liquid Juice.* Upon the parts afflicted it cools Inflammation; and cures *Antho-niesYm*^ if it is mixed with Vinegar and Nitre, and parts mixed with the Gout be bathed there-with with wa; <i>, it eases the pains thereof, and is very prevaJA.it against Bloody Falls, and Kibed Heels.

JF* T^{ae} Ointment. It has the Virtues of the Li- Juice, but not so fit for *Ignh*\Sacer as the Juice

is, because of its unwholesome body, which that Disease agrees not withal-, it eases all Aches or Pains proceeding from a hot and dry cause, and is very beneficial to be applied to hot Apoptetns, and Disease of the Joints, chiefly the Gout and Oedema.

XII. *The Cataplasin.* If it is made with a little Vinegar, and Nitre dissolved therein, it is an excellent thing to be applied to recent Contusions, to prevent the afflux of Humors, as also to any other part where a Fluxion is present; it stops the spreading of *Antho-nies Fire*, cools the inflammation, and disposes it to healing^ it is also an excellent thing to give ease in the pains of the Gout, and also to cure it, Universals being first premised.

CHAP. CCCXXVI.

Of GOUTWORT

OR,

HERB GERARD.

THE Names. It does not appear to have any Greek Name, unless *TIVKVOM*^OV *Diofceridn* be it, *Brunfelsim* called it *Pycnomos*, *G. fax** *Corohorus quibusdam*, *Covdus* on *Diofcorides Elaphohojco fim* *Uis*^ *Tabernamontanus Mgopodium*, *Tragus Osteritium Sylvestre*, *iff Angelica Vitium*, *Camerarius Angelica Sylvestris Communis*, *Thalius Angelica Erratica*, *Bauhinus Angelica Sylvestris minor*^ *five Erratica*^ *Dodo** *naeus Herba Gerardi*, because in the Low Countries it is called *Gerarnt*, *Lobei Podagraria Germanotum*^ *€Sf Herba Podagraria*^, in *English* it is called *AJh-weed*, *Axweed*, *Gout-Wort*, and *Herb Gerard*, from the Low Country Name*

II. *The Kinds.* There are two several sorts here-of, viz. i. *Herba Gerardi*, *Pvdgrarid* *DUlgrdis*. The Common

Common Herb Gerard, or Goutwort. 2. *Podagraria Hirfuta*, *Herba Pcdagraria Qognata*, *Angelica Sylvefris Hirjuta inodora*, Hairy Herb Gerard, or Goutwort.

III. The Defcriptions. *The firft, or Common Herb Geiard, has a Root which runs and creep in the Ground like Quitchgrafs, foon Spreading over a great deal of room, this is but a low Plant, feldom rifing half a yard high, having feveral like Leaves ftanding upon brownifh green Stalks by threes, as in Mifterwort, but they are fmaller and narrower, and not cut deep in; but only flipped about, and of a ftiong unpleafant Savour at the tops of the Stalks and Branches grow Umbles of Flowers, which are white, which being pall away yields blackifh Seed, fomewhat like to, but lefs than that of Mafterwort.*

IV. *Thefecond, or Hairy Herb Gerard, has a thick fibrous Root, of a blackifh brown Color on the outfide hut white within, enduring many Tears, and of a good Smell, from whence fprings up a Stalk about a Cubit high, blackifh at the bottom, and a little Hairy, fpreading into feveral fhort Branches, bearing Leaves thereon, much divided, like to Wild Angelica, or the former Herb Gerard, faving, that they are more deeply gashed, and of a green Color, and Hairy all over, the Footitalks, as alfo the Umbles of Flowers, are fmall and white, and followed with blackifh Seed.*

v. *The places.* The firft grows by Hedges and Walls Fides, and oftentimes in the Borders or Corners of Fields, and fometimes alfo in Gardens, if it is not plucked up, or Weeded out, it is fo fruitful in its increafe, that where it has once taken Root, it will hardly be gotten out again, fpoiling the Grooiid every Year more than other-, the other grows in fome parts of Germany, and it has been found alio upon the Borders of Wales, and other places;

VI. *The Times.* They both Flower from the beginning of June to the end of Augufi, the Seed ripening in the mean Seafon.

VII. *The Qualities.* It is temperate in reffeft to heat or cold, and drying in the firft degree, it is Anodyne, Affringent, Vulnerary, Difcuffive, a little Repercuffive, Neurotick, Arthntick, and Analeptick.

VIII. *The Specification.* It is ftid to cure the Gout and Sciatica, Weaknefles, and all other Difcafes of the Nerves and Joints.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Effence. 3. An Acid Tintfure. 4. An Oily Tintfure. 5. An Ointment or Balfam. 6. A Cataplafm.

The Virtues.

X. *The Liquid Juice.* It may be given inwardly as a Wound Drink, for it mightily contributes to the curing of ill conditioned Wounds, old Ulcers, running Sores, and FiftulaV, alfo outwardly wafhing them therewith it contrributes to the fame purpofes, for it cleanfes, incarnates, dries, and heals, Gouty parts alfo bathed therewith warm two or three times a day it eafes the pain, but more epecially if it is taken inwardly from three to fix Spoonfuls Morning and Night, in any proper Vehicle-, Ulcers in the Lungs, Guts, or other Bowels, it likif, cures.

XI. *The Effence.* It has all the Virtues of the Liquid Juice, but more efficacious, and better to be taken than it, becaufe of its finenefs; it cures Diarrhoea's, Dyfenteria's, Lienteria's, as alfo the Hepatick Flux, being timely giv^i in a Glafs of Spirit of

Angelica, the greater Compofition. Dofe three or four Spoonfuls Morning and Night.

XII. *The Acid TinSure.* It redifies the Juices in the Stomach and inferior Vifcera, deftroying their Tartar and Vifcofity, which being thruft forth into the Joints, breeds the Gout and Sciatica, it comforts the Stomach, caufing a good Digeftion, opens Obftu&ions, cleanfes, and evacuates the flimy matter by Urine. Dofe from twenty to forty drops in a Glafs of Ale or Wine* as often as the Patient has an occafion of Drinking.

XIII. *The Oily Tintfure.* Inwardly taken from teh drops to twenty five, according to Age and Necessity, in a Glafs of White Port Wine or other fit Vehicle, it powerfully opens the Ohftuitions of the Urinary parts, caufing a free Piffing, and thereby carries off the tartarous, vifcous, or flimy matter which breeds the Gout, Sciatica, Stone, and Gravel* bathed upon the Punaure of any Nerve, it eales, the pain and foon cures it, it is good alfo againlt Con*vulfions, Cramps, Palfies, numbednefsof any Member, (ffc. being well bathed upon the Badt Bone Morning and Evening, and likewise upon the pare affeaed, rubbing it well in before a good Fire.

XIV. *The Ointment or Balfam.* It cures Simple Green Wounds, and old Ulcers, of what kind foever, it abfterges, incarnates, and heals them after ah admirable manner, it draws Splinters out of Wounds, and Thorns or Prickles gotten into any part of the Flefh^ applied to any part affixed with vehement pain it prefoitly gives eafe, and being continued upon Joints affliaed with the Gout it cures it, and ftrenghens the part affliaed-

XV. *The Cataplafm.* Applied to Simple Contufions it difcuffes them, and prevents their Apoftemating, gives eafe in the Gout, abates Inflammations, difcuffes the prefent matter, and prevents De-fluxions of Humors^ it is an extraordinary thing # be applied to the Forehead, to cure fore, running and watery Eyes, fyc.

C H A P. CCCXXVII

O/GRASS, or H fe R B AG &

This name is given to a great number of different Plants, which are all called by the name of Grass, it is found in all parts of the World, and is the most common of all Plants, it is used for many purposes, and is the chief of the principal Kinds are the thirty five following, Viz. I. *Bent-era/s*. 2. *Canary-Grafs*. 3. *Catstail-Grafs*. 4. *Corn-Grafs*, j. *Cocksfoot-Grafs*. 6. *CaponsUlGrafs*. 7. *Cotton-Grafs*. 8. *Crejied-Grafs*. 9. *Cyperus-Grafs*. 10. *Darnel-Grafs*. 11. *Dogs^Grafs*. 12. *Dwarf-Grafs*. 13. *feather-Grafs*. 14. *Foxtail-Grafs*. 15. *Fern-Grafs*. 16. *Hairy-Grafs*. 17. *Uaver-Grafs*. 18. *Hedgehog-Grafs*. 19. *Kneed-Grafs*. 20. *Meadow-Grasf**. 21. *Mountain-Grafs*. 22. *Millet-Grafs*. 23. *Oat-Grafs*. 24. *Fanhick-Grafs*. 25. *guakwg-Grafs*. 26. *RuJlj-Grafs*. 4-j. *Reed-Grafs*. 28. *aba-Grafs*. 29. *Silver-Grafs*. 30. *Spiked-Grafs*. ^*Toad-Grafs*. 52. *Water-Grafs*. 33. *Wool-Grasft^A** *Way or Wall-Grafs*. 35. *Woolly-Grafs*. The Dt

criptioiis of all which Species, with their variou
forts, you fhall have in the following Se&ions.

*Gramen Arvcirton venti Spiv a, Gramen ScopuU,
vel Scopularium, Bent-Grafs, or Bents.*

III. The Defcriptions. *This is afinguldr Plant
of its kind, and called by Gerard Harundinaceum,
because its luifhy top ha* Pannicles re/emblihg tbfef
of Common Reed, it has a /mall and Fibrous Root,
ind grows up to be a Yard or an Ell high, with many
thin Graffy Leaves here and there jointed, and its
tufted Heads or Pannicles, fpread almoft like unto
the Sprigs of Feathers, ftanding for the moll part all
one way, and hanging down their Heads, of a fine
brown fhining green Color, which are, being fine
and (lender, eafily rtiaken with the Wind, trom
whence fome call this in Engliſh Windgrafs^ this
is that Grafs which the vulgar commonly call Bents,
of which many Country People make Befoms, and
is many times ty'd in rows together, and ferves in
Summer time to be fet againft the backs of Chim-
neys, to deck up, cool, and refrefh the Room^ it
is Gramen Praten/e tertium Dodonai, and Gramen
Arundinaceum arven/e Tabernamontanu*

*Phalaris, Canary-Grafs, feven Species,
three true and four baftard.*

< *Phalaris vulgaris, Common Canary-Gra/s,*
has a fibrous Root, dying*with us every Winter,
and therefore is but an Annual Plant, to be new Sown
every Year-, it has jointed Stalks half a Yard high,
with Grallie Leaves on them like Barley, and at the
top a long round Chaffie Head, fomewhat pointed
above, whofe Bloomings are yellowifh, wherein lies
flat, round, fhining Seed, bigger than Millet, and
lefs than Lin/eed, of a yellowifh Color and fome-
what like to the Seed ofSe/amum.

V. 2. *Phalaris Semine tiigro, Canary-Gra/s with
blackifh Seed.* The Root hereof is like, and perifhes
as the "i>ther, it differs not from the former, but
in beiD3 lbmewhat leffer, both in Stalk, Leaf, and
He^; but chiefly in the Seed, which is of a pale,
fhining Color-

VI. 3. *Phalaris bulboja Semine Albo, White bulb-
ed Canary-Gra/s,* has a Root confuting ot many fmall
white Bulbs, or rather tubers, growing in Tufts to-
gether, with long Fibres defending from them,
whereby they are faftned ftrongly in the Ground, and
die not every Year, as the others do, but encreafe
into great Tufts ^ the Grafs grows very like the for-
mer, but with fmaller, tenderer, and taller jointed
Stalks and Leaves on them, and at the Rogts are
more foft and gentle, the fpiked Heads are fmaller,
and a little longer, and grow not full out fo clofe
together, bft-are'fofter in handling, and bring forth
fmaller and whiter Seed than the others.

VII. 4. *Phalaroides majus, Gramen Phalaroides,
vel Alopecuroides, Jive Italicum maj us, The greater
Baftard Canary-Gra/s,* has a Root fmall and Fibrous,
perifhing every Year, and grows up very like to the
true Phalaris, or Canary-Gra/s, both in Stalk, Leaf,
and Head, but that the Stalks are fingle, and with
fewer Leaves on them -, the Head alfb or Ear is fmal-
ler, hoary, and fofter, and the Seed not much un-
like.

VIII. 5. *Phalaroides minus, The leffer Baftard
Canary-Gra/s,* is in all things like to the laft, but
the Ear or Head is fmaller and longer, and the Leaves
do fo encompafs the Stalk at bottom, that it feems
to run thro' them, as thro' a Trunk.

IX. 6. *Phalaroides Spied molli, Gramen Phala-
roides Germanicum, Soft headed Baftard Canary-
Gra/s,* has a Fibrous Root, from which Iprings a
Stalk, or Stalks, of a Foot and half high, fome-
what larger than the laft, with a Joint or two there-
Mi, and fhort Leaves at them, encompaffing the Stalk
at the lower end-, the Head is fhorter and fmaller
than the laft, of a fhining Afh Color, and foft to
the feeling.

X. 7. *Phalaroides Spica nigfutio) e, Baftard Ca-
nary-Gra/s with a more hairy Spike or Ear.* It has
Perennial Fibrous Root, from whence fpring up
Stalks and Leaves like the laft, but furnished with a
greater ftore of Leaves and Stalks, the Spiked Head

is alib longer and narrower, and fet with short Hairs.

XL *The Places.* All the three first sorts have been found growing in *Spain*, and brought to us by *Beel*, with some of the *Batard* sorts, the first has been known many Years, and was brought from the *Canary* Islands with those sweet Singing Birds called *Canary Birds*, which feed upon this Seed; *Lobe I* says that it grows in *Provence* in *France*, the second *Baichint/s* says came to us from *Malta*, where those Birds feed on it, all the first three grow with us in our Gardens; the fourth grows as well in our Fields in *England*, as in other Countries, the fifth and sixth grow about *Vlmes*, where they are frequent, and call them *Onocordon*, from their color: where the seventh grows is uncertain.

XII. *The Times.* They all of them flourish in the Summer Months, and their Seeds are ripe in *July* and *August*.

XIII. *The Virtues.* *Canary Seed* in some Places and Islands is made into Bread, which nourishes much like that of *Millet*, or rather less, and therefore to mend it, some mix it with *Wheat*, that the Bread may be the better, which otherwise would be apt to crumble and dry. *The Liquid Juice* or *Effence of the Herb*, are good to ease the pains of the Stone and Gravel, open Obstructions of the Urinary parts, and abate the scalding heat thereof. *The Cataplasm of the Seed* has the Virtues of that of *Millet*, and is good to dry and repress the flux of Humors upon any part.

XIV. i. *Or amen Typhoides, vel Typhinum maximum, The greatest Catstail-Grass*, has very small Roots, compared of many small Skins or Threads, which may be easily taken from the whole Root, from which rise up very fair large Leaves, like *Wheat* and triangular Stalks two Feet high, or more, on which grow long, round, spiked Heads, four times

larger than those of the following Kind, and almost of an equal bigness and roundness from the bottom of the Spike to the top, this Plant is sometimes found with Stalks four or five Feet high, and the Spike somewhat shorter, and smaller at the top.

XV. 2. *Gramen Typhinum minus vulgatifimum* The lesser most common *Catstail-Grass*, has Roots which have small round Heads, like Tubers or Bulbs, from the Heads of which spring forth the Leaves and Stalks, this is the most common with us, and differs not from the former but in the Roots, this being bulbed, as aforesaid, and in magnitude, the Stalks in this rising not above a Foot high, and the round Spike not being above two or three Inches long.

XVI. 3. *Gramen Typhinum minus, The small Catstail-Grass*, has for its Root a little Bulb, or Bulbs, from whence rises up the Stalk, about two Feet high, set at each Joint with long Grass-like Leaves with a Spike or Ear four or five inches long, wholly and handfomly made, like the former, it differs not from the last, but in having a greater store of narrow green Leaves, a longer Stalk, and larger forked Heads.

XVII. *The Places* They are all of them found in many places of *England*, but mostly in watery places, and near Watery the third is found growing plentifully in many places about *Union* as by the Bridge entering into *Chelsea Field*, as you go from *St. James's* to little *Chelsea*.

XVIII. *The Times.* They flourish and Seed in *June* and *July*, keeping the same time with other Grains.

Gramen Segetum, vel Segetale, Gramen Corn-Grass, or *Wheat-Grass*, six Kinds.

XIX. I. *Gramen Segetum vel Triticeum latifolium Spica compaUa* Broad Leaved *Wheat-Grass* clove Ear'd, has from a Fibrous Root a Stalk, or stalks spring up, about half a yard high, having two

three Joints, and fair Wheat-like Leaves at them a Foot long, bearing at the tops a longer Spike or Ear than *Wheat*, and broader, made of several parts, like the Husks of Corn, but separated more afunder, thereby thewing it to be a Graft, and no true Corn, yet the Spike grows clofer than the next, and without any ihew of Awnes or Beard thereon.

XX. 2. *Gram en fegetale, vel Triticeum latifolium Spica divulfa, Broad-leaved thin-ear*d red Wheat, Grafs.* It differs little from the former, but in the Spike, which has the fmall parts thereof more separated, and fet on both fides of the Stalk, and aimed every one with a fmall fhort Awne or Beard.

XXI. 3. *Gramenfegetale, velTriticeumanguftifolium Spica compaita, Broad-leaved doje-ear*d red Wheat Grafs.* It has a Stalk which is fsmooth and round, two Feet high, fet with long narrower white Leaves, rough and pointed. The Spike is about a Span long, fomewhat like unto *Red Wheat*, clofely fet, but each* of the Husks has a (harp rough Awne thereat.

XXII. 4. *Gramen feget urn, vel Triticeum angustifolium fpic a mutica, ^Narrow-leaved or Rujh-leav*d white-ear*d Wheat Grafs, without Awnes.* It has a Root which is white, knotty and creeping * from whence fpring up Leaves which are long and round, like *Rufhes*, and pointed at the ends, fet on round Stalks, a Foot and half high, whofepiked tops are long and flender, without any Awnes at the tops of the Husks, and fomewhat like unto *White Wheat* without Beards.

XXIII. 5. *Gramenfeget um, velTriticeummajits/pica Briza, The greater Spelt Wheat Grafs.* Its Roots and Stalks are like unto *Corn*, four or five Feet high, or more, fet with narrow Leaves: the tops of the Stalks have feveral long Spikes, about a Hand breadtk long, fet on both fide of them, one above another, each whereof is very like a fmall Ear of *Wheat*, armed with fmall Awnes, but very fhort.

XXIV. 6. *Gramen feget um, velTriticeumminus/pica Briza, The lejjer Spelt Wheat Grafs.* It grows not above an Hand breadth high, with fmall, fhort, foft and hoary Leaves ^ and at top of the Stalk there is fometimes but one, and Ibmetimes two or three Spikes or Ears, of an Inch long, and bearded,

XXV. *The Places and Times.* They grow in many parts of *England*, in Paftures and C#fn Grounds in *Kent*, not far from the *Thames* •, and flourifh and feed in the Summer Months, when other *Graffes* do.

V. 'I^V^0 ^ *Ifch&mon& Gramen Ifchamon, Jive Dazy bides, Cocks-foot or Finger Grafs, Six kinds.*

XXVI. i. *Ifch&mon fylveftre folio latiore, Common Cocks-foot Grafs.* It is called, *Galli Crm Apulgn*, and has a Root confifting of a great many fmall fibres-, from whence fpring forth feveral clear, reddilh, jointed Stalks, with fair Grafly Leaves on them, a little dented on the edges, broad at the bottom, and fmall at the end, of a harfh or binding Taite. At the tops of the Stalks grow divers long, flender, rough Spikes, of a glittering purple, or rather *Violet* color, but of a brownifh color when they are ripe, and are divided into four or five Spikes, which are fspread or ftretched out abroad, like a Cock's Foot, when it is fet down upon the Ground, or the Fingers of a Man's Hand, when they are fspread abroad.

XXVII. 2. *Ifchmonfylvejirefpicis Villofis, Wild Cocks-loot Grafs, with a bearded or hairy Spike or Ear* ' Its Root is a Bufh of Fibres, like the other: *Jtrbas* purplifh Stalks, a Cubit high, with fewer,

and much narrower Leaves on them. The fpiked Heads are more in number than the former, and more hairy, having, as it were, fhort yellow Beards, fet on both fides of the Panicles, in which lye die Seed.

XXVIII. 3. *Ifchdimonfativum, five Gramen manno, Efculentuw, Gramen acukatun ThaVu, L:ramentum Germanicum Cordi,* (upon *Diofcorides*) becaufe they account it *Oryz<z Specie's* -, *Sanguinaria, San* guinella*, and *Capnola Italica, Deiv Grafs.* It has a Root greater and more bulhy than any of the former, the whole Plant differing from the two aforegoing no otherwife almoft, than a Manured Plant from a Wild. It has fair jointed purplifh Stalks, and large *Grajfy* or *Reed* like Leaves on them, fomewhat hairy or woolly at their bottoms >0 and about the Joints at the tops of the Stalks ftand larger Spikes or Pannicles, and more allb fet together than in the former, which are made of many fmall, chaffy Husks, with long white Seeds in them, fomewhat greater than *Millet*, and lefler than *Rice*, Handing all, as it were, on one fide.

XXIX. 4. *Gramen fcoparium Ifchfimi panicul, Befom or Brujh Grafs.* It has a Root confuting of many very long h5rd Fibres or Threads, a Foot and half long, or more, (whereof are made, in *France*, where it grows naturally, thofe kinds of Bruflhes with which we ufually bruffh our Heads, ©V.) the Stalks are hard, flender, and jointed, about a Cubit high, with fmall long Leaves on them, like unto the fecond *Ifchmon* aforegoing, but fweeter in tafte; at the tops of the Stalks Hand five or fix, or more, bright long Panicles, like unto the *Cocksfoot*, but larger, flatter, and lefs dented.

XXX. 5. *Gramen Ifchxmon Canarium, Dogs-Grafs like Cocksfoot.* It has running jointed Roots, like to the *Common Quitch-Grafs*^ and *lb* both Stalks and Leaves fomewhat refemble it, fo that it might have as well been enumerated among the *Quitch-Graffes*, or *JDogs-GraJjes*, as among the *Cocksfoot-Graffes*^ becaufe it is, as it were, indifferent between them both-, but the Head is diiperfed or fspread into fuch like flender long Panicles as the *Cocksfoot-Grafs* is, the fmall Chaffie Husks whereof contain the Seed.

XXXI. 6. *Gramen DaUylon repens, Creeping Cocksfoot-Grafs.* It has a fparfed thready Root*, which fends forth many long, flender, and weak Branches, trailing or creeping upon the Ground, and fhooting forth Roots at the Joints •, the LeaAes which grow at the Joints are fmall and Graffe, long and narrow ^ and at the tops of the Stalks, which rife not much above a Span high, four or five fmall, flender, blackifh Spikes or Ears come forth, within the Husks whereof the Seed is found to lye.

XXXII. *The Place and Time.* The two firft Kinds are found growing naturally in feveral places of *Italy*, as alfo at *Narbone* in *France*, and in divers places of *England*, but the third is ufually Sown in Fields, 0 *Corn*, in many places of *Germany*, where with the Seed thereof they make Pottage or Broth, as we here in *England* do with *Rice* and *Oatmeal*, and it is fent into *Middleburgh*, and other Towns of the Low Countries in great Quantities for the fame purpofe, as *Lobel* has affirmed, but with us it only grows in Gardens, tho' fhould we Sow it as the *Germans* do, in Fields, it is probable that it might thrive full as well with us as it does with them, the fourth, fifth and fixth grow in *France*, but with us chiefly in *Gardens* •, the fifth has been found growing in *Spain*, and the firft *Gerard* fays he found growing upon the Hilly Banks near *Greenhith* in *Kent*, and that it grows upon the rough JBanks of Fields, 2V. They all Flourifh and Seed in the Summer Months when the other *Graffes* do.

The Virtues*

XXXIII. i. The Liquid Juice. Put into the Kyes which run and water, or where is a Derluxion of Rheum, caulng rednefs or blearednefs, and drunk, chiefly the Juice of the Dew-Grafs, it difcuffes the hardnefs of Womens Breafts, efpecially being al- 1b bathed thereon. 2. The Cocksfoot Quitch-Grafs, has all the Virtues of Quitch-Grafs, to be difcourfed of in fome of the following Chapters of this Book. 3. The DecoiTwn. It is of ufe (made of the Roots in White Port) to expel the Terms, and it drives thr the Meailes, Small Pox, and is good in the Purples, Spotted, and other Peftilential Fevers. 4. The Ointment or Balfam of the Roots and green Grafs, is good for the Bitings of Mad Dogs, difolves hard-Tumors, and not only heals green Wounds, but alfo old Ulcers. 5. The Cataplam of Herb and Roots applied to any place which bleeds, itops the Blood prefently, whether it be from the Nofe, or a Wound.

VI. A*EK74r*yt Gramen murormm Spica longiftma. Gramen Spica nut ante longijfima, Caponstail-Grafs, or Grals with a long bending Spike, a fingle Species.

XXXIV. This Gramen murorum Spica nutante w qjingularPlant, which ha* a fibrous or stringy Root, jem which arifes Leaves long and narrow, like othe Grafs Leaves, which by Time and Age growing old, grow fomewhat rounder, of thofe of Spartum, or Matweed; from among thefe Graffie Leaves there grows up -4. (lender Stalk about two Feet high, fcarce-iy ltanding upright, but oftentimes hanging down its Head, or top of its Ear, after the manner of a Capons Tad; this Stalk has two or three fmall Leaves at the joints up to its top, where grows a very long opike, bending a little downwards, compofed of fmall and hairy Tufts, which s row of a & eralrh or whitijh Color being ripe, containing within them fmall whitijli Seed. This was found out by Mr- Good- yere.

. XXXV. The Place and Time. This Elegant Grals Mr. Goodyere found growing upon the Walls of the Ancient City ofWinchefier, and was not de- foibedby any Author before him, he gave it the Name -, Gerard had fome of the Seed thereof, which he did Sow, which grew up, took root, and flou- nished, Seeding in the Summer Months.

VII. K«wK«r; quondam, Gramen Tonvnttfum- velTomentarium, Cotton-Grafs, or Cotton Reed- Grafs.

XXXVI. It is a fingnlar Plant of the Kind, ha- ving a Root fomevhat'hard and rough, very tough, fmall and thready, with many long libres tffuing from it. This Cotton Reed-Grafs is in ragghnefs, diynefsj and form of the Leaves, not much unlike to foptail-Grafs, called Pseudofchxnanthum, but much greater, and not Downy -, the Stalks rife up to be three, four, or more Feet high, and but with few Joints, which are rough, garnifhed with many hard Graffie Leaves, bearing at the top Heads, which are Spiked, fet all along a Panicle, reddifh for fome time, but growing to ripenefs, are of a fining Sil- ver like whitenefs, and as fbt as Wooll in hand- ing, from whence it took the Name. This De- Jcription is according to the Dutch Copy* tranflated by Lobd himfeit:

J* A ? VII The places h g^ws in the borders of dry helds, and by Hedge fees, in many Coun-

ties of England^ efpecially in Dorfetjhire -5 Gerard fays it grows upon Boggy and iich like Moorifh places, and is to be feen in Bogs upon Hampfted Heathy it grows likewife in Uiggate Fark^ near London. This with long fpiked Heads is doubtleis the Gramen Tomentofum Arundinaceum of Gerard^ defcribed in Lib. i. Cap. 9.

VIII. EvAos6^a>r*, *} *&y\$uris %V^N% Gramen Crijfla- tum^ Crefted-Grafs, or Cockscomb-Grafs, four Species,

XXXVIII. 1. Gramen Crifatum lene, Smooth, Crefted, or Cockscomb-Grafs, has white Roots, which Mat themfelves in the Ground very much, from whence fpring up divers fsmooth flender Stalks, two Feet or more high, with few, or no Joints on them, and with fmall fiort green Leaves at them •, the tops of the Stalks have flender long fpiked Heads, divided into many parts, each whereof is like unto the Cref of a Bird: this Ear, fays Gerard, is fmall, long, of a pale green Color, fomewhat bending, fo that in fome fort it refembles the Comb of a Cock, (whence the Name) or the Seed Vefel of that Plant which is called Caput Gallinaceum: the Spike or Ear is of a pale yellowifh green, and fometimes of a reddifh Color, which made Bauhinus to compare it to Crijja Galli, or Cocks-Comb. This is Gramen Pratenfe Crijiatum, Gramen Spica Crijfata Bauhini.

XXXIX. 2. Gramen 'Crijiatum Snbhirtutum, Hairy Crefted-Grafs. This feems to be a Species of the former, and differs from it only in thefe particulars, the Roots are of a reddilii yellow color, the Stalks are lower and fmaller, and a little Hairy or Woolly at the bottoms, with longer Leaves, and a more fparfed white Head, not fo finely fet toge- ther, and grows rather among Hedges and Bufhes.

XL. 3. Gramen Crijiatum Anglicum, Englifh Crefted-Grafs. This has fewer and long« Roots, not matting and increafing in the former manner, the Stalks are fraight, with longer and nai rower Leaves on their^ the Spiked Head differs frotothe former, in being longer and clofer fet, and not fprect into *

into Tims, but as it were into clofe short Husks, the whole Spike fomewhat refembling a finall long Foxtail-Grafs.

XLII. 4. *Gramen Criftatum Spica muhiplici* Double English Crested-Grafs. This is very like the laft in its Roots, Stalks, and Leaves, and feems to be a variety of the fame, but it differs in this, that it is fspread out in its top, and parted or divided into feveral fmaller Spikes from the greater main one, otherwife very little differing from it in any thing elfe.

XLIII. The \forall laces and Times. The firft of thefe is ordinarily to be found in Meadows about Midsummer time, that, as alfo the fecond, ufually growing in Fields and Pastures, and near Hedges and Bushes, and places near them-, the third grows plentifully in many By-places near Hackney, not far from London-, the fourth being a vaiiety of the laft, is found growing always not far from the places where the third grows-

XLIIII. i. *Cyperus Typh'inm Gerardi, Gramen Typhinum Tabernamontanum Gramen Typhoides Spica Bauhini* C<xstail Cyperus-Grafs. It has a buiny Koot, from whence fpring forth many long, narrow three fquare, hard green Leaves, among which rife up ftiff green Stalks, half a yard, or two Feet high, or better, with fome Joints and Leaves at them, not much unlike to the Common Reed} at and towards the tops of thefe Stalks grow two or taore long (lender rough Heads, growing one above another, Spike fafhion, almolt refembling a Cats Tail, very chaffie, rough and rugged, of a dark een, pending to Purple.

XLP. 2. *Gramen Cyperoides anguifolium majm* The/heater narrow Leav'd Cyperus-Grafs. It has a retfonable frong Fibrous Root, from whence ftiff, long, and narrow Leaves, like thofe of other Cype-

rus-Graffesipring; the Stalks alfo, (as it is proper to all the Plants of this Kindred) are three fquare, bearing at their tops three brown if h Ears, fott and chaffie, like the reft of this Kind, itanding upright, and not hanging down, as fome others do.

XLV. 3. *Gramen Cyperoides Sylvarum Tenuius Spicatum, Slender Ear'd Wood Cyperus-Grafs.* It has a great yellowifh and fibrous buihy Root, front whence fpring three fquare Stalks, a Foot or more high, with fair, but hard and rough Graffié Leaves, four or five Inches long*, the Spiked Heads which grow at the tops are many, one above another, {lender and long, yet fome more than others, fome one Inch, fome two Inches, orlefs, of a yellowifh green color, with long yellowiifh Seeds in them.

XLVI. 4. *Gramen Cyperoides elegans Spied multifera, A fine or beautiful Cyperus-Grafs with many Heads.* It has a thick fibrous Root, which fends up {lender triangular Stalks, about two Feet high ^ the Leaves are long and narrow, with a long pointed Spiked Head, made of many fmail ones, *ib* clofe fet together, that they feem to be but one Spike or Head.

XLVII. 5. *Gramen Cyperoides echinatum Montanum, Mountain prickly Cyperus-Grafs.* It has a thick buhy fibrous Root, as the thrmr, which fends up three fquare Stalks, about a Span long, or not much more, the Leaves below and on them are very long and narrow, the Heads are fhort, with many rough Burs on them, Fome feperated and fome clofe.

XLVIII. 6. *Gramen Cyperoides sparfa Yamcula, Land Cyperus-Grafs with a dffperfeJ Tuft.* It has a Root which is full of Fibres, which lends forth long Leaves, of a brown green color, and Fomewhat fiat, between a *Rufh* and a *Jprafs*; the Stalk is alfo fomewhat more flat than fquare, fometimes but half a yard high, fometimes three, four, or five Feet high, the top whereof is furniied with a large round fspread Panicle, made of marly parts, and each fmail prickly Head ftanHing on a {lender Footlhk, which is oftentimes bent down with the weight of the Heads.

XLIX. 7. *Gramen Cyperoides parum Lancfum* Cyperus-Grafs a link Wooly. It has a Fibrous Root, which fends forth {lender Stalks, about two Spans high, the bottoms of them being a little Wooly, and having at the middle only a Joint with a Leaf, the lower Leaves are fet clofe upon the Ground, three or four Inches long, fomewhat like thofe of the *rafs-Growfoot*^ the heads of the Stalks have fmall round, fhining Spikes or Ears on them, of a pale brown Color, with a fmall long Leaf under every head: This is *Gramen Cyperoides parvum*.

L. 8. *Gramen Cyperoides Norwegicum, Norway Cyperus-Grafs.* It has a number of long narrow Leaves, fome three or four Inches, others fix or feven Inches long} the Sfelks are clear and fmooth, half a yard high, bearing at the top many Cone like Heads, ft clofe together.

LI. 9. *Gramen Cyperoides Spicatum Lütifolium; Broad Leaved Cyperus-Grafs.* It has long black creeping Roots, with many Fibres at them, very like unto the fweet long *Cyperus*, and has broad Leaves, almolt a Foot long, among which come forth the Stalks, being about a Foot high, which bear three Chaffie Spiked Heads at the top, of an Inch, or Inch and half long, of which the middle-moft is the longeft, each of them like unto the fmall *Catstail-Grafs*.

LII. 10. *Gramen Cyperoides latifolium alterum, The higher broad Leav'd Cyperus-Grafs.* It has a Root which is fomewhat long, bufficaly, with many long Fibres adjoining thereto ^ the Leaves are a9 long as the laft, but the Stalks are much higher, bearing at the tops four or five fmall lotig Fars of

and encmpaffing the Stalk alib at their bottoms-
the top :. liedwitha large Tufted Head, (at-
moit iikethe *True Cyperut*) and greater than ispro-
ponion;H to the Plant, whets two or three pretty
large Leaves come forth, between which rife up
falcs, very much Branched, which
nauy black Seeds, ibinewhat V^s Millet, or

LV. IJ. *Gramen Cyperoides Palufire Vnnkuh*
fperfa, Aqualum vplg-atim JAelij, Marjh Cyperus-
Graft viibfparfed heads. Ir has a Root which
ipreads fomewhat like the *True Cyperut*, but harder
fuller of bladrih Fibres, and without ihell, the
Leaves ate.long, and fomewhat narrow hard and
cutting on both edges; the Stalk ^triangular, tail,
wuhoutany Leaves thereon tothe top, where, be-
twel long Leaves, and verv narrow, divers
Ihort Footfialks thread forth, bearing each of them
four or five (mall rough Heads.

LVL 14. *G L i i*
untam mquctum Thai];, The greaser Merjb
ts-Graft The Root is a bufh of many black-
tin fibres, like unto *Graft* Roots, it has feveral long
and narrow hard cutting Leaves like the laft, and
among them divejs upright Stalks, without any
" all on them, each of thembeacuiga Long,
round, and (bmewhat large prickly head, in which
lits the Seed.

LVII. ij. *Gramen CyferoiAfs Palufire minus,*
P ty" Marfh Cypcrus-Gref*.* The Root of this
* like unto the former, but is lefTer as is the whole
Plant; the Stalk bears (harp, rough, fpiked heads,
four or five together, one above another, on both
bsteoE with a long Leaf at the foot of them.

LVIII. 16. *GrMtnCyperoWesPahftrefpKkmi-*
nutcompaSis The *lejfir Marjb Cyperut* with more
tiU. Its Root is ftmewhar hard or woody,
and full of Fibres, bearing many long and narrow
Leaves, like to *Grafts*-, among which riles up a
Tou^li thretifquare Stalk, bare of Leaves for the
moft part up to the top, where Hand feveral (mall
rougii Heads or Spikes, more loofe or open than the
former, having fliaip pricking Seed within them.

LIX. r 7. *Gramen Cyperoides Palufire Substavef-*
calc Pii'imla fparft!, Carex BAHUS Lonicerut, Tel-
Mtirjb Cyperut-Grafts open headed. The Root
is great at the head, wiith feveral Fibres thereat, it
has finuller and fhorter Leaves than any of the for-
mer, and naked Stalks, bearing at die tops of the
Stalks, between two Jinal long Leaves, a head fe-
vered into many fmall parts or fpikes, of a yellow-
or. Of this fortthere is another, differing
it, but in the color of the fmall
Spikes, which are blackifL

LX. ri. *Gramen Cypcrnda Palace majgt laii-*

folium Lobeft) £5 Otmcrarij, Carex Tr,?gi & Lugd-
nexjis, The greater broad i.em>'d Cyferus-Gr/ift- It
has a urownth Root, and folding it ieif one within
another, with many Fibres adjoining, it has feveral
large and long Leaves, like unto rlioiie of *Reeds*, a-
mong which rile up feveral thieefijiaie Stalks, bear-
ing three or four clofe fpiked browniff heads there-
one above another. There is another of this
eat broad Leav'd kind, called by *Baub'ums Gramen*
yperoiAes majits htifolmm^ fpka Spodkea viridi,
whofe "Roots are more bufhy and fibrous, and the
fpiked heads more green, having a long narrow Leaf
under the lowelt Spike or Head.

LXI. f 9. *Gramen Cyperoides Ydu^re wajus*
angujbe&m, The greater Cyperus-Graft with narrow
Leiwex. This differs little from the bit, but in its
glowing lower, with narrower Leaves, and fpiked
heads, which are thinner and longer, but of the fame
brown greenifli color with it.

LXII. 2c *Gramen Cyperoides fateftre minus*
guftifotium, The lefer narrow Leev'd Cyperus-Grafts.
It has a Root with long Strings and fibres thereat,
Ihooting forth like *Cyperus*^ has narrower Leaves,
and threefquare Stalks, bearing fmaller and more
fpiked long heads, three ufually fer together, one u
little from the other, more ltiff alfo and upright.

LXIII. 2J. *Pseudo Cyprut /pica irevi pendula,*
Lobelij Gefneri, Dodonjii, hafiard Cyprus-Gmfs
v>tb (hart pendulous bids. The Roots of this do
fomewhat relemble the *True Jwa long Cmms*, but
loofer, and not fo firm, fnUer alfo of Fibres, and
not fmelling fweet at all; ifgrows alfo forrewhat
like unto the *True long Cyperus*, having large and
long graffie Leaves, fn a manner threefquare, andfo
is the Stalk alib, at the top whereof; among divers
Leaves, come forth great ipiked, thick and fhort
heads, hanging downwards, every oneby a ffort
Foorftalk.

LXIV. II, *FftuAj-Cyprus, five Gramn*
roides Pa/itflrc /pica pendula toxgiere, Another
fitird Cyperus-Graft vstb, longer beads. It has a R^{oot}
like the former, with a triangular friped Stalk, a-
bout a yard high; bearing long and narrow Leaves
thereon, which encmpafs the Stalk at bottom with
a Skin, or hollow Sheath, having at top feveral long
and narrow pendulous heads, five br fix Inches long
each, with a long Leaf under each head.

LXY. *The Places and Times.* They all grow in
low, moi(t, and Moorifh Grounds, itiminy places
of this Kingdom, as alfo in fveral other Countries^
as their Names exptefts, and do all Flourifh and Seed
in the end of Summer.

X. *>H\$afwUW, *PbanixGraminea, Darnel-Grafts*
fix kinds.

TheJmIkji jingle Darnel-Graft. It is very like to
Red Darnel, but that it has vety few (lenderef and
fhorter Stalks than it,* and the Leaves alfo narrow-
er-, the ipiked head has a few hngle Husks fet very
fpariedly.

LXVH. 3. *Pbraix alxera breviortbus denftoribus*
que fpiiii, Ibe greater fmgk Darnel-Grafts. The
Koots and Leaves hereof are like the *Red Darnel*^
the Stalks grow a yard high, jointed and ftraked,
and the Spike is thinly fet with chaffie heads, hut
rteyarebigger, rounder, and thicker.

LAVHI. I. *Pbamxacerefaaculeate. Small prick-*
ly Darnel-Grafts. \ has a Koor confifting of {mall
white Threads or Fibres, the Stalks hereof #••? about
five, fix or feven laches high; being rough?^1 hard,
full of Joints, pointed or prickly at the ends, ~s^M
with a few (hort Leaves on them, and have withal
fmall,

frruH, fhort, rougii, and chffie like Tongue?, fhjrp at their ends, fet ac the Joints^

LXIX. 4. *Pb&tix mulupltd spicata Van'uuU*, Branched Darnel-Grafs. It has (lender jointed Stalks, Haifa yard or more high, with narrow Leaves i the fpiked head is as it were branched into others, ¹¹ which conffits the chiefct difference.

LXX. S- *Phtenix Hvtltpfki fpiatnut&rte*, Double Darnd-Grafi mth a bowing top. It differs little 01 nothing from the kft, but in the fpiked heads, which are thicker fet together, and the tops of them bow down, or turn a little round.

LXXI. 6. *Pbanix Yalafirk & bogus fpketo*. Branched Mtrjh Darnel-Grafs. It has a Root which is creeping, white, and jointed, with many Fibres ^joining thereto, from which fhoot forth two or three jointed Stalks, two Feet or more high; the fpiked head is a Foot long, branched as the foiirtl is, each Branch ibur or five Inches long, with winged Husks, like u^o Oats.

LXXU. *The Faces <nl Times*. All thefe 'grow either in Fields of Corn, or in the Borders or Path ways of other Fields which are Fallow, and rhe Lif fometimes in Marfli and Wee Grounds, as well a; in the edges of Ploughed Grounds.

XI. *}{<<*w*S, k>s>f<ff(, G™>a^ff CMWW* Dogs-Grafs, fourteen kinds hine Land kinds five Water.

LXXIII. I. **v*~*y'>'><iGr,imcnG'nintMVu'giit* <*, Gmww *Dogs-Grafs*. Ir creeps far about undt Ground, with long white jointed Roots, and fatal Fibres at every Joint, very tweet in tafte, as the fett of the Herb is, and interlacing one another, from whence fhc^ot iorth many fair and long grallie Leaves fmall at *M ends, and (harp of cutting on the edges the Stalks ate Jointed like Corn, with the lik Uaves on them, and a long fpiked head, with long "on it, and hard rough Seed in them.

LXXIV". i. *Gramen Caninum lonpui il,iikaiud Ci Yaniculatum, Dogs-Grafs with a hngeY Root ana. morefparfed, Yanidet*. The Root is fu!^or, larger, longer, and farther fpread, the whole P^iant die but Very little from the rorraer, but in the Tufr or Panicle, which is more fpread into Branches, with (horter and broader husks.

LX.XV- ?. *Gramen Canitftm laliore Pjiriicsla minus, 'Thekffcr Dogs-Grafs vcith a f[MifedTajt*. The Root is .fimal!, and Jointed, but creeps not fo much' as the former, and has many more Fibres among them than the others have, and is a little browner, and not fo white, but more fwcec. it is a fmall fort of *Grafs* and has ilender Stalks, about fix or feven Inches high,¹ with many very narrow Leaves, both below and on the Stalks; the Tuft or Panicle at the top is fmall, according to magnitude of the Planty and fpreads inro ieveral parrs or braiidies.

Dogs-Grafs im hiding.

LX • • *yif>w/i' ^'inuim fitpinitm arvenje.*
Low binding D&gs-Grafs. It has a Soot which
 creeps m: (Sround, bur in u differing m:in-
 ner, die Stalks taking Root in several places, and
 g themfelves up a Foot high, with
 Jich like green Leaves us thefirt kind, butfhorter;
 the Fpikal head is bright and fparfed, or fpread a-
 broad, much like to the *field-Grafs.*

Dogs-Grafs lying along.

LXXVII. %. *Gramtn Mtrorum Kadlec repente.*
Wall-Graft itiih n creeping Root. Its Root is black-
 iili, and (breading abroad, from which fpring forth
 many (mall Stalks, a Foot high, bending or crook-
 ing, with :i lew narrow fhort Leaves on them, at
 whose tops lfend Small white Panicles, of an Inch
 and half long, confiting of many fmall chaffie husks.

LXXVIIl. 6. *Gramen Camnum bulbofum -uel no-
 dofumvulgrefimmonbufoeAor knobbed Dogs-Grafs.*
 It has for its Roots three, or four, or more round
 white Bulbs or Knolis, one fet upon the head of a-
 nother, with feveml Fibres underneath them, from
 the uppermoft of which fpring fbith feveral long
 hard graffie Leaves, (harp at the edges, and in the
 middle of them a jointed Stalk, with three or four
 fuch like Leaves upon them, at the top of which is
 A long Panicle, fpread into many parts, like to that
 of *Oats*, wheieunto fome have compared it. *Label*
 has another fort hereof" differing little in any part
 but the Roots, which are fmall and round, and fet at
 diftances all along the Roots, and foil as fwere as
 the other. The firt of thefe is the *Gramen nodofum*
avenncea pluma Bauhini, who queftiorts whether it be
 not the *JEGHops Plinij*, which has a kind of bulbous
 or tuberous Root.

LXX.IX. 7. *Grante» Cininum nodofum fpica par-
 va, 'i'ubernus or Knobbed Grafs with a fmall round*
< i fmall whjtifh round Bulb or Knob
 for the Root, with ftnallRbres under it, (hooting
 forth ftoin the head thereof another, fomthing like
 unto a Bulb, but much fmaller, and like a flender
 knob, with a finall jointed Stalk above it, and a
 long narrow pointed Leaf at each of them, being

four or five Inches long, and at the top one (*lion*
 foit ipiked head, fomthing like to the head of
Catstml-Grafs.

LXXX. 8. *Gramen Caninttm Genhuhtum majiis^*
The greater Kneed Grafs. It has a large fibrous
 bufhy Root, from whence fpring many long trailing
 Branches upon the Ground, with leyetal great Joints
 on them, and (hooting out Fibres from thofe Joiers
 which lye next the Ground, fo that it does fome-
 times run twenty Foot in length, with one long
 Leaf at each Joint, fmall at the end, but broadet
 below, from which, as wdl as at the tcp, come
 forth divers fimll long fpikes of chaffie husks, of
 an over worn color, which Stalks and Joints are fo
 full of a pleafant Juice, that it feeds Gttel
 much better than any other Hay, and therore thole
 Husbandmen who have ii growing in their Grounds
 do keep the Hay thereof for their chief Winter Itore,
 and inthead of Provender; this is that which is com-
 monly called *Dutch Grafs*, and grows very plenti-
 fully in Plantations in *Florida*, and other parts of
 the *Weft Indies.*

LXAXI. 9. *Gramen Cenicul/ttumusiTiur, Tbetef*
fir Kneed-Grafs.' The Root is fibrous or thready,
 like the former, this *Graft* creeps not fb much on
 the Ground as the *greater* does, but fpreads more
 upright with its Stalks, whole Joints are not alto-
 gethec fo great as the other, and have at their tops
 ipiked heads, which are Somewhat larger than thofe
 Of the *greater Kind*, and of a fadder cverwcW
 color.

LXXXII. 10. *GramenCaninurnGenicuhturtM^*
riumum fpicatum^ Sea fmked TXgfQraft. It fe*SJJ
 long creeping Root, full of Joints, with .rony fmaU
 Fibres running from the Joints, and creeping much
 under Ground; from feveral of the Joints of this
 Root fpring up feveral jointed Stalks, about a Foot
 high,

high, with hard Leaves thereon a Span long, and like to the other Dogs-Grafs -, the spiked heads are shorter by much, and harder than the Common Kind at Seft 73. aforegoing.

LXXXIII. 11. Gramen Caninum Maritimum vulgatio Canario fimile, Sea Dogs-Grafs. This is a slenderer, harder, and lanker Grafs than the Common Kind, and of a more blewifh green color, and differs not in any thing else but there are two other sorts hereof, the one differing in the Roots, which at the feveral Joints as it runs does (hoot up the like Stalks, Leaves, and spiked Tufts, and will be sometimes twenty Foot in length, with a number of those Stalks and Leaves at them, the other differing in the spikes, which have two orders or rows in them.

LXXXIV. 12. Gramen Caninum alterum Maritimum longim Radicatum, Sea Dogs-Grafs with long Roots. It has a very long Root, and differs little from the former, either in the hard Leaves or in the running Roots, but that they spread more, and instead of spiked heads at the tops of the Stalks, this has chaffie heads among the Leaves.

LXXXV. 13. Gramen Caninum Maritimum fplacatum Americanum, American Sea faked Dogs-Grafs. It has slender woody Roots, with but few Fibres joining thereto, from whence spring up several trailing Stalks, a Foot or more high, with several Joints and Branches at them, and short narrow Reed like Leaves on them, at the tops whereof grow spiked heads, three Inches long, of a dark Ash color.

LXXXVI. 14. Gramen Caninum Maritimum afperum Rough Sea Dogs-Grafs. It has a Root which is a bush of long white Fibres, from whence spring many reddifh round small Stalks, about a Foot high, which at first lean downwards, they are encompassed with hard, short, and sharp pointed Leaves, standing as it were in a Tuft together, with hard rough dents about the edges the spiked heads are somewhat like unto small rough hard Burs, breaking out of a Skin, in which they were first enclosed.

LXXXVII. The Places and Times. The first of these is common to be found throughout all England in Ploughed Fields, and other like Grounds -, the second and third are nothing so frequent as the former, but are more natural to Sandy and Chalky Grounds the fourth is likewise found in Fields which have been Plowed and do lye Fallow -, the fifth is often found growing on old decayed Stone or Brick Walls in several places the sixth grows not so common as the first kind, or Creeping Rooted-Grafs, yet sufficiently plentiful in many Plowed fields of this Kingdom-, the seventh is also found in Plowed Fields, and borders of moist Meadows, near Copses, Hedges, or Thickets of Wood, and in some places near Bajil, the eighth and ninth grow in moist Meadows in several places of this Land, but the tenth is especially observed the eighth to grow in the great Meadow in the Earl of the tenth, the eleventh, both of which have been observed on our Sea Coasts, especially upon the Kentish Shoar, the thirteenth upon our Southern Coasts in France, the fourteenth on some of our Shoars as also on the Venetian Shoars, about Mompeher, &c. The first nine are in the month of June and height of the Summer, the last five flourish and perfect their Seed at the latter end of Summer.

The Virtues.

LXXXVIII The first five of these Grafs have a one and the same Virtues, but the first of them,

as it is most common, so it is esteemed to be of greatest effect, the Effence, or Decoction of its Roots, opens obstructions of the Liver, Spleen, Gall, Bladder, and Reins, eases Griplings of the Belly, and waives the Morbifick or Tartarous Matter which breeds the Stone in the Bladder, and heals Ulcers there, being bruised and applied it consolidates Wounds the Decoction provokes Urine, strengthens the Stomach, and stops Vomiting the Roots are cold in the first degree, and temperate in respect of moisture and dryness the Distilled Water is given to Children for the Worms, but it is much more effectual if Worm-Seed be added to it.

LXXXIX. The Bulbous, Tuberosus or Ktotted Dogs-Grafs, viz. the sixth and seventh, are found by experience to be very effectual to provoke Urine, and more powerful than the first Dogs-Grafs for the same purpose, as also to break the Stone, and ease those torments of the Belly which come by Fluxes, Bloody Fluxes, crudity of Humors, and obstructions of the Viscera, and may be used in any case to which the other may be applied.

XC. The Kneed Dogs-Grafs, as also all the Sea Dogs-Grafs, are generally held to be as effectual as the first, or Common kind, but this is to be observed, that the Sea Kinds are more effectual for such as live by the Sea side, and Marthy, or Maritime places, and the Land kinds for such as live in the Midland, or far from the Sea Shoar, or Salt Water sides.

XII. *A?K vdvvt Gramen Tumilam vel nanum, Dwarf-Grafs, three Kinds.

XCI. 1. 2>esv™My©~, Gramen Xerampelinum, Gramen Pratenfe rubrum minimum Jled Dwarf Grafs. It has a Root confuting of many little Bulbs, covered with a reddifh Film or Skin, with very many small, hairy, and white Fibres or Threads, the Stalk is short and round, and the Ear is of a reddifh color, not much differing from the Grafs called Ifebamori, but the Ear is softer, broader, and more beautiful.

XCII. 2. Gramen minimum Pratenfe album, White Dwarf-Grafs. This has many Fibrous or Hairy Roots, the Leaves are small and short, as also the Stalk, the top of which bears a Panicle, not much unlike the Small Meadow-Grafs, but lesser, the color thereof is sometimes white, and sometimes reddifh.

XCIII. 3. Gramen minus duriufculum, Small hard Grafs. It has small Roots, compact of little Strings or Threads, from which spring forth many harsh, fowre, or Ruffy Leaves, about an Inch and half long; the Tuft or Ear is compact of many Panicles, or very little Ears, which in feeling are very hard the harsh the Grafs is unpleasent, and not good food for Cattel.

XCIV. The Places and Times. These all grow in Fields and Meadows, more especially on Heathy, rough, and dry barren Grounds, in most places of England they grow flourish, and come to perfection in the Summer Months, as other Meadow Grafs do.

XCV. *A>faff *wofef, Grdmen Plumofum, Feather-Grafs, two Species or Kinds.

XCV- 1. Gramert Plumofuni, Gramen Tomento sum vel Arundinaceum, feather-Grafs, [It has a root which is tough and hard from whence arises a long benty Stalk, three Feet high, or more, naked, without any Blades or Leaves for the most part, at the tops of which grow long spiky Heads or Ears, replenished with Chaffie and Downie Tufts, which make a very pretty show.

XCVL 2. Spar turn

XCVt 2. *Spartim Aufriacum Ciufij, Gr. men*
ijws Dakcbamfij, Gramen Ptumhfum Mi/pani-
furn, Sp, imij h'taiher-Grafs. It has a Root confil-

ing of many final! graflit Fibres, fiora whence fpring

bearaSpiks, having three or four Seeds, ending in,
 or fending up very fine white Feathers, refembling
 the finaller fort of Feathers of the Wings of the
 Bird of Taradice; ic isa Native of S/wyl, but grows
 with us in our Gardens.

XCVil. *The Places wd Times.* The fait grows in
 •cry fertil Fields and Paltures, and by their borders
 nejr Hedges, and iourifhcs in Summer.

XIV. *A>^r« awwSi, *Qramen Polyanthmn, Grafs*
 »uny ffovmd, *Gramcn'l'i?iai<>n, Rm-Grais.*

XCVIII. It is also called *Heragrofih Greece, Gramen*
Parmuhium^ Gramen Paniathfum Pbakroides
Lobelij, and is a fingular Plant. It has Roots and
 Leaves not much unlike *tteCommon Meadow-Grafs^*
 the Stalk riles to be about a Foot high, and at top
 thereof it bears a beautiful Panicle, (ibr which *ra-*
fon the Spaniards and i'rencb call it the *Lovely-*
Graft.) This Head confits of many little Ears, (rap-
 ed much like thole of' the *Ordinary Quaking-Grafs,*
 but longer and flatter, being compofed of more
 Scales, *ib* that each of them fomewhat refembles the
 Leaf of a *Small tern,* whence the Name. Thele
 tops when thejr are ripe and white, are gathered
 where they naturally grow to beautify and adorn
 Garland!.,

X.CIX. *The Places and Times.* It grows wild in
Spaa and Irar.ce, but with us in Gardens, and Flow-
 ers in the Summtr "Months.

XV. 'A^mf©., *jy0pecuros CaudaVulfk, Gramen*
Tmentofum Abpecuros vera Plimj, Foxtail-Grafs,
 , three Kinds.

A>[K!-I(*tajunaiefiS-v, Gramen Alopeturoides,* Baftard
 Foxtail-Grafs, nine Kinds.

Foxtail- Grafs trite.

1.

Gramen Alopecuros vero PlimjA Tfc great Spiring or Spiked Bifiard twd
gnuina Tbeopbntfi, Stelepkttm r/iaiy,| This is like, that at Sett. i«3 N^4- ^bove, that*

The true foxtail-Grafs, has a perrijing Fibrous Root,
 grows up with two or Three *(bit Jioaiy* Stalks, a
 Foot high, with irnall, Ioi;g, narrow, *ibii* Leaves,
 as hoary as the Stalks, on the tops of which grew
 fomewhat long, round, ibft, woolly or hoary in
 let with loft hairs, of a pale Straw Color, refein-
 blng a Fox Tail.

Q. 2. *Alopecuros alterd Anglica iff fianiric^,*
Another Englijh and Wemijh ibxUtii Graff- In Roots
 and Leaves it is much like the former, but the Sralks
 grow not lb high, the heads are alfo (hotter and
 rounder, and not ib woolly or hoary.

Great English Fox tail Grafs

CII. 5. *Alope(«rosnwxitnJiAngtk<i,Tl)e greateft*
Engfijh FfixtaiJGraft. From a like Fibrous Root
 the Stalks grow up to be half a Yard, or two rett
 high, having fair la;ge Wheat like Leaves fet at *r'M*
 Joints, and at the tops great, large, lull, foft, ani
 woolly heads, like the former, laving that thev art:
 much greater and longer, and this whether the Stalk
 is higher or lower.

CIIL 4. *Gramen Alopecuroides majus, ThegrM'*
er Bitjlard foxtail-Grafs, h has a Fibrous Roof)
 and riles up with a Stalk three Foet high, with 3
 ftw Leaves long and narrow thereon, the Spik<-"
 ibmewhat great and long, bur not fo fort and woolly
 as the former.

CIV. 5. *Gramen AkpeatrfinksCiiftidatumvW-i'*
*mum Angticxm, Our greateji BaHard i'l/Xt-aH-Grnj**
 From a buflly fibrous Root fpring up many long ntf
 row Leaves, and among them Stalks three i'eethigfi
 with few joints and Leaves on them, at top of whicB
 (fends the longeft fpiked head of any other
 what pointed at the top, and bvoud ar bottom, wtfp
 white Hairs on the Husks, ianewbat like tS>wth

CV, 6. *Gramen Abpecuroides Qufp&atmn*

that the spiked head is longer, and rising upwards, is finali at the top, but something broad below, with Oaten like Husks fet on them; the Leaves also are more, and much shorter.

CVI. 7. *Gramen Alopecurus & ides pica asperfi brevi*, Short rough Ear*d Baftard Foxtail-Grafs, -^ has a finali white perishing Root, from whence ifcning up two or three upright finali Stalks, with somewhat narrow and foff Leaves on them, at whole tops ftand thick fhort rough heads, an Inch and half long, not fully, but as it were half round the Stalk, the backside being as it were bare, fo that they seem to ftand but on one fide-, in thefe heads is contained the Seed, which is finall and whire.

CVII. 8. *Gramen Alopecuroides Spica longa majus & minus*, Baftard Foxtail-Grafs lcmg Enr% great and finali. These Graffes are much like oke another, one being greater, the other fmaller, both in Stalk and Leaf, the spiked heads are long and flender, and of a whitifli color.

CVIII. 9. *Gramen Alopecuroides minte Spica aspera longa*, Small Baftard Foxtail-Grafs long rough Ear*d. It differs from the last, in being greener, more replenished with Stalks and Leaves, the spiked heads being more flender, long also, and rougher.

CIX. 10. *Gramen Alopecuroides Cuppidatum minus*, Baftard Foxtail-Grafs finali Jharp pointed. It grows about a Foot high, ftored, but with few Joints, and fhort narrow Leaves on them, having a Spike or Ear almost as big as the last* but fharper pointed, with fbme pieces growing out of the fides.

CX. 11. *Gramen Alopecuroides Cuppidatum minimum*, Smalleji Baftard Foxtail-Grafs pointed. This is leffer than any of thofe going before, in Stalks and Leaves, but longer in both, as is also the Spike or Ear, which is very finali, fleiider, and pointed at the end.

CXI. 12. *Gramen Alopecuroides alterum Radice repente*, five Pseudofchtnanthum, Another Baftard Foxtail-Grafs with a creeping Root, called also Baftard Schanant. It has a creeping Root, which fpreads it felf under Ground, (hooting forth Leaves and Stalks in feveral places, the Plant fomewhat refembles the *greatefi Englijh Foxtail-Grafs* (at Se & 102. N^o. 3. Aove; faving that this has thicker, harder, and differ Leaves, like unto *Rujhes*, the Head or Spike is long and clofe, five or fix Inches long, of a Silver like fhining color, but the Blooms are of a pale red, and the Husks redder, which when it has flood long, begins to open it felf, expofing its Downy fubftance to the Wind.

CXII. *The Places and Times.* The first and twelfth grow with us only in Gardens, the other ten grow in Fields and Meadows in many places of England, fome of them about Hackney, near London. and feveral others of them in Kent; I have found them all in Fields, Failures, and Meadows in many parts of Norfolk- and they all keep the times of Flourifhing and Seeding with other Meadow-Graffes.

XVI. "Arf^W, *Gramen Hirfutum*, & *Hirfutum Nemorosum*, Hairy-Grafs, and Hairy Wood-Grafs, nine Kinds.

CXIII. I. *Gramen Hirfutum latifolium Nemorum vnajus*, The greater Hairy Wood-Grafs broad Leav*d. It has a Root confifting of a tuft of many froall long Fibres or Threads, and has feveral long and fomewhat broad Leaves rifing from the Root, fmaller to the end, greyifh underneath, and green above, fet about the edges with whitifh finali long Hairs, the Stalk rifes up from among them, and comes to be about twp Feet high, with Leaves at the Joints,

having at the top feveral (mall greenifh Flowers in little Husks, containing within them finali Seed.

CXIV. 2. *Gramen Hirfutum Nemorum minus angulifolium*, The leffer narrow Leav*n*i Hairy Wood-Grafs. It has a Root fomewhat long, like a *Cyperus* Root, with a bufh of finali long Fibres or Threads* the Plant is kffer than the sixth following

ing. iij/uig many lojfg aïd narrow weaves grown; at the Koor, as hairy as any-, the Stalk has two c three Joints, and lhort Leaves on them, and at th top feveral fmall heads Handing upright on a'fmaïl hairy Fooctalk.

CXV. 3. *Gramen birfutum Nemorum prdrcorn- jus tuberoſi Radice*^ A greater early hairy Wood-Graf with a tuberous Root. The Root is thick, ſome- what ſhort and brown, almoſt like a *Tormentil* Root, with a great number of ſmall browniſh hairs covering it very thick * the Leaves are larger than th- firſt, of a deeper green color, and as hairy alfo* a- the joints of the Stalks are Leaves, as in the other, and ſuch like heads or knops of Flowers as in th- firſt.

CXVL 4. *Gramen birfutum Nemorum latifolium miſus JunceaPanicula*, The leſſer broad Leav'd hairy Wood-Grafs with Ruſb like Panicles. It is ve- ry like in its growing to the firſt, but that the Leaves liereot are narrower, and the-Panicle or tufted head at top of the ſmall Stalks is ſmaller, and ſomething reſembling the tops of *Ruſhes*.

CXVII. j. *Gramen hirfutum Nemorum majus an- guJUolium*, The greater narrow Leav'd hairy Wood- W > . The Root is ſmall and long, with ſmall fibres adjoined thereto, this Plant is very like in " ? . n J a i q n e r of growing unto the firſt broad Leav'd Kind^ but that the Leaves are much narrower, (hott- ter, and turning downwards at firſt * the Stalk is bare, without Joint or Leaf, having at the top three ſmall, rough, and almoſt round ſcaly heads fet together.

CXVIII. .^* *Gramen birfutum Nemorum maj us fngujtifolium alterum*^ Another great narrow Leav'd hairy Wood-Grafs. It has a ſmall reddiſh fibrous Root, from whence riſes up a Stalk, about two Feet high, and ſmooth, bearing commonly at top a ſoft white Panicle, ſomewhat ſpread abroad, and compoſed of ſeveral ſmall Scales as it were, in every one of which lies a ſmall round blackiſh Seed-, the Leaves are few, a little hairy, and ſome of them encompassing the Stalk-, the whole Panicle has two ſmall Leaves fet at bottom thereof, the one riling higher than it, the other lower.

CXIX. 7. *Gramen birfutum Nemorum minimum, The ſmalleſt hairy Wood-Grafs*. This has a greater ſtore of long hairy Leaves than the ſecond, but in all things elſe, as in its Heads and Flowers, it agrees therewith, but is indeed whiter than the reſt.

CXX. 8. *Gramen birfutum Nemorum, Jive exile ferrugineum*, Small brown hairy Wood-Grafs It has a Root which is ſmall and fibrous, and^the Grafs it ſelf is as ſmall as the laſt, but with leſſer ſtore of Leaves-, the heads on the Stalks are woolly, and not fully round, but a little fiat, and of a yellowiſh brown color, and the Stalks themſelves are about four or five Inches high.

CXXI. 9. *Gramen birfutum capitulis Globojis, Globe beaded hairy Wood-Grafs*. The Root is ſmall and thready, from whence riſes long Leaves, as broad as the fourth Kind aforegoing, with ſome ſmall ſoft hairs about the edges 5 the Stalks are a- bout a Foot high, with Joints and Leaves on them, the tops being furniſhed with two or three round, ſoft, white woolly heads, compoſed of many f_m_a_n Silver like Threads.

CXXII. *The Places and Times*. All theſe grow in many Woods throughout *England*, ſome about *Highbate*, and in *Hornſey Wood*, and other places, and Flower all of them in the Summer Months, or war the end of Summer, except the third, which Howers a Month or two earlier than the reſt.

A. VII. 'A/ < A f > bejtuca^ *Oculus uiprinus*, riaver- Grafs, or Peter-Corn, two Kinds

CXXIII. 1. *JEGilops Itdlica, JEGilops Narbonen* ^ A Fejiuca Italica, JEGilops Dioſcoridis^ Itumentum Sylveſtre Sicilie*^ Italian ñdvergraſs, or Peter-Corn. It has a Itoot compoſed of a ſmall head, with many long Fibres growing from it, from which ſpning ſeveral Grafs-like Leaves, of a pale green color * the Stalk is jointed in three or four places, with Leaves at them, and at the tops two or three heads, je^ one above another, which are round, and iöfliewnat long, hard and friped, having ſeveral UBeards at the ends of them, the Seeds are a little ſmaller than *Barley*, each Seed wrapped up in a creſted bkin, out of which the Awnes put themſelves förth.

CXXIV. 2. *JEGilops Bromoides Belgarum Lobelij, leſiuca prior Dodonti, Avena Sylveſtris 5 five nigra Thalijs* Dutch Havergraſs, or Peter-Corn. It has a Root which is ſomewhat like the former, but the head from whence the Fibres proceed is not ſo conſpicuous, and indeed the Grafs is very like the laſt both in Stalk and Leaf, the top only is in part like to the *Naked Oat*, and in part to the former *Havergraſs*, having ſome Beards fet at every huſk, within which lye long rough brown Seed.

CXXV. *The Places and Times*. The firſt is frequent in *Italy* and *France*, where it is found among their Corn, being a degenerate kind of *Bar ley*^ and in ſome places the Poorer People uſe it to make Bread of, with us it is only Sown in Gardens-, the ſecond is found as plentifully in *England* as the Low Countries, and they are both ripe in *July* and *Auguſt*.

The Virtues.

CXXVI. *Lobel* ſays that he had often tryed the *figilops* to be effe&uai in curing that hollow Ulcer in the Eyes calle^ *JEGilops*, or *Fiftula Lachrymal*^ lox it has a drying quality without (harpnels-, he al- lo ſays that the Seed put into Drink cauſes a kind of Drunkennels, and that the burnt Arties of the Stalks

Stalks are good againft Pkuitous Tumors, and the Gout, bathing with the Lye made thereof \$ and rhat it diffblves hard Tumors and Kernels in the Flefh, difcuffing Swellings of the Joints. For the Fiftula Lachry maills. Take the whole Plant, Root and green Seed three parts, Roots of Wild Oats one part, boil in a fufficient quantity of Water till a third part is confumed, ft rain, and add an equal quantity of Honey, and boil to the thicknefs of a Syrup, to every Quart of which add fine Aloes in fine Pouder one Ounce, mix and diffolve, in which wet Tents, and put them up the Nojrils. Dodonscus. Alfo the Juice of the Plant mixed with Barley Meal to afoft Pafte and infpijated, is good for the fame purpofe, mix a little of it with Damask Rofe Water to a thickenefs^ and apply it Plaifterwife to the iEgilops or Fiftula, and it will cure it, it alfo [oftens and difcuffes hard Tumors in other parts of the Body.

CXXXVII. 1. *Gramen Echinatum vulgare*, Common Hedge-Hog, or prickly headed Grafs, *Gramen Palufire Echinatum Lobelij^ Gramen aculeatum Dalechampij.* It has a fibrous or thready Root, which fends up divers Graffe Leaves, and among them feveral flender Stalks, leaning this way and that way, on which are fet fhort fpiked heads, very rough and (harp, made of many husks, in which lies the Seed.

CXXXVIII. 2. *Gramen Echinatum Italicum aculeatum Matthioli*, Matthiolus bis Hedge-Hog, or prickly headed Grafs. It has a fibrous Root, which fends up fmall Grafs Leaves and Stalks, much like the Small common Grafs, but at the Joints with the Leaves come forth fmall prickly heads, folded in husks, and ending in three points, in which lye fmall long pointed Seed.

CXXXIX. 3. *Gramen Echinatum planum, Gramen Spica plana Echinata Bauhini*, Flat Hedge-Hog, or prickly headed Grafs. It rifes up not much higher than a Palm or Hand breadth, and from a white Root, made of many Fibres, it fends forth a few finall hairy Leaves, an Inch long, as alfo a fine and fmall Stalk, with a flat fpiked head, and very ftarp Awnes at the ends of the Husks;

CXXX. 4. *Gramen Echinatum Montanum Tri-*

Echinata Col urn- #, Grumen Echinato Capitulo, vil Capitulaio, Hedge-Hog., or round prickly headed Grafs. It has a Root compofed of many white Threads, fending forth fome few narrow rough Leaves, two or three Inches long, among which rife up Header Stalks, fome higher fome lower, with one or two Joints, and Leaves at them, each having at the top a lhaall found head, fet with Very fharp prickles., within the husks whereof lyes clear white Seed.

CXXXI. The Places and Times. The firft grows in Watery Meadows and Fields, as in St. George's Fields, near London, and fucli other like places, the other three grow in dry places, atid old Mud Walls, they all Mourifhing and Seeding at the ufual times with other GraJes.

XIX. *A>e*rf >cjct7>JW, \$ TMAySiww, Gramen Geniculatum, Kneed-Grafs, two Kinds.

CXXXII. 1. *Gramen Geniculatum Pratinfe* ha^ a fibrous and hairy Root, from whence come itraight upright ftrawy Stalks, with manifold Joints, like to thofe of Corn, which are very large and confpicious, having thereat many fmall Graffe Leaves, and bearing at their tops fpiky rough Panicles, of a dark brown edlor.

CXXXIII. 2. *Gramen Geniculatum Aquaticum^ Water Kneed-Grafs.* It has a thready Root like the former, from which rife many long and flender Stalks, jointed with many large, knobbed and gouty Knees, almoft like unto Reed, fet with broad flaggy Leave?, lbmething fharp pointed, bearing at their tops Tufts or Panicles, divided into feveral fmall Brandies, of a duskiſh color.

CXXXIV. The Places and times. The firft grows in fertile and rhoilt Meadows, the other in Uioift and plalhy Fields, and places apt to retain much Wet, alfo at the bottoms of Banks, by Ditch and Hedge fide, and flourifh when the other GraJfet do.

XX. "Aysfa* MUAH Gramen Pratenfe^ Meadow-Grafs., five4unds<**

CXXXV. 1. *Gramen Pratenfe vulgatus* M m ra 2 fibrous The greater common Meadow-Grafs. It has a bufhy

fibrous Root, from whence rife up many Graffe Leaves, and among them feveral Stalks, half a yard high, bearing a fparfed Tuft at the top of them, fomewhat refembling the Feather like heads of the *Water Reed*.

CXXXVI. 2. *Cramen Yratenfe minus*, *The fmall Meadow-Grafs*. This in its Roots, Leaves and Stalks is not much unlike the former, faving that it is c-very way fomewhat lefs, and its fpiked Panicles are manifold, growing upon the Stalk lefs and lefs, till they come to the very top. Of this kind there are two other forts, both fmaller than this, the one with white tufted togs, and the other with reddifli tufted tops, the firu more fparfed, the laft more clofe together.

CXXXVII 3- *Cramen multiplici Tfamcula Pra-tenfe Meadow-Grafs with manifold Tufts*. The Root is a thick bufli of white Fibres, from whence rife up divers Stalks, a Span long, jointed, and a little bending downwards 5 the Leaves are fmall Grafs Leaves, and the Tufted Head or Panicle is manifold, and much divided, which when ripe grows hard, and is of a fad reddifli color-

CXXXVIII. 4. *Cramen Fratenfe Paniculatum molle*^ *Soft Tufted Meadow-Grafs*. It has a fliont bufhy fibrous Root, from whence feveral long and fomewhat broad, fof t, or woolly Grafs Leaves fpring, from among thefe Leaves rife up two or three Stalks, a Cubit high, with fome Leaves upon it, and at top comes forth a loft woolly fpiked head, much divided, whose Bloomings are reddiftu

CXXXIX. 5. *Cramen odor at urn Vaniculatum Germanicum*, *Sweet Dutch-Grafs with tufted heads*. V has a Root which creeps in the Ground, which is white, and full of Joints, (hooting out Fibres; dt every One of them ^ the Stalks are two or three tccthigh, with but few Joints on them, whose Leaves are almoft as long, and fome of them exceed the height of the Stalks, being narrow, and fmall at the ends; at the top of each Stalk grows a Pamcle, but nothing near fo much fpread as the for-

mer, the which for their fweetnefs fome ufe* to lay among Garments, or Linnen, to perfume it.

XXI. "A>f<r/f 'Qeivhv>OejLVpyf><»jri<, *Gramen?aniculatum Montanum*^ *Mountain Tufted-Grafs*, five Kinds.

CXL. 1. *Gramen Meritanum Panicu/a fpadicea delicatiore*, *Soft Mountain-Grafs with a reddifh or bright bay Panicle*. It has a fmall white Root, with fliont Fibres, which fends up three or four jointed Stalks, a Foot high, having a few fmall and fliont Leaves on them, and fuch likewife at the'foot pi the Stalks, but few in number •, at the top ftands a brownifh or bay colored Panicle, three Inches long, compofed of many very fmall husks: this is fometimes found growing higher, and with larger Pamcles.

CXLI. 2. *Gramen Montanum ? aniculatum alt ifimum*, *Tall Tufted Mountain-Graft*- It has a Root which creeps ij the Ground, and ftrniflied with ie-, veral Fibres, whence rife two-or three very tall *Ree** like Stalks, two or three Feet or more high, bearing fair broad green Leaves on them, like unto *Cyperus*, and at the tops of the Stalks many fmall tufted Pa- nicies •, both Stalks and Leaves are fo tough, that fome Country People make them Coats or Garments thereof, to defend them againft the Weather, and Husbandmen make Ropes and Traces thereof for their Horfes, wherewith to draw their Ploughs.,

CXLII 3. *Gramen Mntanum avenaceuv*^ *Mountain Havergraft*^ or *Oat Grafs*. It has fmall criigp* ing Roots : the Stalks are about a Foot and half high, flender, jointed, and fet with fliont narrow Leaves. At the tops of the Stalks grow the Ears, which are long, flender and bending, compofed of Downy Husks, containing a Seed like to a naked *Oat*.

CXLIII. 4. *Gramen Montanum fpicaturi Clufii*^ *Mountain fpiked Grafs*. It has a Root of about a Fingers thicknefs, parted fometimes into two or three Strings, with many Fibres thereat, and fomewhat hairy at top, which (hoots forth feveral Heads of Leaves, each containing five or fix, fomewhat long, thick, and half hollow, like a Gutter, very like to thofe of the *greater Thrifty* compaffing one another at the bottom, a little bitter and fharp in Tafte -, from the middle of which fpring up ftiff, fsmooth, bare and knotlefs Stalks, about a Foot high, bearing at the tops feveral fmall Flowers, let Spike-fafhion, and of a greenifli color.

CXLIV. 5. *Gramen Montanum fpicatum angufli- folium*^ *Spiked Mountain Grafs with narrow Leaves*. It has a Root which runs under the upper Cruft of the Ground, full of fmall brownifh Fibres, running one within another : its Leaves are long and naf row, and its Stalks long and finder 5 at the tops of which are fpiked Heads, not much unlike the former.

CXLV. *The Places and Times*. They all srow upon Hills and Mountains in many placès of *Enz-land*; as; alfo in other Countries 5 and they flourifh and feed when other *GraJJes* do. The Seed of th> third is ripe in July.

XXII. "Aypwvyxem'i^ *Gramen Miliare, vel Mihanum, vel Miliaceum* • *Millet-Grafs*, fix Kinds.

CXLVI. 1. *Gramen Miliaceum vulgare*^ *Common Millet Grafs*. I y ^ a bufhy and fibrous Root -, from whence rifelfp flender jointed Stalks, with two or three fomewhat large Leaves thereon : at the top of each Stalk is a bufliy fpreading Tuft, of jnany

many long Feather-like Sprigs, confiding of many small chaffy Husks _h within which is contained final! Seed, which Birds greedily eat.

CXLVII. 2. *Gramen Miliaceum Panicula speciosa, Gramen fegetum Panicula sparfa, Millet Grafs with a fair Panicle*^ or *Corn Grafs with a sparfed Panicle*. It has a buffy fibrous Root, like the former * and grows up with a few long, soft, green Leaves, like to those of *Millet*, some below, and others upon a stiff, tall, round, smooth, green, jointed Stalk, a Yard and half high, bearing on its top abufny, large, spreading Tuft, spread round into many flender Branches, very like in its Form, Parts and manner of Growing to the former *Millet Grafs*, having that it is not only larger, but also more beautiful.

CXLVIII. 3. *Gramen Miliaceum alterum, Another Millet Grafs*. The Root is fibrous and reddish-, it has but a small weak Stalk, not much above a Foot and half high, with a few narrow Leaves, four or five Inches long, growing at the bottom, and two or three thereon at the Joints. The Feather-like Tuft at the top is spread abroad, like the former, but the chaffy Husks are much smaller and finer.

CXLIX. 4. *Gramen Miliacea Panicula arundinaceum, A K^e^m^y< & tfsmtk Millet like Panicles*. It has a white, fibrous Root, which sends forth several Reed like Leaves, yet (shorter than the last _h among which rises up a Stalk or two, about a Foot and half high, with two Joints thereon towards the tops, and narrower and longer Leaves growing at them at the top spreads forth a Feather like Tuft, not much unlike the first, and of about three Inches long.

CL. 5. *Gramen Miliaceum Indicum, vel Gramen Sorghum, Indian Millet Grafs, & Pipe Grafs*. It has a fibrous Root -, from whence spring up W-like Stalks, half a Yard high, or something more, with fair long Lilly like Leaves thereon, and a spread

spiked Top, confiding of many Panicles or Parts above, somewhat like unto the *Indian Millet*, but with larger Seeds therein than in the *Millet*. *Lobel* calls it *Gramen fonarum Ylandrorum*, because Boys there make Pipes of its Stalks.

CLI. 6. *Gramen Miliaceum Indicum alterum, vel Gramen forghinum alterum, Another Indian Millet Grafs*. It has hollow Stalks, like the last, but they are weak, bending down to the Ground, and (hoot out Fibres at their Joints, whereby it roots itself afresh -, having narrow long Leaves on them, the Stalk seeming, as it were, to run thro' them, like to a Pipe ₅ and at the top such alike spread spiked Head as the former, whose Husks in the several parts of it are smaller.

CLII. *The Places and Times*. The second grows in the Borders of Corn-fields, and Grounds which have been Plowed, and flourishes chiefly in the beginning of Summer. All the other grow also in Fields, and by Hedge-sides, as well in *England* as in other Countries, though observed but by few who are curious in Herbarism, and flourish in *June, July* and *August*.

XXIII. "Aygwic^h ^h^, \$ ^h^ ^h^ *Gramen Avenaceum, Oat Grafs*. Twenty two Kinds.

CLIII. 1. *Gramen Bromoides maximum hirsutum, The greateji hairy Oat Grafs*. It has a buffy fibrous Root, and the Plant is all hairy: the Stalks and Leaves are greater than those of *Oats*, being four, five, six or seven Feet high sometimes, whole Panicle at top spreads into many chaffy bearded Ears, hanging down their Heads. It is found in *Paitures* about *London*, as also in *Ejjex*.

CLIV. 2. *Gramen Bromoides fegetum Panicula latiore, Great Corn Oat Grafs*. It has *Oat* like Stalks, four,

four, five or six Feet long •, the Leaves are shorter and narrower, the top is much spread, having divers Ramifications, with many branched chaffy Ears coming forth at a Joint, broadest below, and springing small upwards.

Great Corn Oat-Grafs

CLV. 3. *Gramen Avenaceum incanum*, Great hoary Oat Grafs. It has short narrow Leaves, somewhat hairy, and a little hoary withal. The Stalk has but few Joints. The Panicle is spread, like the last, but less, and is somewhat hoary. This is sometimes found less and grow both of them in the Borders of Corn-fields, both in *EJTex* and *Kent*.

CLVI. 4. *Gramen Avenaceum Pratenfe* Meadow Oaten Grafs. It has many Leaves growing next the; Root, which are long and narrow, and the Stalk is lesser and lower than any of the former, but the Panicles or Ears stand at top, lesser spread, and not hoary, every one upon its own Foot-stalk.

CLVII. ?. *Gramen Avenaceum squamosa gluma*, Scaly-ear'd Oaten Grafs. It has narrow Leaves, eight or nine Inches long, a little hairy. The Stalk is slender, and has such alike Panicle as the last, but that the scaly Ears stand single, every one upon its own Thread like Foot-stalk.

CLVIII. 6. *Gramen Aynaceum pinnata longiufculapica*, Winged Oaten Grafs. It has a slender Stalk, higher or lower, according to the Place and Goodness of the Soil. The Leaves are narrower than the last. The Panicle is somewhat long, but small, and not much spread, each Part being, as it were, winged or divided into several pieces, upon one Rib or Foot-stalk.

CLIX. 7. *Gramen Avenaceum jilicea Panicula*, *Xempelrna*, Red hern like Grafs. It has red shining Scalks, a Foot high. The Leaves are soft and narrow. The Panicle at the top is three or four Inches long, of a whitish green color, divided into many winged Branches, many Parts being let on both sides the Branch, and each Part divided, like a fern Leaf.

CLX. 8. *Gramen Avenaceum murorum erectum*, Upright Wall Oat Grafs. It grows upright, sometimes a Span, and sometimes a Foot high. It has

as many Leaves almost as any Grafs. The spiked Head is three or four Inches long, and parted or divided, each small Ear being bearded. It is often found upon old Mud-walls which commonly enclose Fields.

CLXI. 9. *Gramen Avenaceum fupium Arvenfe*, Low Meadow Oat Grafs. Its Leaves are as small as the last, an Inch or Inch and half long. The Stalks are slender and weak, leaning downwards, with a few bearded Husks, and Spike-falshioned at top.

CLXII. 10. *Gramen Avenaceum fupium fofcul fecalink*, Long-winged Oat Grafs with Rie like flowers. It springs with many Stalks, but they seldom rife up to be a Foot and half high, are full of Joints, and have small short Leaves on them, of a whitish green color. The tops are replenished with four or five Oat like Heads, but more winged, and with short Awnes, somewhat hard, and flowering like to.

CLXIII. 11. *Gramen Avenaceum exile* plus mollicellis*, Small soft-leav'd Oat Grafs. It is very like the *Gramen exile durus*, so that it may be easily mistaken for it, and differs therefrom only in the Leaves, these being longer, and soft, as the whole Plant is, and not above half a Foot high, and spiked at its top, its parts being also winged.

CLXIV. 12. *Gramen Avenaceum atfero alteri innatum*, Small Oat-Grafs one head set on another. It is a fine small Grafs, and much resembles the *Gramen Britanicum Maritimum*, having divers hard Hair like Leaves, with very small Stalks, a Span, or eight or nine Inches high, some of which bear their small sharp Husks at their tops only, as some others do, and others of them out of a Tuft of Leaves in the middle of the Stalk send forth another shorter Stalk, with such like (sharp) Husks on them as on the other.

CLXV. 13. *Gramen Avenaceum Montanum Clu'*, Mountain Oat-Grafs with hoary husks. It has a Root consisting of several long Fibres, the Stalks are slender and jointed, a Foot and half high, with very narrow and long Leaves, and at the tops a long spiked head, bowing the head close, with woolly short husks, containing Seed like to those of *W-d* Oats.

CLXVI. 14. *Gramen Avenaceum Montanum aUrum* Another Mountain Oat-Grafs without hoary husks. It differs not in any thing from the former, but in the spiked head, whose husks are not hoary, as those others are.

CLXVII. 15. *Gramen Avenaceum gluma rariori fpicatum*, Spiked Oat-Grafs with a parted, loaf* chaffy Ear. It has a fibrous or stringy Root, and hair running under Ground, it has slender, weak clear Stalks, a Foot high, with long Leaves on them, and at their tops Weakpending spiky heads, thinly or partedly set with small husks, containing Oat like Seed or Grain.

CLXVIII. 16. *Gramen Avenaceum Xerampelinum*, Red Oat-Grafs. This is somewhat like the last, but with much lower Stalks, clear and reddish, the husks at the top of them are more upright and longer, having the like Oat Seed in them. A lesser sort hereof has been found about *Greenwich*, in a hungry Soil.

CLXIX. 17. *Gramen Avenaceum locujis rubris*, Oat-Grafs with red husks. It has a Root which is long and white, like unto *Dogs-Grafs*, or *Quitch** Grafs, creeping in the Ground, having next to the Earth narrow short Leaves, where the Stalk is reddish, but they grow longer up higher, the husks are set partedly at the tops, all on one side for the most part, and are of a dark reddish Purple color, but white within, with small Grains within them.

CLXX. 18. *Gramen*

CLXX. 18. *Gramen Avenaceum glumk vanjs*, *Oat-Grafs with party colored ft us fa*. It has a Root which is thick, and is covered, with a rough white Bark, the leaves are green, long and narrow, from among which rife up two or three fmooth and brittle naked Stalks, a Foot high, bearing a fhort fpike of fmall husks, of divers colors.

CLXXI. 19. *Gramen Bromoidesⁿ five Avenaceum Yauci Gran urn Coma nut ante fpicata*, *Oat-Grafs with few Seeds*. It is fomewhat hairy all over, the Leaves arc of a fad green color, fet on Stalks three, four, or five Feet high, at whofe tops is a fpiked bending head, having feven or eight fmall long husks, with few Seeds in them: this grows near Woods fides in many places.

CLXXII. 20. *Gramen Avenaceum Sylvarum*, *Wood Oat-Grafs*. It has a Root which runs creeping under the Earth, the Stalks are fmall in all the parts, and weak, being not above half a Yard high, With long, narrow, foft Leaves on them, and at their tops a few fhort husks, and open, like unto Tome of the *Oat-Graffes* before.

CLXXIII. 21. *Gramen Avenaceum exile*, *Small Wood Oat-Grafs*. This has a fibrous Root, and the Stalks are fender and fmall in all their parts, yet tiotwithftanding ftand a little more upright* the husky tops are like, the former.

CLXXIV. 22. *Gramen Avenaceum gluma villofa Sylveftre*, *Hairy Wood Oat-Grafs*. It has fibrous and yellowifli Roots, the Stalks hereof are three Feet high, jvith fmall narrow Leaves, four or five Inches long, the fpiked heads have fomewhat long and hairy husks, the fiftin&ly fet one above another, and is often found lefs by the half than the other.

CLXXV. *the Places and Times*. The firft twelve of thefe grow in many Fields throughout *England*, fome in oneⁿ pfece, fome in another, fome in Meadow Land, fome in Plowed Grounds, ^and fome in Fallow* the thirteenth, fourteenth, fifteenth, fixteenth, feventeenth and eighteenth grow upon Mountains, and on Hilly Grounds* the fifteenth and fixteenth have alfo been found growing in *Denmark* ^ the laft four grow in Woods, and by Wood fides, in Mountainous Woods, and other Woody places: they all flourifti in the Summer Months.

XXIV. *hys*>?n usⁿ vⁿ M> *Gramen Melinoides*, *Gramen Paniceum*, *Panick-Grafs*, fix Kinds.

CLXXVI. 1. *Gramen Paniceumⁿ Panicum Sylveftre Herhariorum*, *Wild Panicky or Panic k-Grafs*; It has a fibrous Root, like unto *Panicky* it has fome near refemblance alfo unto *Millet* in the fpreading of the tufted head, being compofed of feveral parts, each part by it felf near refembling a *Panick* head, the jointed Stalk, with the Leaves thereon, are very like unto *Panick*, yet much lefs in all, for which ⁿ S mther referred to *Panick* than to *Millet*,

CLXXVII. 2. *Gramen Paniceum Spica fimphi*, *ramck-Grafs with fmgle Ears*. It has weaker and fmall Stalks than the former, and fcarcely rifing upright with fhorter Leaves on them* the tops of the Stalks are feverally furnifhed with a fpiked rough head, {ticking to any Garment it touches-, it is fmall at the top, and full of fmall whitifti Seed.

CLXXVIII. 3. *Gramen Paniceum Sylveftre*, *Panicum Sylvedre Dalechampij* \ *Wild Panick-Grafs of Valechampius*. This differs from the laft, in that it grows more upright, and about two Feet high, the Stalks have feveral *Grafs* like Leaves on them, but longer and broader, with one vⁿ XwWf under the hairy fpiked head, which flicks fo fall to their Garments, which touch it, that it is difficultly plucked off.

There is another of this fort, which is founa with us in *England*, which is fmaller, elfe but very littk differing.

CLXXIX. 4. *Gramen Panicenm ariftis hngis armatum*, *Panick-Grafs bearded-*. It has a Root con-filling of many long Fibres, the Stalks and Leaves are not much unlike to the fecond fort oiⁿ *Panick-Grafs* aforegoing, but larger and taller, having divers brown heads at the tops, one above another, , r.ned with long and (harp Beards or Awnes, like unto *Wheat* or *Barley*.

CLXXX. 5. *Grdmin Paniceum firtus*, *Faineⁿ k-Grafs the kffer*. This is lefler than any of the othe: S, going before, having low bending Stalks, eight, nine, or ten Inches long, and (harp long Leaves thereon, with fmall, long, chaffie Ears, like *Cocksfoot-Grafs*, fet fparfedly at the tops.

CLXXXI. 6. *Gramen Paniceum Sylveftre Anglicum iff Africum*, *Panick-Grafs Wild of England and Barbary*. It is a kind of *Wild Panick Grafs*, growing in feveral Woods with us, whofe Spike refembles *Panick*: the like hereof has been brought to us out of *Barbary*, having like Leaf and Head, and differs from ours only in largenefs.

CLXXXII. *The Places and Times*. Thefe *Graffes* grow all of them in *England*, and the firft of them in *France* l ufually among Kubbifh, and in waie Grounds, as alfo in good and Manured Fields, and bear their Heads and Spikes in the Summer Months, as other *Graffes* do.

XXV. *Ayj<s* ^AKdL^H^ ^ ftfAaⁿ JWt *Gramen Phfalaroides*, **y?G>ni MT&pti, x) Tnz&T&pn. *Gramen l remulian*, *vel Tremulentum*, *Quaking-Grafs*, *Maiden hair-Grafs*, five Kinds,

CLXXXIII. I- *Gramen Tremulurh maximumⁿ Phalaris Pratenfis major*, *Gramen Phalaroides Parifulofum*, *Gramen Paniculis Elegantiffimis*, *vel E&ytam majus Bauhini*, *The great eft Quaking-Grafs or Maidenhair-Grafs*. It has many narrow *Grafs* life

like Leaves bocii below arid upon the joinred Stalks, which are a Foot high and better-, on the tops of the Stalks grow a number of fmall, fiat, and long fealy like heads, greater than the following, and each of them on a fine hairy Footftalk, and pendulous, which are fbmetimes of a whitifh color when they are ripe, and fometimes of a brownifh green color, and are to be fhaken with the leaf Wind imaginable.

CLXXXIV. 2. *Gramen Tremulum medimn, Fh&laris Frafenfis minor Lobelij^ Mgilops Tragi & Gefneri in Hortis, Gramen Folyanthos Juugdunenfis. The middle or lejjer Maidenhair, or Quaking-Grafs.* It has a fibrous Root like the other, and grows fomething like it in form, but with fewer Leaves and Stalks, and a large Panicle or tufted head of greener, fhorter, and rounder Scale like pointed Ears, Handing on fmaller or finer hairy Footftalks than the former, which are in fuch continual motion, that the moft fteady Hand cannot hold them full, or from ftirring. Of this fort *Boel* has another, which is fomewhat larger, and of a dull or brown black color.

CLXXXV^a. *Gramen Tremulum parvum, Small Maidenhair, mQuaking-Grafs.* Of this there are two forts, litflr differing in Leaves or Stalks from the laft, the heads only are a little leffer, and fo is the whole Panicle alfo, the one of which is Party Colored, of Purplifh and Green, the other is of a Straw Color and White.

CLXXXVL 4. *Gramen Tremulum minus, vel minimum Panicula parva Bauhini, The fmall or fmalleft Maidenhair, or Quaking Grafs.* The Roots are reddifh, creeping here and there, from whence rife up two or three fhort Stalks, with few Joints and fmooth, narrow. *Gramen Tremulum minus, vel minimum Panicula parva Bauhini, The fmall or fmalleft Maidenhair, or Quaking Grafs.* The Roots are reddifh, creeping here and there, from whence rife up two or three fhort Stalks, with few Joints and fmooth, narrow.

CLXXXVII. 5. *Gramen Tremuium 'maximum album. Bauhini, Gramen ekgans Lupu/i glum is Clufij, The white great eft Maidenhair, or Quaking-Grafs.* It has a fmall and fibrous Root, perifhing every Year with us, it is a fmall *Grafs*, widi fiaider Stalks, and a tew foft green Leaves on them, at the tops whereof ftand flattifh, foit, fealy heads, greater by much than any of the aforegoing, and of a Silver ihning white color, very beautiful to behold, each of them much like to the head of an Hop, hanging upon a fmall Thread-like Footftalk, as thebthers do, and are almoft as moving and ftirring as they are.

CLXXXVIII. *The Places and Times.* All thefe forts of *GraJjes* grow in Corn Fields, and in Lay Grounds, which have been formerly Plowed, and fome of them in dry Meadows and Paftures * the firft, fecond, third, and fourth kinds grow not only in *England^* but alfo in *Spain, Italy, Well Indies,* and other Countries, the third fort is found growing in Upland Corn Fields, as at *Uatjield, &c.* on the *Graffie Banks* there-, the fifth kind is a Native of *Spain,* and grows with us only in Gardens, which tho' it perifhes every Year, yet feldom rifes again of its own Sowing, but of the Sowing thereof in tfe Springy but in *Spain* it Sows it felf, and abides all Winter, in regard they have there no Frofts; the fourth fort flourifhes 5 and is in Bloom with us in *May and June.*

XXVI. *KcA&uiy?*>n<> Qilamogrofti* *iMu Gramen Arundinaceum, Reed-Graif, thirteen Kinds, of which feven are of the Land Kind; three of the Marfb Kind, and three of the Water Kinds.*

CLXXXIX. 1. *Calamogroftis, five Gramen Arundinaceum majus, Gramen Arundinaceum Spica multiphci Bauhini, The greater Reed-Grafs.* It has a Root full of white Strings or Threads, and fome jointed ones, which fpread in the Ground, from whence rife up many jointed Stalks, alfo largf, ftarp, cutting Leaves on them, like to thofe of the *Water-Reed,* but leffer; the tops of the Sralks are tunilhed with feveral hard long Spikes or Heads, fomewhat like to the *Common Reed^* which when they have flood long do open, and having a flocky fubftance in them, are carried away with the Wind. Another Kind is leffg^ and not having above *ont* or two Spikes thereon.

CXC. 2. *Calamogroftis altera minor, fve Gramen Arundinaceum minus Nerweticum. The leffer Reed-Grafs.* The Root confifts of many long Strimi from which rife up Stalks not fo high as the former, which, as well as the Leaves, are fomewhat harder or rougher than the former, (which ye *Tin Moraay* are much more hard and rough) the Tuft at the top is larger, more fpreM into li Panicles, (harper alfo, and a little rougher in

with thick Strings, which fometime fpr d under the Ground it is in B Stalks and Leaves a little like the next *Woolly Reed Grafs,* but the Stalks are jointed in two or three places to the height of three or four Feet, or more, with narrower Leaves, Sharper, and almoft three Feet lone, being a little ftriped with a, the top Panicles are fometimes long, and more like to the *Common Reed,* which are of a ftraw color, and a little rougher in

urn, *Woolly Reed-Grafs.* It has a Root which is fomewhat

fomewhat hard and rough at top, with feveral long Fibres proceeding from ic-, the Stalks are three or tour feet high, or more, having but few Joints ^ thefê Sea Iks are rough, and bear large f piked heads, let up a long Panicle, which are reddifh for fome time, but growing to ripenefs are of a fhining Silva like whitenefs, and as löff as Wooll in handling-, this Plant in its roughnefs, drynefs, and form of Leaves, is not much unlike to that *Baftard Foxtail-Grafs* called *PJseudofch&nanthum*, or *Baftard Squimwth*, at SeÆl. in . aforegoing, but much greater.

CXCIII. 5. *Calamogroftix Panicula Torofa, Large, round, Tufted Reed-Grafs.* Its Root is fmall and Itringy, it has narrow Leaves, fomewhat fofter and gentler in handling than the others before, yet not eaten by any Cartel except Goats, the Tuft or Panicle it felf is more round and thicker, with fhorter heads, let clofe together like fmall Knots or Knobs, but fomewhat flat on one fide •, its Bloomings are of a yellowifh purple color, and fome of its Panicles are found to be more long than round.

CXCIV. 6. *Calamogrollis Montana Enodis, Scirpm primus Tragi, The greater Mountain Reed-Grafs.* It has a Root of fome fmall fubftance, hard, and having many Fibres adjoining to it, it grows up with liiong Stalks as high as a Man, without any Joints on them, or having but one at themoft, having thereat not hard, but foft long Leaves 5 at the tops of the Stalks are many long, flender, chaffie Spikes, growing more fparkedly than the others, each of which is of a bright reddifh yellow color, and ftanding upright.

CXCV. 7. *Catamgroftis Montana Enodis minor, The lejfer Mountain Reed-Grafs.* The Root is like the former, but the reft of the Plant is much lower and fmallier; the Spjkes are alfo inaller and fhorter, and not ftanding fo upright.

CXCVI. 8* *Galamogroftis Palufiris maxima^ Gramen Arundinaceu?n Palufire maximum, Great Marjh Reed-Grafs.* It has a Root which creeps far about in Wet Marfhy places, from which it (hoots forth great, thick, and very tall Stalks, four, five, or fix Feet high., jointed up to the tops, with long and fomewhat broad, hard, rough, and fraked Leaves fet thereon, but lefs thanthofe below * towards the tops of the Stalks with the Leaves come forth many fparked Tufts of chaffie heads, Itanding on fmall long Foottalks, the whole Panicle being at leaf a Foot long, and fometime more.

CXCVII. 9. *Calamogroftis nofira* gluma Acerofa Palufiris^ Our great Marjh Reed-Grafs with chaffie heads.* It has a jointed reddifh Root, from whence lpring many fair large *Reed like* Leaves, not much unlike to thofe of *Millet-Grafs*, but harder, rougher, and fraked all the length of them, having great jRmHike Stalks, three, four, or five Feet high, jointed alfo and branched, and towards the tops having large and fomewhat hard Panicles of fpiky chaffie heads, each of them about feven, eight, or ^{n m j e} ^{l i f ^ l o n} & ^{o f a} whitifh color in fome places, and reddifh in others, in which chaffie or husky Heads thereilyes fmall Seed. *

CXCVIII. 10. *Calamogroftis, vel Gramen Arundinaceum Palufire Sericea nwlwre fpica, Soft headed Marjh Reed-Grafs.* The Root is compofed of feveral fmall Fibres or Strings fet together at a head, it grows fomewhat like the laft, butlefter, with narrower and fhorter Leaves, and lower Stalks, having but few Joints and Leaves on them, the tufted Heads which ttand at the tops are fomewhat like to tffc *Rujh* which is called *Bafiard^ Schananthum*, and turn into Down, which is carried away with the Wind.

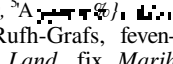

irCXCIX. 11. *Calamogroftis Aquatica major, Gramen Arundinaceum Aquaticum majw^ Great Water*

Reed-Grafs. It has Roots which run and fspread themfelves far, flooting up in feveral places, the Stalks are great and tall, full of Joints, with large *Reed like* Leaves at them, ftriped with White and Green, like *Ladies Laces*, but not fo evidently to be feen, up to the top almoft, where ftands a large and foft tufted Panicle, confifting of many Branches and parts, almoft like to the *Vulgar* or *Common Reed*.

CG 12. *Calamogroftis, feu Gramen Arundinaceum Aquaticum magnum, The great Water Reed-Grafs.* The Root is almoft like; but creeps not fo much as the former, the Stalks are great and high, having broader and longer Leaves than the former, and lomewhat harder alfo^ the Joints likewife are fewer, and the tufted Panicle is much more fspread, and foft in handling, and of a purplifh green color, and its Bloomings are white.

CCI. 13. *Calamogroftis, five Gramen Arundinaceum Aquaticum Panicula fpiciofa, Fair headed Water Reed-Grafs.* It rife to be three Feet or more high, the Leaves are broad, and a Foot long, but flendeily fet on the Stalks, a little rough on the edges, fome of which will be hollow, like a Trunks that the Stalk will go thro^ it half way ^ the top Panicle is made of many fine, foft, fcaly Tufts, very beautiful to behold..

CCII. *The Places and Times.* The firft and fecond grow in moift Meadows, which are Sandy, and rather Barren than Fertile ^ the fecond alfo is found growing in fome moift Fields near *Hackney* ^ the third is expreffed in its Title -, the fourth in the borders of dry Fields, and by Hedge fides, in many Countries of this Kingdom, epecially in *Dorsetshire* ^ the fifth grows in the like places ^ the fixth and feventh grow in moift Woods which are on Mountains and Hills-; the eighth grows in Marly places, and Ditches overflowed with the Tide, I have found it growing in fome parts of *Carolina* y the ninth and tenth grow in low moift Grounds by *Ratclijf* near *London* ^ the eleventh, twelfth, and thirteenth grow in Ditches, Ponds, and Lakes in fe^ral places of *England.*, as alfo in other Countries i the firft feven, as alfo the other fix, flourifh in the Rummer Months^ and their Stalks perifh before Winter.

XXVII. ^tvcy^co^Ky *Schcenogroftis*, ^{5A} , ^{5A} ^{er^mw}, *Gramen Junceum*, *Rujh-Grafs*, feventeen Kinds, viz. feven of the *Land*, fix *Marjh Kinds*, and four *Water Kinds*, of all which in order.

CCIII. 1. *Schcenogroftis community vel Gramen Junceum vulgare, The common Rujh-Grafs.* Its Root confifts of brownifh yellow Fibres or Threads, the Leaves are almoft round, feven or eight Inches long, from among which fpring up the Stalks, which are about eight or nine Inches high, v^ich bear at their heads feveral fmall Panicles Spike fashion, one above another.

CCIV. 2. *Schcenogroftis Mont an urn /pica Subca* rule & Cambro Britanicum 5 Weljh Mountain Rujh-Grafs** From a fibrous or ftringy Root fpring up a great many fine, flenden, *Rujh like* Leaves, nearly a Foot and half long, from among which rife up two or three flender fmall Stalks, eight or nine Inches long, and much lower than the Leaves, bearing at their tops, from between two Leaves, which are rather like *Skins*, being broad below and fmall towards their ends, yet always the one longer than the other, a fmall, fpiked, fcaly head, of a fine blewifh color.

CCV. 3. *Schcenogroftis, feu Gramen Junceum Spcioftm minus^ Another Noble or Excellent fmall*
N n n Rujh-

Rufh-G raj's. It is very like the former, but has much smaller *Rufh* like Leaves, not above three or four Inches long, rising out of a hard brown Husk or Hofe, fet at the top of a final Fibrous Root, from among which spring up several jointed Stalks, with such like Leaves on them, and a small head at the top, like unto the former, but of a brown, clear, Chestnut color, and smaller, as the whole Plant is, having two small Leaves thereat, as in the second foregoing.

CCVI. 4. *Sclmnoqrftis, five Gramen Junceum Ddlecampij) Dakchampius bis Rujh-Grafs*. It has a very long, white, and fibrous Root, from which rise up a very great number of small, round, *Rufh* like green Leaves, and among which spring up divers jointed Stalks, with some few Leaves on them, and at the top a sparfed spiked head, something like unto the *Holoftem Salamamicum Oufij*, or *Spanijh Sea Plant* and confuting of many purplish Husks,

Wood *Rujh-Grafs* with jointed Leaves.

CCVII. 5. *Schcenogrojii Sylvarum, feu Gramen Junceum Syheftre articulato folio majus, The greater jointed Wood Rujh-Grafs*. It has a Root which creeps a little, repeat with many small Fibres, the Stalks are somewhat flat, and very green, the Leaves are almost round, with many several crols Joints on them, the tufted heads at the tops of the Stalks, which are near three Feet high, are spread into many *Rufh* like Panicles, and also somewhat flat.

CCVIII. 6. *Schoenograftis Sylvarum, five Gramen Junceum Sylvarum articulato folio minus, The letter jointed Wood Rujh-Grafs*. It has a Root which is hard, spreading abroad, with many Fibres adjoining to it, from whence spring up many Stalks, which take Root again in the Ground, and bear such like jointed Leaves (as in the left) at the tops of the Stalks are small, spread, Panicle Heads, veiv 1. to the former, but smaller by half in each. TL. another of this kind which is yet smaller, Sofe Leaves are small and flender, but not jointed, the

Panicle of which, is smaller, and sparied in like manner.

CCIX. 7. *Sdanogroflis, feu Gramen Juncmes ipirfa Junci Panicula, Rujh-Grafs with Rujh like parfe.i beads*. It has a Root which is yellow, in spreading it self under the Ground, with long ribes-, the Stalks are flender, Imberhing flat, and near two Feet high-, the Leaves are smaller than the common fort, being about fifteen or sixteen Inches long-, the tops are also smaller, and spread with vyhitiff heads.

CCX. 8. *Schmogrofiis, five Gramen Junceum Palufire racemoso Semine, Maffh RuJh-GraJsvoM Seeds in clusters*. It has a blackish thready Root, from which rise a few small *Rujh* like Leaves, ami from among them spring up several Stalks, a foot and half high, bearing at their tops, between Inair long Leafes, a small head, much like to a Bunch of Grapes, in which the Seed lyes.

CCXI. 9. *Schanograftis, feu Gramen Junceum Maritimum majus, The greater Sea Rujh-Grajr.* it has a tufted fibrous Root, from which spring many hard smooth Leaves, something like *Rujhes*, ana from among them several flender naked Stalks, a about a Foot high, with *Rufh* like heads growing ? their tops, but much smaller.

CCXII. 10. *Schanogrofiis, vel Gramen Junceum Maritimum denfe fiipatmn^ Sea Rujh-Grafs the* fet*. It has a *Rujh* like Root, and long hard Leaves, like *Rujhes*, growing thick and clofe together; *c Stalks are flender, and not much longer than the Leaves, every one of them bearing at their tops a small Head, something tike to thofe of *Rujhes*.

CCXIII. II. *Schanograftis, five Gramen ?***' um Maritimum minimum Zelandicum, The leaji Set' Rtijf-Grafs of Zeland*. It has a fibrous Root, from whence rises a small bush of Leaves-, the whole Plant scarcely exceeds eight or nine Inehes in height from among this well spread bush of Leaves rises up the Stalks, with small hairy like Leaves, and a small thick head at its top.

CCXIV. 12. *Sch*nogro(lis, feu G « f S ; um Maritimum exile Plimofiuu Small Sea K'ij' Grafs of PUmouth* It has f & t confiting of many small long Fibres, coming from one Head sine Leaves are many, growing thick together, ana* fine almost as Hairs or Threads, from amojig which rise up several flender unjointed Stalks, each of which bears a small round head, the Stalks are about four or five Inches high, each of them bearing a small reddish, fealy head, with the top of the Stalk rising up above it.

CCXV. 13. *Schcenogrojii Sylvarum, feu Gramen Junceum articulato folio minus, The lesser jointed Wood Rujh-Grafs*. It has a Root which is hard, spreading abroad, with many Fibres adjoining to it, from whence spring up many Stalks, which take Root again in the Ground, and bear such like jointed Leaves (as in the left) at the tops of the Stalks are small, spread, Panicle Heads, veiv 1. to the former, but smaller by half in each. TL. another of this kind which is yet smaller, Sofe Leaves are small and flender, but not jointed, the

ganlwhol Heads are ali. and proe 1. the Stalk rising above them. asfa the other.

CCXVI. 14. *Schvnoqrofiu, five Gramen Junceum articulo folio minus, The lesser jointed Wood Rujh-Grafs*. It has as few, but smaller than the Eighth Kind foregoing, being about two Inches long; the Stalks are about four or five Inches high, each of them bearing a small reddish, fealy head, with the top of the Stalk rising up above it.

CCXVII. 15. *Aquaticum mag\ sparfa Panicula, Water Rujh-Grafs with a wore sparfed Panicle*. It is very like the last in growing, the greatest differences are in the Stalks, for they are greater and rise higher; and in the Leaves, for they are jointed, like to the *Wood Rujh-Graj*; and in the Heads, the being smaller, and more difperfed.

CCXVIII. 16. *Scbenogrojiiis, JiveGramen Junceum Aquaticum Baubini, Baubin bis Water Ruffh-Grafs.* It has jointed Leaves, from among which rife up Stalks, a Hand high, or more, with certain chaffie Heads, parted into many Threads.

CCXIJC- 'I' *S'chcMogrojiiis, feu Gramen Junceum Aquaticum vulgare, 'the common Water Ruffh-Grafs.* It has a long, thick, fpreading Root, which fends up feveral jointed Stalks, and at each Joint a narrow Ruffh like Leaf* at the tops of the Stalks stand feveral, fomewhat like unto thofe of Rujbes.

CCXX. *The Places and Times.* The firft feven of thefe *Graffes* grow upon dry Land, and in dry places, fome of them upon Hills, fome on Mountains, and others in Woods-, the fecond grows on a high Hill in *Wales* called *Berwin*, continually covered with Clouds and Mifts, and Watered with Showers, whilft at the fame time the Sun fhines fair in the Valleys below it^ others of them grow in the Woods near *Highgate*, in *Hornfey Wood*, and in many other Woods of this Kingdom, as alfo in Meadows adjacent to the fame, and do all of them flou- rixh in the Summer Months, viz. in *June* and *July*.; the next fix *Marfb Ruffh-Graffes* grow in Salt Marfhes, and near the Sea fide, and other like places, in many parts of this Kingdom; the laft four grow in Watery places, and ia or near Waters, whether ftanding or running, and flourifh in the Summer time, as all the reft do.

XXVIII. *Subdijionem, n. n. JAiWto, Gramen Marinum^ vel Maritimum.* Sea-Grafs, Eight Kinds.

CCXXI. I. 'OEWt>f<af* I W ^ *Oxyagroftis Maritima Dalecbampij, Sbarp pointed Sea-Grafs.* The Staffks are buflly, and about two Feet long, full of Joints, and narrow *Grafs* like L*^es at every one >fthem, of a dark green color, anafofharp at the points, that they are ready to prick their Legs who pafs by them unawares.

CCXXII. 2. *Gramen Mantimum afperjamjough Sea-Grafs.* Irs Root is a bufh of long white Fibres, which fends up feveral reddifh, round, fmall Stalks, a Foot or more high, leaning at firft downwards, encompaffed with hard, fliont, and (harp pointed Leaves, Handing as it were in a Tuft together, with hard rough dents about the edges-, the {piked heads are like rough hard Burs, breaking out of a Skin which enclosed them.

CCXXIII. 3. *Gramen Maritimum, vel Marinum exile vicinorum aggerum, A very fmall Sea Down-Grafs.* It has a Root which is fmail and thready, which (hoots forth fivers (hort Stalks, two Inches long, full of fmall long Leaves like Hairs let clofe together, and among them at the tops fmall Heads, like to the *Catkins* of the *Dwarf Willow*.

CCXXIV. 4* *Gramen Maritimum, vel Marinum Spicatum, Spiked Sea-Grafs.* It has a Root compo- fed of a bufh of many long Fibres or Strings, from whence rife up many long, hollowed, or Gutter Leaves, encompaffing one another at the bottom, from among which fpring up two or three Stalks, bare of Leaves unto their tops, where they bear long fpiked Heads of greenifh Flowers, fet clofe to- gether.

CCXXV. 5. *Gramen Marinum fpicatum aherum, Another fpiked Sea-Grafs.* It has long, flender, narrow, hard, and (harp pointed Leaves, growing often on low places *ib* near the Sea, that fometime it wafhes over it^ the Stalks are many and low, with fmall, long, and round Heads thereon.

CCXXVI. 6. *Gramen Marinum majus Statice quibufdam, Great Sea-Grafs, or Sea-Thrift, called by fome ZTWUKV.* It has a pretty large long Root, with fome Fibres adjoined, which lends up many fair, long, and fomewhat broad, and whitifh green Leases, lying clofe together upon the Ground, from which rife up flender Stalks, naked to their tops, except in one place towards their middle, where they have two fmall Leaves turning downwards, contrary to almoft all other Herbs, and at their tops a Tuft of blufti colored Flowers, opening by de- grees.

CCXXVII. 7. *Gramen Marinum Americanum, ZTWXn Statice Americana major, Great Sea Thrift of America.* It has a long Root, with but few Fibres thereat, from whence fpring up a vaft number of Leaves, almoft like the laft, but they are narrower, of a ladder green color, and fomewhat (hining, with two Ribs in each, and blunt at the ends ^ it has flender Stalks, which bear aifo fuch a Tuft of Flowers, but of a white color, and break out of a Skin, which falls down about the Stalk.

CCXXVIII. 8. *Gramen Marinum minus, Small Sea-Grafs, Sea-Thrift, or Sea-Cuffion.* It has many fmall, hard, (hort, green Leaves, growing thick to- gether, and fpreading on the Ground *, the Stalks are many, of a Span high, without any Leaves on them, but at their tops, where grow fmall round Tufts of blufti colored Flowers.

CCXXIX. *The Places and Times.* They ail of them have been obferved to grow upon our Sea Coaits, efpecially on the *Kentifh* and *Suffex* Shoars ^ the fixth grows on the *Mediterranean* Shoars, the feventh on the *American* h and they all Flower and Seed in the end of Summer.

XXIX. 'A>:r* afTVff/a, *Gramen Argenteum, Sil- ver-Grafs, three Kinds.*

CCXXX. 1. *Gramen Argenteumcapitalisglobofis, Silver-Grafs round headed.* It is the *Gramen Lucidum Tabernamontani*^ and is thought to be the *Com-*

bretum Plinij; it has a small, bushy, and fibrous Root, which sends up long Leaves, like those of *Wheat*, which have some small, long, white Hairs upon them, and about their edges* from among these Leaves rise up several Stalks, about a Foot high, with Joints and Leaves on them, at the tops of these Stalks on each Stalk grow two or three round Heads, which are soft, white, and woolly, consisting of many small Silver like Threads, which are laid to shine in the Night, and therefore called by the *ha Hans Luciola*.

CCXXXI. 2. *Gramen Argenteum friatum*, Silver-Grafs jbreaked, called by some *Lady-Laces*, *LadyLacc-Grafs*, and *Painted-Grafs*. Its Root is small and hairy, and of a white color, like unto *Meadow-Grafs*, it has Leaves like to *Millet* in form, and rough or sharp pointed, like to the *Reed*, with many white Veins or Ribs, and Silver Streaks running along thro' the middle of the Leaves, fastening them like to Ribbons or Laces made of white and green Silk, very beautiful and delectable to behold, it grows to the height of *Wild Panick*, with a spiky top, not very much upright, but more compact, soft, and chaffie.

CCXXXII 3. *Gramen Argent eum Spick Tomen-tojis*, Silver-Grafs with Cotton Spikes or Heads. It has a hard, long^ thready Root, from whence proceed many soft, downy, grassie Leaves, of a mean length, seldom exceeding two Feet, or two Feet and half in height, from among which rise up several Stalks, a Yard or Yard and half high, having but few Joints on them, not above one or two, with like grassie Leaves growing up from them^ at the tops of these Stalks are long spiky Heads, let upon a long Panicle, which are a kind of chaffie and the color, which when they come to ripeness are of a shining Silver like whiteness, and as soft as Cotton.

CCXXXIII, *The Places and Times*. The first of these grows in Woods, Copiès, Groves, and other like Woody places, in many places of this Land the second grows in borders of Woods, and upon Woody and Hilly places in *Savoy*, but with us only in Gardens* the third in borders of dry Fields, and by Hedge sides, in many parts of *England*, and all flourish with the *Common Meadow-Grafs*, or in the middle and end of Summer.

XXX, "Aex**t raxvn&i*, ^*raxwJW*, *Gramen Spica**M*, Spiked or Eared Grafs, eleven Kinds.

CCXXXIV. i. *Gramen spicatum pur pur eum Pratenfe Dalechampij*, Purple spiked Meadow-Grafs. Its Root is a bush of white Fibres, from whence rise many Grafs like Leaves, but narrower, softer, and greener, having several short Stalks, not a Foot high, with two or three Joints on them, set with Leaves, at the tops of which, out of a round Skin or Husk, picked at the end, being the uppermost Leaf* breaks forth a thick, short, and somewhat flat Spike, of a delicate reddish purple color.

CCXXXV. 2. *ArM&vto'&yt*™* *Gramen Anthoxanthon Lugdunenfis*, (i. e. Yellow Flowered) *Gramen spicatum flavicjens Pratenfe*, Tellmfpiked *MeadouhGnifs*. \ differs little from the last, either in Roots, Leaves, Talte, or Quality, so that some Authors have called the one the Male, the other the

Female of this is of a pale yellow color, and in some higher Grounds of a more reddish and shining color, and not enclosed in any Skin or Leaf, as the

other, but standing naked or bare, being alfd flenderer and longer.

CCXXXVI. 3. *Qramen Spicatum, Spica multiftici rubra Pratenfe*, Red Spiked Meadow-Grafs. It has a small Root, made of a few Hair like Fibres, whence rise long and narrow Leaves, Ribbed thro' their whole length, and composed as is scarcely to be seen in any other Herb, for some of them are jointed, as if one Leaf grew out of another* on the top of the Stalk stands a very long Head, consisting of a good number of reddish Spikes set together one above another, which are somewhat rough in handling.

CCXXXVII 4. *Gramen Spicatum Fofijs Caryophyllek Pratenfe*, Spiked Meadow-Grafs with Glut-flower Leaves. Its Roots run under the upper Part of the Ground, folding out within and over another, its Leaves are somewhat hard, thick and short, and greener than those of *Gilliflowers* or *Pinks*, but so hard and sapless, that Cattel will not eat thereof* the Stalks are six Inches high, at the tops of which stand small Spikes, sometimes more, sometimes fewer, brownish at first, and afterwards somewhat reddish, with many yellow Threads mixt among them.

CCXXXVIII 5. *Gramen Spicatum Felijs Caryophylleis spicafquamata*, Spiked-Grafs with Giftler Leaves and a scaly Spike. Its Roots are small blackish Threads, it has small long Leaves, narrow, and bowing, the Stalks are small, about eight or nine Inches high, bearing a short scaly Head.

CCXXXIX. 6. *Gramen Spicatum album angustifolium Sylvaticum* White Spiked narrow Leaved Wood-Grafs. This differs from the foregoing, in that its Root is yellowish, with small Fibres, growing aloft in the Ground, the Leaves are many, but very short and narrow, scarcely four or five Inches long, the Stalks many times exceed not the length of the Leaves, having small spiked Heads, beset with short Hairs, scarcely an Inch long.

CCXL 7. *Gramen Spicatum Caryophylleum Spica multiplied Double Spiked-Grafs with Gilliflower Leaves*. Its Root is a bush of many reddish hairy Fibres, whence rise several short narrow Leaves, like those of *Gilliflowers*, among which spring up very many flender Stalks, naked, without Joints or Leaves, scarcely growing higher than the Leaves, which bear short reddish Spikes, many set together.

CCXLI. 8. *Gramen Spicatum Caryophylleum Spica varia*, Variable Spiked-Grafs. Its Roots are finally long, and fibrous, bushing thick together, wheate spring long, narrow, *Gilliflower* like Leaves, from among which grow up several small naked Stalks, bearing a flender, long, pointed Head, sometimes single, and sometimes divided or branched into several long parts, made of many Husks.

CCXLII. 9. *Gramen Spicatum QaryopWleut* Rabinum Bauhtnt*, *Gramen liabinum Gefneri*, Tfc chief or principal *Gilliflower** Grafs. It has a fibrous Root, proceeding from one Head, from which rise up many thick, firm or fleshy, and long pointed Leaves, like to those of *Gilliflowers* lying in a round compass at the head of the Root, not having any Nerves or Veins in them to be seen, and of which Cattel will very well Feed.

CCXLIII. 10. *Gramen Spicatum, Spica Gemina Columns*, Double Spiked-Grafs of Columna. It has a small, whitish, fibrous Root, which sends up several weak and leaning jointed Stalks, with small Grafs like Leaves upon them, at the top of each Stalk grows two several Spikes, jointed together at their Feet, directed on their-edges, with a middle Rib between, and consisting of three or four rows of Leaves like Scales, containing small, brown, cornered Seed.

CCXLIV. 11. *Gramen Spicatum Virginianum Spica articulata, Spiked Virginia-Grafs having a jointed Spike*. It has a buihy Root, which lives long, and is a goodly Grafs, growing great, with many fair, large, and broad Graffie^e Leaves, very small pointed, and fomething hard in handling, the Stalk is also great pd tall, [^]earaög a long Spikt at the top, jointed in feveral parts, eadi of then? aimoit half an Inch a piece, being almoit round, yet a little flat.

CCXLV. *The ffap and Times*. The firft five grow in Fields, Inflows, or Patures, or near to them* the next five grow on Hills, Mountains, Woods, and Woody places, in many parts of *England* ^ as also in other Foreign Countries, the eleventh grows particularly in *Virginia*, and they all Flourish much about the fame times when other GraJes do.

XXXI. *Milogay?flw, Gramen Bufonum, vel Bufonis Flandrorum, Gramen Junceum parvum, Holoftium Matthioli*^ Toad-Grafs, three Kinds.

CCXLVI. 1. *Gramen Bufonum, vel Gramen Junceum parvum, The greater Toad-Grafs*. It has a fi&ous reddish Root, and grows not to be above eight or nine Inches high, the Leaves are very small, and thofe on the flender Stalks and Branches from the Joints leffer, whereat, and likewise at the tops, come forth small, yellowish, chaffie Heads or Husks, with fhort Awnes at the ends, each upon a ffort Footstalk, one qbove another.

CCXLVII. 2. *Gramen Bufonum medium, The middle fiEd Toad-Grafs*. It differs from the former only in its magnitude, tfiis being of a middle fize between the former and the leaft, there is also one fomething smaller than this, whose Heads are clofer or thicker fet together.

CCXLVIII. 3. *Gramen Bufonum minimum, Gramen Junceum minimum Holoftio Matthioli Congener, Thefmalleji Toad-Grafs, orfmalleft Rujb-Grafs*, like the former Toad-Grafs at Se&. 246 above. It has a very small and fibrous Root, and grows with feveral small and Thread like Leaves, fcarcely an-Inch and half long, with yet fmaller Leaves on the Stalks, which are not above three or *mix* Inches high, a whose tops ftand two or three small Heads, like to thofe of *RuJhes*, but with rounder Grains or Seeds therein, and fet clofer together,

CCXLIX. *The Places and Times*. The firft grows in moit and wet Grounds, the fecond in moit or wet places near *Ufghgate*^ the third in low, moit, and Marfhy Land -, they all flourish and Seed in the Summer Months, viz. in *June* and *July*.

XXXII. *A>fkyff %w£&.i % Cjh,7wh\$! Gramen Aquaticum, Water-Grafs, feven Kinds*.

CCL. 1. *Gramen Aquaticum Paniculatum minr/s^ Small Bearded Water-Grafs*. It has a thick, hard, fibrous Root, which fendes forth a round llraked Stalk, about two Feet high, encompaffed with feve* ral broad, rough, pale green Lejves, nearly a Foot long; the top jRanide is a Span lor?g, \tparfedly or thinly placed, compafed of many whitifh Heads, having long Awnes or Beards.

CCLI. 2. *Gramen Aquaticum aculeatum majw, The greater prickly headed Water-Grafs*. It has a fmall Root, which runs deep into the Myd_o and fendes up a Stalk or Stalks two Feet high or more above the Water in Ditches vWice it grows •, the Leaves are long and narrow, bearing at the tops of the Stalks feveral fmall prickly Heads, with long Leaves at them.

CCLII. 5. *Gramen Aqumaticum aculeatum minus, The leffer prickly headed Water-Grafs*. This is like to the laft both in Stalks, Leaves, and prickly heads^ but fmaller, nor has it any Leaves growing with them as the others have.

CCLIII. 4. *Gramen Aqxaticum aculeatum alterum, Another prickly headed or Bur headed. Water* Grafs*. It has long, fsmooth, and tender Leaves, among which riles up a Stalk, about half a Yard high, with a few Leaves fet thereon, and at the top many fmall rough Heads like Burs,

CCLIV. 5. *Gramen Aqxaticum, vel fluidtile Cornutum^ Horned Water-Grts*. It has a fmall and fibrous Root, which fendes up a flender Stalk, about two Feet high, jointed at feveral places, and two fmall Ruffy Leaves for the molt part *ibt* at each of them, growing fomething broad, and compaffing it at the bottom with a large Skin, from whence also rife one or two Stalks, ending in ^skinny Head, which has at the end three or four narrow Leaves, turning downwards, and feeming like Horns.

CCLV. 6. *Gramen FluviatHe Spicatum, vel Aquaticum Spicatum, Spiked Water or Float-Grafs*. It has a Root compact and Tufted, or bulliy in the Mud, compofed of many Strings and Fibres, it has feveral weak Stalks, leaning every way, full of crooked Joints, which are knobby, or round, taking Root again in divers places, having long and narrow Leaves upon them, which lye floating under and upon the Water^ that part which grows up has fome Leaves likewise thereon, and a long, flender, brown fpiked Head at the top.

CCLVI. 7. *Gramen Fluviatile^ vel jjq:taticum Spica multiplier Many Spiked Water or Float-Grafs*, It has a long and round Root, fomewhat thick, like unto *Dogs-Grafs*, iht on even Joints, with fmall Strings and Fibres, from which rife up long and crooked Stalks, croffing and winding, and folding one within another, with many flaggy Leaves on them, more in number than the former, which Horfes and other Cattel eat greedily 5 at the tops of thefe Stalks, and fomewhat lower down upon them, come forth very many little Spikes or Ears, of a whitifti color, compofed of two ranks of fmall chaffie Seeds, let alternately on the Stalks, each of thefe fmall Ears being almoit an Inch in length.

CCLVII. *The Places and Times*. They all grow in watery Ditches and Ponds in many parts of this Land,

Land, but the two laft grow moftly in (hallow Rivers, Brooks, and Rills, where the Water runs foftly, fmoothly and eafily -, they are alfo found fometime growing in Handing Waters, and many times by iredh Rivers fides ^ they all Flourifh and Seed in *June, July, and Auguft*, according to the kindnes of the Seafon.

XXXIII. *'OMysaeK, "co>?af -ni^Kn, "ayfuns TIK C/S, ^Tc<ft, /fd/rw P/i/?i/, Gramen de via, Gramen Muriate, Gramen Semit ^ vel Semit ale, Way or Wail-Grafs, four Kinds.*

CCLVIII. 1. *Gramen Semitale, vel Muriate, Gramen Hordeium, vel magis Secalinum majus, The greater Way Grafs or Wall-Grafs, Barley-like-Grafs, or rather Rye-Grafs.* It has a bufhy and fibrous Root, which perifhes not in Winter, tho' never fo cold, from which fpring up many Grafs Leaves, but fomewhat harder in feeling, and not altogether fo juicy, from among thefe green Leaves fpring up feveral *Benty*; Stalks, a Foot or more high, having fome few Joints on them, with Leaves thereat, every one of which bears at the top a finally long, whitifh, yellow Ear, an Inch and half two or three Inches long, hiving fome Awnes or Beards, within which are contained fmall, long, lank Seeds or Grain: This Ear Authors think has fome refemblance of *Barley*, but it much more refembles *Rye*, and therefore may not improperly be called *Rye-Grafs*.

CCLIX. 2. *Gramen Semit ale, vel Muriate minus, Gramen Hordeium, vel Secalinum minus, The lejjer Way or Wall, Barley or Rye-Grafs.* It is in its Roots, Sralks, Leaves, Ears, and manner of growing very like the former, but it is fhorter and lower, and looks as if it was a *Dwarf Grafs* of the fame kind. I know many have taken it to be the fame, but if does really differ, the Stalk is feldom above nigs- or

ten Inches high, whereas the former comes to be fometime fifteen or feventeen Inches, if in good Ground; the Ear is alfo much lefs, and (horter, and almoft without Awnes, or elfe they are very flort ones.

CCLX. 3. *Gramen Semitale minus, Gramen Secalinum minus, The lejjer Way Grafs, or rather Rye-Grafs.* It has a running and jointed Root, with many bres adjoining, the Stalks rife up to be fometime two Feet high, and better, having but few and more Leaves thereon, the Spike is fometime two, three, or four Inches long, bearded, and very like unto an Ear of *Rye*.

CCLXI. 4. *Gramen Semitale magnumpel Gramen Secalinum minus, The great, or rather lejjer Rye-Grafs.* The Root in this is wholly Fibrous, but otherwife it differs not from the former, laving that it is every ways lefs, and the Ear (very like to *Rye*) is many times not above half the length of the former.

CCLXII. *The Places and Times.* They grow upon wafte and untilled Grounds, by Ways and Path fides, and the fecond of them by Walls fides and upon Walls, efpecially upon Mud Walls, in almoft all places of this Kingdom; they Flourifh and Seed in the Summer Months, viz. in *June, July, and Auguft*.

XXXIV. *ytwteffe* Gramen Nemorak, vel Nemorofum, Wood-Grafs, four Kinds.*

CCLXIII. 1. *Gramen Nemorale, vel Nemorofum majus Spica rufefcente, The greater brown Wood* Grafs.* The Root is a bufh of very fmall Strings or Fibres, from vifience fpring up many narrow graffie Leaves, and among which rife up many fmooth round Stalks, without any Joint or Leaf on them, at the tops whereof ftand loofe, fmooth, brownifh

hiowv i leads, fep rated a little one fro.:
another, and as it were a Hrcle Bearded,

Wood-Grafs Greater.

CCLXIV. 2. *Gramen NemorofuM, vet Sylvati-
atm Cupillaceum Fanitula alba, White Tufted Wood
Grafs.* It has a tufted or buihy fibrous Root, as
It nail as Haire, from the head of which bufh of Fi-
bres faring fmall *Grafs* Leaves, which grow thick
and clofe together in a Tuft in a great number, and
rtfing to be about a Foot long; the Stalks come up
from among the Leaves, about a Foot and half or
ijcere high, fsmooth, and bate, almoft without Joint
or Leaf on them, the tops of which end in a white
Panicle, two or three Incises long, compofed of
fsmall Husks with Beards.

CCLXA^r. 3. *Gramen Syhaticum, vef Nemorale
minus, Tfo lejfer Wood-Grafs.* This differs not
from the firft <ft greater, but that it is in all its
parts leffer and lower, the fmall, chaffie, bearded
Ears being fsmaller, and nothing fo fbft, hut rather
hard, and a little more fpirfed.

CCLXVI. 4. *Gramen JVemorofum, vel fyhati-
<um exite durum, Small hard Wood-Grafs.* The
Roots are fmaH and fibrous, being in a bum, from
whence rile up many fmall hard Leaves, about a
Span long, or a Span and half; the Stalks are (len-
der, with very few Joints and Leaves on them, at
which Joints, and at the tops alfo, come forth final),

T de Spiked H

^{*be Places and Times.} Thefe all
grow m Woods, almoft every where throughout
England and they flourim when other *Crafts* do,
aw. in the bummer Months -. they are never ufed in
Phyfick nor are they good Fodder for Cattel, but
Goats will grow fat therewith.

XXXV. 'E»Syf*«fi "A_w, (i ^ ^ j ^ ^ k i W W, Cw-
«» l j i n t f l w f i , w l B o m b y c i n u m W o o l l y - G r a f i ,
two Kinds.

CCLXVIII. i. *Grumen Lanatum, five Bombycin-
um, Gt-amen Jitncoides Lanatum vulgark Common
Woolly or Cotton-Grafs.* It has \$ Root very buihy,
N fmall, and fibrous, thrufting its Fibres fomevithat
deep into the Moorifli Ground in which it grows,

trora whence riie up man/ long, ileiider, and Grattie
almoft like unto *Rxfies*, whence the Name
'*Juncus Lanatus*;', or *Juncus Bdmbycin*«s\ rrorri
among thefe Lea re's fma It, i l a id et, h ard
lufhy Swlk, about a Foot high, fometimes with a
few Graffie Leaves; thereon, anl fomerimes without
either Lejf or Joint, bearing at their tops 2 ikth or
Part. *Itanimes* ufe, *Itanimes* rone, *Itanimes* *Itanimes*, *Itanimes*
or *Itanimes*, of mull pteating, *Itanimes*, *Itanimes* *Itanimes*,
Itanimes, or *Itanimes*, at the end left and white of the
WhitS Silk, *ib* that they feum to be rather fine foft
White Silk like Heads, mer than the theit whiteft
Wooll that is, and ufually about the btgnfs of a
Walnut, with its outward green Husk, whicii are
fo eminent in ones Eye a tjr off, that they givs
much Delight and Admiration to the Beholders;
thefe being full ripe pafs away wtili the Wind.

CCLXIX. 2. *Gramen Lanatum, feu y m m
minus, Gramen Juncetim Lanatum minus, Small
Woolly or Cciton-Grafs.* The Root is ^fomewhat
black, and not much unlike the former, but this hag
many more RuOiy Leaves than that, but the Stalks
rife not much higher, they bear at their Heads Tufts
of Woolly or Cottony Heads, not fo large as the
former, but are fmall, aji ftmewhat long, which
being ripe fly away with trie Wind, leaving a lraall
Head oi Seed, like a *Crowfoot* Head, behind it.

CCLXX. *Tlie Places ar.d Times;* They grow in
moift, wet, Boggy, and MooTifh places, the firft
oi the Bfig on *Hampflead Heath*, near *London*, as
alfo in *Highgate Park*, not tar from the iame -, the
iicond has been found about *Mompeticr* in *Iraace* ^
they Flower in *July*-

The Virtues;

CCLXXL *Cordus* lays, that the Decbffion of the
firft in Wine, being taken warm, gives eafe in the
griping pains of the Belly. The Woolly Heads are;
gathered by fome to fruit Pillows, Bolfters, zni
Uthfions with, &t excelling in foctneii and good-
nefs any 'llrifle Down. Thus ha^e we given you"
a fhoit Hiftory oi *Grdfifei*, which we think is enough,*

Stone and Gravel in Reins or Bladder, but is not fo effe&ual as the Seed •, you may give it. Morning and Night, two or three Ounces for a Dolè, in a Glafs of White Port Wine.

XII. *The Effence.* It has all the Virtues of the Juice, and of the Seed, being ufed in the fame manner and Dote, but is not fo powerful or fpeedy in its Effets as the Pouder of the Seed is.

XIII. *The De coil ion of the Seed.* It is to be bruied, and then to be boiled in Broth, or PofleNDrink, or rather in White Wine: Dofe from four to eight, or ten Ounces, according to the Age of the Patient, two or three times a day, againft Strangury, Stone, Gravel, and Tartarous Mucilage impaled in the Reins, Ureters, and Bladder^ where note, it is to be ufed for fome confiderable time.

XIV. *The Pouder of the Seed.* It is found to be of fingular force to break the Stone and expel it, whether it be in the Reins or Bladder, it alfo provokes Urine being ftopt, and helps the Strangury, or making Water by drops, caufed by Sand, Slime, or Tartarous Mucilage obftru&ing thofe parts •, it is indeed a pleafant, fafe, and effe&uai Medicine for the Stone and Gravel, being taken every Night going to Bed, and every Morning failing, for feveral days together-, when the Patient is troubled with a Faroxyfm of the Stone it quickly gives relief, *probatum eft.* Dofe from two Scruples to a Dram and half in White Port Wine, or in Broth, or in Barley Cream, or in Almond Milk, or in an Emulfion of the four greater cold Seeds y if it is given to two Drams in Womens Breaft Milk, or in White Wine, or in Parfly Water, it is very effectual to caufe fpeedy Delivery to Women in Travail, who are not eafie to be delivered.

XV. *The Compofitum.* Take Pouder of the Seed three Drams, White Amber in Pouder one Dram, Ceterach or Spieenwort in Pouder half a Dram, mix them. This being taken a Dram at a time, or more, in the Morning falling, and laft at Night going to Bed, in the Juices of *Plantw, Purflane,* and *Let-tice,* and that for feveral days together, it certainly cleanfes, heals, and cures a Gonorrhoea, or running of the Reins.

CHAP, CCCXXIX.

0/GROMEL theLeffer.

I. *TPI/E Names.* It is called in *Greek* $\tau\epsilon\lambda\epsilon\mu\alpha$, $\bar{\chi}$ <uv y**6** * * * Wor, in *Latine* *Uthofpermon minus,* or *Milium Solis minus,* and in *Englilh* *Gromei the leffer,* and *Wild Gromei.*

II *The Kinds.* Of this there are fix Kinds, viz. 1. *Lithofpermum minus vulgare Matthioli, Dodonai, Camerarij\ Gefneri, Lobelij^ & aliorum,* Our common fmali Wild Gromei. 2. *Lithofpermum angustifolium Umbellatum Bauhini, vel angustifolium jru tefcens Matthioli^* Narrow Leav'd Umbelliferous Gromei. 3- *Lithofpermum Anchufa facie Lobelij. Lithofpermum ereftum minus Bauhini,* Small Gromel with tufted tops, or Alkanet like Gromei. 4. *Lithofpermum Arvenfe Radice rubente, Lithofpermum Sylvejire Tragi, Fuch/i^ £? Camerarij, & tertium Dodonai, Echium minus Lithofpenno congener Cefneri^ Anchufa degener facie Milij Solis Lobelij, Anchufa Arvenfis alba Thalij\ Lithofpermum Arvenfe Radice rubra Bauhini,* The fmall red Rooted Corn Gromei. 5. *Lithofpermum minimum Germ*.* $\tau\epsilon\lambda\epsilon\mu\alpha$ *Pafferina Tragi\ \$ Camerarij, Lingua Pajijr-*

na Tabcrnamontani, Lithojpermum Squirt urn Do >, o & i, Pj/Jerina Linaria Gerardi, Lithofpermum Lijru folio Germanic urn Baubini, Sm.ili German iromel, or Sparrow Wort. 6. Lhhofpermum L<^ aria folio Alonfpelienfe Lobelij iff Lugdunenfis, Small French Gromei with Flax Leaves.*

III. *The Defcriptions.* *The firji, or Common* fmall Wild Gromei, *has a Root which is not very long, but is replenijhed with many Fibres or fmali Strings^* which fend forth feveral upright, hard, branched Stalks, full of Joints, two or three Feet high, at every of which Joints grow fmali, long, hard, and rough Leaves, leffer than the fecond of the former, and of a dark green color, among which Leaves come forth fmall white Flowers, and in their places, when they are palt, greyilh round Seed, like the other.

IV. *The fecond, or Narrow Leav'd Umbelliferous* Gromei, *box a Root which is hard and woody, covered with 4 brownijh red Bark,* from which rilè up feveral woody rough Stalks, yet eafie to break, fspread into leveral Branches, about fix, feven, or eight Inches high, with very many narrow rough Leaves growing on them, without any order, the middle Rib in them being fome thing great h the Flowers Itand at the tops of the Branches, and ibmetimes from the upper Joints, divers being let together, as it were in an Umbel, which confilt of five fmall round pointed Leaves, of a blew color 5 or rather, being long and hollow, are parted, and cut into five parts, let in rough green Husks, in which, after the Flowers are palt, there ufually grow two white and hard long pointed Seeds, let together.

V. *The third, or Small Gromei with Tufted tops,* or Alkanet like Gromei. *Its Root is long and woody, fpreading under Ground, and covered with a rough brownijh red Bark,* from which rife many hard, brittle, woody, low, and hairy Stalks, rifing little above fix, feven, or eight Inches high, dividing themfelves, even from the Ground, into many fmaller Branches, on which are let difperfedly fmall, long, and narrow, rough green Leaves, whole mid-

dlj Kib riles up ibmewhat high; the Flowers for th; moft part itand at the tops of the Branches in a Tutc or Umble, many making a Tuft together, and ibmeames alfo at the Joints with the Leaves, Itanding in rough Husks, which are Ibmewhat larger than any of the other, and of a fine blew color in Ibtne, and white or reddifh in others, which being paf away, finall, and fomething long, pointed, hard and white Seed follows, two for the moft part joined together.

ml ^{pl^comh}, or Small red Rooted Corn Gromel. it bat a Root which is fomewhat reidijb, but uttlear nothing coloring the fingers offuch who touch it from this Root (hoot forth three or four rough Branches or Stalks, divided into other fmaller ones, having many finall, long, narrow, hairy, dark green Leaves growing on them, very like thofe of the former *Gromelt*, but not fo hard or long, but fet without order in like manner* the Flowers grow at the tops,, with many finall Leaves among them, confifting of five fmali white Leaves, which being paf away, finall blackifh Seed fucceeds, two, three, or four, fet together in the fame Husk.

VII. *The fifth*, or Small German Gromel, or Sparrow Wort, has a Root which is fmall and thready, and perfhes every Tear; from this Root rife up for the moft part but one {lender Stalk, fpreading it felf out into one, or two Branches at the moft, fcarcely a Foot high, and fet here and there with finall, long, and narrow Leaves, fomething like unto *Line ox Wax*, uponwhich, up towards the top, ftand finall white Flowers, which being paf away, there comes in their places fmall, fmooth, round, blackifh Seed, very like unto *Gromel* Seed.

VIII. *The fixth*, or Small French Gromel. hba* a Root which is fmall and fibrous, orfringy, from which nfes up but one Stalk, branched out into two or three parts at the top thereof, on which grow

long and narrow Leaves, fomewhat larger than the former, and not rough, as the other *Gromels* are; the Flowers are fmall, of a pale whitifh yellow color, like unto the former, but ftand many together at the tops of the Branches, where, after they-are paf, fmall round Heads, like *Coriander Seed* arife, in which are contained round, hard, blackifh Seed, like unto that of *Gromel*.

IX. *The Places*. The four firft grow Wild in many places of *England*, in barren or untilled places, and by the Way fides *, the two firft of them are laid to grow upon the Sea Shoar and Beeches in the Hig of *Thanet*^ near *Reculvers*, among the Kinds of *WildBuglofs* there growing* the fourth, has been found growing in-Corn Grounds, as alfo in the way from *Bristol* to *Bath*, as *Lobel* fays.

X. *The Times*. They all Flower from Midfummer to *September*, the Seed ripening in the mean while.

XI. *The Qualities, Specification, I'reparations end Virtues* of thefe are the fame with thole in the aforegoing Chapter, faving that thofe in the former Chapter are much the more dfeaual-, and of thole in this Chapter the firft is only ufed in *Phyck*.

CHAP. CCCXXX.

Of GROUND-PINE,

OR,

GOUT-IVY,

OR,

FIELD CYPRESS.

THE Names. It is called by the *Arqbian Hamafites*, iff *Opamafabios*, in *Greek* ***** ⁱⁿ, in *Latine* *Chamapitys*, (*quafi* *Humi Finus*.vel *Picea*-J it is called alfo *Ajuga*, & *Abiga*, (*ab Abietis odore*, as *Pana* thinks, tut as moft think, *ab Abigenda partu C? procurando Abortu*; *Pliny* fays, *did tur propter Abortus*, & *abalij* *Thus Terra*.) Some call it *Iva Arthritica*, Cbeaufe of its Virtues in curing the Gout, and other Joint Difeafes.> We in *Engliff* call it *Ground Pine*, alfo *Gout Ivy*, and *Field Cyprels*.

II. *The Kinds*. There are feveral Species, as i. *Of the Field Kind*, of which in this Chapter. 2- *Of the Heath Kind*, of which in Chap. 391. 3. *The Sea Kind*, of which in Chap. 332. of all which in order, as follows.

III. *The vulgar Yield Kinds*. Of thefe we make five feveral Species, viz. 1. *Chamxpitys vulgaris*, which *Matthwlus* takes to be the firft of *Dicfcoridef*, Our Common Ground Pine. 2. *Chamapitys odorator*, *Chamapitys minor*, *ThelelTer* Ground Pine. 3- *Chamapitys Mas*, which I take to be the third of *Diofcorides*, and is his Male Ground Pine. 4- *Chamdpitys Aulfriaca Clufij*, *Chamapitys corulea Bauhini*, *The Auftrian* Ground Pine. 5. *Cbam*phys Adulterina*, *Vfeudocbawtpitys Lobelij* & *Clufij*, *Chamtpitys Spuria Dodonai*, *Baftard* Ground Pine.

IV. *The Defcriptions*. *The firji*, or Common Ground Pine, ha* a Root which is woody, and perfiffing every Tear-, the Herb grows low, and feldom rifes above an Hand bteadth high, flooting forth feveral fmall Brauches, let with {lender, finall, long, narrow,

narrow, greyish, or fhitifli Leaves, (bmewhai haiiy,) ided into thro: parts oftentimes, many buf fv ing together at a Joint, and ibme of them growing fometimes jlio Itliterally upon the Stalks, Imeltirtg fbomething frong, like unto Kofin, or the imeil of the Pine Tree •, the Flowers are very fmall, and of a pale yellow color, growing from the Joints of the Stalks all along among the Leaves, after which come fmall, long, and round Husks.

tifli, Ipott.d with red JLS; ahut which come black, ihining, lorgifh, anJ cornered Seed, four for themoft panencloded inevery^ of ihofe tough Husks, in wliich the Flowers itood before.

Commofti *Ground Pine*

J?n ti ±L(j r nd </i'n

Male Ground Pine

V. *Thefeconi*, or Lefler Ground Pine, *bafēRoot*, which it fowetshat leng and fiejhy^ tike the Root of ^ Succory, or Dandelion, with maty Fibre? thereat, but frontier-, it is alfo a fmall Ftab., growing up with many hairy and hoary white (lender Branches, not above a Hand breadth high, on which are let many fmall long Leaves, yet (hotter than the former, hairy alfo and hoary whiter not in Tufts or Bullies, but growing by couples, dole together all along the Stalks, cut in, or divided into fome parts, of a thong but fweet fcent, much fweeter than, the former; at the tops of the Branches grow the Ftw-eisV, !na. T wB*er> of a pale yellowish white color.

VI. *The third*, or Auftrian Ground Pine, *bat a Rwtfnpofe&oi ntanyblackStrings, tnbari*, growing deep into the Ground, cnifpringing agdin frejh every Tear-, from this Root fife up feveral fquare, wrong, hairy Stalks, a Foot long, with many Joints on them, at which grow two fomethng long and hard Leaves, a little like unto the firft, but broader, green, and fhining on the upper fide, but fcfeie-what hoary and full of Veins on the under fide, divided into three or four parts, and fometimes into more, a little hot in tafte, but not unpleafant, nor of any difpleafing fcent, fi*>m the Joints fpring forth fnuller Branches, with the like Leaves on them, but letter divided, and towards the tops nothing a^{i 2^} but fsmooth and long, like unto *Rofemary* Leaves, from the upper Joints, and ends of the Stalks and Branches, grow feveral gaping Flowers, like ^{unt10} *Germander*, of a deep Purple or Violet Color for the molt part, but fometimes of a lively Red Color, and fometimes of a bleaker Blue, or Sky Color, the lower Leaves or Chaps of the Flowers being whi-

VII. *The fourth^* or Male Ground Pine, *bdr a, fmalt fingle Root^ of a woody fubjiance, which frikes pretty &eet> into the Ground, with fome few Fibres Jhooitiag frM it.* It is a fmall Herb, and very tender.

der, creeping upon the Ground, having small and crooked Branches, full of Joints; at every Joint from the bottom comes forth two long Leaves, one on each side the Joint, which are long, narrow, and slender at the bottom, but as they proceed in length are hairy, and cut or jagged deeply, almost to the middle Rib, into two, three, or four deep Jags, not much unlike to a Bucks Horn, saving that the ends of these Jags are rounder pointed, or broader at every of these Joints, with the Leaves, at their bottoms grow the Flowers, without any Footstalk, only at the foot of each Leaf, and spring out of a little rough Husk, being small, and of a pale yellow color, and sometimes also white; the Leaves growing on the upper Joints, as they approach the top, are for the most part divided into three long parts, not very much unlike to *Rosemary* Leaves.

VIII. *The fifth, or Bastard Ground Pine, has a Root which is somevobat thick and white, abiding all the Winter.* It grows like a small bushy Herb, yearly like unto the *Common Kind*, having small hairy Stalks, set full of long hairy Leaves all along them, parted into three long parts, of almost no scent, but an unpleasent Herby one; the Flowers stand at the Joints with the Leaves at the tops of the Branches, very like to those of the *Common Ground Pine*, but somewhat greater, and of a White color; after the Flower the Seed follows, which is greyish, greater and rounder than the *Common Kind*, four for the most part contained in every one of those brownish rough Husks.

IX. *The Places.* The first grows Wild in *England*, chiefly in *Kent*, (not growing in many other Shires that we know of) very much about *Dartford, along to Southfleet, Graveend, Cobham, Rochester, and Sutton, and upon Chatham Down, hard by the Beacon*, and half a Mile from *Rocheester*, near a Houfe called *Selfey*, the other four are chiefly nurfed up in Gardens, but grow Wild in *Italy, Savoy, Genoua, Spain, and Aufiria*.

X. *The Times.* They all Flower in *June, July*, and sometimes in *August*, and give their ripe Seed in the mean time, or not long after.

XI. *The Qualities.* *Ground Pine* is hot in the second degree, and dry in the first, it is Inciduous, Aperitive, Absterfive, Diuretick, Hepatick, Splenetic, Nephritic, Hyfterick, and Arthrmck, JEmmenagogick, a little Sudorifick, Chyffick, Spermatogenetic, and Alexipharmick.

XII. *The Specification.* It is pecfar against the Strangury, and Hylerick Fits, ^{^ k e s t h e l a m s;} facilitates the Labour, and expels the Dead Child and Afterbirth.

Alii. *The Preparations.* * o u ^ y , & J < 2 A from, 1. A *Uauid Juice*. 2. *Antifence*. 3. *Jl. Vecokwn.* \ . T D J Drink. > - A Lonferve of the Tops and flowers. 6. ? The Virtues.

XIV. T/tf L/W 7^V^ . It does admirably prevail against the Strangury, and all stoppages of Urine, or any inward pain arising from those Diseases of the Reins, Ureters, and Bladder ^ it may be given Morning and Night, from two to four Spoonfuls, in a Glafe of White Port Wine.

XV. *The Effence.* It has all the former Virtues, besides which it singularly opens obstructions of Liver and Spleen, cleanses the Blood, removing its grossness and impurities, it expels that which is

congealed in the Stomach, or other Bowels, and gently opens the Body; it also wonderfully helps all Diseases of the Mother, taken inwardly, and outwardly used, by injection; it provokes the Terms, facilitates the Delivery of Women in Travail, and expels the Dead Child and Afterbirth; yea, it is so powerful upon those parts, that it is forbidden to Women with Child, for that it is apt to induce Abortion, or Delivery before the time; it is powerful and effectual also in all Pains and Diseases of the Joints, as Gouts, Sciatica, Rheumatism, Cramps, Convulsions of the Nerves, Palfies, Falling-Sickness, and other Distempers of like kind, being used both inwardly, and outwardly applied, or bathed upon the parts affected, it is also an especial good help against the Jaundice, griping pains of the Belly, or any pains in the other *Viscera*, proceeding from *oia* and Flegmatick Humors. Dose four, five, or six Spoonfuls, mixt with some Generous Wine, Morning, Noon, and Night, according as the weakness of the Patient, and necessity of the occasion may require.

XVI. *The Decoction in Wine.* It has all the Virtues of the Liquid Juice and Effence, and may be given Morning, Noon, and Night, half a Pint at a time- it ought to be made of the Plant or Herb, when it is in Flower chiefly, for then it is strongest and most powerful; it provokes Sweat, if taken when the Patient is in a naked Bed, and covered warm down upon it; it prevails also against the Puffon of the *Aconites* of all sorts, and of other Poisonous Herbs, as also against the Biting of Mad Dogs, and other Venomous Creatures, the Stinging of Scorpions, Hornets, Wasps, Bees, &c. and is a singular good thing against a Cough, especially in the beginning, before it is grown inveterate.

XVII. *The Diet Drink.* It is made by Tunning it up in new Ale or Beer when it is first *ist on* working, four Handfuls to a Gallon, and may be drunk after four or five days, Dietically, against all those Diseases for which the Juice, Effence, or Decoction are given, and is more pleasant for queasie Stomachs.

XVIII. *The Conserve.* The Conserve of the Flowers participates of all the former Virtues, but in a much weaker degree, however *Matthiolus* commends it against the Palfie; it may be taken to the quantity of a Walnut every Morning fasting, and last at Night going to Bed, for some time.

XIX. *The Pills.* There are three sorts of Pills made with this Herb, 1. *Pilul* Chama-pityos Simplicis*, Simple Pills of Ground Pine. They are made of the Powder of the Herb, and Mucilage or Pulp of Figs, and have the Virtues of the Juice, Effence, and Decoction, given Morning and Night, from one Dram to two Drams, washing them down with a Draught of the Decoction of Ground Pine in Wine aforementioned. 2. *Pilul* Cham-pityos Compositi*, Pills of Ground Pine Compound. Take Powder of Ground Pine five Ounces, fine Powder of *Hermodas* three Ounces, *Sal Nitre* two Ounces, *Scammony* in fine Powder one Ounce, *Venice* or *Strasburgh Turpentine* a Jufficient quantity, mix, and make a Mass of Pills. Dose one Dram, or more, in the Morning fasting. They cure the Dropfie, Jaundice, Gout, Sciatica, Kings-Evil, Strangury, and all stoppages and heat of Urine. 3. *Pilul* Cham-pityos Matthioli*, *Matthiolus* his Pills of Ground Pine. Take Ground Pine. *Betony*, *Rosemary Flowers*, *Stxchas*, all in fine Powder, of each one founce, of *Agarick* in Powder two Ounces, of *Rhubarb*, *Turbitid* in Powder, of each an Ounce and half, *Cblocynth* in Powder half an Ounce, *Diagredium*, or rather *Scammony* in Powder, one Ounce, *Hiera Picraf*, *Wex* four Ounces, *Ginger*, *Spicknard*, *Sal Gem*, of each

Injected into the Womb it softens the hardness thereof and by anointing discharges hard Tumors in other parts of the Body.

CHAP. CCCXXXII.

0/GROUND-PINE Heath, OR, GOUT-IVY Wild.

L ^ p # £ Names. It is called in Greek KM, ob X pulcbntudinem, verhm Hippocrates & Antiquin^v, I e. Pupillam, vocarunt propter Semen, QcuhPupilh,feu anteriori Humeri Cryftallino, ambit u bpbxnco, baud abfimile cernitur; in Latine Corn, and in Englifh Heath Ground-Pine, and Fair Heath-Ground-Pine.

.II. The Kinds. It is the third Generick Species of hrouni-Pine mentioned in Cap. 330. Se8. 2. and of this Species Authors have enumerated three feveral Kinds, viz. 1. Corn Matthioli, fo called by Catrier/m9... Tubernamentanus, & alijs, Coris lutea Baulm The Common, or moft vulgar Pa? Heath Ground-Pine. . 2. Coris Legitima Eric* fmiltsfel Heath Ground-MonpeljacaPen* * l ^ ^ J enfmn, Coris namontam, Cons quorundamoS?J Muritima Baulm Coris Purfiz, & p* carulea Heath Ground-Pine. u w r i * * * » w . Purple Fair

III. The Descriptions. The fir ft, or Common Heath Ground-Pine has a Root which is fomewhat long and woody, with many fibrous Threads thereto... reddish Stalks, full of Joints, rifing up to the height or ah ooc or more, and having alfo on them many iraal and long, thick and fat Leaves, fet together

at every Joint, fomething like unto Spergula, ot frank Spurry-, at the tops of the Stalks grow feveral Flowers, each of them upon a fhort Footstalk, confifting of five or fix Leaves, not much unlike to Hypericon, or Ornitbogalum, Star of Bethlem, as Label compares them, but of a whitifh red color, with yellow Threads in the middle, yet Matthiolus and others lay the Flowers are all yellow, like Hypericon, finelling a little fweet, which being pafaway, the Seed is found enclosed in round Heads. This Plant keeps its green Leaves all the Winter, but turn of a fomewhat yellowifh red color towards Autumn.

IV. The fecond, or Fair Heath Ground-Pine of Candy, has a Root which is long, fpreading, and woody, abiding with green Leaves thereon all the Winter. This Plant, as Bellus faith, grows in good Ground to be a Cubit and half high, Branching forth many ways, and bearing many fmall Leaves, like unto Heath, on woody Stalks and Branches; the Flowers grow at the tops of the Branches, and are much like to thofe of Hypericon, and of a yellow color, which being paf away the Seed follows, being enclosed in Husks like the former.

V. The third, or Purple fair Heath Ground-Pine, has a Root which is reddifh, hard, and woody, greater than the proportion of the Plant fhouldjeem to require, giving a Dye or Color, not only to the Fi- of them which touch it, but ferves alfo to Dye nen Cloth withal, among thofe People where it g naturally; it abides all Winter, alw the Leaves are then more reddifh than in Summer, but requires fome care to preferve it with us. From this Root rife up many round, woody, and reddifh Stalks, not To high as the former, having many fmall, long, thick, and roundifh Leaves fet thereon, moft commonly without order, and yet lbmetimes conformable one to another, fomewhat like unto the greater Kind or Heath; the tops of the Stalks are furnifhed with a great Spiked Tuft or Bufe of Purplifh Blew Flowers, (but of a pale Red with us) finelling fomething fweet, each confifting of four Leaves apiece, forked as it were at the ends, two whereof ftand uppermoft are greater than the other two which are lower, which will continue long in their perfect color, being gathered in their prime, and each of them ftanding in a brownifh Husk, parted at their tops into five points, and fpotted with five blackifh fpots on the outfide, wherein afterwards grows the Seed, which is fmall, round, and blackifh, wrapped up as it were in many Coats or Films, whofe Husks then do grow fomewhat hard, and harp at the ends when as before, while the Flower lafted, they were not fo.

VI. The Places. The firft Matthiolus fays grows in many places in Italy, in dry and Hilly Grounds, which Pena confirms; it grows by Caraña, a Village in Liguria: the fecond grows in Candy, the laft as Pena fays about Mompeljer, alfo near the Sea in Valentia, and in dry Grouds about Salamanca in Spain, as Clufius fays; with us in England they only grow in Gardens, but I have found them all in several P's of & 1 f l §

VII. They Flower early in all thofe hot Countries even in March in fome places, and in others in April and May, but with us in England later as in June and July, but do feldom perfeft their Seed with us.

VIII. The Qualities, Specification, Preparations, Virtues and Ufes, are fully the fame with the Common round... and therefore to the fame we refer you.

IX. Note, 1. The Seed of Heath Ground-Pine, either bruifed and drunk, or made into a Deco&ion in

in White Port Wine, powerfully provokes Urine, and the Terms in Women where they are flopped, and also cures the Strangury, if die Bladder is not exulcerated} it is also a Remedy for those who are bitten with the *Phalangium*, and for those troubled with the Gout and Sciatica, if bathed therewith, and taken with Pepper in substance, it reprehends the shaking Fits of Agues: the same things do the Juice, Effence, or Decoction of the Herb.

X. Note, 2. An Oil, Ointment, or Balsam, made of the Seed or Herb, ease the Gout and Sciatica, anointing therewith, they also heal any old or running Sore or Ulcer, and dry up that superfluous moisture, which by an afflux upon the part, hinders the Cure.

CHAP. CCGXXXIII

Of GROUNDSEL Common.

I. **The Names.** It is called in Greek *Ἐριγέρων*, in Latine *Erigeron*, *Senetio*, & *Senecio*, quia cito Senescit, and in English *Groundfel*, and *Grunfel*.

II. **The Kinds.** There are two several sorts of *Groundfel*, i. The *Common Kind*, of which in this Chapter. 2. The *Cotton Groundfel* of which in Chap. 334. following. Of the *Common Kind* there are also two sorts, 1. *Senecio*, vel *Senetio vulgaris*, (called by some Authors *Senecio minor*, because they call *Jacoea*, or *Ragwort*, *Senecio major*) and *Erigeron*, from the Greek Name, Common or *Vulgar Groundfel*. 2. *Senecio*, vel *Erigeron Montanum*, *Senetio Montanus*, *Senecio fecundum Tabernamontani*, *Mountain Groundfel*.

III. The Description, *The first, or Common Groundfel*, has a Root which is small and thready, and from [er]ishes, from whence rises a round, green,

and somewhat brownish Stalk, spreading it self towards the top into several Branches, set with long, and somewhat narrow green Leaves, very much jagged, or cut in on the edges, same thing like unto *Rocket*, or rather an *Oaken Leaf*, but leiser, and round at the ends-, at the tops of the Stalks and Branches grow many small green Heads, out of which grow small yellow Threads or Thrums, which are the Flowers, which continue many days blown in that manner before they pass away into Down, and with the Seed, (which is long) is carried away with the Wind, but from this Seed which is thus filed it soon rises again, so that it may be seen many Months in the Year young and green, and in Flower, and in Seed, for it will spring up and Seed twice in a Year at least, if it is suffered to grow in a Garden.

IV. *The second, or Mountain Groundfel*, has a Root like unto the former, and rises up with a like round and green Stalk, which is branched in the same manner, it is almost wholly like the other, but it grows not altogether so high, and its Leaves are greater, and more cut in on the edges.

V. *The Places.* The first is found every where almost, as well on the tops of Walls as on the Ground amongst Rubbish, and in untiled Grounds, but more especially in Gardens; the other grows upon Hills and Mountains, both in England and places beyond the Sea.

VI. *The Times.* The first is found to Flower almost in every Month of the Year, perfecting its Seed in the mean season the second comes somewhat near unto the first, but its Flowers do not so suddenly decay.

VII. *The Qualities.* It is cold and moist in the first degree, is Digestive, Absterfive, Diuretick, and Emetick.

VIII. *The Specification.* It is a peculiar Remedy against the Yellow Jaundice, stoppage of Urine, Difeases of the Eyes, and the Falling-Sickness.

IX. *The Preparations.* You may make therefrom, 1. A *Liquid Juice*. 2. An *EJence*. 3. A *Decoction in Ale, Beer, Wine, or Water*. 4. A *Powder of the Herb*. 5. A *half an Ointment*. 6. A *Cataplasim*. 7. A *Distilled Water*.

The Virtues.

X. *The Liquid Juice.* If it is drunk from one Ounce to two Ounces, mixed in any proper Vehicle, it cleanses the Stomach from all corrupt and crude Humors by Vomiting, whereby it eases the Pains of the Stomach caused from the abounding of Cholera it is also good against the Jaundice and Falling-Sickness, in which two Cases it ought to be several times repeated, it also takes away the heat, scalding, (harshness, and stoppage of Urine, and the pain in making Water, expelling Sand, Gravel, Stones, and Tartarous Matter from the Reins and Bladder,

XI. *The EJence.* It has all the former Virtues, and is much more pleasant to take, it prevails against the Colick, and Gripping of the Guts, as also the Gout, Sciatica, and Rheumatism, it purges the Liver of its Recrements, and provokes the Terms in Women, giving it from two Spoonfuls to four in White Port Wine, it Vomits as the Juice does, and therefore must be given with the same caution.

XII. *The Decoction in Ale, Beer, Wine, or Water.* It has all the Virtues of the Juice and Effence, and works in the same manner, but not all out so strongly, and therefore may be given from four to eight, or ten Ounces, according to Age and Strength.

XIII. *The Powder of the Herb*, it may be given co a Dram or more in *Oxymel*, proportioning the

Poff

Dole according to Age and Strength of the Patient, it effectually cleanses the Stomach, and prevails against Gout, Sciatica, Rheumatism, Jaundice, Dropsie, and Epilepsie, it is alib said to expel Sand and Gravel from the Urinary parts, it dries up also Humidities in Wounds and Ulcers.

XIV. *The half an or Ointment.* It may be made with the green Herb, or with the juice of the Leaves, adding some fine Frankincense, or Olibanum in Powder; it cleanses and heals Ulcers and old Sores, and cures Wounds, whether in the Flethy or Nervous parts, strengthens the Joints, gives ease in the Gout, dissolves hard Tumors, and prevails against the Hemorrhoids or Piles in Man or Woman.

XV. *The Cataplasm.* Made of the fresh Herb by boiling, &c. and applied to Womens Breasts which are swollen with heat and pain, as also to the Privy Parts of Man or Woman, and to the Hemorrhoids, or Yicm in Ano, tho' much swelled and inflamed, it gives present relief * if Salt is added to it it dissolves Knots or Kernels in any part of the Body, yea tho' proceeding from the Kings-Evil.

XVI. *The Distilled Water.* It is said to be effectual against all the aforementioned Diseases, besides which it is especially good against Inflammations of the Eyes, and to help the watering of them, proceeding from a dejection of Rheum, and weakness of the part.

XVII. *Note.* Pliny has a Relation for the Cure of the Toothach, which, tho' it seems Fabulous, we find here relate. *Tou must Jig up the Plant without any Iron Tool, and then touch the aking Tooth there-zoibfive times, Spitting three times after every such touch, which done, Plant or Set the Herb again in the same place, so that it may grow, and the Toothach shall presently cease and be perfectly cured.*

CHAP. CCCXXXIV.

Of GROUNSEL Cotton.

I. *Topical Names.* It is called in Greek *Κλωστή* X yr*fi**»Af_i in Latine *Erigeron Tomentofum*, *Senecio Tomentofus*, *Senecio Tragi*, and in English *Cotton Groundfel*, or *Woolly Groundfel* also *Clammy Groundfel*, from the Leaves flicking as it were unto ones Fingers.

II. *The Kinds.* There are three several Species of this Kind, viz. i. *Senecio incanus*, *Erigeron Tomentofum*, *Senecio Tragi*, Cotton Groundfel. i. *Erigeron Tomentofum alterum*, *Senecio fatidus*, *Erigeron jectidum Thalij*, *Senecio incanus pinguis Bauhim*, *Jacob & a Pannonica prima Clufij*, Stinking Cotton Groundfel. 3. *Senecio odoratus*, *Senecio floridus odor at a Camerarij*, Sweet smelling Cotton Groundfel.

III. *The Descriptions.* *The first, or Common Cotton Groundfel, hat a Root which is small, and full of Fibres,* it has much larger Leaves, and more jagged or torn in on the edges than the former *Common fort*, and of a greyish or Ash Color, soft and hairy, or rather hoary all over the Stalks are higher and greater, but with such like yellow Flowers upon them and as soon fading and turning int Down as the other: this differs chiefly from the for

ner *Common fort* in the hoariness and largeness, as well of the whole Plant as of the Leaves.

IV. *The second, or Stinking Cotton Groundfel, hat a Root which is very fibrom, yet lasteth not after Seedtime, but perishes at the Common does, and springs again of the shed or fallen Seed:* It has many fair, large and long Leaves lying next the Ground, very much jagged or torn in on the edges, whereby they consist of many divisions, somewhat like unto those of *Mugwort*, for which reason some have called it *Arthemisia fetida* but it is soft, and in handling very hairy, being also bedewed with a fatty clamminess, so much that the Leaves will stick to the Fingers of those that touch them, and one Leaf will alib stick unto another, so as with some difficulty to be taken asunder ^ it smells somewhat strong, and of an ill scent, (tho' not unpleasantly to some) as *Clufius* says, but like *Scrophularia*, or *Ebulus* as others say from among which Leaves rise up hairy crested Stalks, half a Yard high, spread out into several Ramifications or Branches, but bearing at their tops fewer Flowers, lesser, and of a paler yellow color than the *Common Groundfel*, and upon longer Footstalks, which quickly fade, and turn into Down, as the others do.

V. *The third, or Sweet smelling Cotton Groundfel, hat a fibrous perishing Root, at the others have, from which rise up Leaves and Stalks, like the others, and indeed this Groundfel is somewhat like the last kind in the soft and woolly Leaves, but not so much jagged or torn on the edges as it; its smell is sweeter, something like unto *Ambrosia*, or *Oak of Cappadocia*, or the *middle Coniza* or *Yleabane*, the Flowers are like the rest, and as soon growing old and Downy, as the others do.*

VI. *The Places.* The first grows by Wood sides, and borders of Fields, as alib upon old Walls, in

many

ny plices; uiv¹ lecond grows also in woody, barren, and unfilled places- ilie third w.is (ent by Ji ittibjiiit to the Great Duke or ny, to i'dnteraruus out o3 I

VII. *DfeTimes.* The first Flowers almojc every Mouth, as die *Common Kind* does, the two last Flower in *May, J>*ne, July, and Attgufj.*

WJ[. *The ^jia/iries, Specification, Vrepsration and Virtues* ofrhefe are the fame with tiofeorche *Common Kind*, delivered in the former Chapter from Sett 7. to Se£l is. and therefore we fhall fay no more thereof in this place.

III. *The Dekriptioiis.* I •. Bla>v tngi Hares-Bells. I *tini* are alike, being r* <iu, anivtry ffimy^Jtme Kill bu grf-'t dñid round, otbefi fagger ..;•! flena anAtbefewbijbtyt near tot top of the tiartk baic^wii be of a grttm coh. From this Root x. ver^S-long ;iuid narroi* green Leaves, hocftanding iippiiyit, nor yec fillly lying upoi: the Ground, among vvbieh fpritigs up the Sccttk, baring at the top E: and hollow Flowers, hanging down their Heads, ail forwards for the molt part, and divided at the brtms into Jix Leai^jor !)-. idr points a lirtle again, of a fweetifh but heady ieenc.; fi what like unto the Grallie Flower, the Heads tot Seed are long and fqu;tre, in vthjch are contained much black Seed ; tfe color of the Flowers are in ibme a deeper Blew, ttning to 4 Fuiple. in others of a paler Blew, or of a bleak Blew, tending 10 tH Alii Color; and fbme are Party Color^J.

IV. *Theficond, or White Englilh Hares-Selfs, k.u Roots, Letmes, Stalks end Hewers very like the jumer, iavtng, tiatthe Leaves in this are fomewfcfl broader, and the Flowers more optn, arst of a • white color, yec fomecirtKS they are Wjbite and Blew mixt together.*

V. *The third, or Carnation EngVifh Haies-Bells; The/e in their bulbous Roots, Leaves, Stalks, towers, and St^td, at alfo in their magnitude and jonn of growing, ere very like io the jirft aind jeZoful Kinds, faving that the Flowers in this are oi a me Carnation Color for the molt part, OY of a fine delay ed purplifh Red, or blufh Color, which feme call i Peach Colon*

VI. *The fourth, cr Greater SpanifTi Flares-Bells. It hat a bulbous Root, from whence fprirtg up Jew* ral long and narrate green Leaves, which have net ftrenth enough in themfehes to fiand upright, but a little incline or bend downwards. This Plant is very like to the firft aforegoing, but that it is greater in all its parts, as well of Leaves as Flowers, man/ growing together at the top or [he Stalk, wirh many fhort green Leaves among them , hanging down their Heads, with larger, greater, and wider open Mouths, like unto Sdk, oi a dark Blew Color, ajji of^ no pleating iindi.*

VII. *The flecesi* The first *Varkinfcri* ilsys is fa common every where, rhat it fcircely needed any Defcription, and that it is more frequent in *England* than in the *Low Countries,* or in *Spain % u* grows in *Woods, Copies,* and in die borders of *Fields,* every where throughout *England;* the fecond and third are not ib common, but they grow in the *Woods by Cokbefter, in EJJex,* in the *Fields and Woods by Southfieet, near vsixoGrauefend, in Kent,* as alfo in a piece of *Ground by Canterbury* called the *Clapper,* alfo in the *Fields by Bath,* and in the *Woods by Warringtun, in Lancajhire^* and in other places.

VIII. *The Times.* They Flower from the beginning of *May* to the end of *June,* and the Seed ripens in the mean *Sejfon,* and in fome little time arer.

IX. *As te their Qualities, Specification, Preparations and Virtues* Authors have did nothing, nor do we know any thing by Experience corner aing the fame, faving, that an Ointment being made of the Roots hereof, is of fingular ufe to itiengthen weak Joints.

X. *Nate.* The *Root of Hares-Bel/h,* 3\$ his gpnally bulbous, fo it is full of a thick, ilimy, Emplatick Juice, whichisof foitrongabody, thaititwili ferveto fet Feathers upon Arrows, inleatd of Glew, or to pafte Books with; and hereof was frbrmerly made the belt Starch, nexr to that oi^Aren, ©r *Wake-Robin* Knots.

C H A P. CCCXXXVL

Of H A R E S-E A R S.

THE Names. This Plant is called in Greek Βύλερον, *Bupleurum Plinij*, $\nu\epsilon\lambda\lambda\eta\lambda\lambda\omicron\varsigma$ *Cordi*, in Latine *Bupleurum*, *Auricula Leporis*, *Herba Vulneraria Tragi*, who takes it to be *Panax Chironium Tbcopbrafi*, in English *Hares-Ears*. It is doubtless the *Bupleurum Hippocrat/s*, mentioned by *Pliny Lib. 22. Cap. 22.* and by *Nicander in Theriach. Gefner* says that the French call it *Elapbobofcum*, and *Gratia Dei*. Some take it to be *Panax Chironium Diofcorid/s*, but fallly. Some will have it to be *Amni vulgatum*, others to be *Sanamunda. Cordm* in his History of Plants calls it *Ifophyllum*, so that there is great difference of Opinions among Herbarists in judging to what Plant of the Ancients it ought to be assigned -, however, as long as we know what Plant it is to which we give the present Names it is sufficient.

II. *The Kinds*. There are three Kinds hereof, viz. 1. *Bupleurum Angustifolium*, *Auricula Leporis Angustifoha*, Hares-Ears narrow Leav'd. 2. *Bupleurum Latifolium*, *Auricula Leporis. Herba Vulneraria, Ifophyllum*, Hares-Ears broad Leav'd. 3. *Bupleurum Angustifolium Montanum, Sedum petreum Bupleuri Folio, vel potius Bupleurum petreum Grammeo Folio Pent, Perfohata Alpina Gramineo Folio, five Bupleurum Angustifolium Alpinum, Bupleurum Angustifolium Folio Baubini*, Narrow Leav'd Mountain Hares-Ears.

III. *The Description*. *The Jirfi, or Common* narrow Leav'd Hares-Ears, *has a Root which is somewhat long, but small, and white on the out side, much like to a Parsly Root, with divers Fibres adjoining, which with us in England perishes every Tear*. This Plant rises up with a round, stiff, green Stalk, two

Feet high, at the several Joints whereof grow several long and narrow, very dark, green, smooth, (hiring Leaves, broadest at the bottom, and narrower gradatim unto the ends, with divers Ribs running thro^o them, the middlemost whereof is greatest, yet nothing so narrow as *Grafs* Leaves, tho' some Authors do compare them with them, these Leaves stand one above another up to the top, growing smaller and smaller, being placed likewise at the Joints, from the middle of the Stalks, at the least, upwards (if it grows in any good Ground) come forth small Branches, (and sometimes with few or no Branches at all) at the tops whereof stand many small Tufts or Umbles of yellowish Flowers, which turn into small Seed, not much unlike to *tarjy* Seed, but of a darker color, and somewhat longer.

IV. *Tloefecond, or Toad Leav'd Hares-Ears, has a Root like the former, and grows in the same manner, with like Stalks, Branches, Flowers, and Seed** but herein this chiefly differs from that, viz. that this bears broader but (shorter Leaves, smallest at the foot, broadest in the middle, and ending in a small sharp point, somewhat hollow, and bowing downwards, with several long Nerves or Ribs therein, as in the former, and the middle Ribs most eminent or raised highest.

V. *The third, or Narrow Leav'd Mountain Hares-Ears, has a round thick Root, about a Foot long, with Knobs or Bunches instead of Branches, and has a thick Bark, of a dark red on the out side, and pale within, and divided at the head into many parts** from these Knobs or Heads arise several long and narrow green Leaves, lying on the Ground, compact one another at the bottom, like a Star, for the form of them like to the first Hares-Ears, but narrower from divers of these Tufts of Leaves rise up dark round Stalky about an Hand breadth high* bearing at the tops many pale yellow Flowers, made of seven pointed Leaves apiece, and in the middle of them several small Seeds set thick together, forcing like unto *Thorow-Wax*, or as the fow*

hans-bUus, which iincl very frong, the whole Plane die raftes like an *Artichoke*.

VI. *The Places.* The two firft *Lob el fays* grew about *Mompelier* in *trance*, and *Tragus fays* in dy? ftony places in *Germany*, and are both of them found in feveral places of *England*, the third *Pena lays* grows upon *Mount Baldus*, and has been found up' on Mountainous places in *Florida*, near the *Englijh* Plantations.

VII. *The Times.* They all Flower late, viz. not until the end of *July*, and in *Auguft*, and their Seed is ripe in *September*.

VIII. *The Qualities.* They are temperate in tefpea to the firft Qualities, as to heat and cold, dnefs and moiiture, are Abfterfive, Vulnerary, Diuretick, Cardiack, Nephritick, Hyfterick, and Alexipharmick-

IX. *The Specification.* They are peculiar for healing of Wounds in any part, whether inward or outward.

X. *The Preparations.* You may have therefrom, I. *A Juice or Ejjence of the Leaves.* 2. *A DecoSi-on in Wine.* 3. *A Pouder of the Root or Seed** 4. *An Ointment or Balfam.* ? . *A Cataplafm,*

The Virtues.

XF. *The Juice or EJJence.* Taken to three or four Spoonfuls, either alone, or mixt tvith Wine, it is good againft the Bitings or Stinging of Serpents, or other Venomous Creatures, the place alfo outwardly bathed with the f^{me} it alfo provokes Urine, and prevails againft the Strangury, and is of good tife to bring down Womens Courfes when ftopt, being taken Morning and Night in White Port Wine j taken alb inwardly Dietetically it fingularly contributes to*the Curing of Wounds, old running Sores, and rebellious Ulcers.

XII. *The Decoilion in Wifie.* It has all the Virtues of the Juice or Eflence, but not full out fo powerful, yet it more excellently chears the Heart and revives the Spirits, and is prevalent againft Fainting and Swooning Fits in Men or Women.

XIII. *The Pouder of the Seed.* Being given to one Dram in a Glafs of White Port Wine, it refills the Poyfon of Vipers, Rattle-Snakes, and other Venomous Beafis, is alfo Diuretick, cleanfes the Reins and Bladder of Tartarous Matter, and prevails againft the Strangury.

XIV. *The Ointment or Balfam.* It heals fimple Wounds at once or twice drefling, and is good againft all forts of Sores, whether they be frefh and green, or old and malign, when rebellious and difficult to be Cured.

XV. *The Qataplafm.* Applied to the Biting of Serpents, Mad Dogs, and other Poyfonous Animals, it attratts and draws forth the Venom.

CHAP. CCCXXXVII

O/HARES-FOOT,

OR,

TREFOIL Spiked.

THE Names. It is called in *Greek* *...* in *Latine* *Lagopus*, *Lagopodium*, *Trifolium flumile*, *Leporis Cuminum*, *U Pes Leporis*, a *Lepo-*

ns birjuto Pede, from the hairy Kot of a: i Hare, aV fo *Lagopyron*, by *Hippocrates*, *quaji'lniticum L(p"-rinum*, becaufe it grew among Corn, and in *Enguib* it is called *Hares-toot^ Spike Trefoil^ 2nd Corn Tre* foil.*

II. *The Kinds.* Authors make fix feveral Species of this Plant, but we fhall take notice only of three, as being thole chiefly which are to be found wirth us, or in fome of our Plantations beyond the Seas. They are, 1. *Lagopus vulgaris*, *Lagopus minor*, *Lolas Campedris Tragi^* Our common Hares-Foot. 2. *Lagopus maxim us blare rubro* *Lubelij & Clufi^ Lagoput major tofo* *Trifolij Lobelij iff Bodor.ti^* The greateft Hares-Foot. 3. *Lagopus major bolio Pinnato^ Lugo* pus alt era Folio Pinnato* *Lobelij, Trifolium ma jus tertium Clujij, Trifolium magnum Loniceri f^ Qor* di^ Cytifus Tragi & ColumelU, Trifolium Spicalum Tbalij,* The longer headed Hares-Foot*

III. *The Defcriptions.* *The fir ft, or Our Coromori* Hares-Foot. *It ha* a fmall, long, Jringy Root, which fends forth Stalky with J'mall, vohitifh^ molly, Trefoil Leaves Jet upon them^ with Jhort Footjalks^ the Heads at the tops are with their roundnefs fbme- what long, and compoied, as it were, all of a hairy or hoary Downinefs, whofe Flowers in fome are of a White, in others of a Blufh Color^ it is an Annual Plant, as are the two following, but this is epecially to be noted in this Stock of Hares-Feet, or Spiked Trefoil^ that thefe perifh Yearly, whereas; moft of the other forts of Trefoils do not: This Common Hares-Foot is well known to be a faiall Plant, but it grows greater and higher in fome places, and fmaller and lower in others, according to the goodnefs of the Soil or Ground it is found in;*

IV. *The fecond^ or Greateft Hares-Foot, has an Annual, finally long, thready Root alfo, which fends forth feveral Trefoil Leaves, each fianding on a long Footjalk, being almoft round, and dented about the edges, very like to the Meadow Trefoil, as well in bignefs as form, very foft, and of a pale green color -, from among thefe rife up weak bending Stalks, a Foot or more high, branched out, and beating the like, but fomewhat longer Leaves on them, and at their tops clofe Spiked Heads, with many fmail Flowers round about them, each in a five cornered Cup, of a delicate Crimfon Color, in which Husks,*

? VP² ft

after the Flowers are past, grow small yellowish round Seed, one only in a Husk, whole brims or corners then stand displayed, something like unto a Scar.

V. *The third, or Longer Headed Hare-foot, has a Root much like the former, its Leaves are hoary, large, and longer than the former, with several conspicuous Veins in them, making them shew like Wings, the middle Rib on the back of them being somewhat great alib-, the Flowers are like the second above, both in form and color, but the whole Head is longer and larger.*

VI. *The Places.* The first grows with us almost every where throughout *England* in dry Grounds-, the two latter grow chiefly with us in Gardens, but are found growing wild in many places of *Italy, France, and Germany.*

VII. *The Times.* They flourish and flower in the Summer Months only, and their Seed is ripe in *August* and *September.*

VIII. *The duties.* They are temperate in respect to heat or cold, and dry in the first degree, Afrigent, Vulnerary, and Stomachick.

IX. *The Specification.* They are peculiar against Fluxes of the Bowels, chiefly the Bloody Flux, and other Fluxes of Blood, as Spitting Blood.

X. *The Preparations.* You may have therefrom, 1. An Effence. 2. A Decoction of the Herb in Wine. 3. A Powder of the Heads and Seed. 4. A Jhes of the Heads. 5. An Ointment or Balsam.

The Virtues.

XI. *The Effence of Leaves, Stalks, Spiked Heads.* It dries and binds admirably, and it is known by most certain Experience to stop a Looseness, and other Fluxes of the Bowels, chiefly the Bloody Flux being taken two, three, or four Spoonfuls at a time

in a Glass of Red Port Wine-, but if a Fever is present, it may be given in a Decoction of the Herb in Watery it is good against Choleric Belchings of the Stomach, and griping pains of the Belly, and is profitable to be given to such as have foul and hollow Ulcers, which are stubborn and of difficult Cure.

XII. *The Decoction in Wine.* It has all the former Virtues, but not full out so powerful being mixt and taken with Juice or Effence of *Mallows*, or *Marsh Mallows* it eases the pains of the Bladder and *Urethra*, and abates the scalding and heat of Urine, and this Decoction, as also the Effence, is said to be admirably good against the Running of the Reins in Men or Women, and may be used as a Vulnerary Diet-Drink.

XIII. *The Powder of the Heads and Seed.* Taken to one Dram Morning and Night in a Glass of Red Port Wine, or in a Decoction of the Plant in Wine or Water, (according as the Nature of the Distemper and Habit of the Patient may require) it helps Spitting or Pissing Blood, prevails against the Bloody Flux, and is singular good in the Cure of a Gonorrhoea, (Universals being premised) it is an Absterfive, and not only cleanses foul and hollow Ulcers, but also incarnates, or fills them up with Flesh, and Cicatrizes them.

XIV. *The Ashes of the Heads, &c.* Being applied to the Haemorrhoids or Piles, it stops their bleeding, eases their pain, and heals them.

XV. *The Ointment or Balsam.* It is Vulnerary, cleanses, incarnates, dries, and heals old running Sores, and rebellious Ulcers, &c

(from *C/w**, as being of an Aft Color and in *Engl*
lijk Artichoke and *Hartichoke*,

II. *The Kinds.* There are three principal Kinds, viz. 1. *Cinera Borten* Is, Garden Hartichokes, of which in this Chapter. 2. *Ci* » ^ *Sy/veftris, vel Spnosa*, Wild Hartichokes, of which in this next Chapter. 3. *Heliantbimum Canadense*, *Jerusalem* Hartichokes, of which in Chap. 340. following.

III. *The Garden Kinds.* They are manifold, as 1. *Cinara Rubra*, The Common Great Red Hartichoke. 2. *ii/ta*, The White Hartichoke. 3. *F/77-dis*, The Green Hartichoke. 4. *Procera*, The Tall Hartichoke. 5. *Pumi/a*, The Dwarf or Low Hartichoke. 6. *Gall'ica*, The French Hartichoke. 7. *Mofcbata* ^ The Musk'd Hartichoke. 8. *Spno* \ The

The Thiitle like Hartichoke. 9. *Aculeata*, The Prickly Harchicoke, of all which in order

not being fo clofely compared together, ia which it alfo differs from the fait Kind.

IV. The Defcriptions. *The fir ft, or Common Great Red Kind, has a Root which fpreads it felf in the Ground pretty largely, whereby it yields divers heads of Leaves, or rather Suckers, by which it is multiplied or increafed;* from this Root fpring up feveral great, large, and long hollowed Leaves, much cut in or torn on both edges, without any great fiew of prickles on them, of a kind of whitim green, like unto an Afh Color, from whence it took the *Latin Name Cinara-*, the Stalk is thick, round, and ftrong, with fome Skins as it were down all the length of them, bearing at the top one fealy Head, made at firft like a *Pine-Apple*, but after, growing greater, the faid Scales are more feperate, yet in the beft Kinds lying clofe, and not ftaring, as fome other Kinds do, which are either of a reddifh brown, whitilh, or greenift color, and in fome broad at the ends, and in others fharp or prickly-, the Stalk, Leaves, and Skins which inclofe the Stalk, are extremely bitter in tafte, beyond expreffion^ after the Head has ftood a great while, if it is fuffered, and the Summerproves hot and kindly, in fome there will break forth at top a Tuft of blewifh purple Thrums, or Threads, under which grow the Seed, wrapped in a great deal of Downy fubftance, but that Root which yields Flowers will hardly abide the next Winter, but elfe, being cut off when it is well grown, that Downy fubftance abides clofe in the middle of the Head, having the bottom thereof fiat and round, which is that matter or part which is ufually eaten.

V. *The fecond, or Great White Hartichoke, n br all things like to the former Red Kind, but that th head thereof is of a whitijh Afh color, like the Leaves, whereas the former is reddifh.* The head of this is nlore apt to dilate or fthead it felf farther abroad,

VI. *The third, or Green Kind. It is Hot wack unlike the two former Kinds, javing, that the head of this is green, and very fharp upwards, and is found very common in many places; nor does it differ much in goodnefs from the former Kinds, but it ismot altogether fb fweet in tafte;*

VII. *The fourth, or Tall Kind. It grew* to 4 Mans height, and is branched into divers Stalks or Arrns^ every one bearing a head thereon, almoft as large as thofe of the firft Kind.* This, though com* mon formerly, is more rare to be met withal now,

VIII. *The fifth, or Dwarf or Low Hartichoke. This is a French Kind, and grows much about Paris* and which the French efteem more than any other.* It is lower than the following *French Kind*, the head of which, as well as the Leaves, are of a lighter green Color, almoft yellowifh.

IX. *The fixth, Or French Hartichoke. It has d white head, the fcales of which (land flaring far a* funder one from another dt the ends, which are fharp:* it is well known by this Quality, that whilft it is hot, after it is boiled, it fmeils fo ftrong^ that one would verily think that it had been boiled in ftinking Water: this Kind was brought over to us in *England* after a great Froft, which had almoft de~ ftroyed our beft Kinds; but we have now almoft loft them again, not being willing they ftould take up the room or place of better.

X. *Tbefeventh, or Musked Haftichoke. It is a Kind which grows much like the former French, but it is much better in fpending, though it has a leffej bottom.*

XL *The eighth, or Thiff e like Hartichoke. it is almoft like the Wild Kind in its manner of growing^ but it grows fmaller, and with a more open and prickly head than any of the former.*

XII. *The ninth, or Prickly Hartichoke, which tU French call Chardon, or Cat don, becaufe it is almoft of the form and nature of a Thiftle, or Wild Hajti* choke h it grows high, and full of (harp prickks, of*

a greyish color-, *John Trackjcant* said that he saw Three Acres of Land about *Bruffels* Planted with this Kind, which the owner whiced like *Endive*, and then fold them in Winter for Winter Salleting.

XIII. *The Places.* These all grow in Gardens, but the first two or three are the most common with us ^ we find by daily experience that our *Englilh Red Hartichoke* is the most delicious of them all ^ they have been sent from us to *France, Holland, Italy* and other Countries, where they have grown well for a Season, but they have not in these places retained their excellency and goodness for above Two Years, but have much degenerated, whereas with us they daily improve, so that it seems our Soil and Climate has the preheminance, and is the most natural to this Plant in exalting it to its highest perfection.

XIV. *The Times.* All these Kinds are increased by flipping the young Shoots from the Roots, which being replanted in *February, March, or April*, have many times the same Year, but the next at furthelt, born very good Heads: The *Hartichoke* is to be Planted in a very fat and fruitful Soil, and they love Water, and a moist Ground ^ it is a great Error to cut away the fide, or superfluous Leaves which grow by the fides, thinking thereby to increase the greatness of the Heads, when as in truth they deprive the Root of much Water by that means, which would nourish it, to the feeding and enlarging of the Heads -, for if you mark the Trough or hollow Channel which is in every Leaf, it will appear very evidently, that those Furrows were designed, even from the extrem point of the Leaf to the Ground, where it is fastned to the Root, for no other purpose, but to guide that Water which falls far off unto the Root, for that without such store of Water the whole Plant would wither, and the Heads pine away and come to nothing-, they are Planted for the most part about *October*, or somewhat sooner, the Plant must be set, and nourished with good store of Athes, for that kind of Manure is thought to be best for the Planting thereof, and every Year the Slips must be taken or flipt off from the Root, and are to be set in *April*, as aforefaid, which will be fruitful about *August* following, as *Columella, Palladius*, and others, as also daily experience teaches,

XV. *The Qualities.* They are, viz. the nails or bottoms of the Scales or Flakes, as also the bottoms, on which Down and Seed stand, hot and moist in the first degree, Diuretick, Analeptick, and Sperma-

XVI. *The Specification.* Being much eaten, they are said to be singular in flopping the involuntary course of the Seed in Man or Woman.

XVII. *The Preparations.* You may have therefrom, i. An Effence, or Blood of the Heads. 2. A Decoction of the Root in Wine, the peel being first taken away. 3. A Fonder of the Seed. 4. The Sallet*

The Virtues.

XVIII. *The Effence, Sanguis, or Blood.* It is made of the bottoms, as the Blood of *Parfneps* ^ it is Diuretick, nourishes much, and restores in Consumptions, tho' of the Lungs *, and being taken from two to four Prams in Red Wine Morning, Noon, and Night, it hops the involuntary flux of Seed, commonly called *Gonorrhoea /Implex*, yet it provokes Lult extremely, for it strenghtens the whole Body,

XIX. *The Decoction of the Root in Wine,* Being drank liberally, it takes away the rank smell of the Arm Holes, for it sends forth plenty of stinking Uim, whereby the rank and rammish favour of not

only the Armpits, but of the whole Body is much amended.

XX. *The Ponder of the Seed.* It opens obstruitions of the Urinary parts, provokes Urine, and cleanses those Vessels from Sand, Gravel, finally Stones, and other Tartarous Matter, and much amends the evil smell of the Body, carrying off the foetidness by Urine.

XXI. *The Sallet.* It is manifold, i. Made of the Heads, by boiling them soft, after which they are eaten with melted Butter, Vinegar, Salt, and Pepper ^ this being much and often eaten nourishes very much, and restores in deep Consumptions 5 .it also very much increases Seeds and fits up Bodily Luft. 2. The Leaves of the heads and their bottoms pickled-, eaten with Meat they are very pealing and grateful to the Stomach. 3. The raw Sailer. It is made of the Ninth Kind, being whitened like *bn* * *dwe*, and so used as a Winter Sallet, being eaten raw, with Pepper, Salt, Vinegar, and Oil, as you drefs whitened *Endive, Sallary, &c.*

CHAP. CCCXXXIX.

O/HARTICHOKE Wild,

O R,

Wild ARTICHOKE .

THE Names. It is called in *Greek* *Ταλιχία*, *Diofcoridis*, and is doubtless «-«* *f. ** *Ltf* « *Cynam*, and *Omra Sylvestris*, in *Enghjb Wild Artichoke*, 01 *hamchoke*.

II. *The Kinds.* There are two several Kinds, viz. I. *Scolymus Diofcoridis, Cynara Sy he fir* is *Lebeh* (because it fo nearly resembles the *Cihara aculeate*

Sil.

Scolymus Syhefiris, *Cynara Sylvefris Latifolia Bait-him*, The Wild Harcichoke, or Artichoke Thiitle. 2. *Cynara Sylvejiris Cretica Honorij Belli*, *Agriocinara* by the *Cretians*, *Agriocinara Cretica Pen**, in his *Italian Baldus*, The Candy Wild Hartichoke. To which Authors add. 3. *Scolymus Theophrasti*, *Eryngium luteum*, *Carduus Chryfanthemus*, The Golden Thiitle.

III. The Defcriptions. *The jirfi*, or Wild Hartichoke, has a great Root, which spreads much, and fends forth feveral thick, long, hard, but narrow Leaves, ending in long points, very confiderably fcolloped in on the edges, fet with ftrong great prickles, and very Jharp, which growing on the Stalks encom-pafs them at the bottom, and are of a dark green color-, at the tops of each Stalk and Branch grows one fcaly and prickly Head, lefler than thofe of the Ninth Kind in the former Chapter, which are kept to be eaten, from the middle of which put forth feveral bright, purplifh, Crimfon Threads, which compofe the Flower, which, after they have flood fome time, pafs away, the Seed in their Heads being flat, and like other *Thiftles*.

IV. *The fecond*, or Candy Wild Hartichoke. It has a very long Root, which grows deep, which fends up long and hoary white Leaves, fome thing broader than the former, very much indented or cut in on the edges, and thick armed with long and Jharp prickles; from among which Leaves rife up feveral round stalks, fet with but few Leaves, and branched fometimes into two or three parts, bearing at their tops fmall, fcaly, fharp, prickly Heads, which are eaten by the Peafants of the Country both green and boiled, with Pepper, Salt, Vinegar, and Oil, and are as pleafant to them as the belt *Hartichoke* is to us.

V. *The third*, or Golden HJaiftle, has a Root which is long, of the bignefs of a linger, very fweet and leaf ant to eat, like unto *Eryngium*, or *Sea-Holly*, which fends forth feveral skinny and prickly Stalks, which in fome Countries, as in Spain, Italy, Sec. Jiand upright, but in other Countries, as in France and England, bends with them unto the Ground, bearing at every Joint both a Branch and a Leaf, which is long, and fomewhat narrow, fmaller at bottom than any where elfe, much cut in on the edges, and fet with fmall white prickles, in fome places marked with white fpts on the deep green Leaves, but in other places none at all j at the Joints, between the Leaves and the Stalks, and at the tops alfo, come forth feveral fmall Heads, fmaller than any of the former, compofed of fmall Scales, with very fharp prickles at the ends, out of the middle offwhich come forth many Gold yellow Threads, which abide not long, and are the Flower, in which, when they are ripe, is hid a fmall round Seed, being fmall and thin Scales lying clofe together.

II' US The firft grows in France, Germany, and Italy, the fecond is natural to Candy, the third is brought from Spain and Italy, but they all grow here in England in Gardens.

A k 5 P The all Flow in July and August, some in the end of Summer, and their Seed ripe in the beginning of Winter.

VIII. *The Outon* They are temperate in re- fpective, Abfterfive, and Diuretick. The *Hartichoke* is ufe to take away the itinking fmell of the Armpits.

A. *The Preparations*. You may have therefrom, 1. A *Milky Juice*, 2. *The Flowers*. 3. A *Sallet*.

The Virtues.

XL *The Juice or Ejjence*. It opens the obftru- fions of the Reins, Ureters, and Bladder, and is very Diuretick, thereby expelling much itrong and itinking Urine, and by that means amends the Itrong rank, or itinking fmell of the Armpits, and of the whole Body. Dofe three or four Spoonfuls Morn- ing, Noon, and Night, in a Glafe of Generous Wine, or other fit Vehicle.

XII. *The Decotfion in Wine*. It has the fame Virtues, but not altogether fo powerful, if it is made in Red Port Wine, it is a fingular good thing to prevent Abortion, and it to ftrenghen the Womb, as to caufe a Woman to go out her time.

XIII. *The Milky Juice*. *Clufius* lays, that with this the People in lbme parts of Spain do coagulate or curdle their Milk, in order to the making of Cheefe, but this is to be underftood chiefly of the Juice of the third Kind.

XIV. *The Flowers of the firft Kind*. They are uld by the *Italians*, as *Pena* and *Lohel* lay, to curdle Milk, of which they make Cheefe-, and that the faid Flowers, being given to Women with Child, in their Broth, or Drink, do hinder Abortion, and caufe them to go out well their whole time; they are alfo very good for fuch Women as are barren* and to caufe Fruitfulnefs.

XV. *The Sallet*. Hie young Shoots of the firft are eaten like *Afparagus*, as alfo the young Heads, (in Spain) before they Hower, but they ufe to raife the Earth over the young Shoots till they are rilen a good height, which are then white, and very tender and delicate to be eaten raw with Pepper, Salt, Vinegar, and Oil, or elfe boiled, as you eat *Afpa- ragus*. *Theophrastus* fays, that his *Scolymus*, viz. the *Golden Thiftle*, is very pleafant eaten raw, or boiled, but chiefly when in Flower, and that the inner fub- ftance of the Heads is eaten and with the Flowers they counterfeit *Saffron*, as we do with the *Bujiard Saffron*, or *Sajflower**

CHAP. CCCXL.

Of HARTICHOKE Jerufalem,

O R,

Canada P O T A T O .

THE Names. It was unknown to the Greeks, but has variety of Names given to it by the Latine Writers: *Pelleterius* calls it *Heliotropium Indicum Tuberosum*, *Columns* in the fecond Part of his *Phytobafanos* calls it *Flos Solis Farnejanus*, (becaufe growing in the Cardinal's Garden) alfo *After Peruanus Tuberosus*, *Bauhinus* in his *Prodromus* calls it *Chryfanthemum Latifolium Brafilianum*, but in his *Pinax*, *Helianthemum Indicum Tuberosum*; but our *Parkinfon* in his *Paradice*, as alfo in his *Theater of Plants*, calls it *Bat tat a* de Canada*, which he Eng- lifhes, *Potato's of Canada*-, but our ufual Engli/b Name is *Jerufalem Hartichoke*. *Bauhinus* allb in his *Pinax* calls it *Aristochifub Terra*.

II. *The Kinds*. It is a fingular Plant of the Kind, but how it ftould be accounted among the Species of *Hartichoke* is difficult to conceive, becaufe it has no refemblance to any of thefe Plants in any of its parts, but the vulgar feldom give Names to Plants according to Judgment, and therefore it is not to be wonder'd

... t; aU thai can be laid tor the Name is, that when it is boiled and dreft, it has a little like- neis in talte to the bottom of an Hartichoke; but why it Ihould be called Jerufalem, is more to be admired at, for that it came not out of Afui, or Eu rope, but from Americd to us, with whom it grows as well and as naturally and plentifully as ever it grew in its Original Native Clime.

III. The Defcription. *Thk admirable Plant heu dtiriji but one fmall Tuberos Root, which fends up fometimes one or more ftiff round Stalks, which grow in our Country to be eight or ten Feet high, but fcarcely blow or fhew their Flowers, whereas the Head of Flowers in their Native Countries, (as Columna fays) being of a Pyramis or Sugar-Loaf fafhion, fpreading broad below, and* growing fmaller upwards, almoit to a point, is nearly of the fame length, on which are fet large and broad, rough, green Leaves, very like unto the Leaves of the Sunblower, but fmaller, and growing in the very fame manner round about the Stalks; at the very latter end of Summer, or beginning of Autumn, if the Root is well planted and defended, it will give a ihew of a few fmall yellow Flowers at the tops, like to the Flowers of After, oiStarwort, and much fmaller than any Sun-Flower, which come to no perfeftion with us; the Root, while the Plant is growing above Ground, increafes not to its full growth, but when the Summer is well fpent, and the fpring- ing of the Stalks is paf, which is about the end of Augujt, or in September, then the Root is perceived to be increafed in the Earth, and will (before Autumn is fpent) in OQober, fwell like a Mountain or Hilllock round about the feet of the Stalks, and will not have its Roots fit to be taken up, until the Stalks be halt withered at fooneft, but after they are withered, and fo all the Winter long, until the Spring & A the v are good and fit to be taken up and ufed, which are a number of almoft roundim Tuberos Roots. Sowing clofe together, fo that it has been obferved, that from one Root, being fet in the Spring, there has been forty or more taken up again, and to have done more than to have filled a Peck Meafure, Which Roots are of a pleafant good tafte, much like to the bottoms of the Heads of the Common Red artichokes.*

IV. Another Defcription from Gerard. *Flos Solis Pyramiddis parvo Flore, Radice Tuberofa.* . This wonderful Plant has growing up from one Root one, fometimes two, three, or more round, green, rough, hairy, ftraked Stalks, commonly about twelve Feet h'gh, fometimes fixteen Feer, or higher, as big as a Childs Arm, full of a white fpongy Pith within; the Leaves grow all along the Stalks, out of order, of a light green color, rough, iharp pointed, about eight Inches broad, and ten or eleven Inches long, deeply notched or indented about the edges, very like the Leaves of *Flos Solis Peruanus*, but nothing crumpled, nor fo broad as they; the Stalks divide themfelves into many long Branches, even from the Roots" to their very tops, bearing fmaller Leaves and fmaller towards the tops of the Plant, making the Plant appear like a little Tree, narrower and flenderer towards the top, in fain ion of a Steeple or Pyramid; the Flowers witlj us grow only at the tops of the Stalks and Branches, like thofe of the laid *Flos Solk*, but no bigger than *Our Common Jingle Marigold*, confifting of twelve or thirteen ftraked, iharp pointed, bright, yellow, bordering Leaves growing forth of a fcaly, fmall, hairy Head, with imayellowv thruhmy fubftafce within •, thefe Flow ers, by reafon of their late Flowering, which is com- monly two, or three Weeks after *Michaelmas*, neve, with us bring their Seed to perfon, and it make,

a (few or abundanceof fmall Heads near the tops of the Stalks and Branches, lorth of the bolbms of the Leaves, which never open and Flower in our Clime, by reafon they are prevented with the Frofts, which otherwife might poffibly be a noble Sight; the Stalks fend forth many fmall creeping Roots, by which the nourifhment is received, which are full of hairy Threads, even from the upper part of the Earth, fpreading far abroad, among which, from the main Root, grow forth many Tuberos Roots, cluttering together, fometimes faftned to the great Root ir felf, fometimes growing on long Strings, a Foot or more from the main Root, railing or heaving up the Earth above them, and fometimes appearing above the Earth, producing from the increaiè of one Root thirty, fourty, or fifty in number, or more, makigg in all commonly about a Peck, and many times neat- half a Bufhel, if the Soil or Earth be good; thefe Tuberos Roots are of a dirty reddiff color without, and of a foft white fubftance within, bunching out many ways, fometimes as large as a Mans flit, or not fo big, with white protuberances, whence they will fpout out or grow up again the next Year; the Stalks are bowed down, and fometimes iome part of them covered over with Earth, and fend forth fmall creeping thready Roots, and alfo Tuberos Roots like the former, as by experience has been feen; thefe Tuberos Roots are of a dirty reddiff color without, and of a foft white fubftance within, bunching out many ways, fometimes as large as a Mans flit, or not fo big, with white protuberances, whence they will fpout out or grow up again the next Year; the Stalks are bowed down, and fometimes iome part of them covered over with Earth, and fend forth fmall creeping thready Roots, and alfo Tuberos Roots like the former, as by experience has been feen.

V. *The Places.* It is a native of *Brazil* ^ *Canada*, and *Peru*, and feveral other parts of *America*, and now it grows as plentifully with us in *England* in anv of the places wherg it grew naturally *, Mr. *Goodve* fays that he received two fmall Roots of this plant from one *Yfranquevill* of *London*, no bigger than Hens Eggs, the one he gave to a Friend, and the other he Planted, and it brought him forth a Peck of Roots, wherewith he ftoed *Hampjhire*; and now it grows in great plenty in many other parts of this Kingdom.

VI. *The Times.* It Flowers generally in *Ottober*, but Seeds not with us, and its Roots are in perfeU- on all the Winter Months.

VII. *The Qualities, Specification, Preparation, Virtues and Ufes,* are the lame with thofe of *Hani- chokes* in Chap. 538. aforegoing, fave, that whereas in thefe the Heads of the *Uartichoke* were only ufed, and eaten, in thefe the Tuberos Roots only are

VIII. *Note.* They are boiled in Water till they are tender, after which they are peeled, fliced, and Stewed with Butter, Salt, Pepper, and a little Red Port Wine, by which means they become an Excel- lent Difh, and more pleafant than the bottom of an *Uartichoke*; being now aery plentiful and cheap, the/ may become good Food for Poor People, and keep Thoufands from Starving, which might be a r perifh.

HARTSHORN, See BUCKSHORN, Chap. pi, aforegoing.

C H A P . CCCXLI.

O'HARTS-TONGUE True,

O R,

DEERS-TONGUE.

I. THE Names. It is called in Greek *Phyllitis* *quafi foliofa*, in *L'atine zKotis*, and *Lingua Cervina*, in *Englijh Deers-Tongue*, and *Harts-Tongue*, I juppofe from the form of the Leaf.

II. Tfo KWx. It is either, 1. *Phyllitis vera*, of which in this Chapter, or 2. *Phyllitis Notha*, *Baft ard Harts-Tongue*, of which in the next. The *Phyllitis vera*, or *True Harts-Tongue*, is alfo three-fold, viz. 1. *Phyllitis*, five *Lingua Cervina vulgaris*, Our Common or Ordinary Harts-Tongue. 2. *Phyllitis laciniata* Jagged Harts-Tongue, or Finger Harts-Tongue. 3. *Phyllitis ramofa Alpini*, Branched Harts-Tongue of *Alpim* which he has notified in *Libro de Exoticis*.

III. The Defcriptions. *The firji*, or Common True Harts-Tongue. // has a Root which is a bunch of many black Fibres or Threads, folded or inter heed together, which fends up feveral Leaves, evey one of them rifing up fingly from the fa?ne Root, which, as ether Ferns, fold themfeives*in their Jirji fpringing and fpreading; thefe Leaves when they are full grown are about a Foot long, fsmooth and green above, but hard, or with little Sap in them, and fraked on the back athwart on both fides of the middle Rib with Snail and ibmewhat browtuffh marks-, the bottoms of the Leaves are a little bowed on each fide of the middle Rib, forfewhat narrow with the length, and fbmething fmall at the end. Some do make two forts hereof; and diftinguiff them by the Epithets of *Latifolia* and *Angujiiifolia*.

IV. *The Jêcond*, or Jagged Harts-Tongue, *dijjrs nothing from the former neither in Root, Lt' < ?f, n?r manner of growing*, *bjit only in the divijion of the tops of the Leaves, which in tjpis are diver fly torn or jagged, fome Leaves much and ibme little, according to the place of growing and time of ab'ding: Notir it is to be obferved, that neither of thefe Plants have either Stalk, Hower, or Seed.

V. *The third*, or Branched Harts-Tongue. // *hra a Root 7ybich_m is fomth_y* woody, vo'uh*black b'ifocs thereat, Jkooting forth many ftenlcr broad Stalks of Leaves, of two or three tect long, a little Downy at bottom, divided into hmany Ibri^and narrow Leaves, dented about the edges, and let one againft another, with an odd one at the end, each reicmbling the JHead of a Javelin, marked thick with ttraight Line* on both fides unto the middle Rib-, the whole Plane is without fmell, but of an auftere tafte, contain'g fome heat, which is not prefently felt, but continues long.*

VI. *The Places*. The fir ft, or *Common Harts-Tongue*, grows by die way fides in great plenty as you go from *London* to *Exeter*, in fhadoty phlces, and in moit llong Vallies and Wells, anti is much planted in Gardens ^ the fecond grew in the Garden formerly one *Cramcidfs*, a Chirurgical, living at *Much Dunmow* in *E(Tex_h)* the third is purely a itran* ger with us.

VII. *The Tims*. They aic gicuii all the Year long, but lefs green in Winter, and in Spring and Summer they fometimes bring tbrth new Leaves. *

VIII. *TIJV Qualities*. They are drying and binding in the firft degree, Aperitive, Afrtingenr, Hepatick, Splenetick, and Alexipharmick.

IX. *The Specification*. They eafe the Splëen ftop Fluxes of the Bowels, and Bloody Fluxes, and wonderfully ftrengthen the *Vifcera*.

the Virtues. -

X. *Tjje Preparations*. You may have therefrom^ I. A *Decoffion* in *Wine of Water*. 2. An *AcidTm^* fture. 3. A *Spirituous Tincture*. 4. "4 *bijill/cd Water*.

XI. *The Becoffion in Wine or WJcr*. It opens obitru£Hons of Liver and Spleen, taking awaf also the pah and hardnefs of the Spleen, and it is a fingular good thing againft the Ricketts in Children, and the Cachexia in Virgins * and* Young Women 5 it flops all forts of Fluxes of the Belly, rfttprefpecially the Bloody Flux, ftrengthens the Stomach, and reitores the Tone of the Bowels, being depraved, or hurt-, made in Water it abates the heat 6f the Liver and Stomach, and is good againft the falling of the Pallate. Dofe four or fik Ounces.

XII. *The Acid Tih&ure*. It more powerfully opens obftu£tions of Stomach, Liver and Spleen than the former, and therefore is a fingular thing to cure the Cachexia and Green-Sicknd\$«in Virgins ^ and being continued to be given to Chndjen troubled with the Ricketts, it pgrfaftly cures than* give it to them in all that they drink, fo many drops at a time as may make their Drink be gratefully pleafant -, it opens the obftu£tions of the Lungs and Stomach in little Ones, and makes them breath freely 5 it i^ good againft the bleeding of the Gums, and a fingular thing againft the Birings of Serpents, or other Venomous Beafts.

XIII. *The Spirituous Tm^ure*. ^m ftrengthensthe Stomach, Liver, and Spleen, and more powerfully flops Fluxes of the Belly, and in efpecial Bloody Fluxes, than tle-Decoffion in Wine, or any other Preparation of Jthe Herb* it is good to refitt the force of Poyfon^and reUor's the Tone of the Bowels being hurt, lengthening them ro admirati- <?!. Dofe from one- Dram to three Drams, in any

proper Vehicle, Morning, Noon, and Night, for some time.

XIV. *The Dijil/ed, Water.* Taken with some of the Spirituous Tincture it is good against Paintings, Swoonings, and other Passions of the Heart * and fo mixed it flops the bleeding of the Gums, and fatten^ the Teeth if oofoe.

C H 4 P. CCCXUL

Of HARTS-TONGUE Baftard,

OR,

M U L E S ~ F E R R

I # T^H S^E ^ amies. It is called in Greek 'frW'm, X % ZIA>wof in *ijitinc Hemionitis, and Splemum*, the former *quafLMularia*^ the latter *Splemum, ax Sp/en, a Sgenkfigura*, in *Englijb* it is called *Baftard Harts-Tongue, iMules-tern, and Moon-torn.*

II. *The Kinds.* It is threefold, viz. **Hemionitis man\ Hemionitis vulgans Bauhini, Hemionitis IT^Aut^ Thc* Common, True, or Greater Baftard Harts-Tongue. 2. *Hemionitis minor Pent, feu ^era* *Hemwntiis JJeris Lobelij, The lefler, or torren Harts-Tongue.* 5. *Hemionitis peregrina Clu-*/> Lobeh, Dadonti, Strange Baftard Harts-Tongue.*

1.1. The Defcriptions. T/^ /?r/?, ^r Common <aitard Harts-Tongue, #> its Roots, Leaves, and manner of grovSTn^ does very much refemble the former jirfi, or True Hjrts-Tongue, both inform and color, but that the Leaf is femewhat broader or larf LI f Af thf Leav^ es, being broadest below, have Jch^L f^ ^ n g, like UMO an Half Moon, o backs of th the m i ^ K i b ^ the ftrakes on tf? backs of them are, mora floping, e Barren m m ^ ris-

Tongue, has a fmall thready Root like the former, quickly withering -, its Leaves exceed not the breadth of three Fingers, not hard, nor rjppgh, but fmbotli and gentle, and without any marks on the back fides of them, yet with a hollow roundnefs at the bottom of them, as in the former, and befides ibme^what unevenly dented about the edges: Clufms fays, that *Lobe/* having fent him some Plants of this Species, after that he had kept them in a Pot, becaufe ot^ their tendernefs^ in two Years time they changed their form into the *Jagged Hartjhorn*, at which, he ftuich wonder'd, for afterwards, (as he fays) when he came into *England*, he gathered with his^owrt Hands in the fame place the like Plants, which there held the form of *Hemionitis*, or *Baftard Harts-Tongue.*

V. *The third, or Strange Baftard Harts-tongue, differs in nothing from thejirjl of thefe three kinds, but in the bottoms of the Leaves,* which have a fmail Ear, or piece of Leaf, fet on each fide of the arched of hollowed bottoms, *

VI. *The Places.* Thefe all grow upon fliadqWy Rocks, and moft hollow places, where little heat of the Suri comes, and are green all the Year, as is the *True Harts-Tongue* in the former Chapter: The fecond of thefe *Lobel* fays he found on *St. Vincent's* Rock, not far from *Briftol*, in a hollow Cave or Hole.

VII. *The Times.* They are in their perfe^Hon in the advance of the Spring, but keep their greennefs all the Year long. *

VIII. *Their g^ualitih, Specification, Preparations and Virtues,* are the fame with the *True Harts-Tongue* in the former Chapter \$ they are fpecially good againft Difeafes of the Spleen, and may be ufed instead of the true *Lingua Cervix** to all Intentions and Purges •

CHAP, cccxtm.

Of HARTWORT.

I. ^THE A 'antes. It is called in Greek st«A/, Jn X. L<l>? SV/^p and of ibme &<?, and in £>?k-lijh *Hartwort.*

II. *The Kinds.* Authors make many Kinds hefe-tof, but the following fourteen are chief, viz. i. 6V-/*>ll wjg/*, *quod Diofcoridiscenfetur, Sefeli Mh/R-Henfemiof<nicuilo Lobelij £? Qufa* The True Sefeli or Hartwort of Diofcorides. 2. *Sefeli Craiova Sefeli Maffihenfe Lobeh) ferula aut Dauci Cretin^ facie, Sefeli MaJJUienfe Matbioli, Sefeli nonnulloram Came rani, Candy Hartwort of Marfelles. S^/i tenfe, S^/i* and *Bauhnus* thinks it to be *Silvaus* ?hn,T mUp 26. Op 8. and fays it is *Pajinaca* N^ra u9ur. U L that of an^ /w has divided Leaves, like *Wild Carrqts*, and has yellow Flowers, whereas this is more like *Fennel*, anH has white Flowers. 4. *jjeje/i I eloponejuicum recentiorum., Sefeli Peloponefe verurr Sefeli Pepponefe folio pcuu Uofcoridis, as LobelTays, The Common or True Hartwort of Peloponefus of Diofcoridis. j. III. The Defcriptionis. Tbejrft, or True Hart-
 won of Diofcorides, bat a very white, long, flen&er
 Root, like unto Fetmelj but (melting, betta
 ing better -ymg a few fibres adjoining
 thereto; from whence rife one or more Stalks, hav-
 ing but few Leaves, thinly fet thereon, which are
 thicker and fhoret and harder than fennel L>-
 • 1 ng downwards, of a greyith A(h color, as all
 the reit of the Plant is, more efpecially in th* h>c-
 ter Countries, for in fome phec3 they are thicker,
 or longer, or lhortei than the^fete in others, as Bmi-
 binus has obferved. the middle Staik feldom rife
 up above a Foot high, bowing to and fro fometimes,
 having many Branches from its bottom, with the
 tike Leaves on them, and each baring Umbles of
 white Flowers, but fometimes purplifh, though fel-
 dom; after the Flowers are gone, linall long Seed
 fellows, more tike to Anifeed trf n fennel Seed, TJt
 *ty pleahng in tutte, yet Oiarp and km.

IV. The faond, or Candy Haitwort, being an
 Hartwort of Marfclles. U bat a thick, M?, ,
 white Rost^ with feveral String? and fibres adjo
 thereto from, whence rife up feveral Stalks, the mid-
 dlemofl of which rs about a Yafi or more high, of a

Fingers thickueis, erclttd, j:.. td forth
 : ••j! Branches, and other fmaller pans; the
 Leaves are i'ennel like, but thicker, and' (liorter di-
 vided, green, and hard, wich-white points; its wing-
 ai Sulks.or Branches are large, and more fpread
 out rhan Yer,mi-, at the top or" each Stalk and i
 iyan Umble of wbjri Flowers, which mrs; ii
 Seed, not much unlike to Angelic^ Seed, but larger
 than Oill Sa*d, hot, and very Aiomarical.

Hartwort
 of Candy

Sffajj-/Hen Mtrfmort.

1691 1692

V. *The third, or Meadow Hartwort, has a Root which is black without and white within, divided into several Branches, with Fibres adjoining to them; from this Xoc rise several Stalks of Leaves, as after; one main Stalky two or three Feet high, with several large spread Stalks of winged Leaves, very finely cut into many parts, each being like unto Fennel, but larger, harder, and of a dark green color, set at the joints, and branching forth towards the tops. bearing Umbles of white Flowers, which being past small, long, and somewhat flat Seed comes in their place, which is larger and blacker than Fennel Seed, and near unto Meum, or Spignel, of little smell, and a small sharp taste.*

VI. *The fourth, or Common or True Hartwort of Dioicorides. This Grecian Hartwort has a great Root, blackish on the outside, and white Within, growing deep into the Ground, like Ferula, or Thapsia, something sweet in smell, and hot in taste, the Stalk grows to be about two Feet high, or more, as thick as ones Finger, with several large spread Leaves at the bottom, as great as Hemlock, but crumpled, rough, and hairy*, the Stalk and Branches bear large Tufts or Umbles of yellow Flowers, which being past away yield broad, flat, winged Seed, of a pale yellow color, somewhat like unto Angelica, but greater, and nothing so thick, of a very sweet smell, as sweet as the Seffeli Mithiopicum-, this, says Lobel, the most Learned and Judicious Herbarists of Mompelier acknowledge to be the true Seffeli Peloponese Dioicoridis, though formerly they took it to be a kind of Thapsia, but the true Thapsia is much differing from it both in form and color, as those who please to observe may find.*

VII. *The fifth, or Narrow Leav'd Meadow Hartwort of Germany, has a Root as thick as ones Finger, and very long, black without, and white within, of a sharp and somewhat bitter taste, from this Root springs up a round crested or fraked Stall three Feet or more high, for their form and division, Wild Larret Leaves, but smooth, and not rough and of a deep green color, spreading it forth in*

to several Branches, bearing at their tops Umbles of whitish yellow Flowers, after which follow small long Seed, somewhat like to those of Fennel or Caraway, or between them both, and a little Aromatic in taste.

VIII. *The sixth, or Milky Marth Hartwort. It has a long Root, which is brown on the outside, white within, and of an unpleasent taste, joined with much heat, by which it inflames the Throat-, but being Planted in a Garden it looses much of that evil taste and burning quality, becoming much more mild-, this Root sends up a Stem or Stalk four or five Feet high, with Joints, and long Stalks, or Branches of, well spread Leaves set at them, the divisions of which are small, and much cut in, almost like to those of Caraways, or between them and Fennel at the top of, the Stalks it spreads forth into Branches, which bears at their tops small Umbles of white Flowers, which being past away, flat, thin, winged, Seed follows the whole Plant, or any part thereof being broken, there flows from it a certain Milk like Juice, as there likewise does from many other Umbelliferous Plants.*

IX. *The seventh, or Greater Candy Hartwort. It has a Root which is white, somewhat long, and woody after it has Seeded, and then perishes, rising again plentifully from the Sowing of its own Seed: This Root sends forth rough, hairy, round Stalks, about two or three Feet high, set with long Stalks of winged Leaves, much resembling Farfnep Leaves both in form and magnitude, yes somewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewise, and turning themselves a little backwards to the Stalk-, towards the tops of the Stalks they spread themselves forth into Branches, and have smaller Leaves set at the Joints than grow below, bearing small Umbles of purplish white Flowers, whereon, after they are gone, grow whitish, flat, round Seed, circled about, as it were, with a Border, and cur in round about it all with round fents, of little or no smell or taste.*

X. *The eighth, or Small Candy/Hartwort. It has a Root which is unprofitable, and as perishing as the last, which sends up such like Stalks of winged Leaves as the former, but smaller, rounder, and shorter, a little hairy, and whitish-, the Stalks are lesser and lower, fuller of Branches, bearing paler purplish Flowers in Umbles, and Seed after them, of the same form or shape, but quicker, as the Herb also is, and therefore the more accepted, and used as a Sallet Herb in Italy, and other Southern and hot Climates.*

XI. *The ninth, or Great yellow Candy Hartwort. This has a like Root, and grows very like the seventh, or Greater Candy Hartwort, having the like Leaves on the Stalks, but somewhat broader and shorter, a little sharp in taste, and not above two or three pairs together, set on the like Stalks, but smaller on the Branches, and bearing Umbles of yellow Flowers like Dill, without any Leaves under them as the others have, which being past away the like whitish flat, round, Buckler like Seeds, ringed and dented about the edges follow, but they are larger and smoother, and divided in the middle with a brownish stroke or line, making the Seed seem like unto a kind of Tflapfi, or Treacle MuJardSeed: Columna says that this Flowers and Seeds at Naples in Italy, and grows only in Gardens there.*

XII. *The tenth, or Smallest Candy Hartwort. It has a Root which is small white, hard, and a little bitter in taste-, this Plant is very like unto the Lejjes Candy foregoing at Sect. X. above, but it has Leaves like to the lower Leaves of Coriander, soft, but a little hairy, the first Leaves being of an Inch and*

hair long, and air Inch broad, and dented about the elges vvirii round dents*, the fecond Leaf is of two Indies long, the third has a longer Stalk, with two Leaves let thereon, imailer and rounder than the other, about half an Inch broad, and a jigger Leat at the end, yet fmaller and longer than the firft Leat^ the next are leiler and longer, and the Stalk is naked of Leaves below, being {mail, hairy, hard, and itraked, and carrying thick Umbles of white Flowers, with yellow Threads in the middle, and underlet wi^i long hairy Leaves, the outward Flowers being larger than the inner, thereby making tKe Umble relemble that of the *Wild Carrot*-, after which come fuch like Seed as the former, but not half fo large, the middle part being of a darker color; before they are ripe they look of a purphfh green, but when they are tull ripe white, of-an aromattck taft, fomewhat bitter, and a little fweet in fmell

XIII. *The eleventh, or Mountain Hartwort* with fmooth Hemlock like Leaves. *It has a long Root, divided into two or three Arms or Branches, of a brown/b blade on the outside, and white within, from whence fprings up a Stalk, which is hollow, and riles up to the height of two Feet, or two Feet and a half, from which Stalk comes forth (at Joints) large fspread Leaves, divided into many fmaller parts, like unto Hemlock^ or Sefeli Peloponefe, the higher up the Stalk the fmaller and longer the Leaves, which are fmooth, and more finely divided-, at the top of the Stalk comes forth larger Umbles of white Flowers, which turn into yellowvifh crefted Seed, two joined together, of a hot and aromattck taft,*

XIV. *The twelfth, or Mountain Hartwoit with hairy Hemlock Leaves. It has a long, thick, dark colored Root, which fend forth broad Hemlock like Leaves, or like to the Greater fBeet Chervil, of a dark green color, and fomething rough and hairy, efpecially the' footftalks of the Leaves, from the midft of vvhich riles up a thick* hollow, grafted, hairy, and jointed Stalks, about two Feet high, divided into feveral Brandies, with fome few Leaves thereon, but much lefler, and in like manner divided -, near the top of the Stalk it (hoots it felf forth injp many Arms or Branches, at the tops of every one of which jgrovvs a pretty large Umble of white Flowers, fucceeded by long (harp pointed Seed, two joined together.*

XV. *The thirteenth, or Shrub iEthiopian Hartvort. If has a Root which is great and woody, ff reading it felfout into feveral Arms or Branches, with feveral Fibres iffuing therefrom, and which abides many Hears, if it is defended from (he cold-, from this Root (hoot forth feveral woody rough Stems, covered with a blackifh Bark, divided into many Branches, two, three, or four Feet, or more long, befet with many fair, large, thick,*ard, fmooth, pale green Leaves, being long, and fomewhat like unto *Woodbind* Leaves, but not fo broad, fmooth or even on the edge& and not dipt or dented at all •, on the tops of the Branches Itahd^ fmall Tufts of yellow Flowers, which afterwards bear brownith, round, and long Seed, bigger than *Sweet Fennel* Seed * the whole Plant fmells very ftagrant, and the Seed beft^ being of an Aromattck taft, fomewhat bitter, and (harp withal; This is commended by *Diofcorides* to be the beft of all the *Hartworts*, beyond that of *Candy* or *Marfelles*.*

XVI. *The fourteenth, or Great Jointed Hartwort of Candy. It has a Root which is compofed offegC^ tylftender, long, white, woody Strings, which penfhes Tearfy, which Root fend up f_{our} or five hard, round, rough, or rather prickly Stalks, about two^ Feet high, whofe Joints are great, and bunched out like Knees, with a rough, Yaxge, winged Leaf or two at each of them, fome confifing of three, and*

fome of fire parts, and every one or them aiio cLvi^ ded into feveral parts, of a fad green color, chang-mg r^ddiuh at Seed time-, the Stalk is rougti^nd creutd, and the feveral Branches hereof do c!Rry ievelial fmall Tufts or Umbles of white Flowers, which heing pa ft away, there comes in their placei greac^ long, round, and rough Seed.

XVII. *The Placet. Moft of thefe SejWs or Hart worts grow about Mompeliet, AUi^felles, and Natbone in trance, as alioiri haly and GinJy, fome in the Morea in Greece^ and ibme in JETHIOPIA, and fome of them in Germany, and almolt all of them grow with us in England, where they thrive well f but are with us nuried up only in Gardens.*

XVIII. *The Times.* They Flower moft of them in June and July in tjeir native plates, but with us in July and Augufi, and do bear ripe Seed in September, or before the end of Summer, it care be had bordering and keeping them, fo as they be Planted in the warmeft places, and in a Southern Sun.

XIX. *The Qualities.* They are all of them hot and dry in. the fecond degree, Aperitive, Abfterfive^ Carfrinative, and Diuretick, Stomatick, Pe&orai-, Nephritick, Neufotick, and Hyfterick, Antiemetick, and Alexipharmick.

XX. *The Specification. Hqrtvoort opens Obftuitions of the Lungs and Urinaif parts, helps Coughs^ and the Strangury, Afthma's, Colick, obftuention of the Terms, and Hyfterick Fits, and facilitates the Delivery of Women in Travail*

XXI. *The Preparations.* Of all thefe Kinds the four fifth are chiefly ufed in Phyfick, (tho' it is poiffible all the reft may have as excellent Virtues, and be fully as efficacious) but the' *JETHIOPIAN* is preferred for* its fingular Virtues beyond all the other forts % and is doubtlefs that which ought to be put into the *Compoftions of Mithridate and Venice Treacle-*, and this *Lobel* gathered in great plenty about *Mompeliet* in *France-*. As to the parts of the Plant, the Roots, the Herb, and the Seed, are all ufed, and from them the following Preparations ate made, viz. i. 4 *Juice of the Herb.* 2. *An Effence of the Herb and Root.* 3. *A Deo&ion in Wine or Water of the mrbh Root, and Seed.* 4. *A Pcuder of the Seed.* ? . 4 *Cataplafm of Root, Herb, or Seed.* 6. *An Acid Tintfure of Root or Seed.* 7. *A Spirituous Tinture of Root or Seed.* 8. *An Oily Tintfure. of Root or Seed.* 9. *A Difilled Water from Root, Herb) or Seed, or from all of them.*

The F_{IT}T

XXII. *The Juice of the Herb.* It is cotamended by *Dio/corides* to help the Strangury, and difficulty of breathing, as alia the Suffocation of the Womb, to provoke the Terms, and expel the dead Child? it is prevalent alfo againft the Falling-Sicknefs, and pains of the Kidnies. Dofe three or four Spoonfuls, twice or thrice a day, mixed with a Glafs of White Port Wine-, mixed with Honey and taken, it is good againft Coughs, Colds, Wheezings, and Obftuitions of the Lungs.

XXIII. *The Effence.* It has all the former Virtues, being given in like manner and Dofe, befides which it facilitates the Delivery of Women in travail •, the Effence or Juice taken with the Pouder of the Seed for ten days together in White Wine, gives? eafe in the pains of the Reins, and is fad to' expel the Stone lodged in thofe parts -, if the Stone is great I am confident it can do nothing, at all, but if it is Tartarous Matter, Sand, Gravel, or fmall Stones, then poiffibly it may expel them, and clear the parts of thofe Recrements: The Effence made of the Root is powerful in heating, and opening Obftu&ions,

by reason of its thin parts, for which reason it powerfully provokes Urine, and helps the Epilepsy, and this Galen speaks of all the *Hartworts* in general and *Diofcondes* lays they have the same Faculties and Operations.

- **XXIV. The Decoction of Root, Herb, or Seed, in Wine or Water,** has the Virtues of both the former Preparations, but in a much lower degree, however it is often given against the Strangury, stoppage of Courfes, and to facilitate the Delivery of Women, &c

XXV. The tinfder of the Seed. It is said to prevail against the Stone, Gravel, Strangury, Colick, obstructions of the *Vifcera*, &c. Made into an Electuary with Honey, it is good against Asthma's, Coughs, Colds, obstructions of Flegm, and causes easy Expectoration. Dose of the Powder is one Dram, Morning, Noon, and Night, in any proper Vehicle, as White Wine, Parsly Water, Arsmart Water, &c.

• **XXVI. The Cataplasm of the Root. If it is beaten into a Pulp,** or boiled soft, and then beaten, and brought into a confistence with *Terra Samia*, or to two parts of the Root, one part of *Terra Samia*, and an eighth part of Honey; being then applied, it is of good use to disperse simple Contusions, or Bruises, and to take away the black and blew marks or spots of the face, cooling by Blows, Pinching, or otherwise.

XXVII. The Acid Tinure of Root or Seed. It is good against all sorts of malign and burning Fevers the Small Pox, Spotted Fever, Calenture, and the Plague, or Peffilence it self, it is also prevalent against the Bitings of Serpents, or Mad Dogs, or the Ringing of Scorpions, Hornets, or other Venomous Creatures; it cleanses powerfully the Urinary passages, is good against Stone and Strangury, as also against Shortness of Breath, difficulty of breathing, Hoarseness, Wheezing, and the like. Dose twenty, thirty, or forty drops at a time (more or less, according to the quantity of the Vehicle) in Ale, Wine, or other liquor, three or four times a day.

XXVIII. The Tinure of Tinzure. It powerfully refits Vapors, and gives relief to the Colick, and is good against the Poison of any Venomous Creature, it is good against the Epilepsy, and other Diseases of the Nerves, Head, and Brain, proceeding from cold and moisture; it lengthens the Stomach, causes a good Appetite and Weakness of the Stomach, cleanses and lengthens the Womb, and causes Conception. Dose from one Dram to three, Morning and Night, in Ale, Beer, or other Vehicle, as Decoction, Water, &c.

XXIX. The Oily Tinture. It is good against weakness of the Nerves, Pains, numbness of any part, Pains or Aches whether external or internal, proceeding from cold and moisture, or any obstruction of the part: it facilitates the Birth, and causes a speedy and safe Delivery; it gives ease in the Gout, alleviating the pain in a short time, it causes an evacuation of Sand Gravel, and Tartarous Matter from the Reins, and other Urinary parts, and prevents the breeding of the Stone; it also gives ease in the Colick. Dose from twelve to thirty drops in any fit Vehicle, or in the Distilled Water of the same Plant, it allays itching in any place, by allaying the ferment of the Humors.

XXX. The Diftilled Water. It is good for all Weaknesses, but is much weaker, and therefore used as a Vehicle; outwardly applied it takes away its discolorings, as yellow

C H A P. CCCXLIV.

Of H A * W K W E E D Common,

THE Names. It is called in Greek *Accipiter*, An Hawk, (sic dicitur quod Accipitres sibi hujus fucco aciem Oculorum acuire dicuntur) in *Lahne Hieracium*, and by some Authors *Accipitrina*, in *Engliffh Hawkweed*.

II. *The Kinds.* Authors make a vast number of the Kinds of this Plant, many of which grow not with us in *England*; *Parkinfon* divides so many as he Treats of into nine general Heads, making them in all Fifty Five several Species, viz. 1. *Sharp pointed Dandelion like Hawkweeds, Seven Kinds.* 2. *Blunt pointed Dandelion like Hawkweeds, Ten Kinds.* 3. *Gum Succory like Hawkweeds, Four Kinds.* 4. *Garden Succory like Hawkweeds, Three Kinds.* 5. *Wild Succory like Hawkweeds, Four Kinds.* 6. *SmcoW Mountain Hawkweeds, Five Kinds.* 7. *Hairy Mountain Hawkweeds, Thirteen Kinds.* 8. *Meadow Hawkweeds, Three Kinds.* 9. *Bujhy Hawkweeds, Six Kinds.* We shall not follow this Division, nor yet Treat of all those several Species, but only of so many as are to be found growing in *England*, and therefore we divide them but into two principal Kinds, viz. 1. *Of the more common Kinds of Hawkweed,* of which in this Chapter. 2. *Of the less common Kinds,* of which in Chapter 345 following.

III. *The more common Kinds.* There are in number Eleven viz. 1. *Hieracium majus Sonchtes, Hieracium majus Mastlioli, Fuchfij, Dodonai, Lobelij, & aliorum; Taraxacon majus Lomcen, intubus jecundus Tragi, Hieracium Sonchi Folio variorum, Hieracium piinum Lugdunen/s,* (because he makes the *Chondrilla prior Diofcoridis* to be his *Hieracium magnum*) Common Great Hawkweed with Sow-Thistle Leaves. 2. *Hieracium Dentis Leonis Folio asperum, and bifute asperum, and magk laciniatum Lobelij, Hieracium jalterum Saxatile Montanum Q> lumn <e,* Rough Dandelion like Hawkweed. 3. *Hieracium Dentis Leonis Folio obtufo minus Flore magno,* Dandelion like Hawkweed. 4. *Hieracium Dentis Leonis Folio Floribus parvis, Dandelion Hawkweed with small Flowers.* 5. *Hieracium asperum Hypoch<eris, five Porcellia d) 3um Tabernamontani, Hieracium minus Dentis Leonis Folio sub aspero, Swine's Hawkweed with rough Leaves.* 6. *Hieracium Folij & facia Chondrillu Lobelij,* Gum Succory like Hawkweed of Lobel. 7. *Hieracium Chondrillu Folio glabrum,* Smooth deep jagged Hawkweed. 8. *Hieracium tenus Radice pramorfa Lobelij, Hieracium minus Matthioli, Tragi, Fuchfij, Gefneri, Tabernamontani, Gerardt, & aliorum, Hieracium Leporinum Succifa Tertia Tragi, (?), LaUuca Leporina, Picris Dalechampijs & Lugdunenfw,* (because of its bitterness; *Hieracium Chondrilla Folio Radice Succifa Bauhini,* Hares Hawkweed, w Yellow Devils-bit. 9. *Hieracium finuatum profunde Pratenfe Meadow Hawkweed with deep cut Leaves.* 10. *Hieracium Pratenfe non finuatum majus, Greater undented Meadow Hawkweed.* 11. *Hieracium Pratenfe non finuatum minus,* The lesser undented Meadow Hawkweed. This being said, it is to be understood, that the *Hawkweeds* stand as in a *medium* between the *Succories* and the *Sow-Thistles*, as in some measure partaking of them both.

IV. *The Descriptions.* The first, or Great Hawkweed, has a Root which is long, and somewhat great, with many small Fibres thereat, from; whence spring

up many large hairy Leaves, lying on the Ground, much rent or torn on the sides into feveral gashes and jags, fomewhit like unto *Dandelion*, but widf greater parts, more like unto thofe of the *Smooth Sow-Thijile*, the whole Plant being full of a bitter Milk •, from among which rifes up a hollow rough Stalk, two or three Feet Jiigh, Branched forth from the middle upwards, on which are fet, at every Joint where it Brancheth, longer Leaves, little or nothing rent or cut in, bearing at their tops feveral pale yellow Flowers, confifting of many fmall narrow Leafes^ broad pointed, and hotched in at the ends, fet in a double row, or more, the outermoft being larger than the inner, which form mod of the *Hawkweeds* do keep in all their Sorts or Varieties, which being paff away turn into Down, and with its fmall brownifli Seed is blown away with the Wind,

V. *The fecoiid, or Rough Bandelion* like flawkweed. It has a Root which is fmall, fomewhat like a linger, with a few Fibres adjoining thereto, from whence fpring up feveral long *and narrow hairy Leaves, reddifh at the bottom next the Root, deeply wavdd or torn in on the*edges, being about two Inches long, from among which rife up one, or two# or more bare or naked Stalks, rough or hairy, bearing each.of them a double yellowr Flower, like unto the *Hawkweeds*, which being paff away turns into Down, as the former does.

VI. *The third, or Dandelion* like Hawkweed, fiai a fmall, and fibrous Root, which fends forth fix or feven thick rough Leaves, lying on the Ground, about two Inches long, and half an Inch broad, round pointed, and jagged about the edges, as Other *Hawkweeds* are •, t^e Stalk is hoaty alfo, and Branched, about a Span, or eight or nine Inches high, having imaller Leaves therepn, with lfhaller divifions-, at the tops ftand very yellow Flōwers on very fhort Footftalks, (hooting out very fine hoary Husks, pointed at the brims with many points. ..

tVII. *The fourth, or t)andelioii ttawkweed* with finall Flowers, ha* a Root which is fmall,-white, and fibrous-, the Stalk is round, a Foot high,

and fomewhat hoary, at rhefebtoitri bfwlfiichgrcw a few rough Leaves, bitten in (as it were) abort t the edges, and about three Inches long, and half an Ithi broad, having but few Leaves thereon,» and thōfe about the middle, which are bur only dented/and encompafs it at the bottom, bearing very many fmall yellow Flowers together at the tops thereof which grow upon very fhort Footftalks.

VIII. *The fifth, or Svyines Hawkweed* with rough Leaves.. 7l has" a fmall and long Root, and is but a fmall Plant, having feveral fomewhat long and rough Leaves lying on the Ground, fmallejwjt the bottoms, and broader towards their ends, unefenly waved .about the edges \$ the Stalks are a little rough, {lender, and bare of Leaves, Branching into feveral long Stalks, about half a Fpot in length, bearing every one a large yellow Flower, like unto the *Hjwkwee'ds*. There is another Plant of this fort, whose Leaves are fsmooth and narrower, but differing little in any thing elfe.

IX. *The fixth, or Gum Succory* like Hawkweed. This grow? not Jō high a* jbme others, and has its Leaves thicker jogged, but not fo large, each jag fomething dented alfo, and iomething hairy -, the Flowers are yellow, but not fo thick or double, but growing in a Tuft together, which being ripe, and turned into Down, are, with its Seed at bottom, blown away with the Wind, il the Down of other *Hawkweeds* are.

X. *The feventh, or Sfciooth* deep jagged Hawkweed. This differs not much from the la ft, but that the Leaves hereof are fsmooth, and very much and very deeply jagged, even to the middle Rib, each jag being fmall, narrow, and pointed5 its Stalk's, Flowers, Down, and Seeds are like unto the former/

XL *The eighth^ or Hāres Hawkweed, or YdloW Devils-Bit.* Its Root is made up of many Strings, dika a Plantane Root, but the middlemoj^ part, which is great eft, isjhort, as if it had been'bitten *g, like & Root ^Devils-Bit: This Rdot fends up mlny Le ivS, of which thofe which lye next the Ground are fo ne- what long and narrow, cut in on the*edges into ltri ill and

and in short pointed galhes-, the 'Stalks' are small, and scarcely grow to be a Foot high, spread out into a few Branches, with some Leaves here and there upon them, which have no division or dents on the sides, at the tops of the Branches stand the Flowers, which are much separated one from another, each upon a long Footstalk, consisting of fewer Leaves, or being left double, of a Gold yellow Color, which being past away, are succeeded with Down, like the other *Hawkweed's*, the whole Plant, and every part thereof is very bitter, rather more bitter than any of the others.

XII. *The Wnthe Meadow Hawkweed with deep cut Leaves. The Root is blackish and woody*, the Leaves lying next the Ground are many, long, and narrow, and deeply cut or torn in on the edges; and pointed at the ends, each Leaf standing upon a long Footstalk, and covered with a Downy hairiness, as the whole Plant besides is-, the Stalk is hollow, round, and about a Yard high, having a few such like deep cut Leaves thereon, it is spread forth into several Branches, at the tops of which stand Gold yellow Flowers on several long Footstalks, succeeded by Down, as the others are.

XIII. *The tenth, or Greater undented Meadow Hawkweed, has a small and black Root, with several long Strings adjoining to it, from whence rise up several rough Leaves, lying upon the Ground, each about five Inches long, and an Inch and half broad, without any gadi or dent upon the edges, being very green, and ending in a round point, from among which rises up one single, straight, and crested Stalk, about a Foot and half high, wholly naked, or destitute of Leaves, bearing at the top a number of small yellow Flowers, set close together, as it were in a Tuft, every one upon a short Footstalk, which being past away, do, like the rest, turn into Down, and pass away with the Wind.*

XIV. *The eleventh, or Lesser undented Meadow Hawkweed. Its Root is something long, and of a mean thickness, the Plant is less than the former, and has many lesser Leaves undented lying upon the Ground, of an Inch and half long, and an Inch broad, being almost round, and rough, the Stalk which arises from the middle of them stands upright, and is crested, bearing at the top a few such like Flowers as the former, which being past away, turn into Down, which is also carried away with the Wind.*

XV. *The Places.* The first and second grow in several places about Fields and Pathways in dry Grounds, the third, fourth, and fifth grow also in Fields, waste Grounds, Lanes, and By-Ways in many places of England; the sixth, seventh and eighth grow also plentifully enough in many places of our Land, and sometimes in Gardens, the ninth, tenth and eleventh grow in Fields and Meadows, and by Wood sides which lie open to the Sun.

XVI. *The Times.* They all Flower, and the Down flies away in the Summer Months, viz. in June, July, and August, and rise again of themselves in Sowing.

XVII. *The Qualities.* They are all cold and dry in the first degree, Absterfitive, Astringent, Anodyn, Diuretick, Peccoral, Stomatick, and Alexipharmick.

XVIII. *The Specification.* It eases pains of the Liver and Spleen, and opens obstructions of the Lungs.

XIX. *The Preparations.* You may have therefore, 1. An *Injunctive Juice*. 2. An *Effence*. 3. *MDecottion in Wine*. 4. A *Collyrium*. 5. A *Cataplasma*. 6. A *Distilled Water*. 1. An *Acid Tincture*. 2. A *Saline Tincture*.

The Virtues.

XX. *The Injunctive Juice.* A Dram thereof dissolved in White Port Wine, adding a little Vinegar when it is given, opens the obstructions of the Reins, Ureters, and Bladder, provokes Urine, and prevails against the Dropsie, it is also good against the Stinging of Scorpions, and Biting of Serpents, or other Venomous Beasts, it is also good against the pain and hardness of the Spleen, and procures Rest and Sleep.

XXI. *The Effence and Liquid Juice.* It is cooling, drying, and binding, and therefore good for the heat of the Stomach, and gnawing thereof, for inflammation and the hot Fits of Agues; the Juice given to two or three Spoonfuls in Wine, helps Wegestion, diffuses Wind, hinders Crudities, helps the depraved Tone of the Stomach, is good against the Strangury, or stoppage of Urine, and prevails against all the Diseases for which the Injunctive Juice is given.

XXII. *The Decoction in Wine.* It has the Virtue of the Juice and Effence, but not full out for the relief; made with *Wild Succory* and taken, it helps the Wind Colick, pains and hardness of the Spleen, procures Rest and Sleep, hinders Venery, and Nocturnal Pollution, cools and purifies the Blood, opens obstructions, and cleanses the Stomach, Reins, and Bladder: The Decoction mixed with Honey and taken, it digests thin Flegm in the Thorax or Lungs, helps the Cough, Hoarseness, Wheezings, obstructions of the Viscera, and causes expectoration: Dose six or eight Ounces twice a day, viz. Morning

XXIII. *The Collyrium.* It is thus made. Take clarified Juice of Hawkweed eight Ounces, Honey four Ounces, Roch Alum six Drams, melt, and make a Collyrium. It is singular good for all Diseases and Diseases of the Eyes, in tender Sighted People it may be mixed with Womens Breast Milk, or with Cows Milk, and so used; it is also used with good success in curing fretting and eating Ulcers in any part, especially in their beginning.

XXIV. *The Ophthim.* Outwardly applied it is good for hot Distempers of the Eyes, if it is made of the green Herb bruised, and with a little Salt applied to any place burn'd with Fire, before Blistering, it takes out the Fire, and gives ease; it also allays Inflammations, and St. Athons-Tumors, cures Putties and Eruptions in the Skin, abates heat, and draws forth the virulent Humors, if it is made by boiling with a little Milk and Barley Flower, or White Bread, and applied to any place affixed with Convulsions, or the Cramp, or where there is a simple Contusion, it relieves the Tumor, and eases the

XXV. *The Diarrhoeal Water.* It is said to cleanse the Skin, and take away Freckles, Spots, Morpheus, or Wrinkles in the Face and Skin.

XXVI. *The Acid Tincture.* It removes the putrid heat of the Stomach, cools the heat of Fevers, and helps a hot and dry Liver. Dose in any drops as to make the Ale, Beer, or Wine sweetly acid, and it may be drunk in all that the Patient drinks; it cures also a hot Scurvy.

XXVII. *The Saline Tincture.* It is good against the Gout; whether in Hands or Feet, the parts affected being well bathed therewith as hot as can be endured, it is also good against Tanning, Sunburning, yellowness of the Skin, black and blue spots, thro' Blows, or Bruises, Freckles, Lentils, Scuffing, Morpheus, Pimples, and other hot, fast, and fiery breakings out of the Skin, in what part of the Body, or loever, being skilfully applied.

C H A R CCCXLV.

Of H A W K W E E D L e f s C o m m o n .

I. THE Names. It is called in Greek *Ἱεράκιον* [AAVQV, Ἱεράκιον] in Latine *hieracium minus commune, vel rarum, Hieracium minus commune, in English Hawkweed lefs common, or not so eafie to be met*: with, as being either rare, or otherwise, Exotics, and fo only Garden Plants with us.

II. *The Kinds.* All the various Kinds enumerated in Author's, aforementioned, we fhall not trouble you withal here, many of them being abfolutely Foreign, and fo never to be feen with us, fome of them only various, or degenerated, or otherwife altered, from the poornefs or richnefs of the Soil, or other qualifications of the Ground, and fb never to be met withal ajpin in Nature ^ thofe which we fhall now defcribe are the twenty following, viz. i. *Hieracium afperum, Hieracium Intybaceum afperum Tabernamontani, Sharp, or Sharp pointed Hawkweed.* 2. *Hieracium majus alterum, The other Great Hawkweed.* 3. *Hieracium longtus Radicatum Lobelij, and Microphyllon Tabernamontani, Hieracium minus primum Dodonai, Apargia Dalechatnpij,* of Which *Theophrastus* fpeaks Lib. 7. Cap. 9. *Hieracium Dentis Leonis Folio obtufo majus Bauhini,* Long Rooted Hawkweed. 4. *Hieracium Intybaceum Flore luteo Bauhini,* Garden Succory like Hawkweed with yellow Flowers. 5. *Hieracium Intybaceum Flore magno albido,* Garden Succory like Hawkweed with white Flowers. 6. *Hieracium Intybaceum Wore Carneo, Hieracium Ramofum Pen*, Hieracium Apulum flore fuave rubente Column*,* Garden Succory like Hawkweed With blufkFlowers. 7. *Hieracium Folio Hedypnoidis,* Wild Succory like Hawkweed with yellow Flowers -, it is called *Rhagadiolus* by *Cafalpinitis*. 8. *Hieracium Montanum latifolium glabrum majus Tabernamontani > Great broad Leav'd* fmoother Mountain Hawkweed. 9. *Hieracium Montanum Latifolium glabrum mitius Tabernamontani,* Small*broad Leav'd fmoother Mountain Hawkweed. 10. *Hieracium Montanum Rapifolium, Turnep Leav'd Hawkweed.* 11. *Hieracium Montanum Folijs dentatis Flore magno,* Dented Mountain Hawkweed with a great Flower. 12. *Hieracium Ramofum Flore magno,* Great Flowered Hawkweed. 13. *Hieracium Montanum Latifolium villofum magno Flore Clufij^* Hairy broad Leav'd Mountain Hawkweed with a large Flower. 14. *Hieracium Montanum Dentis Leonis Follb incano, Hieracium Folio Hedypnoidis Cichoraceis Tabernamontani,* Mountain hoary Dandelion like Hawkweed. 15. *Hieracium Britanicum Conyz* Folio Clufij,* Engliih Fleabane like Hawkweed. 16. *Hieracium Latifolium Clufij, Hieracium Phlomoideis Tabernamontani, Hieracium Latifolium Vannonicum tameranij Flore magno luteo,* Broad Leav'd Hawkweed with a great yellow Flower, which is the *Primum Clufij.* 17. *Hieracium fruticosum Folio fubrotundo Bauhijnt,* Round Leav'd bufky Hawkweed. 18. *Hieracium fruticosum Latifolium hirjutum,* Rough broad Leav'd bufky Hawkweed; *Hieracium fruticosum Anguftifolium majus^* Greater narrow Leav'd bufky Hawkweed. 20. *Hieracium fruticosum minus,* The Leffer*bufky Hawkweed.

III- The Defcriptions. *The firft, or Sharp pointed Hawkweed.* It has a Root which is tough, and fibrous, or thready, fom whence rife up nunny Leaves > which are long and narrow 3 like th|e of

Languebeej, or Qx-Tongue, but much narrower, which are (harp about the edges, rough in the middle> and withal (harp pointed > the Stalks are long and flender, fet with the like Leaves, bur leifer, the Flowers grow at the tops, which are yellow colored and double, which being pait, are fucceded by Down, which is carried away with the Wind.

IV. *The fecond, or ether Opeat Hawkweed.* *The whole Plant is bitter, and perijbes at the jurji approach of Winter, being but Annual^ and to be new Sown every Tear-,* its firft Leaves are little or nothing dented, but fomething like *Endive,* yet thofe which follow aie cut in on the fides, not fo much as the *Sow-Tbift/e,* elfe not much unlike, which are more tender, yet larger than the firft in the former Chapter, as the Stalks are likewife, bearing on the Branches greater Husks, wherein the Flowers grow^ which pafs into Down, with rough crooked Seed lying therein, and are both difperied and blown away with the Wind. #

V. *The third, or Long Rooted Hafvkweed:* Its Root is white; fmall; and long, running down as deep into the Ground fays *Lobe/as* the Stalk is high, yet fome of k has been obferved with more and fhorter Roots-, the Leaves which lye upon the Ground are long and narrow, much torn and jagged on the edges, ibmewhat like unto *Dandelion,* but cut into many fhort round pointed pieces, of a dirk green color; the Stalks which arife frpm atop the leaves are fmoother and blackifk, fcarcely a Foot high, bare, pr without Leaves on them unto the tops, tut at the upper Joint, from whence fpring feveral Flowers, each itanding upon a Jonglcock-ftalk, which are of a yellow colett, like unto other *Hattoktjoeeds,* and being omce pa ft away, the Heads are filled with Seeds covered with Down, which is carri^ away with the Wind.

VI *The fourth, or Garden Succory like Hawkweed* with yellow flowers. It has a long, down ngnc Root o*na nican fize for thickpefs> ancfome Fibres a.djoinii^to it, *vhich lends forth a flender fmoother Stalk, fabout a foot high, et Ibewhat leaning

 from tli:
 • Foot lc
 Hawfted,

many black Strings, which perish not, but abide many Years-, this Plant rises up with round, fraked, reddish, green Stalks, a Foot and half high, fet with fomewhat large rough Leaves, like unto those of *Fleabane*, without any order, but not so fat or thick, and dented about the edges, encompassing them at the bottom, and pointed at the ends-, the Flowers are yellow, like to other *Hawkweeds*, fet in hairy Husks upon long Footstalks, which turn into Down, and with the whitish long Seed is blown away with the Wind.

XVIII. *The sixteenth* Kor Broad Leav'd Hawkweed with a great yellow Flower. It has divers large hoary Leaves lying next the Ground, sometimes a little waved, sometimes again torn on the edges, sometimes with black spots on them, and sometimes without any, from among which rises up an hairy Stalk, with very few Leaves thereon, spread out at the top into two or three other Branches, at the tops of each of which is a large yellow Flower, like to the *Great Hawkweeds*.

XIX. *The seventeenth, or Round Leav'd* bushy Hawkweed. It grows about a Foot and half high, the Stalk being fraked, round, and fomewhat rough, spread out at top into several Branches, three or four Inches long apiece, every one having at its head a pale yellow Flower^ the Leaves encompass the Stalk at their lower ends, and are fomewhat round, about an Inch and half broad, yet ending in a little point, dented about the edges, hoary, and of a light green color.

XX. *The eighteenth, or Rough broad Leav'd* bushy Hawkweed, has a Root wholly composed of Strings and small Fibres, which being cut or broken yield a Milk like Juice; as most of the *Hawkweeds* do^ it has broad and something long, hard, rough, dark green Leaves lying on the Ground, without any inciffures or dents on the edges; the Stalk which rises up among them is two or three Feet high, thick fet with such Leaves unto the top, but less and growing less and Idler-* at the tops stand a few yellow Flowers, composed of fewer Leaves than the Flower of the other Kinds, consisting but of one row, which are as the border to the middle Thrum, and being past away turn into Down^ sometimes this is found to vary, with less rough, or rather with soft Leaves, sometimes broader and shorter.

XXI. *The nineteenth, Or Greater narrow Leav'd* bushy Hawkweed. It has a Root which is whitish, very long, and deeply spreading into the Earth, quickly over running a great deal of Ground, for every little piece being broken off will grow, and so is not eafie to be rooted out of that place where it has once taken possession^ this *Hawkweed* grows very like the last, but has longer and narrower Leaves, fomewhat rough, and dented or waved about the edges, the Stalk is more branched at the top, where the Flowers are more and thicker, the Leaves of a fairer color.

XXII. *The twentieth, or Tetter bushy* Hawkweed. It has a Root which is (hort, and as it were bitten off; without any Fibres at it* this lesser bushy Kind rises up with a single Stalk, about a Foot and half high, fet about with several short and smooth Leaves in some places, and with almost round rough Leaves in others, dented about the edges, and at the top bearing several yellow Flowers upon short Footstalks, much like the last.

XXIII. *The Places.* The first six are Planted for the most part In Gardens, having been first brought to us out of *Italy*, yet the second of them has been found growing Wild in *England*-, the seventh is a native of *France*, but transplanted hither-, the eighth and ninth only grow with us in Gardens the tenth,

eleventh, twelfth, thirteenth, fourteenth, fifteenth, and sixteenth, grow upon Mountains and Hills in several parts of *England*, are also Natives of *Italy* and *Germany*, and are many of them transplanted also into our Gardens * the four last Kinds grow with us in Gardens, as also naturally Wild in several places of *England* and *Geniuidy*^ the eighteenth and nineteenth have been found growing in the way going from *Lomim* to *Hampsted Heath*, as also in several other places.

XXIV. *The Times.* They all Flower, and their Down flies away in the Summer Months, and rise again of their own Seed, but some of them will abide until the cold of *Autumn* causes them to perish, but the most tender of them will Flower with us till the end of *August*, the Seed ripening in the mean time.

XXV. *The Qualities, Specification, Preparation* and Virtues* of all these are the very same with the *Common Kinds* in the former Chapter, and art; thought to be no less effectual than they in all the Effes and Properties pertaining to them, to which you are referred.

XXVI. *An Observation.* It is to be noted, that though the properties and force of all these Plants may be said to be one and the same with the former *Common Kinds*, both, from their form and their bitter taste, which indicates in a great measure their Qualities and Virtues, yet the *sixteenth* or *Broad Leav'd Hawkweed* aforegoing, is particularly commended by *Camcrarius* as a thing singularly good for the Phthisick, or Consumption of the Lungs, being made into a Conserve or Syrup, or the Powder of the Herb* being taken with Honey* he says that *In-Myfia* they put it into their Sallets, Broth, and Meats, for the same purpose^ and that it is available for the Pleurisie also, being so affirmed by several Authorities, and that without any help of Blood letting: If the Powder, Conserve; or Syrup be so effectual as *Camcrarius* says, then without doubt the Liquid Juice or Essence must very much transcend any of those Preparations: The Essence may be given three or four Spoonfuls at a time, Morning, Noon, and Night, either alone, or else mixed with any proper Vehicle^ and so to be continued till the Ulceration of the Lungs is digested, cleaned, and healed, which you may easily know by the fresh Countenance of the diseased Patient, and by his getting a new Rod of Flies upon his Back, as also by his ceasing to spit Matter and Corruption.

C H A P. CCCXLVI.

O / H E A R T S ~ E A S E Garden,

T A N S I E .

lth T^h flames. It is called in *Greek* *Tit ifid* X x & w i it seems to be the *Viola-flammed*, which *Gaza* will have to be *** or ***tyov*, in *Theophrastus Lib. 6. Cap. 61 in La tine Viola Tricolor, Herb a Trinitat^h HeHa Clavelhtd*, and of some *facea*, but this last Name is most proper to *Knapweed*, of which in its place; in *Engljb? Hearfs-Eafe, Herb Trinity, and Panjie*:

II. *The Kinds.* It is of three principal Kinds, viz. i. *Viola Tricolor Viola Trinitatis*, or *flps Trinitatis Hortensis*, Garden Herbs-Eafe, of which in

this Chapter. 2. *Flos Trinitatis Sylvejis*, Wild Hearts-Eafe, of which in Chap. 347.

III* TV Garden Kinds. There are three sorts of the Garden Kinds, viz. 1. For, feu *Viola Tricolor Hortensis communis*, *Viola flammae major & minor*. The Greater, or Common Garden Hearts-Eafe. 2. *flos, K?# Vibla Tricolor Hortensis*, KOO *Flammae Hortensis Flore duplici*, Hearts-Eafe with double Flowers. 3. *Viola Flammae lutea maxima*, The Great yellow Hearts-Eafe*

IV. The Defections; *The first Greater or Common Garden Hearts-Eafe* It beu a Root composed of*

*nothing elje but a bunch or knot of fibrous Strings^nd perishes every Tear, the Plant raising it self up plentifully by its own Sowing, where it is suffered; its Leaves are longer, and more indented or cut in on the edges than those of the Violet**; the Stalks upright, yet weak, and ready to fall down and lye upon the Ground, set here and there with rlike Leaves, from whence come forth the Flowers, having little or no smell, and made in form like unto a Violet, yet more open, and with larger Leaves but so variably mixed with Blew, or Purple, White and Yellow^that it is difficult to set down all the varieties ^ for some Flowers will be more White, or but some spots of Purple or Blew in the two^app. Leaves, and the lower Leaves with some stripes o, yellow in the middle-, others will have more Purple in them than any other color, T>^ in the upright and lower Leaves, the side Leaves Blew, and the middle Yellow^ and others White and Blew, with yellow stripes, as Nature is pleased to vary the Colors: The Seed is small, whitish, and round, and contained in small round Heads. The leaf is like to this.

V. *The second, or Hearts-Eafe with double Flowers. This is a very pleasing Plant, and bears flowers with more "Leaves than the former, making it seem to be twice double, and that only in Autumn, for the first Flowers, which come in Summer, are single •, this is of that sort which bears Purple Flowers, and it is to be noted, that the Seed of this Kind will not all bring double Flowers, but only some of them, where the Ground is fit, and the Plant thrives and takes a liking to it* so that if you have once had of this Double Kind, you shall seldom miss to have double Flowers again every Year of its own growing or sowing.*

VI. *The third, or Great yellow Hearts-Eafe. This is another Species which decks and adorns our Gardens, *and therefore is not to be left out \$ its Leaves and Flowers are like the former, but more plentiful in Stalks and Branches; and better abides our Winters* the Flowers are larger than any of the former, of a fair pale yellow color, with some yellow stripes < now and then about the middle, for it is sometimes without any stripes, and also of a little deeper yellow color* this Plant is to be increased by slips, which will multiply in a fertile and moist Ground,*for it has scarcely ever been observed to bear Seed.*

VII. *The Places.* All these Plants were first Wild, and by being brought into the Garden, and Manuring, they have been brought to a very great fairness of color, and the beauty which they now possess and also to a better smell than when they grew Wild* and in the same manner I believe many other Wild Plants might have been improved, even to a kind of perfection.

VIII. *The Times.* Hearts-Eafe seldom Flowers until May, but then some will abide to Flower until the end of Autumn almost, if Frosts, by their being too early, hinder not, as those of the Double Kind.

IX. *The Qualities.* Hearts-Eafe seems to be temperate as to its first Qualities, it is Emollient, and Glutinous, in all its Parts and Qualities- like unto Violets, but in its glutinous quality more like to Mallozvs*; it is Cosmetick, Vulnerary, Pectoral, and Alexipharmick.

X. *The Specification.* It is said to be good against the Scurvy, the Dropsy, the Jaundice, the Stomach, the Lungs, and the Epilepsy.

XI. *Preparations.* You may have them from, 1. A Juice or Essence, 2. A Decoction in Water or Wine. 3. A Syrup. 4. A Cataplasm. 5. An Ointment or half an. 6. A Ponder of the Herb and

ter. 8. An Acid Tin

*P at firfi many round Leaves, afterwards they grow Something longer, and are {lightly cut about the edges, and by their weakriefs lye upon the Earth •, the Stalks are weak and tender', and tho' they feem to grow a little upright, yet they feem to trail, or lean towards th#Ground, upon which grow feveral like Leaves, us alfo Flowers^like to *Viole**, upon longFootstalks-, the chief difference between thefe *Wild* and the former firil *Garden Kind* is in the color, and largenefs of the flowers, (for in the Leaves and form of growing there is but little variation) the Flowers in this being for the moft part fmaller than thofe of the *Garden*, and of as little fmell-, but as to the Colors they are various, yet there is fcarcely a Flower among many which has three colors, for they are chiefly White, and pale Blue, more or lefs marked orfpotted, and fometimes yellow in the bottom; the Flowers being patt away, little round Heads fucceeds forrething lefs than a Tare, about the bignefs of a large great Pins head, which being ripe, do open ihemleives, and in a little time after let their Seed tall forth.

IV. *The fecond, or Upright Wild Hearts-Eafe. It i' Jt a Root coHipofel of fibres, or Strings, which perijh qlter Seed-time, the Plant rifing again of the jdkn Seed:* This *Htiiks-Eafe* grows to be about a Foot high, or more, ^Khard upright St As, which yet at their tops bend a little again, they have two Leaves let at each Joint, but longer, and more dented about the edges than the firil *Garden Kind* in the former Chapter ^ at thefe Joints with the Leaves, on both fides of the Stalks, comes forth a larger Flower, and morefpread open than thofe of the firil *Garden Kind*, yet very like to them, of a pale puilifti color, and almoltt as fweet as a *Violet*, as *Matthiclus* fays, but without fmell, as *Lobel* fays-, *Dodonus* defcribes this Kind with variety of Colors, and therefore calls it *Viola affurgens Tricolor*, whereas *Matthwlus* declares his to be only Purple; after the Flowers are paff, longer Seed Veifels follow than thofe of the *Garden Kind*, in which is contained {mall whitifli Seed.

V. Gerard bat this *Description of it.* The upright *Panfite, or Hearts-Eafe*, brings forth long Leaves, deeply cut in on the edges, fharp pointed, of a bleak or pale green Color, fei; upon ilender upright Stalks, cornered, jointed, or kneed, about a Foot high, or higher, upon which grow very fair Flowers, of three colors, viz. Purple, Blue, and Yellow, in form or ihape like unto the firil *Common Garden Hearts-haje* but greater and fairer, which Colors are fo excellently perfum'd, that the odors thereof are much more agreeable than the odors of the *Common Hearts-haje*, and oftentimes that the uppermoft ^ ^ ^ f f f f f i from thofe which grow upon the middle of the Plant, and thofe afrin vary from the lowermoft, as Nature is pkafed to play with things of fuch beauty.

VI. *The third, or Wild Yellow Hearts-Eafe. This in its Rot, State, Leaves, and manner of growing, is much like to the firft aforegoing, and ha* been taken? by fome young Herbarifts to be the Yellow Violet ; the Flowers a* of a faint yellow color, without mixture of any other color, yet having a deeper yellow' fpot in the loweft Leaf, with four or five blackifli purple Lines, in which it differs from the firil Wild Kind.*

VII. *The fouKth, or Stony Hearts-Eafe, is a mean, and low Plant, the Leaves are rounder, and not fo much cut about the edges as the firft is;* the Stalks or Braffches are weak and feeble, trailing upon the Ground^ the Flowers are likewife of three Colors, viz. White, Blue, and Yellow, but void of findl; and the Koot, penih.es having perfe&ed the Seed.

VIII. *The Places.* They grow in wafte and Corn Fields, about their borders, and in Fallow Grounds and borders of Groves and Forrefts ; the firft and fecond, tho' they grow Wild in the Fields, yet they fometimes alfo grow in* Gardens; the fecond, el *Upright Kind*, grows on M^{ount} *Lobel* fays it grows in *Languedock* in *trance*, and on the tops of fome Hills in *England*; the third, with yellow Flowers, has been found by a Village-in *Lancashire* called *Latham*, about four Miles from *Kircham*-, the laft grows only in Rocky, Stpnejr, Gravelly, and barren Grounds, and other like places.

IX. *The Times.* They Flower not only in, the Spring, but for the moft part all Summer long, thro April, May, June, and July, even to *AuguJ.*

X. *The qualities, Specification, Preparations, and Virtues,* are the fame jwth thofe of the *burden Kind* in the former Chapter, fo that no more need be laid concerning the fame in this place.

C H A P. CCCXLVIII

Of HELLEBOR BLACK True, OR, CHRISTMAS FLOWER.

H F Names. It is called in Arabick *Cherb-chemiZd Charbach afued*, in *Greek* *E^Co-e** and fometimes without the *Afpirate*; *E^S I S / >* fi/AAawx, and *Helleborus*, alio *Iffegef. r >* and *Veratrum, quod Mentem vert at*, in *E^E(/& Mo Hellebor*, and *< & * / >* «^{1 7 ^ r}

II. Hc ICzWx. There are two principal Kinds, viz. 1. *EM^Id?r /UAett, XJ^EAMCO^ fihua^M^fiov, *Helleborum nigrum*, *Veratrum nigrum*, Black Hellebor, of which we fhall Treat in this Chapter, and in Chap. 349. and 350. *EAAEEO# MWCS*, *Helleborus albus*, vel *Helleborum album*, *Veratrum album*, *Sanguis Hercules*, *Confiligo vegetij*, *Abfyrti ColumelU & Plynij*, White Hellebor, and Sneeze-Root, of which we fhall (God willing) Difcourfe in Chap. 351. and 352. following.

III. *The Kinds of Black Hellebor.* There are feveral Kinds of this Plant, as 1. *Helleborus niger verus*, The true Black Hellebor, called alfo *Veratrum nigrum verum*, (of which in this-Chapter. 2. *Helleborus niger nothus maximus*, *Hellebor after maximum*, *Confiligo*, Baftard Black Hellebor, or Bears-foot, called by fome Country People *Setterwort*, quaff *Setonwort*, being applied to the Ears, Neck, and other parts, after the manner, or in place of a *Set on*. 3. *Helleborus niger nothus minor*, *Hellebor after minor*, The le#er Baftard Black Hellebor, which is alfo* called *The leJJer Bears-foot*, of both thef&we fhall Treat in Chap. 549. 4. *Eileborine > vel Helleborine nigra*, *SanicuU folio major*, Wild Black Hellebor with Sanicle Leaves the Greater-, it is called alfo *Afrantia nigra* by *Lobel* w&*Gefner*, *Ofteritium MontaAum Tragi*, *l'mperatcria nigra Tabernamontani*, but *Dodonaus* takes it to be *Ellebcrus niger*, or *Veratrum nigrum > iojcoridis* •, and *Bauhinus* calls it *Elleborus niger SanicuU folio major*, y- *Elleborine nigra SanicuU folio minor*, *Helleborus niger SanicuU folio minor*, Wild Black Hellebor with Sanicle Leaves the Le#er, or The *LeTer Sanicle* like Hellebor. 6. *Elleborine ferulacea*, *Helleborus niger ferulaceus*, *Pfeudohelkborum Matth'wli*, *Bitpbtbaum ma jus Anguillara Qufij^ & aliorum*, Wild Ba-

ward Black Hellebor Fennel Leav'd, of which there is left in Chap. 350. following.

IV. The Description. *The firji*^ or true Black Hellebor, called Christmas Flower. It ha* a Root which consists of a great number of brownish black Strings, which run down deep into the Ground, and are fanned to a thick head, of the bigness of ones Finger, growing /mailed from its top or head downwards, from this Root rise several fair green Leaves, each of them standing upon a thick, round, stiff green Stalk, about a Hand breadth high from the Ground, divided into seven, eight, or nine parts, or Leaves, and each of them nicked or fented from the middle of the Leaf to the pointward on both sides, abiding green all the Winter, at which time the Flowers rise on the like (short Stalks as the Leaves grow on, without any Leaf thereon for the most part, yet sometimes having a small, (short, pale green Leaf, resembling rather a Skin than a Leaf, a little under the Flower, and grow but little higher than the Leaves, each Stalk also bears usually but one Flower, very rarely two, consisting of five large, round, white Leaves apiece, like unto a great fingering White Rose, chancing sometimes to be either dashed with a Purple about the edges, or to be wholly Purple* without any White in them, as the Season, Weather, or time of continuance does contribute to effect the same, this Flower has many pale yellow Thumbs in the middle standing about a green Head, which afterwards grows to be the Seed Vessel, divided into several Cells or Pods, like unto & Columbine Head, or Aconitum Hymeale, but greater and thicker, in which is contained somewhat long and round blackish Seed, like to the Seeds of the Baflard Kinds, or Bears-icots.

V. The Places. It grows in Greece, Italy, England, France, and Germany, in many places of those Countries, as also in Anticyra, an Island over against the Hill Get a in Theflasy, where it is said to grow in extraordinary plenty, whence came the proverb (speaking to a Melancholy or Mad Man, as to j.

this Cure) *Naviga ad Anticyras*-, but with us in England it only grows in Gardens.

VI. The Times. It Flowers in December, and January, if the Season of Weather be any thing temperate, if the Air is mild and warm, it generally Flowers about Christmas time, from whence with us came the Name of Christmas Flower.

VII. The Qualities. It is hot and dry in the third degree, Aperitive, Abiliferive, Cofmetick, Hepatick, Splenetick, Arthritick, Cathartick, Emetick, and if given by an unskilful Hand *Jwjmw&f* or Venefick*.

VIII. The Specification. It is peculiar against Madnefs and Melancholy, Quartan Agues, Scabbinis, and Leprosie, kills Worms, and cures the Kings-Evil, Dropfie, Yellow Jaundice, and Gout.

IX. The Preparations. You may have therefrom, 1. The Liquid Juice of the Leaves. 2. An Effence of the same. 3. An Infusion or Decoction of the green Leaves. 4. An Infusion or Recotton of the Root. 5. A Syrup. 6. A Ponder of the Leaves or lloh: 7. A Set on of the Root. 8. An EST raft-of the Root. 9. A Pcfjiury of the Root. 10. A Lotion of Herb or Root. 11. An Ointment of the Herb. 12. A Distilled Water of the Green Herb. 13. An Acid Tincture of Herb or Root. 14. A Spirituous Tincture. 15. An Oily Tincture. 16. Atialine Tincture,

The Virtues

X. The Liquid Juice of the Leaves. It is useful for most Diseases in which White Hellebor is available, but it is nothing so violent or dangerous as the Juice of the Leaves made up with Flower into small Cakes and baked, has been used to good purpose against the Dropfie, Jaundice, Cachexia, and other evil dispositions of Liver, Spleen, and Gall; it may be given from half a Dram to two Drams, according to Strength and Age.

* XI. The Effence. It is used to open and purge the Body in several Cases (as well as the Extract of the Roots) and is of great use and effect against all Melancholy Diseases, long and tedious Agues, as the Quartan, and the like, it eases the Megrims, and Cepheata, or old inveterate Headach*, Yellow and Black Jaundice, Leprosie, Falling-Sickness, Consumption, either of the Lungs or whole Body, pains of the Belly, Sciatica, Cramps, Convulsions, or Thrinking of the Nerves, as also all other Griets and Pains of the Joints or Nerves, as Gout, Inflammation, and the like, it being taken Morning and Evening, half a Dram at a time, in any convenient Vehicle, always increasing or diminishing the Dose, according to the Age and Strength of the Patient, and as you find it by observation to work.

XII. The Infusion or Decoction. It may be made in each Water (if for hot Diseases) or Wine (if for cold Distempers), but Authors advise, that the Herb or Root be first corrected by steeping it in Vinegar, because of its dangerous and obnoxious Qualities) for day and a night, and then dried again yet our English Kind seems not to be so violent as that which grows in hotter Countries, nor has it such a violent operation in working, for which reason that previous correction of it may be forborne, we have all the Virtues of the Juice and Effence, but work with more moderation, and are much safer to be taken, and may be used in all the Cases aforementioned. Dose from half an Ounce to two, three, or four Ounces, according to Age, &c.

XIII. An Infusion or Decoction of the Root; it has all the Virtues of those of the Leaves, but it operates more moderately and therefore is the more safe to be taken. Country People give the Infusion or Decoction of either Leaves or Roots to kill Worms in Children, I confess they may be given to jaett

ucfa as are come to Mans itrength and growth, but to Children it ought to be given with a great deal of caution, or elfefotborn, fince there are many other things which will do the fame safely, and fully as effe&ually as thefe can,

XIV. *A Syrup.* It is made of the Infufion or Deco&ion of Herb or Root, boiled up to a confiftency with Honey, or as ibme will have it, *With Honey* and Vinegar, which is indeed better^ it is both Emetick and Carhartick^ and evacuates Tartarous Matter from the Lungs •, it^cleanses alfo the Tunicles of the Stomach and Guts from evil juices adhering to the fame. Dofe from one Spoonful to two or three.

XV. *The Yonder of the Leaves or Root. It fias 41* the Virtues of the Liquid Juice, Effence, Infufion, Deco&ion, or Extra&, but it works much more churliflily, caufing Gripings, Fainting, vehement Sickneis at Heart, and fomerimes Swooning away-, it^kills Worms, and is good to give in Madnefs, and to fuch as are troubled with a Hypochondriack Melancholy •, if an Iflue is cut in any flefhy part, yea, in the Neck, or upon the Shoulder, or brawn of the Arm, or Thigh, or Ceg, and a Pea be put into it for a day or two, and then the hole of the Iflue be flopped up with the Pouder of *Hellebor* Leaves, and left there for one, tvfe three, or more days, it will make a Tumor nearly as large as an Egg, and draw all the ill Humors froft all, yea, the molt remote Parts of the Body to that place, and, exoel them there and by this means the Kings-Evil, Leprofie, Gout', Sciatica, and Pocky Symptoms, have been cured •, yea, after that a number of Purgings, Vomittings, Bleedings, and Salivations, have all been ufed in vain, and had no effect upon the Patient.

XVI. *The Seton of the Root.* It is ufed to Rowel Cartel fithal, fe Country People call it. *Wuy Lib 2\$. fyp. \$.* fays, that a piece of the Koot of *Black Hellebor* being drawn through a hole made in the Ear of a Bealt troubled with the Cough, or having taken any poyfonous thing, cures it, if it be taken out the next day at the fame Hour: *Abfyrtes* and *Hierodés* lay the fame thing, as alfo *Columella*. This manner of CiAing is ufed with us, but the place is changed from the Ear to the Dew-lap in Oxen, and to the fore Leg oi hinder Leg of an Horfe above the Pattern.

XVII. *The Peffary.* Being applied to the Womb; it mightly prevails to bring down Womens Courfes; and if there is any callous or haid flefh grown in tin- *Vagina*, leading to the Womb, or in a Fiftula, the Root being left therein for two or three days, it will totally confume it^ *Galen Lib. 6. de Simp: Med:* affirms this, and *Julii&Alexan&inus* fays he often tryed it to be true.

* XVIII. *The ExtraS of the Root.* This has all ti* Virtues of the Juice, Effence, Infufion, Deco&ion, and Syrup aforegoing, and is more mild and fit to be taken than any of them, and as it may be always ready at Han& fo it may be given in all thofe Diftempers for which thofe Preparations are to be exhibited, pofe from a Scruple to a Dram, or Dram and half, in the Morning fafting.

XIX. *The Lotion of Herb or Root. It is^made],* Infufion or Deco&ion in Wine Vinegar, or in half Vinegar half Wine* it is good to wafh any place troubled with Scabs* Wheals, or Puffes, Leprofie, or any other like breaking out, yea, altho' it be a Gangrenous or Phagedenick Sore or Ulcer, it ftays their fpreeding or eating, and preferves the Flefh from putnfaaion, this lame Lotion helps alfo the Toothach it the Mouth be gargled therewith, and yu be held fome iratik time therein, alfo droppes into the Ears, it eases the pain, helps again A the aofe of fte Ears, and remove; rhe deathes, if m

bul or callous Ulcer or Fiftula be wafhed with this Lotion, and then the Pouder of the Root be firewed thereupon, it dries, heals, and fuddenly cures them.

XX. *The Ointment of the Herb.* If People afflicted with Lice be often wafhed tvith the Deco&ion of *Hellebor* hot, and then the Head or other parts anointed with this Ointment, it kills them, and perfectly deftroys the breed.

XXI. *The Dijilled Water.* It is of good ufe to remove black and blew fpots or marks from the Skin, and to take away the yellownefs thereof, as alfo Tanning by the Air, Sunburning, Pimples, Morphew, and other like deformities of the fame. •

XXII. *The Add Tinfare.* Given to a grateful acidity in any proper Vehicle, it kills Worms in Ola or Young, it gently Purges, and prevails againft all the Difeafes the Herb or its Root is good for* it dUto overcomes *Yoyfbnjfcf* the Patient takes it loon after the receiving of the Poyfon^ mixed with *Damask Rofe Water*, it is good to wafh Pimples in the Face and Skin, as alib *Lentils*, *Freckles*, &c./t foon taljes them away, and reftores the Skin to its true and natural color,

XXIII. *The Spirituous TinQure.* It is an extraordinary thing to bath hot withal in a Gangreeq, preventing, and curing the fame-, it may be given inwardly from half a Dram to two Drams, and more, according to Age and Strength, againft the Kings-Evil, Jaundice, Dropfie, Gout, Leprofie, *French Pox*, and other Difeafes of like kind •, it ibmething troubles the Stomach, otherwife it woiks well enough.

XXIV. *The Oily Tinture.* It is very good againft the Sciatica, Gout, and weaknefs and pains of the Joints and Nerves, it refolves Convulfions, and yet ftrenghens the Nerves, and reftores in a Palfie -, it is good alfo to anoint withal upon any* (training of the Nerves, or when the Bones are QUC of Joint, becaufe it warms and comforts the part, and reftores the tone thereof being hurt.

XXV. *Tffe Saline Tinfure.* It is to be ufed as hot as can be endured upon the part or parts afflicted with Scabbinefs, Teftars, Ringworms, Pimples, or other breakings out, as alfo againft yellownefs, blacknefs and blewntfs of the Skin, *Lentils*, *Freckles*, *Sunbunjing*, *Tanning*, *Scurff*, *Morphew*, *Leprofie*, or any other likf detoedation ^ if it is conttantly ufed two or three times a day for fome time, it certainly cures thofe deformities, and leaves behind it a pleafing fmoothernefs and beauty.

C H A P . CCCXLIX.

0/HELLEBOR BLACK Bastard.

.OR,

B E A R S - F O O T .

I. *THE Narges.* It is called in Greek *Ζακύνθος* J. i*80. in *Xatine Helleborus notbus*, and *Elkborum noibum*, in *Evglijh BajUrd Black Hellebor*, and *Bears-loot*.

II. *The Kinds.* There are two Kinds hereof, viz- *K Helleborafter*, *HeUeborajhum maximum*, *Halleborus notbus maximus*^ *Qonfiligo*^ *The Greater Ballara* Black Hellebor, or Bears-Foot, called alib *Sttwor*, and *Setterwort*. 2. *Helleborajler*^ *tidlehrapu*^ *minus*, *Helleborus niger notbus minor*, *The*^ *Bastard Black Hellebor*, or *Laffer Bears-Foot*.

Jius calls *xKxsJHellebcws adultennug Hortenfis*, and *Confidigo minor Lugdunenfis*, but the *Belleborus niger vidgark: Gejheri*,

III. The Defections. *Thefirfi*, or Greater Baftard Black Hellebor. *It has a Jingle Root, with nothing fo many Strings growing to it as th^t True in the former Chapter has[^] and oftentimes perifhe* after it has given Seed, jiet not always, nor in all places*, from this Root proceed feveral fad grebn Leaves, each upon a ldng Footstalk, which are divided into feven or nine Leaves, each *if* which are narrower than thofe of the *LeJJer Baftard Helleborm* the next Section, a little dented about the edges, but not fo deeply as the *LeJJer*, and abiding above Ground green all the Winter, whereas the following perflies every Yea^s, 3nd rifes again in the fpring; from among thele Leaves lhoots up a reasonable large and tall Stalk, higher by half than the *Small* following, with fuch like Leaves thereon as grow below, but foialler up to the top, where it fpreads it felf out into divers Branches, bearing many hollow Cup-like Flowers, divided at the brims into five parts, but do feldom fpread themfelves open, of aiyhitifh yellow green color, fomewhat Ifte the ne^t *Baftard Kind*, and fometimes purplifh about thp brims or *tiges*, with a green Head in the middle, and a few tvhite Threads about it, by which it feems to be *Veratrum nigrum quart urn peregrinum Qujij*: This green Head growing to be the Veffel, wherein the black Seed is contained, fhoots fprth into four, five, or fix Horns, fashioned like the following *Baftard Kw<t*, faving, that it is fmaller, as the Seed alfp is for the moft part} the whole Plant, and every part thereof; is of a woife fmell than the following; the Root of this, with the lower part of the Stalk next; to it, is of *thai Bears-Foot*, or *Setterwort* \ which Country People ufe to Rowel their Cartel with.

IV. *The fecond*, or *Lefler Baftard Black Hellebor*. *It has Roots which are more firingy, black and hard than the former in Chap. 348.* it is in moft things like unto that *True Black Hellebor*, for it bears alfo 7^{*any} Leaves, as feven, eight\ or nine, upon fhort

Stalks, divided into many parts, but each of them are longer and narrower, of a darker green color and dented on both fides, feeling fomethin^g hard, thefe perifh every Year, but rife again the nex Spring; the Flowers hereof itand on higher Stalks than the *True*, with fome Leaves on them alfo., yet very few, and are of a pale green color, like the *True* in the former Chapter, but fmaller by half at leaft, having likewifemany greenifh yellow Threads or Thrutns in the middle, and fuch like Seed Veffei[^] and blackifh Seed in them.

V. *the Places.* The firft grows, as *Tragus* fays, in the borders of Stoney Fields and Grounds, all^o on Rocky Hills, as by the *Mdfe/Ja. and Rhine*, alfo in *Sylva Harecynia*, and as *Vena* fays, *ixAquitane* in *France*, and by the River *Lanus* at *Mompelieri*, it grows Wild in many Woods and fhadowy places in *England*, as alfo in almoft all our Gardens about *London*, and feveral other parts of the Kingdom, the fecond has been found in fome Woods in *Northamptonshire*, and in other places of this Land, as alfo in fome places within Eight or Ten Miles of *London*.

VI. *The Times.* They both Flower in *February* or *March*, according as the preceding Winter and Spring Seafon are in mildnefs, and their Seed is ripe in *May*, or towards *June*.

VII. *The Qualities, Specijimion, Preparation's and Virtues* of thefe *Baftard Black Hellebors* are the fame with thofe of the *True* in the former Chapter, fo that no other declaration need be made thereof.

VIII. *Obfervat.* 1. That the *Greater Baftard Black Hellebor*, *Bears-foot*, or *Setterwort*, was held by *Dodotus* to be a kind of venomous *Aconite*, or *Woolfs-bane*, not to be ufed, and that it w^{ill} kill Woplves, Foxes, Dogs, &c. I have know^rft ufed in *Deco&Hon* to kill Worms in the Belly; iyhich it would effectually do, but it had a deleterious or poyfonpus quality, which fome Bodie^s could not overcome, where it killed not the fatient, it would indeed kill the Worms, but it is fo dangerous a Medicine, that it ought not to be internally ufed, but by a very Skilful and Prudent Hand, and yet nothing fcarcely is more common to be ufed by Women in the Country than the Deco&tion of this Herb for the purpofe aforefaid, I knew a little Youth rake it to kill Worms, but it killed him firft ^ alfo a Woman between Forty and Fifty Years of Age, whom it killed in about three Hours time \$ at the fame time, by a Worrians Advice, the Deco&ion was given to my felf, being then about Eight Years of Age, but I met with a better Fate in the ufe thereof, yet my danger was great, it vehemently Vomited me; and made me Heart-fick, to fwonifig away; the Vomiting being over, I revived, but it had filch an effect upon me, that it made melbofe my Hair, and Nails both of Fingers and Toes; and all the Skin of my V/hole Body peeled off, from Head to Foot \$ whether my good hap was from the ftrenth of my Cpnftitution, or the fmall Dofe of the Medicine, I leave others to determine, but from th^{efe} bad effe&s k is manifelt that it is not very fafe to be given, *no r, &c.* to very ftrong Bodies, but Outwardly applied it m^{ay} be of good ufe.

. IX. *Obfervat. i:* That the P[^]der of the Leaves of this is much more effectual than the Pouder of the Leaves of the *Tint* in *Chap 948. Seff* 15.* to all the external Intentions and Ptirpofes there mentioned; and that the Leaves of this ought father to becholeir than the Leaves of that, especially being applied or put into the hole of an Iflue, as is there dte&ed y it is a wonderful thing co fee what a tatt quantity.

*1 Humor it will draw away from all parts of the Body for many days together, doing therein what a Salivation it self could never be able to perform, and that in the moil deplorable, stubborn and rebellious Difeaies \$ indeed it. is beyond what Words can fpeak. The Root ilib of this" ufed as a Peffary, is much more effectual than the Root of the True, especial^l ly being put into a Fiftula^s, or part where there is any callofficy, because it fo admirably difflbles the iarne.

X.-^lOb/ervat. 3. That the fecoml Kind, er *Leffer Bdfiard Black Hellebor*, or *Smaller Bears-Foot*, (from the great Experience which I have had thereof) is much more violent and churlifh in working, whether by Vomit or Stool, than the *True BJack Hellebor* deferi bed in the former Chapter, you may adven^{*t} ure to give the Infufion of a Dram of the Root, be^{ing} infufed all Night in Pouder in White Wine os Canary, to be drunk the next Morning falling, fo exhibitcd it powerfully prevails againft all the Difeaies which the *True Hellebor* is faid to be good againft, for which reafon there is no need in thft place to repeat thofe things again⁵ and the ufe of the Pouder of the Leaves or Root are in like manner ufe^t ul in all outward Cafes for Scabs, old running Sores: foul Ulcers, Fiftula's, &c.

C H A P. CCCL.

0/HELLE BOR BLACK Wild.

tytoes. -rit is called in *Greek* ^{ἡλίβορις} *Heliborin*, in *Latine* -*Helleborine nigra*, *veimrus niger* Sy he fir is, and in *Englilh* Wild Black Hellebor.

II The *Kinds*. There are three Kinds of *Helleborine*, viz. 1. *Helleborine nigra SanieU Folio major* ^{ἡλίβορις} *Helkborus niger SanieU Folio major* ^{ἡλίβορις} *Sanicula fcemina Fuchfii Aftrantia Wg^l nien* *Qfieritium Mont an urn Tragi*, *Imperatoria nigra iabernamontani*, *Elleborus nher*, vet *Veratrum nigrum* *Diofcoridk*, as *Dodoxtus* thinks, The Greater Wild Black Hellebor, or The Greater Helleborine with Sanicle Leaves. 2. *Elleborine mgra mirur*, *Helkborus niger SanieU F&o minor* *Sylvftris*, The Leffer Sanicle Leav'd Wild Black Hellebor, The Leffer Black Helleborine, or Wild Black Hellebor. 3. *Helleborine ntgra Feruhcea*, *Bupthalamapis* *Anguittar* ^{ἡλίβορις} *Quiff* & *dlianon*, *Helleborum nigrum* *FwnkuU folio* ^{ἡλίβορις} *Pseudobellehrus niger* *Aiatthwh*, *Feniel* Leav'd Wild Black Hellebor.

III. The Defections. The firft, [?] Greater WHD Black Hellebor Sanicle Leav'd. It has a Root composed of *fmaii* ^{black S/W} floating forth fromj top bead, like unto the Root [^]/*Bears-Footj* from this head of a Root come forth fe^{veral} broad dark ^{reen} Leaves, each of them growing upon a long Footftalk, which ate cut in on the edges into fivedivifions for the moit part, and dented about.befides, fomething refemjling the Leaves-of the *Common Sanicle* but more truly the Leaves of the Field *Ranunculus* or *Crowfoot*, or *GcTMium Batrachoides*, or *Crowfoot Cranesbill*, from \$nong which file up feveral ^{ien} der, fsmooth, grten Stalks, having fome Leaves up on them, and at the tops of them two, or three, or more Flowers together, each of them, confifing of many fmall, hard, whitilh Leaves, as a pale border: encompassing many Threads in the middle, which bang fallen, there rife up many fiat, whitifh, and

long Seed, fomewhat like unto *Sweet fennel* Seed, but not altogether fo big, nor fo yellow.

IV. *The fecond, or The Leffer Wild Black Hellebor Sanicle Leav'd.* It has a *fmall black fibrous Root, like the former*, from the head of which rife up feveral *fmall* and fomewhat round Leaves, every one of them upon a long Footftalk, being not much broader tijan the Nail of a Mans Thumb, yet divided, eventw the middle Rib, into feven parts, every one of them being fhort, narrow, and dented about the edges, - the Stalks are many, and *fmall*, not above an Hand breadth high, with one or two Leaves on them, more cut in and divided than the lower are, at the tops of them fiand feveral *fmall* Howa²

very thick fet together in Tufts wimbles, like unto the *litt*, but smaller, after which come *fmall* fiat Seed, fomething like the former, but leffer by muef as it is alfo in aU the other parts thereof.

V. *The third, or Fennel Leav'd Wild Black HeV lebor.* Its Root confiftsof many long and blackifi Strings fet together, and proceeding from one head, very hke unto the Leffer Black Hellebor [^]/*Bears-Foot*, ;>Chap. U9*S&-4-"foregoing, but harder, fiffer, or more brittle, andfeeming to be without[^] moifture in them, but abide and encrease every Tear,

This Kind of *Wild Black Hellebor* fhoostiofth *mm* green Stalks,; fometimes lying or leaniflg toth^l Ground, and fometimes ftanding a little *uV* ^{S^{ht}} befet very thick with *fmall* Leaves, finer and fhpv[«] than *Fennel*, fome of them ending in a Tiift offiich like fine green Leaves, and fome having at their tops one large Flower apiece, fomewhat reddifh or brownifh on the outside while they are in bud, and a while after, which being open confift of twelve or fourteen long and narrow Leaves, of a fair mining yellow color, fet in order round about a green Head, with yellow Thrums in the middle, laying tierrefelves open in the Sun, or a fair day, but elfe remaining cloiej after the Flower is pafst, the Head growing greater, (tews it fcl^f compatt of many round whif

tifti Seed, very like unto the Head of *Adonis Flower*, but much greater.

VI. *The Places.* The first and second grow upon Hills in *Germany* and Mountains in *Italy* on the Alps, and *Pyraenean Hills* the third grows, as *Clufuts* ikys, near *Vienna* in *Aufiria*, and in both the Upper and Lower *Hungary* but they all three grow with us here in *England*, only in Gardens, where they flourish very well.

VII. *The Times.* The two first flower not in Winter, but in Summer Months, as in *May* and *June*, and they abide green all the Year through, the third flowers in *Aprils* if the Weather is warm, and its Seed ripens in the Month following.

VIII. *The Qualities, Specification, Preparations and Virtues* agree exactly with those of the *True Black Hellebor* \$ Chap. 348. foregoing, and therefore need not be repeated again in this place*

IX. *Obfervat.* 1. *Afrantia nigra*, the first of the foregoing, is doubtless no *Mafterwort*, as the purging faculty does (hew, and it is certain, and several Experienced Physicians can testify, that the Roots hereof do purge Melancholy, and other Humors, and that they have perfectly cured Melancholy Mad People therewith, and that it has this Purging Faculty, *Gefner* does likewise testify in a certain Epistle written to *Adolphus Occo* in which, he shews that *Afrantia nigra*, or *Greater Wild Black tiellebch* with *Sanicle* heaves, is almost as strong as *White ijellebor*, and that he himself had made Experiment if the Purging Faculty thereof by Stool, which thing bespeaks it to be a *Black Hellebor* if not the *True of Dioscorides*.

X. *Obfervat.* 2. *Dodometus* supposes this *Greater Sanicle Leafed Black Hellebor* to be *Helleborus verus Dioscoridis*, (in which I am of Opinion he was deceived) and therefore ascribes all the Virtues of the *True Black Hellebor* which grows in *Anticyra* to it but in a word, this may be laid of it, that it has been found by often and good Experience to open and Purge the Body of Melancholy Humors, and that safely, without such perturbation and trouble as is said to be in the use of the other *Black Hellebors*.

Common White Hellebor. 2. *helleborus albus* frifcox, *Ellcborum Flore airo ruberje*, *Veratrum album* pr*cox_K pitrpura mgricaite. The early Flowering White Hellebor, or Early Sneezcroot with daik red Flowers.

IV. *The Descriptions.* The first, or Common White Hellebor. It has a Root which is great, a?hl reasonable thick at the head, having a number of great white Strings, running down deep into the Ground, by which it is strongly fastned*, this Plant rises at first out of the Ground with a great, round, whick green Head, which growing up opens into many goodly, fair, large, green Leaves, plaited as it were with eminent Ribs, all along the Leaves, compassing one another at the bottom, from the middle whereof rises up a strong round Stalk with several such like Leaves, but smaller, to the middle thereof, from whence to the top it is divided into many Branches, having many small yellowish or whirish green Star like Flowers all along upon them, which being past away turn into small, long, three-square, whitish Seed, (landing naked, without any Head or Husk to contain them, tho' some Authors have wrote to the contrary.

V. *The second, or Early Flowering White Hellebor** It has no such tuberous heald Robt as the former, but as it were a long bulbous scaly head, from whence shoot a*many long white Strings as the other: This Hellebor is very like that just now described, but that it springs up a Month or leaf before it, and that the Leaves are broader, longer, thinner, and no less plaited, folding themselves backwards oftentimes, and sooner perish, fading away from the Plant, the Stalk hereof is higher than the other, with fewer Leaves thereon, bearing such like Starry Flowers, but of fo dark or blackish a red color, that they are scarcely discernable, but at a near distance, after which come small Seed, very like the turner both these Plants loie their Leaves wholly, iresh springing up again every Year*

Gnats, &c. come, it kills them upon the spot[^] mixed with Crumbs of Bread, Cheefe, and Butter, and let in proper places, it kills Rats, Mice, and the like[^] if Hens, Ducks, or Geefe (hould chance to eat it, it would quickly kill them -, being made up into a Mafs with Meal and Butter, and put into Mole Holes, or their BurroWs, it will quickly defroy them: The Liquid Juice dropt into the Ears takes away the noife and finging in them, and kills Worms in that Organ, if any be, which is known by their extraordinary itching, and sometimes by a pain in the Ear^h mixed with White Wine in equal quantities it is good to cleanfe (he Hands, or other parts of the Skin troubled with Scurf, Morphew, Leprofie, Tettars, Ringworms, Herpes, Scabs, Itch, Freckles, Lentils, and other like deformities thereof

XVII. *Mel Elleboratum.* Honey Helleborated, or impregnated with the Virtues of Hellebor. *Take Roots of White Hellebor dryedandcuta Found, fair Waterfourteen Ounces, digeft three days, then boil gently till the halfbe confumed[^] Jirain it carefully out, and with clarified Honey three Hounds boil again to the confitence of Honey.* It is a ftrong Medicament, and to be given but in a fmall Dofe, viz. from one Dram to two, or but three at moft[^] it is prevalent againft Melancholy, Dotage, Frenzy, Mad-iKp, Gout, Sciatica, Rheumatifm, Dropfie, Lethargy, Vertigo, Palfie, Apoplexy, Epilepfie, and fuch l[^] p deperate difaffefitions * you may mix it with c[^]trifled Whey, or Deco&ion of *Sena*, or *Epithy-*

J XVIII. *Oxymel Elleboratum.* Honey and Vinegar impregnated with Hellebor, *Take leaves of Rue, tops of Ty me, Dittany of Crete[^] tops of Hyijop, Fennyroyal, Horehound, Carduus, Roots of Celtick Nard, of each a handful, Calamint two Fugils, Seeds of Anife, Bafil, Dill, Fennel, Roman Hetties, of each two Drams\ Roots of Angelica[^] Aron, Squills prepared, Birthwort long, round, and climbing, Cojius, Flowerde luce, Polypody, Turbith, Linton Peels, of each an Ounce, Strings of Black Hellebor, Spurge, Agrick, (added towards the end of the boiling) of each two Drams, Strings of the Roots of White Helleborfdur Drams, all being dried and bruifed digejl in a Glafs or glazed Vejfel clofe ftopt in the heat of the Sun, or of a Furnace, inPofca, (which is a mixture made of equal parts of Wine Vinegar, and Water) eight Founds, Rob or Sapa two Ounces, three days digeft ion being paf, boil it gently till*it is wafted a little more than half away, firain it[^] preffing it gently, and to the ft rained Liquor add Honey ofRafes, (in which Citron Feels two Ounces have been infufed) a Found and half, boil to the thicknefs of \ Honey, and with Cloves, Saffron, Ginger, Galangal, Mace, of each a Dram, aromatize it according to Art. It is Emetick, and ought to be given after other general Remedies, being then profitable againft Madnefs, Frenzy, Epilepfie, Apoplexy, Convulfions, Melancholy, Vertigo, Lethargy, Megrim, obftrua[^] :ns of the Stomach, Liver, Spleen, Mefentery, Reins, and Womb, it provokes Urine and the Courfes, and is prevalent againft Agues. Dofe four or fix Drams to an Ounce in a Glafs of White Wine.*

XIX. Another *Oxymel Hellebor at um[^] Take Strings of Black Hellebor well bruifed half an Ounce, Strings of White Hellebor w[^]ll bruifed an Ounce, Wine Vinegar[^] Juice of Quinces, Farfly Water, of each three Pints and half, Winters Cinnamon, Jamaica Fepper, both in Fonder[^] of each two Ounces, mix, digeft in a Glafs Vejfel in a gentle Sand heat for Four days, then boil gently in Balneo llll d^{no} fi half is wafted away, ft rain out, and to the Liq[^] clarified Honey three Founds, Cremor Tartar in nne Fonder one, Four 's, boil to the confitence of Honey, being cold add Chymical Oil of Umon^s one Ounce[^] mi-*

well, and keep it in a Vejfel clofe ftopt for ufe. This Preparation has not the tenth part of the trouble and difficulty of the Former, yet is double[^] in its etiefts and operations, having all the Virtues aicribed to the former -, you may give it from half ah Ounce to an Ounce, of more, according to Age and Strength.

XX. *Elleborifmtcs*, or an Electuary of ipiite Hellebor, *Take White Hellebor Root cut thin one Pound[^] Spring Water twelve Pounds, digeft warm three whole days, then boil to the conjunction of the half, ft rain out, preffing it ftrongly, adding Honey three Pounds, boil it again to the confitence of Honey * t[^]hb Eletharyput into a Glafs or glazed Vejfel and keep itfcf ufe.* This is no El[^]ftuary, but rather a Lohochj it cures Melancholy, Frenzy, and Madnefs, and is appropriated to all the Dileaf^o the uvo former Preparations are applied to -, it may be given from twd Drams to four, or more, in a Glafs of White Port Wine.

XXI. *The Lotion.* *The Root very thinly flked[^] or in grofs Ponder boiled in Vinegar, or in Juice of Quinces, or in an equal mixture of both, makes ar excellent Gargle for a Canker in the Mouth, as alfo to eafe the pains of the Toothache it is alfo good againit Tanning Of the Skin, unburning, yellowneis of the Skin, Scurfy Morphew, Scabs, Itch, Leprofie, Freckles, Lentils, and other like deftedations of the Cut is-, it alfo cleanfes and dries old running Sores, foul Ulcers, callous Fiftula's, and the like, in the Legs, Thighs, Feet, Arms, Hands, OV. and is alfo of good uie againit Kings-Evil Sores-, if it is boiled in Lye made of Pot Afhps it kills Lice in the Head, being wafted therewith Morning and Evening, and heals running Sores and Scabs of the Head, Scald Heads, Kings-Evil Sores, ©V. being often wafted therewith, and a little kind of Cataplafm be alfo laid thereon made in this manner. *Take jine Ponder of White Hellebor Root two Ounces[^] Wheat or Barley Flower fix Ounces, Honey enough to make it up into a Cataplafm, mix and apply it -, fome inftead of the Honey ufe frefh Butter, fome Hogs Lard, others White Bread foftned with Milk, ©V.**

XXII. *The JTenejick.* *Take the Juice of White Hellebor Roots, put it into a Horn, or fome zwodcrt Cup, and let it ferment for fome little time* Take a Needle and Thread and wet them therein, and draw it thro^o a Frog, or Chicken, and if it die prefently it is good and ready, if not, you mutt ferment it for fome little time longer \$ till it will upon trjral exquifitely perform that Work. This is the Poyfori the Spaniards ufe in poyfoning their Arrow heads, they dip their Arrow heads therein, and then what Beaft foever fliall be Wounded therewith fhall fuddenly die. This thing Matth'wlus fays he tried on Dogs and on Chickens, which died prefently after they were Wounded. This Popfon is only ufed while it is frefh, for if the juice dries upon the Arrow head it lofes its ftrength, and therefore to keep them the better they ufe to keep them⁴ in a Cafe, the Iron heads being wrapped in Wool, and Cloths dipt therein. But this is very admirable, as it is related, that this Poyfon -being- drank gives alnoit no harm to them that drink ir, unlefs the/ take too much} and it is laid that-Hunter^s often-take it thenafelves, to purge the[^] rhom[^] evil Humors, and preferve their Healths. This is alfo remarkable, that the Flefti of thofe Beaf^ts killed by this Poyfon is not in the lea it hurtful, but is more tender[^] and pleafant in earing than the Flefti" of other B[^] iis not killed therewith, more elpecialiy tiat part about the Wound**

XXIII. *The Spirituous Tinchre.* *It ought to be corrected with > Vinegar, or Juice of Quinces, added in equal qmfoity- after th[^] Tin&ure is made[^] and kept in V[^] i[^] fctivn[^] V[^] mlr S.ind heat for ont whole Month*

Month or more. Being thus prepared, it may be Riven inwardly for all thole Difeases the Pouder it ieif is good for •, it works much gentler, and may be given from half a Dram to two, three or four Drams, mixt with any convenient Vehicle, as fiarp Wine inixr with Water, &c. Outwardly, it is good againft Freckles, Lentils, Pimples, Scurff, Morphews, and other Breakings out in the Skin.

XXIV. *The Oily Tmture.* It is good againft ContraSures of the Nerves, Pains of the Joints, Gout, Sciatica, &c. being anointed upon the Parts ^flitted Morning and Night for fome time. Anointed upon the Reins, it gives Eafe in Pains of the Back, proceeding either from Weaknefs or Obstru&ions of thofe Parts. It digefts and haftens the Maturation of Tumors which Nature determines to break.

XXV. *The Saline Thttficre** It is a peculiar thing againft Scurff, Morphew, Dropfy, Elephantiafis, rufhes, Pimples, Tettars, Ring-worms, Kings-evil Sores, Pocky-eruptions, Herpes, Itch, Scabbinefs, Freckles, Lentils, Yellownefs and other Vices of the Skin- It may be ufed either fimply of it felf, or mixt with Vinegar, (harp Wine or Water, according to the Nature and Condition of the Part to which it is applied. It alfo eafes the Gout and Sciatica, being bathed tot upon the Parts affected Morning and Night for fome time.

XXVI. *The Pejfary or Tent.* Being put into any Callous Fiftula, or up the Womb, where the Vagina is Callous, it foftens and refolves the Caliofity, mundifies the Fiftula or Ulcer, and takes away the Callous Matter which hinders Curation, after which the Ulcer may be healed with fome incarnative Balfam or Ointment fit for the purpofe. I feave been told, that if it is put up the Womb as a r^Iary, it provokes the Terms, and brings away the dead Child ^ but it ought to be ufed with Caution and good Advice.

* ^ VIL TU *Sternutatory,* i. Some make it of the fane Pouder or Flower of the Root alone, but uled, it is much too ftrong. 2. Some make it thus : & fine Flower or Pouder of White Uellebor ^{Poudero Ro} feMary, of Sweet Marjoram, and of Winter Savory, of each equal parts, mix them. 3. some make it thus : & fine Pouder of Tobacco, or rather of Tobacco Stalks, three Ounces •, Pouder of Rofemary ilowers an Ounce and half Pouder of Clove one Ounce, fine Pouder of White Uellebor Root fix Drat&F -, mix and keep them for Ufe. Being fnuft up the Nostrils, it caufes much Sneezing, and evacuates the Head and Brain of cold, moft, vifcous Humors and Feculences, and is very good againit Vertigo's Megrims, Head-aches, Lethargies, Apoplexies, Falling-ficknefs, and other cold and moft Difeases of thofe Parts.

XTM ; & Wa * his Vomit. Take Roots of White Hellebor one Ounce, noafh dry and pouder the Roots of Bryony and Sowbread in pouder, of each two Drams •, add Spirit of Wine fo much as to cvertop them two Inches or more: digeji in Balneofor twenty four hours, then difill by an Alembick, take out the Fvces, heat them, and add the Spirit drawn off: digeji a Week in a clofe Vejfel, then decant the clear filter and keep it for Ufe. * Dip a Feather in it, and put it into a Glafs of Sack, and drink it * repeating it as you fee occafion.

XXIX. *Ue^mius* his Vomiting-Wine. Take grofs Pouder of White Hellebor Roots a Scruple, Ca^{TMP} ****&* : ***** and infufe in the Sun for a Week. One Spoonful of it will Vomit •, but half a Spoonful, with other Laxatives, will purge downwards, and evacuate cold, vifcous, flimy and griping Humors out of the Bowels, Hypochonders and Parts adjacent

XXX. *An Obfervation.* That the black and White Uellebors much lymphatize together, with relation to their Virtues -, and what the one will do, the other will do alfo, but the latter much more powerfully, and with far greater Violence, in fomuch that by reafon of its Violence, and dangerous Ufe, the Internal Fra&ice, with the Root of White Hellebor uncorre&ed, is wholly almoft given over, and left off : otherwife, as to the Virtues and feveral Preparations of the True black Hellebor in Chap-548. aforegoing, the fame things in a manner may be faid of the True White, with Advantage.

c H A P. cccUt

Of HELLEBOR White Wild.

I. **T**HE Names. It is called in Greek, ^{Μυκίς} MyKif 2ya@-: in Latin, *Hellebom alhuſt' veſtris, Elleborine alba agreil'is j* and in Enghp^{Wild.} White Hellebor.

II. The Kinds, i. *Elleborine recentiorum* ^{Calj} Elleborine alba major ^ *Qalceolus mariuS-*, *Calceohts Jrif riamss*, *Elleborine ſefruginea Uigduncnjs* ^ *Da*, ^{cbampji} *Alifnatis Species Gefwri & JbaM;* *D;* *mafonium nethum, zk Pfiudodamjornum> ahorum*, The great wild white Hellebor ^ ^ L a d i a', ^{Slipper.} 2. *Elleborine minor flore alba* *Elleborine* ^{nt*} *At:ra Damafonium, and Epipaſis a-* ^{uorum} *White Flower.* 3. ^{ne} *alba m&arpirant** ^{blnft}

White Hellebor with whitifh-green Flowers. 5. *Elleborim-alba Americana* ^ American wild white Hellebor.

III. the Defcriptions. *The firft, or Great* ^{white} *white Hellebor, or Ladies Slipper. It bar a Root composed of a number of Strings, interlacing themselves one within another, lying within the up&et, Gruflofthe Earth, and not ſpreading deep, of a dark,* ^{gownijh} *color.* This Root fends up one, two, or more Stalks, a Foot and half high; bearing broad green Leaves on e3ch fide, one > y one, ibriewhat like thofe of the *Vulgar true white Hellebor*, but fmaller, and not fo ribbed, and each compaffing the Stalk at the lower end. At the top of the Stalks ftands fometime but one Flower, and fometime two, or but three at moft, one above another, upon fmall fhort Foot-ftalks, with a fmall Leaf at the foot of every one. Each of thefe Flowers are of a long oval Form, and hollow withal, eſpecially at the upper part, the lower being round, and fwelling like a Belly : at the hollow part there are pieces like Ears or Flippers, which at firft do cover that hollow place, and afterwards fiond apart one foTM another, all which are of a fine pale yellow color in moft Plants -, but fome have been found of a brpwn color, as tending to purple. There are aifb four long, narrow and dark colored Leaves, at the fetting on of the Flower upon the Stalk, wherein the Flower, as it *WOTQ*, at the firft was encloded. The whole Flower is of a pretty *rweet* Smell: the Seed is very fmall, and Kke unto thar of the *Or chides* or *Dog-Jiones*, and is contained in the like kind of Pods.

IV. *The fecond, or LeTter* wild whire Hellebor **with a white Flower. It has Roots like the former-, but fmaller:** and this fraall Plant grows up in like

miiuitt,

manner, and not much lower, bearing the like Leaves, but smaller, and of a white green color, much like those of *Lilly Convally*. The top of the Stalk has many more Flowers, but letter, growing together Spike-failion, with small flori Leaves at the Stalk of each Flower, which consists of five small white Leaves, with a small cloie Hood in the middle without any Smell and having also like Seed.

V. *The thirds* Small wild white Hellebor with blufh Flowers. *The Roots, Stalky Leaves Flowers and Seed, as also its Manner of Growing, are all much like the lajfy* but herein this differs from that, that the Leaves hereof are narrower than those, and the Stalk and Flowers are smaller, the Flowers in this being of a pale purplish or blufli color, with very small dufty Seed.

VI. *The fourth, or Wild white Hellebor* with whitifh green Flowers. *This is also one of the small kinds of the Wild white, and differs not much from the laft, either in its Root, Stalk, Leaves, Flowers or Seed, but only in the Color of its Flower*, for whereas that Was of a blufh color, this is greenifh colored on the outside, and of a whitifli color within, with like finall Seed.

VII. *The fifth, or American wild white Hellebor*. *This is a Species of the fi^i Great k*d, of Wild white Hellebor, or Ladies Slipper* -, which fort has been brought to us from the Northern parts of America, and differs in this only, That it is greater in its Stalks, Leaves and Flowers, which are not yellow, but white, with reddifh Strakes thro' their Bellies.

VIII. *The Fifes*. The fifth grow not only beyond Sea, as in *Germany, Aujiria, Hungaria* -, but also are found Wild in many places of *England*. The fourth particularly in a Wood called the #^£*^ Lancafhire, near the Borders of *Torkfhire*. The fifth grows in the Northern parts of *A^erle^* as *TSfew-England, New-Jerk, Maryland*. The fecOnfi

was found in the Woods by *jD^aW-Faitures*, liat a Mile from *Welwen* in *Henfordjhire* -, it grows also in a Wood five Miles from *Lonion*, near & Bridge called *Lock-bridge*; and by *Rpbin Hood's Wel%* in the Woods by *Dunmore* in *Effex*; by *South fleet* in *Kent*, in a little Grove *oijuniter* \$ and in a Wood by *Clare* in *Effex*.

IX. *The Times*. The fifth flowers about the middle of *June*; the other four in the Month of *May*; and if the Weather prove cold, in the beginning of *June*: some earlier and some later than others, according to the Richness of the Soil, and Warmth of the Situation, and perfect their Seed in *Anguji*.

X. *The Qualities, Specification, Preparations and Virtues* of these, are the very fame with those of the *True black and True white Hellebors* in *Chap* 348, and *Chap* 351. foregoing, tho' possibly not full out for strong, and therefore the more fit, and the rather to be chosen for the more vulgar life,

XI. *An Obfervatioh*. The second of these is supposed to be the *Epipattis* of *Diofcorides*, but if either that or any of the two following be it, he says it is good against the Distempers of the Liver, and against Poifon, and to procure Vomiting, which *Theophrastus* also affirms: and *Gerard* says, that did Decoction of *Wild white Hellebor* being drunk, opens the Obstructions of the Liver and helps any Imperfections of the same. This is certain, That the Juice, or a very strong Decoction of any of them is good to wash and bathe the Skin withal in order to the taking away of Scurf, Morpew, Scabs, Itch, Leprosy, Herpes, Pimples, Freckles, Lentils, Yellowness of the Skin, or any other Deklacion thereof

c H A p. CCCLII

Of HELMET-FLOWERS,
OR,
MONKS-HOOD.

THE Names: It may be called in Latin *Glij^t: iri* Latin, *Napellus*, *Thora*, and *Cappa*, also *Cappa Monachi*, and *Luparia* in English, *Helmet-flower* and *Monks-hood*.

II. *The Kinds*. It is a Species, of of the Stock of the *Aconita* or *Wolfs-bane* -, and is manifold -, but those which we shall take notice of; are only the three following, viz. I. *Napellm Verus*, (*Verr/s* is added because it is the *True Napellm* of the Ancients, which they so termed from the Form of a long Turnep, called *Napus* in Latin:) *Cappa*, & *Cappa Monachi*, The true *Helmet-flower*, or *Monks-hood*. 2. *Napellps minor*, *Lycqtonum carnleim parviwi facie JSfapelli Lobelij*, *Thora It alien Gsfneri & Babinii*; *Aconitmn LycoSonum tertium caruleum parvum Dodonai*, *Aconitum deamum Clufij*, The finest blew *Helmet-flower* or *Monks-hood*. 3. *K dpi iJ us tertius Baubim Napellra purpurem*; *Accnituvi fieubergenfe Clufij* The purple *Helmet-flower*, or *Monks-hood*.

III. *The Description*. *The first or free Helmet-flower, or Monks-hood*: its Robs are hrowijb on the out side, and white within, somewhat bifatin round above and fmaU doihniards*

to a small Carrot Root, or not much unlike to a long Turnep, and sometimes two of them are joined at the head together. This Root sends forth divers Leaves of a fresh green color on the upper side, and greyish underneath, much spread abroad, and cut into many Slices and Notches, more than any of the *Wolfs-banes*. The Stalk rises up two or three Feet high, beset to the top with the like Leaves, but smaller. The top is sometimes divided into two or three Branches, but more usually without, on which stand many large Flowers, one above another, in Form very like unto a Hood or open Helmet, being composed of five Leaves, the uppermost of which, and the greatest below is like unto an Helmet or Head-piece, two other small Leaves are at the sides of the Helmet, closing it like Cheeks, and come somewhat under; and two others, which are the 1. mallest, hang down like Labels, or as if a close Helmet was opened, and some pieces hung by, of a perfect or fair blew color, (Ijut grow darker, having stood long) which causes it to be curled up in Gardens, that their Flowers, as was usual in former Times, and yet is in many Country Places, may be laid up among green Herbs in Windows, and put in Pots to stand in Chimneys, in the Summer time. But tho' they may be thus entertained for their Beauty, and put to the Uses aforesaid, yet you must beware that they come not near your Tongue or Lips, lest they discover, to your Colt and Peril, their virulent, poisonous and dangerous dualities. In the middle of the Flower, when it is open, and gapes wide, are seen certain small Threads, like Beards, standing about a middle Head, which, when the Flower is past, grows into three or four or more small blackish Pods, containing black Seed within them.

IV. *The second, or Small blew Helmet-flower, has a kind of round bulbous Root, big below, and small above, and encreases thereby, giving such lib Roots, with smaller Fibres thereat than at the greater Roots, from this Root rises up a round green Stalk, two or three Feet high, whereon grow several dark*

green, shining Leaves, cut into five Partitions very deeply, each of them somewhat cut in on the edges, very like unto the Leaves of the *Greater or True Helmet-flower*, but that these are not so finely divided, and the Divisions are somewhat broader. The top of the Stalk is divided into two or three Branches, each whereof bears one Flower, and sometimes (tho' seldom) two or three, of a very fair deep blewish purple color very like in Form unto the former *Helmet-flower*, but that this is smaller, and the Crest of the Helmet rises higher than in that* after which come small Pods, much like to the other, giving also such like Seed.

V. *The third, or Purple Helmet-flower. It has Roots much like to the first, or True kind: it has larger Leaves than the other, of a fadder green color, and shining withal, incised or cut in after the same manner: the Stalk also grows very high, and often spreads itself out into several Branches, bearing large purple blew Flowers, in longer Spikes than the first, which being passed away, like Seed comes in their places, not much differing from the former!*

VI. *The Places.* They all grow naturally Wild on Mountains, and in Woods and shadowy places in *Italy, Germany* and other places: and it is laid, that they grow upon some Hills in *England*: however, with us they are chiefly nursed up in Garden[^] where their flourish extraordinarily well.

VII. *The Times.* They all flower in the principal Summer Months* vizⁱ in *Jurteix* A July -ⁱ, and their Seed is generally ripe in *August*.

VIII. *The Qualities.* They are hot and dry in the Ultimate of the fourth Degree, Deleterious, and a most mortal Poison both to Man and Beast, and therefore they are called *Wolfs-bane*, because they kill Wolves, Dogs, Rats, Mice, &c whether the Juice of the Herb or Root, or the Herb or Root itself, being mixed with their Food or Fleish, and so given them to eat. And that this *Monks-hood* as well as *Wolfs-bane* is as destructive to Mankind also, is manifest from that accidental Tryal had thereof at *Antwerp* at a Treat there, where certain ignorant Persons gathering of a Sallet in the Garden, among the Variety of Herbs, gathered also *Napellus* or *Luparia*, which with the other things was served up at Table, where all who did eat thereof, were taken with most cruel Symptoms* and after the violent Tortures which they endured for some considerable time, died miserably.

IX. *The Specification.* *Helmet-flower* (as also *Wolfs-bane*) is a peculiar thing to kill Lice and Nits in the Head, and to cure the fame of Scurf, Dandriff, Scabs, &c. to cleanse old and fretting Sores, running Ulcers, take away dead Fleish, (provided these Sores, Ulcers, &c be not in the Mouth, Nose, Eyes or Privy Parts, by reason of their Vicinity to the principal or more noble Parts:) as also to cure Diseases of the Eyes by a special Application.

X. *The reparations.* You may have therefrom, 1. A liquid Juice. 2. A powder of the Herb or Root. 3. An Oil or Ointment of the Juice, grest Herb or Root. 4. A Decoction or Lye of Roots[^] Leaves or Seed. f. A distill'd Water.

The Virtues.

XI. *The Juice.* It is a deadly Poison taken inwardly any way: it is also as deadly to Wolves, Dogs or other Creatures who shall take thereof, or eat in any manner of ways of the Herb or Root, The Juice of the Roots especially Hunters of Wild Beasts do use, dipping the Heads of their Arrows into the same, by which means they quickly kill the

Beait which is wounded with the lame : yet it certain, that the Flefh of the Beait fo killed is not at all poifonous, but very fafe, and eats more tender than if it had been otherwiie killed, more efpedaily if it be kept for a Day and Night.

XII. *The Pouder of the Herb or Root.* Mixt wirf Cheefe or Bacon-fat, and put in proper places for Rats and Mice, it kills them, if they eat it. Mixt with Pouder of *Liquorice*, and ftrewed upon filthy Ulcers, it cleanfes them, dries in fome meafure, (if skilfully applied) and difpofes them for healing, which may afterwards with proper Incarnatives and Ulceratives, be perfe&ed.

XIII. *The Oil or Ointment of the Juice or green Herb, or Root.* It kills Lice and Vermine, if the Head or any part of the Body, in which Lice and Vermine breed, be anointed therewith, it quickly kills them, and frees the Patient from the fame.

XIV. *The decoction or Lye of the Roots, Leaves or Seed.* If it is a fimple Decoction, it is then made in fimple fair Water only : but if it is a Lye, it is made in a fmall *Lixivium* of Pot-afhes. It cleanfes the Head and other Parts from Morpew, Scurff, Dandriff, Scabs, Itch, Pimples, Tettars, Ringworms, Leprofy, and other like Breakings out, the Parts affected being bathed therewith.

XV. *The diftilled Water.* Being dropped into the Eyes, it takes away the Inflammation or Rednefs in them, alfo cleats them from any Haw, or Pin and Web, growing in or upon them. The lame thing is faid of the Juice * but I fear it is dangerous, and if it is ufed to the Eyes, it muft be done with much Caution, and by fuch as have Judgment and Skill, and not by Fools. It ought to be mixt with a fufficient quantity of *Damask-Rofe* Water, both to allay its Heat, and to take off the Violence of its Operation.

XVI. *To Cure fuch as are Poifoned herewith.* The firft thing you are to do, is to give an Emetick, as two, three, four, five or fix Grains of *Emetick Tartar*, from half an Ounce to an Ounce or Ounce and half of *Infufion of Crocus Metallorum*, or *Vinum Benedictum*, or *Vinum Antimoniale* or a Dofe of any other proper Emetick which you have at hand, proportioning the Dofe according to Age and Strength. The next thing you are to do, is to exhibit *Cathartick Clyfters*, or this following, if the Patient is weak: *Take Poffet-drink or Mutton-broth a Pint, brown Sugar four Ounces: mix, melt or difolve, and exhibit it warm.* This is to Be done, that the Body be effe&ually, and as foon as may be, difcharged of the Poifon : which being performed, *Cordials* and *Antidotes* are to be given, the one to defend the Heart, preferve and keep up the Vital and Animal Spirits * the other to enervate and deftroy the force and power of the Poifon; for the firft of thefe, we commend our *Aqua Bezoartica* *Tinttura Bezoartica*, or fome other like Cordial Water, Spirit or Tinture, to be mixt and given with fome noble and generous Wine. The Antidotes we commend in this Cafe, are, *Mithridate*, *Venice Treacle*, the Antidote in *omPhylaxa*, or for Want of them, to drink a *Decoction in Wine of Origanum*, *Pennyroyal*, *Savory* Sage, *Southernwood*, *Wormwood*, *Gentian*, *Winters Cinnamon*, *Eletf*. *Diateffdron* is good, fo alfo is a mixture of *Caftoreum*, *Pepper*, *Cubebs* and *Rue*, of each a like quantity, being in fine *Powder*, and mixt up with *Honey* into a *Bolus*. *Petrus Aponenfis* commends a Dram or two of *Terra Lemnia* to be taken in warm Drink or Wine; but above all he fays, that *Arifolochia longa* is the moft efppecial Antidote or Remedy againft all *Aconites*. *Avicenna* has an Antidote againft this Poifon, which is made of the *Fly* which feeds upon this Poifonous Plant, which he found to be very effectual, not on-

ly againft other Poifons, but chiefly againft that of *Napellus* or *Helmet-flower*, and Poifon of the *Tarantula*. It is thus made: *Take Anjlolochia longa, line Bole, each in fine powder, a Dram; Flies which feed upon the Napellus number twenty: make a fine Powder, *and mix them: Dofe a Dram at a time in a Glaif of Wine.* *Guainerius* his Antidote is this: *Take Bay-berries, Terra Lemnia, both in fine powder Mithridate, of each two Ounces; Flies which have fed upon Napellus number twenty four in powder: mix them, and with a fufficient quantity of Honey and Oil, make an EleS-uary.* Dofe from a Dram to two Drams at a time, with a Glaifs of generous Wine. But the true Antidote againft this Poifon is the *Anthora* or *Antithora* in the Chapter following, of which we (hall there fpeak more largely.

C H A P . CCCLIV.

Of HELMET-FLOWER *Alexi** phanfricfc,

O R,

MONKS--HOOD Antidotal-

THE Names. It is called In *Greeks* *Antiphora* in *Latin*, *Antiphthora* or *Antithora*, but moft commonly, for Shortnefs fake, *Anthora*, (as being the Oppofite or Antidote to *S⁹*, *Helmet-flower* or *Woolfs-bdne*;) in *Engli/b₇* *Helmet-flower AlexiShar** *mick**

II. *The Kinds.* It is a fingular Plant of the Kind and is called by the *Piemontoife*, *Anthora*, *quafi Antithora*, that is, the Remedy againft the Poifonful Herb *Thora*: *Avicenna*, the *Arabian* calls it *Mopellus Moyfis* In *lib. 2. cap. 500*, and in *cap. 745*; calls it *Zedoaria*, by which it is manifelt that this *Zedoaria* is not our *Common Zedoaria* or *Zerumbeth*

Zerumbeth of the Shops; it is alib called *Acomtum SoJutiferum*, *Nape Urn Alexipharmacw*, and *Ant or a. Tbora* and *Anthora*, or *Turn* and *Antura*, seem to be new Words, and yet they, are used in *Marcelhis Empiricus*, an old Writer, who teaches us a Medicine to be made of *Tura* and *Antura* against the Pin and Web in the Eyes*

III The Description.- *The Rootshereof are small and tuberoifs, round, and fomewhat long, ending fur the most part in a long Fibre, and with some other small Threads frim the Head downwards*: from the Head whereof rise up several green Leaves, every one severally upon a Stalk, which Leaves are very much divided, as finely almost as the Leaves of *Larks heels* or *Larks' spurs*: among which rises up a hard round Stalk, a Foot or more high, with some such Leaves thereon as grow below *, at the top of which Hand many small yellowish Flowers, formed very like unto the *Whitish Wolfs-bane*, bearing many black Seeds in Pods afterwards in like manner.

IV. *the Places*. It grows on the *Alps*, and on Mountains and Hills near the *Lake Lemane*, 2nd in some places in *Germany*: with us it is nurfed up only in Gardens,

V. *The Times*. It flowers at the latter end of *June*, thro' all *July*, also in *Auguk*, and the Seed; is ripe in *Auguft* and *September*.

VI. *The Qualities*. It is hot and dry in the third Degree, and is Cardiack, Emetick, Cathartick and Alexipharmick.

VII *The Specification*. Its chief Defignation is for the enervating or destroying and expelling of roifons-of all forts, chiefly those of *Helmet-flower* or *Monks-hood*, *Wolfs-bane* and *Leopards-bane*.

VIII. *The Preparations*. You may have therefrom, 1. *A Pouder of the Root*. 2. *A DecoUwn thereof in Wine*. 5. *A SpirituottsTintture*. 4. *An Acid TinSure*.

The Virtues.

IX. *The Pouder of the Root*. *Hugo Solerius* says, that it will purge the Body very strongly of vicious and watery Humours, both by Vomit and Stool, the quantity of a *Bean* being taken in Broth or Wine. And by reason of the exceeding Bitterness of the Root, it kills all forts of Worms in the Body. *Guainerius* says, that by his own Experience and Sight, he found it to be as effectual as *Ditfamnus* unto all the Purposes unto which that ferves. The Pouder of the Root taken in Wine, (from half a Dram to a Dram) is a speedy and special Remedy against the Wind-Colick, which the *Savoyards* about *Diam* (where it grows in great plenty) familiarly use with great Success, and call it the *WindrColick Herb*. This fame Root also used inwardly, is not only the chief and principal Antidote or Remedy against the Poifon of *Monks-hood*, or *Helmet-flower*, and *tyolfs-bane*, but also of *Leopards-bane*, or any other Poifonous Herb whatsoever, being given first and last Morning and Night.

X. *The X)ecoUNon in Wine*. It has all the former Virtues, but not full out so efficacious as the Root in Subftance. If you so please, the Pouder of the Root may be given in this Vehicle for the same Purposes.

XI *The Spirituous Tintture*. It has the Virtues of the Pouder and Decoation-, besides which, it is good against Surfeits, the Meafles and Small-Pox, for by gently provoking Sweat, it expels the Malignity to the Surface of the Skin, and so defends the Heart and Vital Spirits from the Poifon and Force

of those Difeases, causing them orderly to come forth: you may give from one Dram to two Drams, (according to Age and Strength) in any proper Vehicle. It defends the Heart, and strengthens the Spirits as a most Sovereign Cordial.

XII *The Acid Tintture*. It has the Virtues of the Root, Decoction and Spirit, besides which, it is more effectual than any of them against the Plague or Pestilence, and all forts of Malign or Pestilential Difeases, as also against all malign and burning Fevers, destroying the Malignity, and extinguishing the burning Heat of the Difease. It is also good against the Venom and Poifon of Mad Dogs, Serpents of all kinds, as Viper, Rattle-snake, Slow-worm, OV. and the Stinging of Scorpions, Hornets, Wasps, Bees, OV. Let the Patient take it in all that they drink, so many Drops at a time as may make the Vehicle pleafant, and continuing the Use of it for some days. The Figure which we have given you in this place, is from *Matthiolus* his *E* pitonic*.

C H A P. CCCLV,

Of H E M L O C K Common.

1. *HE Names*. It is called in *Arabick*, *Suca-Xram*: in *Greek*, *Kt!mov > 7M& <n>K<>v*!v>> <cir-cum vertendo, quod Vertiginem, d? imaginem earum rerum qua afficiuntur^ tanquam circumagantur ac in tenebras indue at ijs qua earn biberunt*: in *Latine*, *icuta*, and in *Englilh^ Hemlock*.

II *The Kinds*. There are three, principal kinds, viz. 1. *Cicuta vulgar^* The Common Hemlock. 2. *Cicuta minor, Cicuta fatua, Cicuta Apijfolia^* The lesser or Parfley-leay'd Hemlock, in Cap. 35:6. 3. *Cicuta palustris^ Cicuta aquatica^ Water or Marft Hemlock, in Cap. 357- following.*

III. *The Common Kinds.* Of this there are several sorts, viz. 1. *Kwewoitfr* *Qicuta vulgaris*, *Cicutn major*, (by almost all Writers) *Geptark* *Oufij* Our Common Hemlock. 2. *KaW* *Gcutaria latifolia* *focAhiffiya*, *Gcutaria maxima* *Brancich* is by *Lobe I*, *Gcutaria Myrrhis* *Tbalij*, *Sefeli* *Velopnefe* *Matthi* *ch*, *Gefneri* and *Lugdunenſis*, which *L?fol* contradicts, The great or greatest Hemlock, that this is a Hemlock, and no *Sefeli* or *Harjwort*, ho doubt is to be made of it.

IV. *The Descriptions.* *The Jit fi*, or Common Hemlock, *bat a Root which is long, white and sometimes crooked, and hollow toithn*: from Oie Head of which Root it grows up with a hollow green Stalk, three or four Feet high, or more, full of red Spots sometimes, and having at the Joints very large winged Leaves, one set against another, dented about the edges, of a fad green color, branched towards the top, where it is full of Umbles of white flowers which being puffed away, give white, flat(h), long Seed. The whole Plant and every part has a strong, heady, ill-conditioned Smell, offend- ing the Senfes-

V. *The second far Greater greatest Hemlock.* It is *Our* growing as well deep into the Ground as spreading many great Branches therein, which sometimes dies after it has given Seed and sometimes not, abiding all Winter in some Seasons, and in some places. This Hemlock has much larger winged Leaves than the former, thicker let, more spread, and of a ladder green color, having a Smell which *Lobe I* calls *itidiffima*: yet *Partinſon* says, that tho' he had it growing many Years in his Garden, he never found any offensive Smell it had. The Stalk is great, but rises not so high as the *Common fort* does, but bears as large Umbles of white Flowers, where, afterwards grow large and thick white crooked Seed, of no evil Smell

VL. *Tfe P / ^*. The first grows in all Countries throughout *England* by Walls and Hedge-fides, and in waste Grounds and untilled Places, as also in Gardens of a fat and rich Soil. The second I have found in moist and fertile Medovvs abounding with other Wseds near their Borders, but grows with us mostly in Gardens, where it is generally weeded out.

VII. *The Times.* They both flower in *July* and *August* and feed in *Anguji* and *September*.

VIII. *The Qualities.* Hemlock is cold in the fourth Degree, and dry in the second, Repercussive, Altringent, Arthritic and Venefick.

IX. *Specification.* It is chiefly of External Use for the Cure of the Gout, Sci/rhus Tumors, erythelas, Inflammations, Wheals, Pufhes creeping Ulcers.

X. *The Preparations.* You may have therefrom, 1. *Alquidjuice*, 2. *A Cataplasim of the Leaves*, 3. *A Cataplasim of the Root*, 4. *A Venefick*, 5. *An Eniplasim*.

The Virtues.

XI. *The liquid Juice.* It is applied outwardly to the Testicles of such as have Venereous Dreams, or the like, to suppress them: also to Maidens and Womens Breasts, to repress their Swellings, and repel their Milk: yet by reason those places are so principal, and full of Vital Spirits, it sometimes happens that the Remedy is worse than the Disease. It may safely be applied to an Inflammation, an Erysipelas, Pains of the Gout, arising from hot or fiery Humors, and to Wheals, Pulhes and creeping Ulcers, accompanied with a hot and sharp Matter, for by cooling and repelling the Heat, it puts a stop to the Humor.

XII. *The Cataplasim of the Leaves.* A Cataplasim being made of the raw Leaves by only bruising, and laid to the Brows and Forehead, is good to stop Defluxions of Rheums falling into swollen and red Eyed, to quickly to ease the Pain, and take away the Swelling and Redness. And being applied with a mixture of Bay Salt in fine powder to the Wrift, (renewing it twice a day for three or four days) it takes away a Pitt and Web growing in the Eye, but it ought to be applied (as they say) to the contrary Wrift. Applied in Pains of the Joints, it eases them.

XIII. *The Cataplasim of the Root.* It is to be roasted under the Embers, wrapped in double wet Papers, until it becomes soft and tender, then to be beaten in a Mortar to a Pulp, and applied: it prevails admirably against the Gout in Hands, Fingers, as also in other Parts, quickly easing the Pain.

XIV. *The Venefick.* The Juice mixed with Wine, if it is given to any one, is prefeut Death, as *Tragws* says. And this possibly might be the Venefick which the *Athenians* adjudged the Wife *Socrates* to die by, for not thinking repleting of their Gods, or rather Devils, being accused by *Aristus* and *Me* *rtins*. *The Oar*. In any one *Iris* taken the juice of Hemlock or this Venefick, or by mischance has eaten this Herb instead of *Pscifley*, or its Root instead of *Parfneps* which causes Frenzy, or Perturbation of the Senses, as if stupified or drunk: the first thing I say in this Cafe which is to be done (if it is soon enough) is to give the Patient a Vomit of *Emmn Benedicth*, *Vinum Amimoniale*, or *tartar* *metick*: which being effused, a good Draught of Wine (in which *Gentian* has been infilled) is to be drunk, as *Pliny* advifts. *Tragus* says, he cured a woman who had eaten the Root, by giving her a Draught of good Vinegar: and this may be proba-

ble, becaufr, for that if the Vinegar was given in a good large quantity it would caueie plentiful Vomiting, to evacuate the poyfonous matter, and withal, by reabn of its acidity, it would enervate and detroy the force of the Poyfon, making it of no effe&l

XV. The Efiup/after .. called Emplaftrum e Cicuta cum Ammoniac. Take juice of Hemlock four Ounces, Vineg&ur -oj Squills, Qum Ammoniac urn, of each eight Ounces, d/Jfolve the Gum in the Juice and Vinegar, by g gentle infufwn in a warm Sand heat, then fir din, and reduce it to the confidence of an EmplaHer. Here note, that if the quantity of the Juice was doubled it would be fo much the better-, it was invented to eafe pains, chiefly of the Spleen and Gout, my Experience has confirmed it, and fuch as fiiall ufe it upon my Word may have caufe to return me Thanks for this Recommendation ^ it is alfo ah excellent thing to diffolve Sc&rrhus, and other like hard.Tumors in any part of the Body, chiefly Tumors of the Liver, Spleen, Hypochonders, and Joints.

XVI. Nota. It has been *found by obfervation that fome Countries bring it forth in greater frength than other fome do; and where it is produced in greater frength it is a greater Poyfon* and tho' it is a kind of Poyfon with us here in England, yet it ielems not to be fo great a Poyfon as in Greece, and °J?^ h°t Countries, nor attended with fuch violent effe&s.

 bis Koot rifes up o:ie Sulk, four, fivej fix, o-

Feet high, according to the goodness of the Soil, with many Leaves set thereon at distances, this Stalk is rough and bulky, with many Leaves also on the Branches, every one of them standing upon a long Footstalk and divided into five, six, or seven several Leaves, joined together at the bottom of them, and dented about the edges, something like unto the form of the Leaves *salma Cbrjii*, or *Barbadoes Black Hellicbor*, of a dark green color, and of a strong smell, but not unpleasing towards the tops, from the bottoms of the Wings and Leaves, comes forth the Seed on long Branches, without any show of Flowers, which is round, somewhat hard, and full of an oily Nut like white substance, and contained in round Heads, every particular Leaf is narrow, long, and sharply pointed, finely notched in about the edge; this is called *Winter Hemp*.

V. *The second, or Female Kind, has like Root and Stalk as the former, but the Leaves are lesser, and of a lighter green color, yet like in form and shape; the Stalk is finer for the most part, with few or no Branches, having a like strong smell as the other, it bears a great number of Flowers, which are finally of a whitish yellow color, standing many together upon long Branches, which turn jointed, and are carried away with the Wind, not leaving any Seed after them, for which reason it is called *Barren Hemp*, and by reason of its bearing no Seed it comes to ripeness sooner than the other by a Month, or more, being the tenderer and weaker Plant, the Stalk being hollower, and not so strong, for which reason it is usually called *Summer Hemp*.**

VI. *An Observation.* These two sorts *Male* and *Female* are not originally two differing Kinds, but both rise from one and the same Seed, that is, they both spring from the Seed, growing upon one and the same Stalk or Plant, being herein somewhat like unto the *French Mercury*, but how this change in Nature should be, or how it is brought to pass is very hard to determine: The *Summer Hemp*, as it is the tenderer and weaker Plant, so it makes the finer Stuff or Tare, and that makes the finer Thread,

and by consequence the finer and better Linnen Cloth, The *Winter Hemp*, as it is the stronger Plant, and harder peeling, so it makes the courser and harder Thread and Cloth, and of this sort it is they usually make their Cordage. As for the way and manner of steeping or watering of *Hemp*, and how it is dried, picked, cleaned, and beaten, &c. so as to be made into Cloth or Cordage, as it is not pertinent to, or the business of this Work, so it is pretermitted, and you are referred to the proper place in my *Agriculture*, which, if it (shall please God to Bless me with Life, (shall in due season be emitted into the World, for the general Benefit of Mankind.

VII. There is also a third Kind of *Hemp* growing in *Virginia*, and other of our *Floridian* Plantations, which in Roots, Stalks, Leaves and Seed differ not much from our *Mainland Kind*, having, that the whole Plant is much bigger, the Stalks are greater, and the Leaves and Flowers much larger.

VIII. *The Places.* *Pliny Lib. 40. Chap. 11.* That *Hemp* formerly found growing wild in our days can find no such thing, for in all places of the World it is now sown in several fields chosen for the purpose for the sake of *Columelw* & says it delights to grow in a Fat, Dugged, and Watery Soil or in plain arid, moist Grounds deeply ploughed.

IX. *Best Times.* It is sown in the end of *May* or beginning of *April*, and is ripe in *August* or *September*, according as the two sorts grow ripe and fit to be gathered; the second of these, or *Summer Hemp* is ripe and fit to be gathered in the end of *July*, and beginning of *August*, the first, or *Winter Hemp*, is gathered a full Month after, viz. in the end of *August*, or beginning of *September*.

X. *The Qualities.* It is hot and dry in the end of the first degree, it is Afringent, Carminative, Dilcussive, opening Obstructions of the Gall Bladder, and is Anodyne, Neurotick, and Arthritick.

XI. *The Specification.* It is a peculiar thing in curing the Jaundice and Colick, in killing Worms, and easing pains of the Gout.

XII. *The Preparations.* You may prepare therefrom, 1. A *Liquid Juice of the Leaves*. 2. A *Decoction of the Leaves*. 3. A *Decoction of the Root*. 4. A *Decoction or Emulsion of the Seed*. 5. A *Diluted Water of Root and Herb*. 6. An *Oil by Infusion*. 7. The *Leaves* fried.

The Virtues.

XIII. *The Liquid Juice of the Leaves.* Taken to an Ounce or two in a Glass of Wine it is an extraordinary thing to kill Worms, whether in the Ears, or in the Ears, it kills Worms in the Ears, and draws forth any other living Creature which has crept into them: And to (hew the strength hereof for this purpose, that if it is poured, or put into the Decoction of the Herb) into the holes of Earth-Worms, it will drive them forth and that Fishermen and Anglers have used this Juice to get Worms to bait their Hooks.

XIV. *The Decoction of the Leaves.* It has the former Virtues, but not altogether so strong, and may be given from three to eight Ounces, according to Age and Strength, but is no very agreeable thing for the Stomach.

XV. *The Decoction of the Root.* It has the same Virtues also, but this in especial it is laid to be good against, viz. to allay Inclinations in the Head, or any other part, to ease the pains of the Gout, to help hard Tumors or Knots in the Joints, Cramps, and Shrinking of the Sinews, and to ease the pains of the Hip, or Sciatica, being applied thereto by Fomentation.

tion, and afterwards mixed applied made up into a Cataplafm with Barley Flower, renewing of it every day.

XVI. *A Decoction or Emulfwn of the Seed.* The Decoction in Water or Wine is hur and dry, and confumes Wind, and by the much ufe thereof it does difperfe it fo much, that it confumes and dries lip the Natural Seed of Generation. The Emuffion of the Seed in Water or Milk ftops continual Fluxes of the Bowels, and is good againit a Gonorrhoea, it eafes the pains of the Colick, and quiets and allays troublefom and griping Humors in Stomach and Belly, it is good againft a Bloody Flux, and ftops bleedings, whether at Mouth, Nofe, Yard, or Womb. The Emulfion made in Milk, by boiling the Seed fo long in it till it is perfectly broken, and then ftrained out, as *Sylvius de he Boe Prax. Med. Lib. I. Cap. 47. S'zS. 74. Pag. 306. b. quarto Edition* Printed 1680. has taught, if it is taken five or fix Ounces at a time twice or thrice in a day, it will, as he fays (from great Experience) cure the Jaundice; it is alfo good for fuch as have a hot and dry Cough, opens obftructions of the Lungs, and obftructions of the Gall Bladder, and caufes a digeftion of Choler.

XVII. *The Dijlilled Water of the Herb.* It allays Inflammations, and has all the Virtues of the Juice of the Leaves, and may be ufed to be mixed with fome other Preparations, as a Vehicle.

XVIII. *The Oil by Infolation, Infufion, or Decoction.* It is good to be applied to any place which is burnt with Fire, and to remove intamations in the Skin, fo alfo if an Oil or Ointment is made, by mixing the frefh Juice with Oil Olive, or Hogs Lard, or frefh Butter, it heals Burnings or Scaldings after an admirable manner.

XIX. *The Leaves fried.* In a Hemorrhage if fome of the Blood which comes from the Patient be taken, and the frefh Leaves of *Hemp* be fried therein, and then given to the Sick to eat, it ftops the bleeding prefentiy, and if they be fo fried as that the Leaves may be crumbled into Pouder, this Pouder Wowed up the Noftrils, or put upon any Wound Where there is a flux of Blood, it prefently ftops it, and given to a Dram or more inwardly in a Spitting of Blood, Vomiting Blood, Piffing Blood, Bloody Flux, or flux of the Terms, it quickly ftops it, and by repeating the exhibition quickly cures it, and given to fuch as are troubled with Worms in the Bowels it kills them.

XX. *Nota.* *Matthiols* fays that *He?npfeed* given to Hens in the Winter, when they lay feweft Eggs will make them lay more plentifully.

iijs jerratii alt era Bauhini, who thinks it to be the *Uderitk Cordi*, The fecond Baltard or Wild Hemp, *S. Qannabk Spuria tertia*, *Cannabk Spmia facie Ortica Lobelii*, *Urtica aculeata fblijs non ferrati* Bauhini*, *Sideritis alt era Matthioli*, The third Baltard or Wild Hemp.

III. The Defcriptions. *Thefirft, or Firft* Baltard Hemp, *ha* a Root which is hard afkd white, an&& little fpreading, but dying before Winter*, from the head of which rifes up a reafonable great, hairy, fquare Stalk, not very ftrong, nor upright, but as it were leaning down, with feveral Joints bunching out like Knees, and two Leaves fet at every one of aiem, fomewhat long, hairy ^ and pointed, of a frefher green color than the Leaves of the *Manured Kind*, and dented about the edges ^ at the Joints alfo come forth feveral Branches, jointed and fet with-Leaves in like manner, whereabouts, towards the tops, grow feveral hooded and gaping Flowers, like thofeof the *Dead Nettle*, but larger and greater, of a pale purplifh color, ftanding in fmall, green, prickly Husks, in which, after the Flowers are paf, grows the Seed, which is fmall and round, three or four growing together.

IV. *Thefecond, or Second* Baltard Hemp, *differs not much in Root or Stalk from the former*, but the Leaves are (horter and rounder ^ the Flowers hereof are of the fame fafhioi!, but not fo great as they, the uppermoft part or hood whereof is of a pale color, tending to yellow, and the lower part of a deeper Red, or Purple Color, the Husks of the Flowers are fomewhat more prickly alfo than the other.

V. *The Third, or Third* Baltard Hemp, *is in its growing much like the la/), but its Root is a bujh of fibres and Strings*, from whole head comes forth one fhort body of a Stalk, which quickly divides it felf into two ^ three, or four others, which growing up with feveral Joints, ipread themfelves out into many Arms or Branches, two and two at every Joint,

Of H E M P Baftaid or Wild-

A vme *Chnn.* *%wBii*, in *Lathe Cannabn Spuria*, w/ *Afofo*, and *Lannabis Sylvefiris*, in *£W/* & *i? ^ i ifc^p*, and *Wild Hemp*.

II. *The Kinds.* Authors make three feveral forts of *Cannabis Spuria* *t rima*, *Cannabis Sylvefiris Tragi & Lugdunenfis*, *if Spuria alt era Lobelii*, *Lannabina alba Tabernamontani*, *Urtica aculeata*, *W/jerr*[H Bauhini*, The firft Baltard Hemp, or *White Baltard Hemp*. 2. *Cannabn Spuria fecunda*, *Sylveftris Spuria tertia Lobelij*, *Myij album Tabernamontant*, *Urtica aculeata to*

but the Leaves at the Joints are fomewhat long and narrow, a little fadder, and not dented about the edges in moft of them, the Flowers hereof are hooded and gaping, but they are wholly of a pale yellowifh color, with little or no fhadow of ipot in them, and ftand thicker about the Joints, whofe Hifticks have longer and iharper points than the reft.

VI. *Nota.* You are to take notice that there isano*
*per variety of the fir (1 of thefe Kinds, whofe flower
Kjor the moft part of a perfect white color, or a little
Rale whitijh, which does manifetly exprefs the dit-
terence, and therefore is called in Latine Cannabis
Spuna prima I lore albo, Baftard Hemp of the fart
ion with a white Flower.

VII. *The Places.* Thefe Kinds of Baftard or Wild
Hemp do all grow as well in moift Grounds as cky,
by Ditch fides, and by Pathways, and under Walls,
and fome of them will be found in Gardens, whence
they are continually plucked up as Weeds; the firft
Kind with a white Flower mentioned it Se:l VI.
above has been found by the Pathways near Clapham,
and in the Ditches by Redriff, or Rotherhithe, as it
was formerly written, they all grow alfo upon bar-
fer Hills and Mountains, as Gerard fays, and efpe-
cially on Earable Land and they have been often-
times found in the Corn Fields of Kent, near Grave-
end and Southfleet, and in all the way from thence
to Canterbury and in many places about London.

VIII. *The Times.* They all Flower for the moft
part in July, and from July to the end of Auguft, the
Seed ripening in the mean time.

IX. *As to their Qualities, Specification, Prepara-
tions and-Virtues,* they are thought to be nearly the
fame with thofe of the Common Hemp in the former
Chapter, as fome Authors are of Opinion, but they
are feldom ufed in Phyfick, either inwardly or out-
wardly, when and where the others are to be had.

X. But Lobel fays they are ufed as an allured Re-
medy againft Nodes and Wens, and other like hard
Tumors in the Flefh, and that after other things have

failed and done no good, 'tis very poffible that they
may be of extraordinary ufe in curing the/Kings-Evil*
if prudently prepared and applied, and by a Wi-
and Skilful Hand.

HEM P Water. See A G R I M O N Y Water.

C H A P . CCCLX

Of H E N B A N E Common or Black.

p # £ Names. It is called in Arabic[^] Alter-
JL cum, and Altercangenum, and by the A?[^]
an Phyficians Bengi, which differs but little from
Indian and Perfian Name Bangué, as Oarctas[^]
to, and Chriftopher Acofta declare, in Greek
quafi Faba Porcina, in Latine alfo W
and corruptly Jufquiamus, alfo Ajwilin
lne Median* invent ore, vel quid opplet u
vittio & fetido halitu? eoque Mcntem percclth
fi Apollinis JEftro. Scribonius fays that the Urp
alfo Gill it Altereurn, ab Altercando, quia q
borum Altercatione rixaquefe tor quern HyofaW
mentati. Comer arm faith it is alfo called Priff
quia It all Semine utuntur adPnapifmumi/eda.

II. *The Kinds.* There are feveral forts
Plant, but the principal Kinds are, i r r ^ ^
Kcau Hyofcyam* niger, called alfo Hyofcyamus «*;
gar is, and by Fuchjjus Hyofcyamus Flavus, Our Com-
mon Henbane, which is the Black Henbane and is a
fingular Plant, of which in this Chapter. 2. r « w
*>©- Kivvilu Hyofcyajmus albus, f6 called by all Au-
thors, White Henbane, of which in Chap. 361. fol-
lowing.

III. *The Defcription.* It bat a Root which is great*
white, and thick, branching or ff reading itelff?*)

r always under (irrouni^o jo like unto a Parihep It e^l (7>|| ll&l• ll'lj wTjfo white) that it ha* deceived j ex i rd, from this Root spring up several very large thick, fdlit, woolly Leaves, lying upon the Groiiacl, much cur in or torn on the edges, of a dark or very dull grayish green color, among these Leaves rise up divers thick and fofl' Stalks, two or three Feet high, and fometimes higher, which spread themselves out into several smaller Branches, with ibme finale Leaves on them, and many hollow Flowers, Belliafilon fearcely appearing above the Husks, and commonly torn on the one side, ending in five round points, growing one above another, of a deadlihtaint, yellow, white color, fomewhat paler toward the edges, with many purplish Veins therein and of a brownish color, or dark yellowish purple in the bot torn of the Flower, with a small romtel of the lam color in the middle, each of them Handing in a hard clofe Husk, which, after the Flower is past, grows very like the Husk of a Pomgranet Flower, or the Flower or Husk of Afarabacca, and fomewhat sharp at the top points, in which is contained much final Seed, very like unto Poppy Seed, but of a dusky grayish color, almoit enclining unto black, whence came the Name Black Henbane.

IV. The Egyptian Henbane. I shall put this Plant into this Chapter, and describe it here[^] tbo* an Exotick bgaufe Parkirifon fays it is, or will have it to be[^] <u> species of the Slack, and withal it is not a very great ranager in fomic of our Englifh Gardens[^] it ha* a phil white Root[^] with fome Fibres adjoining to it, which perfishes every Tear[^] this Root fends up a strong woolly Stalk, about two Feet high, on which are growing letter Leaves than those of the Common Kind afore described, and almoit as much torn on the edges, especially those towards the bottom, but those which grow up higher towards the top are little or nothing indented oit the edges, and the higher the fmoother edged, all of them being very white and hoary[^] the Flowers stand every one of them at the Joints with the Leaves, and at the tops likewise, in such like Husks as the Common does, and of the lame pale yellow color, with purple Veins therein, at the first blowing of them, but afterwards, as they grow larger, for the color changes to be of a dark reddish color, with Veins of a deeper Dye, and a whitish bottom, with a Purple Pointel, encompassed with yellow Threads in the middle, which being paid away, there succeeds such like prickly Heads as the Common Kind has, and also such like Seed.

V. The Places. The first is commonly found growing by the Way sides, and under Hedge sides, and old Walls, about the borders of Fields, on old Dunghills which have lain long, and in other rude and untilled places, the other is an Exotick, common to be had in Egypt[^] as the first is with us, but by transportation of the Seed to us, is now to be found in several of our Gardens.

11⁵ Times. They faring out of the Ground all April and in May, and do both Flower in July, and in August[^] the Seed being perfeded in October, when growing ripe, if it is suffered to die or fall, it springs up again every Year.

VII. The Qualities. They are cold in the fourth degree, and dry in the second or third, they are Anodyne, Afringent, Epiphrafitive, Repercuflive, Arthritick, and Venefick.

VIII. The Specification. They are good against inflammation of the Eyes, Sciatica, Gout, Rheumism, Kings Evil, hot Tumors of the Cods, and of Womens Breasts, noise, deafness, and pains in the ears, it prevails against Coughs, and Fits of the Mother.

IX. The Preparations. You may have, I, the Leaves whole and in substance* 2. A Juice of the Leaves and Roots. * 3. An Ejjence of the fame. * 4. A Juice or Emulfwn of the Seed. 5. An Oil of the Seed by Infolation or Expreffion. 6. The Seed in fubstance. 7. A Decction of Root, Herb, and Seed. 8. A Vinegar of the Root-or Herb, or green Husk* of the flowers. 9. An Extract of the Juice of the Roots and Leaves. 10. An Ointment of the Root, or Leaves[^] or of their Juice. II. A Cataplasim of the Roots or Leaves boiled in Red Port Wine. 12. A fomentation. 13. fumes of the Herb or Seed. 14* A Diftilled Water of Root, Herb, flowers. Iy A Venefick. 16. The Cure of the Poyfon of Henbane. 17. A Hijlory.

The Virtues.

X. The green Leaves in substance. Applied they cool all incarnations, either in the Eyes, or in any other part of the Body, and are good to affwage all manner of swellings, whether of the Cods, or of Womens Breasts, or in any other part, the fame applied to the Joints give ease in pains of the Gout, and Sciatica, and to the Forehead and Temples they ease a vehement Headach, proceeding from a hot caufe, or for want of Sleep in Fevers, and are very good against fimpje Contufions while recent.

XI. The Liquid Juice of the Leaves. It has all the former Virtues, being bathed warm or fomented upon the parts affected, and seems to me to be the more powerful of the two, but after bathing it will be necessary to lay Linnen Cloths four, fix, or eight times doubled dipped in the lame Juice upon the difaffection, dropped into the EARS it takes away any noise therein, deafness, thickness of hearing, or pain there held often in the Mouth of one who has the Toothach it gives relief and ease, and if there is Worms in the Teeth or Gums it kills them.

XII. The Ejjence of the Roots and Leaves. It has all the Virtues of the green Leaves and Juice aforegoing, and for the excellent use which may be made hereof it ought always to be kept in a readyness in the Houfe[^] if it is mixed with Wine, or Wine and Water in equal quantities, and a lousie Head bathed therewith, it will kill Nits and Lice, and this it will do in Man and Beaft[^] the fame thing the Liquid Juice will do also.

XIII. The Juice or Emulfwn of the Seed. An Ounce of the Seed will make twenty or twenty four Doles for a Man or Woman, it is an excellent thing against hot, fait, and (harp deluxions of Rheum falling upon the Lungs, eases Coughs, tho' never ib extream, and is good against pains of the Spleen, and Womb, and Hyfterick Fits, or Fits of the Mother[^] it flops all forts of fluxes of the Bowels, as Diarrhceas, Difenteria's, Lienteria's, and Hepatick Flux, as also the overflowing of the Terms, and the Whites in Women.

XIV. The Oil of the Seed by Infolation or Expreffion. Dropped into the Ears it is good against noise, and pain there, as also against thickness of hearing, and kills Worms in the Ears and anointed on the Joints of Gouty People, it gives ease to the pain and affwages the swelling of the part: The Oil by Infolation is good for all the aforementioned things, but the Expreffed Oil is five times more powerful and efficacious, and therefore the rather to be chosen.

XV. The Seed in substance. It has all the Virtues of the Juice or emulfion of the Seed at Seftv till, above, besides which it is a moil excellent thing to be given about ten or fifteen Grains at a time (30 according to the Age of the Patient) to such as find a Seed, or cannot hold their Water, being continued for some time, and by this Remedy alone I have

cured several Young Perions, (even Women kind, which are the most difficult) who had been troubled with the same many Years, the Cure succeeding beyond expectation: The Emulsion of the Seed will also do the same thing, but whether it is so powerful as the Seed in substance I will not determine, because a great Virtue may reside in the Hulls or Husks of the Seed, which in the Emulsion are all cast away, but if the Emulsion be made with all the Husks of the Seed in it, I know not but then it may do as well as the Seed in substance itself, it the Seed is given in substance, it ought first to be all bruised in a Stone or Glass Mortar, and then mixed with the pulp of a foasted Apple, or other proper Vehicle, and so given (for some time) every Night going to Bed.

XVI. *The Decoction of Roots, Herb, or Seed.* If the Feet are washed herewith it causes Sleep, and given in a Clyster it does the same, so also bathed upon the Temples and Forehead, and a little snuffed up the Nostrils also, it has all the Virtues of the green Leaves, Liquid Juice and Effence at Seal. X. XL XII. if in like manner applied, but the Decoction is much the weaker Preparation, and ought therefore to be the oftner used: The Decoction of the green Husks of the Flowers has also the same Virtues.

XVII. *The Juice of the Roots of the*

Sand hat, or gentle boiling, or dissolved in, hold the Reel in a gentle heat, or in the Sun, till it is fit for use. The Juice of the Roots of the Sand hat, or gentle boiling, or dissolved in, hold the Reel in a gentle heat, or in the Sun, till it is fit for use. The Juice of the Roots of the Sand hat, or gentle boiling, or dissolved in, hold the Reel in a gentle heat, or in the Sun, till it is fit for use.

XVIII. *The Juice of the Roots and Leaves of the Sand hat, or gentle boiling, or dissolved in, hold the Reel in a gentle heat, or in the Sun, till it is fit for use. The Juice of the Roots of the Sand hat, or gentle boiling, or dissolved in, hold the Reel in a gentle heat, or in the Sun, till it is fit for use.*

gainst Deaf heft., or dulneis of hearing, noise and pains in the Ears, and held in the Mouth it gives ease in the toothache and so dissolved in Wine, or otherwise in Spirit of Wine, it may be given from twenty to thirty, or forty drops, or more, in any convenient Vehicle, to cause Rest and Sleep, and to ease the pains of the Spleen and Bowels, or pains in other parts of the Body, it operating not much different from an Opiate, and this Extract is that Juice of *Henbane* which you ought to put into the Composition when you Confect the *Laudanum Opia?* F^m *Paraceffi.*

XIX. *The Oil or Ointment of the Roots, or green Leaves, or of their Juice.* It is made by a trebble addition of the Vegetable matter to the Oil Olive, or Hogs Lard, or mixture of Oil and Sheeps Suet, ever continued and boiling till the aqueous particles are all consumed. It is good to cool inflammations, and ease pain proceeding from a hot cause, if it is made (instead of the Hogs Lard, or mixture, Oc.) with *Unguentum Populeon.* it will give admirable ease in the Gout, affuage the pain and swelling of the Testicles, and the Inflammations and Tumors in Womens Breasts, it eases all pains of the Joints, and in any other part, and will perform what the Leaves, Juice or Effence can do.

XX. *The Cataplasim of the Roots or Leaves.* Applied to simple recent Contusions it dissipates the Tumor, or prevents its rising, and quickly cures if made by boiling them soft in Red Port Wine, if applied to Womens Breasts, or to the Testicles, or other like painful Tumors, it eases the pain and affuages the swelling, applied to the Temples and Forehead it eases the Headach, gives Rest, and induces Sleep* that made without Wine is good to be applied to pains in the Reins, and to the brawny parts of the Arms and Legs, but it ought to be applied hot, that made with Wine is an excellent thing against the Sciatica, and the Gout in Hands or feet.

XXI. *The fomentation.* It is made of the Wine in which the former Cataplasim was boiled, adding to every Pint thereof a Dram or two of *Oleum Tartariper deliquium*, it allays Inflammations, dissolves Tumors or Swelling proceeding from heat, and eases any pain proceeding from a hot cause, or hot and sharp Humors, it is good also to bath therewith Hands and Feet which are apt to be hard and dry* it is also good to hold in the Mouth for the Toothach, and to foment that side of the Cheek and Jaw therewith, it giving present ease to the pain.

XXII. *The Fumes of the dried Root, Herb, or Seed.* The Fume of dried Root, Herb, Stalks* or Seed, being burned, and the Hands held over the Fume thereof, will quickly cure such as are troubled with Swellings or Chilblains in the Winter, the same done to such as have Kibes in their Heels it will quickly heal them, though inveterate and very bad* it also cures the Toothach.

XXIII. *The Distilled Water of the* Herb, Homers. It is effectual to all the purposes for which the green Leaves, Juice, Effence, infusion Decoction, &c. are used, but is much weaker than they* it clears the Skin, being washed with it, of heat Pimples, hot eruptions, or breakings out, Herpes, Scurf; Morphew, Yellowness, and other Deformities, &c.

XXIV. *The Venefick.* It is made of the expressed Juice of Root or Herb, dieested in a Glass Body in a very gentle Sand heat for a Week, mixed with any proper matter, as Paste, Bread, Meat, &c. it kills Rats and Mice, or other Vermine: this Venefick mixed with some of the Distilled Water kills Nirs and Lice, the Head and parts affected being washed therewith, it also affuages Tumors, cools

infamations^a alleviates pain, and gives eaie in the Gout* the parts affected being often bathed therewith.

XXV. Tfo *Cure of such us an Poyfoned with Henbane.* If it is recent, the first and only thing which is tote done is, to give an Emetick, Which may be *Tartar Emetick, Vinum Antimoniale, Vinum Benedictum,* or fomefuch Antimonial Vomit, which, when it has almoit done working, its force downwards ought to be encouraged, by giving this Clytiter. *Take Mutton Brother Poffet-Drink a Pint, Ibrown Sugar four Ounces, mix, welt, and exhibit it tsarmy* by this means all the Vifcera or Bowels will be effectually cleared of the Poyfyn, then give to the Patient Goats Milk, or Mead, or Honied Water, or Pine Kernels w^h fweet Wine, or if rhere be not at Hand, give *fennel* or *Dill,* or *Caraway Seed* in Pouder, *Nettle Seed,* or *Seed of Mallard* or *Radijhes* in Wine[^] alfo Onions or Garlick taken in Wine do all help to free them from the danger, and retlore them to their due Temper again^h laity, being put to Bed give two or three Drams of *Mithridate* or *Venice Treacle* in a Glafs of Canary, cover them down warm, and let them rest upon it-

XXVf. A *Uiftory.* *Parkinfon* gives a Relation of j^{ne} who digging up fome *Parfnep* Roots in a f^h & en, by chance alfo dug up fome *Henbane* Rco.s which grew among them, they being both very like f^h another, as is before related[^] thefe *Henbane* f^h pots were boiled with the *Parfneps,* and drefsed with them, and they were eaten at Supper[^] the Perf^hon who gave the relation hereof laid that he eat of them, and was prefently after very dry, and the drought was fo great, that nothing he could take would quench it, his Tafte was depraved, and his relifh of things was taken away[^] fuddenly alfo his Sight was troubled, fo that he could not difcern things as they were, but as if they were three or four fold} his Urine was alfo quite flopped, fo that notwithstanding he had a great defire, to make Water, yet it was wholly obfti uled[^] in this f^h Condition he continued to f^h part of the Night, neither could he[?] rest ot[^] fleep being in Bed, but his Urine, by the floppage thereof, mkrw j^h hot with in him, thattf added muth to his Wief[^] at length he bethought, himfelf of a Medicine, which was good againft the Stone, it was a[^] Pouder, he prefently took ft, and it xaufed hip to make Water, and thereby he felt incredible eaie in his whole Body, for all things which he had taken before did him no good • but by this means he quickly recovered his Sight, and the otha: Symptoms vanifh'd, and by Morning he was ver/weli: The Servants alfo who did eat of this f^h Mefs were Diftemper'd, fome more, fome lefs, according to their feeding, and the ftrength of their habtt of Body, ox Conftitution, operating together.

Okf^{eva}*ton. Mountebanks and Uuack-balvers pretend to cure the Toothach with the tumes of the burned Seed, and to bring many Worms out of the Teeth and Gums therewith, it is true that the Fumes of the Seed will give eaie in that pam, but the pretence of Worms falling out of the Teeth is a Cheat which they put upon the byftanders, for thefe Vile Fellows, to deceive thofe from whom they would get Money, caufe the Patients to hold their Mouths over a Bafon or Bowl of [air warm Water, they receive the Fumes of the jurning Seeds up % Funnel* thefe Seeds[%] are fruck tall upon a ftick, with a great many fmall bits of very fine Lute String, which being mixed with the Rofin, and fixed on the tick, with the Seeds afterwards, while the Rofin is hot; as the Rofiny ftick*s then kindled and burns, melting the Rofin, and as

the Koiin burns the fumes go up the tuinielinro the Mouth, and the Seeds burft, jnd the very fmall bits of the Lute String fall into the Water, which feem to move or ltir themfelves, whereby the lookers on think them to be live Wotms come out from the Teeth and Gums, whereas in truth they are nothing but thefe bits of Lute String mixed and blended with the Rofin juft fallen down by means of the Fire, for it is the property of thole Lute Si rings, that feeling the heat of the Fire, and alfo falling, into warm Water, to feetn to ftir and to move about in the Water as if they were alive.

C H A P. CCCLXL

Of H E N B A N E White.

I. T^p H E Names. It is called in *Greek* & A *MVKif:* in *Latin, llyofcyamus albus* [^] and in *Latin* (iij)[^] White lipnbant.

II. The Kinds. There are feveral forts, as i. *Hyofcyamus albus,* (fo called by all Authors) White Henbane, and this is *major*[^] the greater kind, for *Bauhinus* makes two of them. 2. *Hyofcyamus albus minor*[^] The leffer white Henbane: whether they be one and the fame Plant (as *Parkinfon* fays they are) is hard to determine, fince difference in Soil may make a very fenfible difference both in Growth and Magnitude : however with *Bauhinus* we fliall here admit them to be two y and fo *Johnfon* upon *Gerard* allows them. 3- *Hyofcyamus Creticus*^h *Hyofcyamus albus Creticus*[^] White Henbane of Candy -, and this *Cluftus* makes to be twofold, as alfo does *Bauhinus,* which are a greater and a leffer, tho' *Parkinfon* will have them to be but one, and this larger fort is that which he thinks to be the *Hyofcyamus Lute us Diofcoridis* : but thefe in their Figure and

tefc muclt different. 4. Hyofcyamus ttibuf
:ff: Hyficyamus aboCretkupiter. The
other white Henbane of Candy; and this is that
whicht h defcribed by Johnjon in his Gerard,

III, The Descriptions. The firfi, or White Hen-
ft the greater kind) ha* a Root which
:::ikc to that of the Common Henbane,
(bet every Tear after it has giver.

!: this has divers large Leaves, but not fo large
as the Zcmmn, yet more foft and woolly \ and tho'
very much torn in or jagged on the edg«, yet not
ib much as the former, fomething rounder alfo, and
of a paler green color: the Stalks grow higher, and
Eh fewer Branches on them. The Flowers are in
Foim like to the Vulgar, but fmaller, and of a pale
color, encliniug to a whitifh yellow : the Seed
likewife grows in fuch like hard Husks, but lefs
pricMy, and is winter, but the Smell of ihs whole
Plant is nothing fo foporifeious, offenfive and heady
as the firft kind in the former Gupter.

IV. The feevnd, or Letter white Henbane. This
rsnot math in the-Rost, Stitlk, Branches, or
manner ofGrcm'wg from the prtifer White He:
but that ifgems to be every ways lefs • the Leaves
alfo, as they are fmaller, ib they are much rounder,
having indented Scallops upon them, and hanging
upon pretty long Foot-ftalks. The Flowers and
Set; re very like to thoië laft defcribed in
the fonjK.

Root vhi'h is fommhat thick and Jbort, like a "Na-
vew Rwt, dyi. v Yeur. It has lefler
thinner Leaves than the firft White, more whit*
and woolly, ana much more cut in on the ed:
dented aifo, and Itanding upon longer Foot-j:
The Stalks are more tender and fhort, having fiich
like EtoweK, ending in foil round Leaves, itanding
higher above ti of a fair yellow, and fomet-
times of a pale yellow color, and purple at the bot-
tom, ^ftd which (being patted smay J there comes

Ground Ivy leaved Chickweed

III. The Description of the Black Henbane

jh'iking ft rait into the Ground and perijhes every Tear. From this "Root spiiing forth feveral feeble Stalks, gvovving ulmolt upright, or a licdeenclining towards the Ground,* having ac certain distances teveral Joints thereon. The Leaves are of an Alehooj or Ground Ivy Form, almoft round, and not piuch unlike thofe of the Dead Nettle^ they are a little dented in on the edges, of a dull green color, and ibmewhat hairy, as the Stalks alfo are, which have at every Joint fuch round dented Leaves as grow below -, but whereas thofe which grow below, grow upon pretty, long Foot-ftalks, • thefe which grow higher at the Joints of the Leaves, are without Foot-ftalks, and encompafs the Stalk at their bottoms. From the Bofoms of thefe Leaves, from the middle of the Stalk upwards, come forth (lender blew Flowers, tending to purple, and hooded, not much unlike to thofe of *Germander*, or like thofe of the *Srilall Dead Nettle*^ which being paff away fmall Seed follows after them in their places

IV. *The fecond, or Small Henbit.* It has a Root which is fmall, and fibrous cr thready. This Plant grows lower and more leaning upon the Ground with its Stalks and Branches, which are fomewhat hairy: alio fmall, and more tender than the former, with feveral Joints thereon., the Leaves are thin and hairy, fomewhat broad, yet nothing fo large as thofe of the former, which are much refemble a *Dead Nettle*^ where the Leaves of thefe are dented in with two gaffes in the fides, which make? them a little refefent the *Climbing Ivy*, whence the Name in both of them, and in fome fort thofe Leaves refemble the back of a Bee when the m<k, the Joints of the Stalks and Branches are fet alfb witt; two Leaves of like form at a Joint, even up to the tops of the fame-, the Flowers grow from the bottoms of the Leaves at the Joints, upon long Footftalks, confifting of five fmall, blew, round pointed Leaves, and the Seed is fmall, contained in little round Heads,

V. *The Places:* Thefe Plants grow upon Hills and Mountains in feveral parrs of *Vid\N Spain, France, and England*, and I have found them growing alfo in the Hilly and Mountainous parts of *Florida* •, they grow in Fields alfo after the Corn is dF, and in fome Gar9en.s.

VI. *The Times.* They both Flower in *June* and *July*, and the Seed ripens in *Augujh*

VII. *The Qualities, Specification, Preparations and Virtues* of thefe are probably the fame with the other *Quickveeds* in *Chap. 127** aforegoing, but otherwile Authors have laid nothing of them from Experience of what they may poffibly perform, but it is very likely, that being in tatte very much agreeing unto the common forts of *Chickweed*, their Qualities and Virtues may not be much differing.

C H A R C C C L X I I I

Of HERB CHRISTOPHER

I. *Names.* It has no known *Greek* Name, nor fcarce any good *Latine* Name, but it is called by moft Authors *Chrijophoriana*, alfo *Herba Cbrijlophori*, *Cf SanSi Chrijtophori*, but for what caufe or refefent is not known, and in *Englijh Herb Chrijlophor*.

II. *The Kinds.* *Gerard* fays, that tho* this Plant be none of the *Bindweeds*, or of thofe which have need of fupporting, fo as it might climb up upon any thing, yet becaufe it bears Grapes, or clutters of Berries, it might have been numbred among the* A^ mkoh or Vine like Plants: There are two Kinds of this Herb, *Via.* 1. *Chrijtophoriana, vulgaris*, Our Common Herb Chrijtopher. *Lugdunenfts* calls it *Napellus Leucanthemos*, fome *Aconitum Bacciferum*, others *Napellus Racemofus*^ fome call it *Caftus ritger*, but that is a vain Name 5 *Pena* and *Lobel* almoft make it *Aft<ea Plinij Lib. 7. Cap. 7.* becaufe his *A8<ta* bears black Berries, but doublefs *Plin/s A8<ea* is *Ebulus*, which has a rough Stalk, whereas this has a fmooth; but *Paulus Mgmata* interprets the Root of *Afta* to be the Root of *Satnbucus*^ *Baubi-nus* calls it *Aconitum Racemofum*, fome call it *Scro* phulatia Chrippbor'r.* *Camerarius* calls it *Luparia*^ Which is a kind of *Wolfsbane*, but *ParkinJon* not finding therein by the tatte any pernicious quality, could not judge* it to be any of thefe dangerous and pernicious Herbs. 2. *Chrijtopbariana Americana*^ *Chrijtophoriana Canadenjis*^ *Chrijtophoriana Americana vel Floridiana Baccis niveis & rubris*^ *Jacobus Cornutus* in his *Canadenfium Plantarum Uijioria* calls it by the Name *P(Maces m*w% five Racemofum Canadenfe*^

nadenfe-7 but why he calls it *Panax* is very obfcure, fince it is not manifeft that it is any Wound Herb; we in *Englijh* call it *Herb Chriftopher of America*.

III. The Descriptions. *The firft, or Our Common Herb Chriftopher, has a thick long Root, black without and yellowifh within, like Box, with feveral great Fibres or blackifh Strings adjoining thereunto, trailing and creeping far abroad in the Earthy by which it greatly increafes, not perijhing in the Winter, altht the Stalks and heaves die away every Tear, frejh fpringing up again from the fame Root the next Spring;* it firft ilioots tbrth divers green Stalks of Leaves half a Foot long, which are divided or made into three parts, and fometimes into five, the lower parts Hanging for the moft part oneagainft another, or not much diftant, and the other at the end of the Stalk, each of thefe parts confifts of three Leaves, feparate afunder, Hanging upon fmall Footstalks, which Leaves are fomethjng broad, and ending in a point, fome of them cut in on the edges more deeply, and all of them dented about the edges, of a fad green color -, from among thefe Leaves rife up feveral fomewhat weak, fmoother, and round Stalks, half a Yard or two Feet high, yet not bending, but Hanging upright, having three or four fuch like Leaves thereon as grew below, but with fhorter Footstalks at the tops of the Stalks ftand a Tuft or Buft of white Flowers, every one confifting of five fmall Leaves, ivith many whitifh Threads in the middle, after which, when fallen, come fmall round Berries, green at the firft, and afterwards black when they are ripe, having upon one fide a ftreaked furrow or nollownefs, and growing near together, after the manner of a Clufter or Bunch of Grapos: where note, *Gerard* in his Defcription fays, i. That the firft is not much above a Foot long or high - 2. if W. are of a light green color. 3. That the Flowers growing at the tops of the Stalks in ipokie Tufts, confift but of four little white Leaves apiece. 4. That the Berries, or Fruit, tho' they are 5. the y are alfo fomewhat long withal.

iv. *The fecond, or Herb Chriftopher of America, is crooked, black Root, not growing downwards, nor creeping, but having many Fibres* ad { } ito it., it (hoots forth in the Spring many reddifh Stalks, about a Foot high, with feveral Leaves thereon, divided into many parts, fomewhat reiembling the former, but larger, rougher, and of a gdder green color, at the tops whereof ftand a large Tuft of white Flowers, compofed in a manner wholly of Threads, yet if they, be more nearly viewed, there will app J for every Flower fix fmall white Leaves, with their Threads in the middle, encompassing a round green Button, which coming to maturity is either white, with a purplifh tip, ftanding on a Podftalk, or TJSouy reddifh, V^ ^ of them in *Carolina*, but the Berries were of fo to a red as they f_ern>d to be black, and when dead ripe were indeed perfeaily black.

V. *The Places.* The firft grows generally in the Woods or Mountains which are fomewhat open, and out too much fhadowed, and other like places, as well in *England* as other Countries; it grows in the North parts of this Land, neat unto the Houfe formerly *Sir William Bowes*, alfo *Gerard* fays he had it growing and flourifhing in his Garden, being Plants which he received from *Robinus* of *Pans*, I alfo once found it growing near Forty Years ago in *Hornfey-Wood*. The fecond grows bpth in ours and the *French* Plantations in *Florida*, as thofe of *Carolina* are in much plenty. The y Flourifh and Flower in the end or *May*, alfo in *June* w& *July*, and the Fruit is ripe in *July* and *Auguft*,

VII. As to the *Qualities, Specification, Preparations or Virtues* of the firft we can lay little or nothing, having had no experience thereof and Authors are not agreed about them, fome, as *Canterarius*, *Lugdunenfis*, and *Gerard*, taking it to be a kind of *Aconitum*, or *Wolfsbane*, will have it to be a pernicious, poyfonous, and deadly quality, whereas *Pena* and *Lobe!* feem to think otherwife; and *Parkinfon* fays, that tho' many good Authors held it dangerous, yet he in his Judgment could not think fo, nst finding therein by the tafte any pernicious quality, as is before noted, and whereas it is reported that the Inhabitants of the Mountains and places where it grows do generally hold it to be a moft dangerous and deadly Poyfon, both to Man and Beaft, and that they ufe to kill Wolves herewith, yet *Parkinfon* does think that the Herb which thofe Inhabitants do think to be fo dangerous and Mortal, is the *Aconitum LycoSonum, or Lupicida, which grows* in thofe places, and that it is not this Our *Herb Chriftopher*, but that thefe dangerous Qualities are put up<i it purely by a miftake.

VIII. As to the *Qualities and Virtues* of the fecond, or *American Herb Chriftopher*, the faid *Jacobus Cornutus* fays that it is eaten familiarly both by the Natives and by the *French* which inhabit in thofe parts as a Sallet Herb, and I my felf who have been in thofe parts for fome Years, have feveral times eaten of the Fruit without any danger.

C H A P . CCCLXIV.

OF HERB FRANKINCENSE Narrow Leav'd, O R, ALLHEAL Fennel Leav'd.

THE Names., It is called in *Greek* ΑΓ^ωτ^ε and ift Nsn, In *Latine* *Ubanotis Angustifolia*, in *Englijh* *Herb Frankincense narrow Leav'd, or Fennel Leav'd Attbet.* The *Arabians* call it *Xair Almarjani*,

II. *The Kinds.* There are many Kinds of *Herb Frankincense* w^ehall only tteferbe the following principal Kinday viz; j. *Lybexajfts Angustifolia*, Narrow Leav'd *Herb Frankincense*, of which in this prefent Chapter. 2. *Libanotis Latifolia*, Broad Leav'd *Herb Frankincense*, or *Frankincense Allheal* of which in the next Chapter.

III. *The Kinds of the Narrow Leav'd Herb Frankincense, or Fennel Leav'd Frankincense Allheal.* Authors make feveral varieties of this Plant we (hall only Treat of the following Seven Kinds, as being chief, viz. 1. *Libanotis Ferula Folio Diofcoridis, Theophrasti, Galea*, (yfaofe Seed is called *Cachrys*, or *Canchrys*, as it is in fome Copies becaufe of its fiery tafte) It is the *Ubanotis Cachryfira Omerarij, Cachrys verayel verior Lobelij, Libanotis Galeni, Libanotis Candida Sifalпинi, Fennel Leard* *Herb Frankincense*. As for *Mxim*, vel «» it is faid by *Biofcorides Lib. 3. Cap. 87.* to be *Fruttus vel Semen Libanotidis*, and fo we taki? it, fee *Theophrastus Lib. q. Cap. i.* 2. *Ubanotis FeruU Folio iff Semine Bauhni, Panax Afdepium F'eruU facie Lobelij, Panaces Afdepium Dodon<ei± Lobe!* his *Fennel Leav'd Herb Frankincense, Allheal, or W^aad Wort of Efculapius.* 3. *Panax Afdepium Matthioli Panaces Afdepium Lugdunenfis^ & aliorum, Panax Afdepium*

Afclepium pnum Lithuictidi fecunda familis Bauhini, Matthiolus his Efculapius Allheal, or Woundwort. 4. *Panax Afclepium Apulitm Columms*, IV *Panax Semitic Foliofo hauhini*, Columna his Efculapius Allheal, or Wound wort of Naples. 5. *Panax Afclepium Anguilara iff Carrier anj*, *Libanotis fecunia Tabernamontani*, *Libanotis nigra Cxfalpini*, Camerarius his Herb Frankincenfe Fennel Leav'd, or Efculapius his Allheal of Candy. 6. *Libanotis minor Umbel la Candida*, *Libanotis Scfentrioiulinm Herbariorum Lobelij*, *Libanotis minima Lugdunenfis*, Small Fennel Leaved Herb Frankincenfe, or Allheal. 7. *Libanotis Ferulacea Germanica*, *Thalius* in his *Uarcynthia Sylva* calls it *Libanotis* German Vennel Leav'd Herb Frankincenfe, or Allheal.

IV. The Defer iptions. *The fir ft, w fennel Leav'd Herb Frankincenfe. It has a Root which grozvs deep, afdfpreads much, and with many Branches fixes it felf in the Ground, larger than a great Parfnep at the top, and white both on the out fide and on the infide, with a Pith in the middle, but it is fo brittle, that you tftuft handle it very tenderly if you defire not to break it, and when cut or broken it fends forth a clammy pale Juice, of an odoriferous, fharp, piercing fmell, not much unlike to that of Limons, and endures in the Earth many Tears* from the head of this Root $\text{f. } \text{f}^{\text{eral bu(h)} \wedge \text{S}^{\text{redt}} \text{>}$ reddifh Stalks of Leaves, of a ireih green color, being Tomething thicker and longer than thofe of the *Ferula*, and fhorter than thofe of *Peucedanum*, or *Hog-Fennel*, yet often and in many places fet three together, of a quick aromatic fmell, coming fomewhat near to that of a *Limon*-, from among thefe Leaves rifes up (fometimes, but not every Year with us ih *England*) a good large Stalk, but neither fo great nor half fo high as the *Ferula*, not much exceeding a Yard in height, nor much higher than the Stalks with Leaves, fpreading it felf out into very many Ramifications or Branches, which at their tops bear Umbles of yellow Flowers, which being paf away ate followed by a good large fort of whitifh yellow Seed, round, and a little long withal, fomewhat crefted on the outfide, being join-

ed two and two together, as is very ual in moft Ferulous Plants, which makes one fide Bat, theiiuall Footilalkor ure Leaves running up between, and is laid to be Can (tick, o: burning, for. which reaf on the Name & *yx?') <> *Canchrys*, is given to it: This, as it is, a rare, fo it is a molt excellent goodly and noble Plant, of a vaft value in many Cafes.

V. *The feceni, or Lolei* his Fennel Leav'd Herb Frankincenle. *It has a Root which isjhml, and not growing deep into the Ground, nor abides after it has given Seed, its fmell and tafte not being mud) refinals or JharpT*, this Plant grftws nothing fo high or great as the *Ferula*, but with line Leaves like unto it, and at the tops of all the Branches Umbles of yellow Flowers, but the Seed which follows is broad, not fo fmail as *Fennel*., but mote like to that of the *Ferula*, of a little quick or brisk tafte and fmell.

VI. *The third, or Matthiolus* his Efculapius Allheal *Its Root like to the lafi is fmall, but no ways anfwrable to ^Ferula*., the whole Plant is lefs than *Ferula*, the Sulks are not fo large nor fo tall, the Leaves are fine^m fmaller, and fhorter than thofe of that Plant, the Umble of Flowers is fmaller alfo, and the Seed leffer in proportion to all the reft of its parts.

VII. *The fourth, or Columna* his Efculapius or Wound wort of Naples, *It has-afmaM /ender Root^ with a buJJ? of hairs at the top, of the bignefs of ones Thumb, with a thick rugged Bark, of a whitifh yellow color on the out fide, and afpungy, white, and iwody Pith within i full of a clammy white Milk, hardn'ng quickly into a Gu'rn^ which is bitter andfharp in tafte, and unplefant^b, but yet aromatic**, the Stalks of Leaves which are fpread next the Ground in a round form at head of the Root are cut into feveral lqsg hairs, as it were thick fet together, fomewhat like unto *Common Tar row*, and hairy withal, -vftich is not feen in the other Kinds, or rather like unto *Fennel* Leaves, but bigger, having icven winged Leaves fett on a pretty large Stalk, five bigger and two fmaller, which are next the hairy Stalk, befog green at the firft, but changing yellow when it grows towards Flowering, which with the Leaves is about half a Yard long-, from among thefe Stalks of Leaves rifes up but one main Stalk, which is flender, and about two or three Feet high fometime, having fome Joints, but no Leaves thereon to the very top, where ufually grow but one or two fmall Tufts or Umbles of yellow flowers, but fpread a little largely, and growing dofer and rounder as it turns to Seed, which are fiat, and winged on both fides, two growing together, as is uful in all other Umbelliferous Plants, whereon, as alfo on the Stalk, is often foanda-fweet fmelling Gum, as clear as *Turpentine*, or *Gum Arabick*, which will fcarcely diffolve in Water without heat^ the like alfo is taken from the Root cut in pieces, but it is yellower, becaufe it muft be forced out by the Fire. *Columna* fays that this *Panax Afclepium* is the trueft of any which has been defcribed by any other Author, and that it grows frequently in *Apulia*, anfwering in every part the Defcriptions thereof in *Diofcorides* and *Theophrastus*.

VIII. *The fifth, or Camerarius* his Herb Frankincenle. Fennel Leav'd, or Efculapius his Allheal of Candy. *It has Roots like the former, and rifes up with a round Fennel like Stalk fix or feven Feet high, or more, with feveral Joints thereon, divided into Branches of Leaves, larger than Fennel, and fmaller than Ferula, of a dark green color on the upper fide, and of a blewifh green underneath, with large Umbles of yellow Flowers at the tops, which being paf away will turn into broad, fiat, winged Seed, of 3, refinous fmell and tafte, the Leaves being much more mild, and yielding a whitiffc Milk, nothing fo hot or frong in fmell as Ferula.*

IX. *The Jixth, or Small fenriell Leav'd Herb Frankincense, or Allheal.* It has a great and white Root divided into several Branches, and with a bush of hairs above -, it is a small Herb, and has divers Leaves lying upon the Ground, much cut and divided into longer parts than *Peucedanum*, or *Hogs-femcl*^ and narrower than *Our green Englifh Saxifrage*^ the Stalk has but few Joints, and Leaves on them, bearing small Umbles of white Flowers, like *Mcum*, or *Spigncl*, which being paft away leave small Seed after them, almoft like the Seed of *Ammi*^ or *Bijhopfwced*.

X. *The j"eventl*;, or German Fennel Leav'd Herb Frankincense. It has a blackish long Root, as thick as ones b'mger, full of a refinous Juice, Jharp, and wellfmclling, Jet with a bufy of hairs at the top, from whence ifpring Stalks of fine *Yenhel* like Leaves, but fhorter than they, the Stalk rifes to be a Foot and half high, on the tops of which ftand bowing white iweet fmelling Flowers. There ts of this a lefter fort alib, differing nothing from it ^ in its univerfal fmallnefs. *

XL *The Places.* The firft fix Kinds have been found growing in many Countries, as *Italy, Sicily, Candy, France, Florida, &c.* the feventh in fpmel plates in *Germany*«, I know not that they grow wild in *England*, but with us are only nurlt up in Gardens.

XII. *The Tims.* They alb Flower in *July* and *Auguji* if the Year is feafonable.; and their Seed comes to rinenefs in *Auguft* and *September*.⁴

XIII. *TBB Qualities.* They are faid to be hot and dry in the fecond degree, Aperitive, Abfterfive, Digelive, Difcuffive, Diuretick, Traumatick, Cephalick, Neurotlck, Stomatick, Arthrtick, Sudorifick, and Alexiphatmick.

XIV^ *The Specification.* They conglutinate fimple ^teen Wounds, digeft, cleanfe, incarnate, and heal old Ulcers and running Sores, and eafe pain in any part, proceeding from Blows, Falls, Strains, or cold and moift Huafers.

XV. *The Preparations.* You may have herefrom, i. *The green Leaves bruifed.* 2. *Greeh Root bruifed.* 3. *Juice of the Herb and Root.* 4. *An Efcence of the fame.* 5. *A Decoffion or Mfujion in Wine of Herb and Root.* 6. *A Vinegar of the Seed.* 7. *A Pouder of the Root.* 8. *A Pouder of the Seed.* 9. *A Pouder of the Seed Canchrys.* 10. *An Elcffuary.* n. *An Oil of the Seed by Infufion,* 12. *An Ointment of Root and Herb.* 13. *A Balfam of Root and ff&b.* H-^ *Cataplafm of the Seed.* 1j. *A Diftilled Water.* 16. *An Acid TinBure of Root and Herb.* 17. *An Acid Tintfure of the Seed Canchrys* 18. *A Spirituous Tintture of Root and Herb.* 19. *An Oily Tindhire of Root and herb.* 20. *A Saline Tintture of the fame.*

The Virtues.

• XVI. *The green Leaves bruifed.* Being applied *Diofcorides* fays that they ftay the bleedings of the Hemorrhoidal Veins, and eafe the heat and inflammation and fwelling of the Fundament •, they do'alfc digeft the Kernels of the Kings-Evil, and Apoftern; in any part of the Body, tho' hard to be cured. #

XVII. *The green Root bruifed.* If it is applied to Wounds of any kind, efpecialiyto fimple green Wounds, it quickly heals them; if it is not preiently applied it, then caufes digeftion, then cleanfes and heals.

XVIII. *The Juice of the Herb or Root.* Taken inwardly to two, three, or four Spoonfuls in Wine, or other proper Vehicle twice a day, it heals all inward Wounds and Bruifes •, mixed with Honey and

anointed on the Eyes, ic clears and (harpens the Sight, Takes away Mifts, Clouds, or any thing which is growing over the Eyes, and heals Wounds and Ulcers in the fame.

XIX. *The Effence of the fame.* It has all the Virtues of the Juice, befides 'which, being taken inwardly, it difpofes ill conditioned Wounds, old Ulcers and Fiftula's to a fpeedy healing, let them be in what part of the Body foever^ Wounds and old Ulcers being alfo outwardly vvaith'd with the fame it cleanfes, incarnates, dries, and heals them.

XX. *The E>elbfion.* It has the Virtues of the Juice and Efcence, if it is made in Wine and iweecend with Honey, it makes a good Gargle to heal a fore or ulcerated Mouth and Throat, alib fore and ulcerated Eyes.

XXI. *The Vinegar of the Seed.* Ufed as a Loti-on it cleanfes the Skin from Pimples, Freckles, Scurf, Morpew, Leprofie, Tettars, Ringworms, Scabbinefs, and other like deformities of the fame.

XXII. *The Pouder of the Root.* If it is mixed with Honey and applied*, or anointed, or put into tfe Eyes, it clears from any thing which may &oyr on them or offend them, "heals" Wounds or Ulcer* in them, and quickens or fliarpens the Sight ^ being taken alfo inwardly in a Glafs of Wine from halt a Dram to a Dram, Morning and Night for fomerkonfiderable time, it does the fame thing, it provokes Urine and Womens Courfes, and! it helps alfo thole who have the Falling-Sicknefs, or have an old pain in the Stomach, Liver, or Spleen^ and if ifeTi given with an equal quantity of Pepper in Wrne, it is found profitable againft the Kings-Evil.

XXIII. *The Pouder of the Seed.* Given to a Dram in White Port Wine it opens obftruitions of the Reins and Ureters, and provokes Urine and the Terms, it expels Wind, ftrengthens gn4 fortifies the Stomach, refills Poyfon, and is good againft the deleterious quality of the Biting of Mad Dogs, Serpents, &c being put into Ulcers it cleanfes, dries, and heals them.

XXIV. *The Pouder of the Seed Cachrys or Canchrys.* By reafon of its burning property Authors do not advife to give it inwardly, for they* fay' it⁵ too fliarp, and will exasperate the Throat: *Diofcorides* fays it is of a heating and mighty drying &cl, lity, and therefore is good to be put into WafhbaliS? or fuch things as cleanfe the Skin ^ but if the whole Seed is infuied twenty four Hours in Vinegar, and dried again, and then beaten into Pouder, it then may be given inwardly, and has all the Virtues of the former, exhibited in the fame Dofe and manner.

XXV. *The EleSuary.* It is made oji eful parts of the Pouder of the Root and Seed, mixed with a half part of Nutmegs in Pouder, and eighth part of Cloves, and afixtmtbpart of Pepper w fine Pouder, -and made up with a treble proportion of clarified Honey- It is a good Stomatick, prevalent againft the Scrvy in a cold habit-of Body, ftrengthens the Tone of the Stomach, caufes a good Appetite and Digeftion* ftrengthens the Head and Brain, clears and iharpens the Eyefight, and provokes the Terms in Women.. Dofe one or two Drams in a Glafs of Wine Morning and Night. .

XXVI. *The Oil of the Seed by infufion or boiling.* Being anointed upon the parrs affected 'it is laid xo help fuch as are Buiften, and to cure Cnmps, Convolvions, Pains, Aches, Lamenefs, and the Gout.

XXVII. *The Ointment of the Root ami Herb.* It digefts and ripens Tumors, cleanfes, incarnates, dries, and heals Wounds and Ulcers, confolidates Fja&ures, and ftrengthens the Nerves, Tendons, and Ltgaijents in DiflocationS" it alfo e&fes pain in any part-beiflg anointed on the place.

XXVIII. *The*

XXVIII. *The Balsam of Root and Herb.* It is a most admirable Vulnerary, not inferior to any made of *Prunella*, or *Selphval*, *All-heal*, or any of the *Wounfaorts*, it digests contused or otherwise complicated green Wounds and Phagedenick or eating Ulcers, and cleanses them, and if there is a want of Flesh it admirably incarnates, dries, and heals them, it is good also against fretting and running Cankers, Wheals, hifhes, and the like breakings out of the Skin.

XXIX. *The Catagasm of the Seed.* Take Voider of the Seed, Darnel Flowe of each a like; quantity, Vinegar a Sufficient quantity, to make it into a *tatap/afL* Being applied it diicuffs simple Contusions, and prevails y ^ * ^ ^ I ^ ^ ^ " ? ? ^ Scurf, Moiphew, Xepfofie, di (cx)lorir]gsof the Skin, and other defcedations.

X2SX. *The Diftilkd Water.* It has the Virtues of the Juice, Effence, DecoSTbn, ot'Million of the Herb and Root, but much less efficacious, and is chiefly used as a Vehicle to convey some of the foregoing or following internal Preparations down into the Body.

XXXI. *The Acid Tincture of Root and Herb.* It refists Poyfon, and the Plague, qnd all forts of Malign and Pestilential Difeases, it prevails against the bitings of Spiders, as the *Tarantula*, of Mad Dogs, Vipers, Rattle-Snakes, and other Serpents, as also the biting or flinging of any venomous Creature * It is prevalent also against all hot and burning Fevers, it quiches Thirft, #extinguifhes the heat, and detroyes the Febrittick Ferment? Dose from ten drops to forty, fifty, or sixty, in any proper Vehicle, and according to the quantity of the Liquor it is taken in.

XXXII. *The Acid TinUure of the Seed Canchrys.* It is Stomachick, causes good Appetite and DigelHon, refists Plague and Poyfon, opens obftmElions of Stomach and Lungs, takes away Hoarfenefs and Wheezing, and thereby causes free respiration or breathings it has all the Virtues of the Tin&ure in the former SeQion, and is to be taken in the same Dose and maffler.

XXXIII. *The Spiritual* TinEjure of Root and Herb.* It is prevalent against Poyfon, expels Wind, and gives present ease in the Colick and Gripings of the #uts from cold, crude, and sharp Humors, it provokes Sweat, and is good against the Plague or Pestilence, expelling the malignity thro' the Pores of the Skin, being taken in Wine it is good against the biting of poysonous Serpents, provokes Urine, and facilitates the Birth of Women, in Labor. Dole from one Dram to two or three Drams in Wine.

XXXIV. *The Oik Tinffure of Root and Herb.* Outwardly applied It eases the Gout, and all external pains proceeding from cold, straining of the part, Blows, Falls, or the like-, it gives ease in Cramps and Convulsions, and very much *lengthens the parts weakened by those Difeases-, it is also prevalent against the Pallie, being anointed upon the *Vertebra*

and also Upo? the part afflicted. *The Saline T*ndvve.* It is of great use against freckles, Lentils, Sunburning, Tanning of the skin, black and blew Marks, Scurf, Moiphew, and other like defilements thereof!

Frankincense ALLHEAL.

I. *The Kames.* It is called in Greek ΑΙΡΑ I ^ αΑΙΤΙΥΑΑΚ, in *Libanotis*, and in EngUfh Broad Leaved Herb Frankincense, or Broad Leavd Frankincense Allheal.

IL *The Kinds.* This is the second Species of the (aenerick Kind, and is fourfold, viz. 1. *Libanotis major* Theophrasti, *Libanotis jrtilk* ppn a "Ti*oophra-*stia* 9. 7. *Sch JEthiopicum* Herba *adon*, *Sylt primiv* Wgr *DDa* aller urn ge'nm Fuchstij, *Titimeri*, *Lugdunenjis*, The Greater White Herb Frankincense. 2. *Libanotis Theophrastii minor*, *Libanotisfevt*. M\$Secunda *Theophrasti*, T\z Leifer White Herb Frankincense. 3. *Libanotis Apij Folia Crct/ca Ttieopbrafri*, *Siler Crcticum*, & *Lib a not is vera* *Thveopbrafti*, *Qamerarij*, The truest Herb Frankincense of Theophraltus. 4. *Libanotis Aquigaijs Velio Lutijolia*, *SeSch JEthiopicum ahcrum*, Columbine Lejv'd Herb frankincenle.

IH. *The Descriptions.* *The firfl or Greater White* Herb Frankincenle*, ba* a Root which grows great and long, whit Wo on the out side ^ with a *spjpt ofhdir at the tap, abiding long, and having a ft rang *Small and taste like the Roots of many other Umbellijerous Plants*-, from this Root spring foL *Large* great long Stalks, with wings of large broad Leaves some eight Inches long apiece, and almost four Inches broad, I've being fet together, two and two\ one against another, and one at the end, three or four Inches broad below, and smaller t(Mhe#end, being somewhat hard in handling, of an overworn greenish color, and a little dented about the edges, among which rises up a round frong Stalk, oftentimes four or five flet high, having such like Leaves on the Joints, but fewer, and lesser than grow below, and a few Branches rising from the upper Joints, bearing large spread Umbles of whit'fh Flowers, after which comes somewhat Hat-and round light Seed, two of them joined together, white on that side w^re it is joiral, and fraked with rough crumpled itakes on thwack or round side, and of a pale brown color when it is ripe, but a little purplish below.

IV. *The Second, or Lesser White Herb frankincense*, has a Root not much unlike the former ^ white, but wore bitter than it, fiis agrees with the former in the shape or form of th 2 Leaves, Flowers, Seeds, and shape of the Root, but that they are ail le^s, and the number of the Leaves are more, let together on every Stalk, being also mere deeply dehdred about the edges : There is another fort orchis Plant, which *Baubinvs* calls *Libanotis Lit folia mi not Seminecny-po*, which differs only in having fewer Leaves on the Sralks, altho' as finally and but one or two dup ts on the edges.

V. *The third, or Truest Hero Frankuicerife* ft* *Theophraltus*, has a Root which is covered with a blackish Bar/z, and very ubite' underneath, Spelling frong^ //^Frankincense, from which I springs up a Stalk about a Foot and halt high, divided Into some Branches, with Leaves let sparingly both below and above, something rQlembing *Small age* for the large- nefs of the Leaves, and ci:irevl about the ed^es, bear-

ing white Flowers, and large, rough, crooked, brownish Seed, having a pretty itrong finell.

VI. *lie fourth, or Columbine Leav'd Herb* Frankincense, *hw a thick, rough, fibrous, brown Root,* TW; a white Pith in the middle, fuelling fomewhat facet, but hitted in taste, having a Tuft, of blackish Hairs at the top**, from this five several Leaves upon long footstalks, broad, and hollow at the bottom, like a skinny Husk, computing one another, as those do alib on the upper Stalks, they are hard in handling, yet of a shining dark green color above, and whitish underneath, with several purplish Veins running thro' them, not all of them divided like unto Columbine Leaves, but many of them parted into five Leaves, with three divisions apiece, others into three Leaves, each Handing on a Stalk, fraked with purple, rising up above four, or almost five Feet high, with fevenri Joints thereon, and branched towards the tops, bearing every one a large Umble of small white Flowers, and after them long and broad itriped Seed, of a purplish color, a *Uttle bitter, hot,* and drawing Water into the Mouth if it is a little chewed therein, being alib fomewhat sweet of fifell.

VII. *The Places.* The first two sorts *are found in many places in Germany, and parts near adjoining, the third is a Native o&Candia, and the last is said to come out of Mthiopia, but they are all of them now made free Denizons of England, by being planted and nurs'd up in our British Gardens.

VIII. *The Times.* The two first Seed with us Yearly after they are well grown, viz. about July and August, but the two last very feidom, unless the Year proves hot and very kindly.

IX. *The Qualities, Specification, Preparations and Virtues* of these are the same with those of the *Angulifolia*, or *Narrow JJeav'd* in the former Chapter to which we refer you, yet these being extraordinary Traumaticks or Vulneraries, and of an extremely motifying and digeiting power, we (hall make these following farther Obiervations concerning the same.

X. *The LiOd Juice\ or Effence.* They are good against Chfonick Difealés of the Breaft and Lungs, and prevail against the Epilepsie and Jaundice, more especially if a little Pepper in fine Pouder is added, and ib given in Wine •, given in Poflet-Drinjcthey increafe Milk in Nurfes Breafts, and ease pains in the Stomach and Belly proceeding from sharp Humors, or Wind-, they are also good against Poyfon, and the lutings of Mad Dogs, Venomous Beasts, and Serpents, or the flinging of Scorpions, they provoke Urine fberfully, and the Courfes, being stopy the juice of the Leaves and Roots clears the Eyaight, and (harpens it, and diverts the Rheum which falls into the Eyes, by strenghtning the parts, being dropt into the Eyes, and Cloths dipt therein and applied over the Forehead and Eyebrows.

XI. *The Decoction in Wine.* It has all the Virtues of the Juice and Effence, but much weaker, and therefore may be given in a greater Dose, as from four to six Ounces ^ it is highly Traumatick or Vulnerary, and may be used Dietetically, as well as outwardly *towfiuh any Sore, Wound, or Ulcer* therewith.

XII. *The Ealfam or Ointment:* They cure Wounds and Ulcers after an admirable manner, and if a little of *Birthiwrt* Root, or of Tobacco be added * them, they do wonders in these kinds of G... beyond exprellion.

XIII. *The Cataplasm of the bruised Leaves.* Being-applied it Hops "bleeding in any part, and cures the Haemorrhoids or Piles, removes the heat, and dikufles the tumor or sweUing of the Fundament, bringing the same (if Nature intends it) to a speedy rmcumy or ripenpls-, the Catapjefem being made

with *Darnel* Meal and a little Vinegar, and applied, gives ease in the Gout, Cramps, and Convulsions, and takes away Scurf or Morphew, Leprofie, and any difcoloring of the Skin.

XIV. *The Pouder of the Root.* Used either alone by it self, or mixed *with Honey and applied, it thoroughly cleanses foul Ulcers, and heals them, and is of extraordinary use in curing Fiftula's, more especially if Pouder of Tobacco about a third part be added thereto.

CHAP - CCCLXVI

O/HERB MASTICH,

.OR,

M A R U M-

I. **T**HE Names. It is called in Greek *cf: * Latine Marum, from Maron, a certain *v* of Thracia, who is said to have found it out *w* ab Amaracoper Apocopen, utpote *MAMA* *A* *cies videatur Marum, in EngHJh Herb Mafüick, Mafüick, also Marum.

XV. *The Kinds.* Some Authors will hatte it to be a Species of *Marjoram*, others a Species o? *Thyme*, others again make it a middle Plant between them both, it seems to me to be rather a particular of its own Kind* there are three Species hereof, viz. * *Marumyulgare, Qinopodium Camerarij, Dodon't, Gefneri, Tragoriganum primum Clusij, Sampfuchrt Diofcoridk Quijj, Helenium odor urn Theophrasti* > Common Herb Mastich. 2. *Marum fupinUm Lobe* lij, Marum ex Sicilia allotum Qcfaipmi, Marum repens vertici Hatum Bauhini, Amaracm fcrp. ens, Creeping*

ing HerK Maftich.. 3. *Marum Syriacum Lobelij, Do> donai, Tabernmontani, Alarum Cretenfe Alpini, Major an-a Syriaca, vel Cretica Bauhini, Syrian or Candy Marum, ^or Herb Mattich.*

< III^The Defcriptions. *The firji, or Common Herb Maftich, has a fibrous or thready Root, which fends up greater and more woody Stalks than any of the Marjoram, it rifes up to be two Feet or more high in fome places, where the Ground is agreeable .to.it, and the Air warm and clear, it branches it felf out on all fides towards the upper parts, leaving the Stem bare below, if it is old, otherwife if it is young, thinly furnifhing the Branches from the bottom with fmall green Leaves, larger than the Leaves of any Thyme, and near to the largenefs of the Leaves of Marjoram Gentle*, at the tops of the Branches ftand fmall Flowers on a Head, which afterwards turn into a loofe Tuft'of a long, white, hoary fuk fance', like unto foft down, with fome Leaves under and about them, which abide nqt long on the Stalks, but are blown away with the Wind^ the Seed is fo very fmall, that it is fcarcely to be obferved* the whole Plant is of a fweet refinous fmell, ftronger than Marjoram, and abides our Winters if it is carefully planted and look'd afteriv^.*

IV- *The fecond, or Creeping Herb Maftich, has a long/lender Root, and fibrous withal, from whence fpring tip feveral /lender weak Stalky riot fid'ding upright, but lying upon the Ground, therèin refembling Wild. Thyme rather than Sweer Marjoram or Herb Maftich} the Leaves are many, .and fmaller than thofe of Mother of Thyme, growing at feveral diftances upon the Branches^ the Flowers are fmall and purplifh, growing at the tops, with Leaves among them, the fmell of which is very fweet and frong, coming neareft:unto Sweet Marjoram, and of a hot and "bitter tafte.*

V. *The third, or Syrian, or Candy Herb Maftich, has a very fibrous or thready Root, like unto the firji, from whence fpring up feveral upright Stalks, about half a Yard high, not fowobdy as the &tl Herb*

Maftich, but more tender and iieider, on which grow many fmall whitifh green Leaves, very like to the Small fihe Sweet Marjoram, but ibnewluU roughtr up to the'very tops, which bear'fsmaller Heads of Knots than thofe of Sweet Marjoram, and white Flowers out of them all the Herb is of a moft fragrant fweet fmell, whic'i endures a long time after it has been dried\$ it is very render to keep, and will not endure our cold Nights, which come in Mguji, or September, but is quickly deftroyed,by them.*

VI. *The Places* They all grow Wild on the Mountains of Spain, Candia, and Syria, but with us they are all nur'd up iii Gardens, the lait indèed with fome difficulty.

VII. *The Times,* they Flower about Ai^uft With us, and fometimes later, if the SummerSe^fon proves cold, and the Seed is perfected not lone after.

VIII. *The Qualities.* Herb Maftich is hot and dry in the beginning of the fourth degree, it attenuates, opfeqs, is Abfterfive, Aftringent, Anodyn, Carminative, Digeftive, Difcuffive, and Strengrhning-, it is Cephalick, Neurotick, Stomatick. Hyfterick^Arhririck, Emmenagogick, and Alexipharmick..

IX. *The Specification.* It is good againit Poyfon, the bitings of Mad Dogs, Serpents, and other Venomous Beads, Convuliions, Cramps, Lethargies, Palfies, Epilepfies, Hyfterick Fits, Vapor's, and other Diftempers of the Womb.

X. *The Preparations.* You ma^ have therefrom, 1. A Liquid Juice. 2. An EJJence. ?. An Infufion or Decoffion in Wine. 4. A Decoded or Infufed Oil : \$. A Di^illed Water. 6. A Spirit, 7. A Chymical Oil. 8. An Acid Tintfure. 9. A Spirituous Tin ffure. 10. An Oily Tintlure. 11. A Powder: i 2. A Compound Decoffion.

The Virtues.

XI. *The Liquid Juice.* Given from one Spoonful to two in a Glafs of Wine, or other proper Vehicle, it prevails againft Convulfions, Epilepfis, Lethargies, Headachs, Palfies, and difaffeasions of the Womb, it attenuates tough Flegm, opens obftructions of the Womb and Reins, provokes Urine and the Terms, and digefts crude Humors.

XII. *The EJJence.* It is good againft Coughs, Colds, Wheezings, Hoarfenefs, fliorthefts of Breath, difficulty of breathing, and other Difeafes of the Thorax, it opens obftru&ions of Liver and Spleen, and frees them from the morbick matter which offends them, it has indeed all the Virtues of the Liquid Juice aforefaid, befides which it opens, cleaites, ftrengthens, and confirms the Womb, cqrrefts the windinefs thereof, or of any other part, Which are commonly called Vapors, and is beneficial for uch as are falling into a Dropfie, and helps the lofs of Speech, by the .refolutioji of the Tongue, it provokes Urine, and eafes the Colick.

XIII. *The Infoion or Decoffbn in Wine.* It has all the Virtues of the Liquid Juice andEflence, it is very Stomatick, powerfully provokes Urine, eafes the Strangury, zpd all pains and torments of the Belly. Dpfe to fix Ounces.

XIV. *The Oil by Infufion or Decoffbn.* It warms and comforts the putward' parts, being Morning and Evening anointed upon the fame, it is good againft the Gout, eafes pains of the Joints, Nerves, Tendons, and Mufcles, difcuffes Tumors, is good againft' Convulfions; Cramps, Lamenefs, Nurhbednefs, and the Palfie, and anointed upon the lower Rejon of the Belly it helps cold gri?fs'.of the Womb, and gives eafè to pains of thofe parts.

XV. *The DH'til'ed Water.* It has the Virtues of the Juice and Efflence, but very much weaker in all helps, but it may be used as a Vehicle, to convey some of the other Preparations in; sweetned with Sugar and given to Children troubled with Convulsions it cures them.

XVI. *The Spirit.* It is Cephalick, Neurotick, Hyfterick, and Cordial, and therefore is good against Apoplexies, Epilepsies, Lethargies, Convulsions, Palfies, Vapors, Fits of the Mother, palpitation of the Heart, Fainting and Swooning Fits, ficknefs at Stomach, Colick, and other like difaffes&ions of those parts. Dose from one Dram to four Drams, either in this Distilled Water, or in Wine, or some Neurotick, Cordial, or Hyfterick Syrup, it may be given in the Morning falling, and last at Night going to Bed, and also two or three times besides in the day time if need requires.

XVII. *The Chymical Oil* It has all the Virtues of the Juice, Efflence, and Spirit foregoing, but operates in a more ample and powerful manner, inwardly it may be given from five drops to ten, or twelve, and that Morning and Evening, you mull first drop it into White Sugar, or into Honey, or some proper Syrup, and mix them well together, then mix it with the Vehicle you intend to take it in, for all cold and moid Diseases, as Palfies, Cramps, Gouts, Numbbednels, Trembling, weaknefs of the Nerves, &c. it ought to be taken in a Glass of Generous Wine; in Vapors, Fits of the Mother, &c. it may be given in the Distilled Water, or Barley Water, or Black Cherry Water ^ in the Colick it may be given in Juniper Water-, outwardly for the Palfie it is to be anointed on the Back Bone, as also the parts affected -, fo also for Convulsions, Cramps, deluxions of Humors, &c.

XVIII. *The Acid Juice.* It is a powerful Medicament against the Plague, and all sorts of Malign and Peitential Fevers, it destroys the putrefactive ferment in the Blood and Juices, allays Vapors, and rising up of the Mother, cools preternatural heats, and refills malignity in its Root, &c. Dose from fifteen drops to thirty, forty, or more, according to the quantity of the *Vehiculum* in which it is taken.

XIX. *The Spirituous Tincture.* It is a kind of Heavenly Medicament, and a Noble Cordial* it cheers the Heart, revives the Spirits, strengthens Nature, refills Vapors, Faintings, Swoonings, ficknefs at Heart, and other Diseases of like kind, it takes away ficknefs at Stomach, pains there, restores its Tone being hurt or depraved, and admirably strengthens it. Dose from one Dram to two, or three Drams, in the Morning falling, an Hour before Noon, and at Bed time, in a Glass of Generous Wine, or in Syrup or other proper Vehicle, it causes a good Appetite and a strong Digestion.

XX. *The Oily Tincture.* Inwardly given from ten drops to twenty, or more, in some proper Vehicle, it prevails against the Palfie, Convulsions, pains and weaknefs of the Back, the Stone, Sand, Gravel, and Tartarous matter in the Reins, Ureters, and Bladder, &c. for Palfies it ought also to be anointed on the Back Bone and parts affected twice a day, and to be applied upon the part and well rubbed in in Convulsions, Cramps, &c.

XXI. *The Powder of the Herb.* If it is dusted up the Nose it provokes sneezing, and thereby purges the Head and Brain of cold pituitous Humors * the Herb being chewed in the Mouth it draws forth much Rheum and Flegm, causing pains and aches in the Head, Jaws, Throat, &c. given inwardly from half a Dram to a Dram in any proper Vehicle it strengthens the Stomach, expels Wind, eases the Colick, and facilitates the Birth of Women

Labor, bringing away also the Afterbirth.

XXII. *The Compound Decoction.* Take Herb Mastic two Ounces, Origanum, Pellitory of Spain, of each six Drams, Ac or us, Long Pepper, of each three Drams, White Port Wine twenty Ounces, put all into a Tinrid Copper Vefica, or Glass Body, which cover with a Blind Head, and let it simmer over a gentle fire for an Hour, then let it cool, and decant the clear for use. Dose two or three Ounces at a time for the Palfie, Epilepsie, Lethargy, &c. two or three times a day; it is good also to gargle the Mouth for a Palfie of the Tongue * when it is taken inwardly it may be dulcified with Syrup of Clovegillflowers, or other proper Syrup.

CHAP. CCCLXVII.

O/HERB ROBERT,

OR,

Robin's CRANESBILL.

THE Names. We cannot learn that it has any Greek Name, the *Utines* call it *herb* Robert%* and *Geranium Robertianum*, and we in *tag-land Herb Robert*, and *Robin's Craneshill*

II. *The Kinds.* It is certainly a Species of *Geranium* or *Craneshill*^ and hereof there is two special Kinds, viz. \ *Geranium Robertianum vulgare*. *Geranium Rupertianum commune*, *Herba Roberti*, vel *Ruperti communis*, *Vanax Heracleum Anguillara*, *Sideritis tertia Dio/coridis*, which most of our modern Authors take it to be, and it is easily to be perceived that they are both one, for *Dio/corides* has three sorts of *Sideritis*. viz. one with a *Horehouni* Leaf,

Leaf, one with a *tern* Leaf, and one with a *Chervil* or *Coriander* Leaf, Which is this present Herb; it is alib called *Herba Roberti*, w/ *Ruperti minor*, *Geranium Robertianum minus*, The Vulgar, Common, or Lettér Herb Robert. 2. *Geranium Robertianum ?najas, herba Roberti, vel Ruperti alt era, Herba Roberta major, Gerani Robertiani alter a Species Lobelij, Geranium Gruinale Dodon&i, Geranium Violace urn Tabernamontani, Sanguinaria Radix Germanoru?n*, The Greater Herb Robert.

III. The Descriptions. *The Jirft*, Common, or Small Herb Robert, *ba* a fmall and thready Root, which IneUs as the whole Plant does, very ftrong, and almoft inking*, which fends up a reddifh Stalk, commonly two Feet high, having feverai Leaves thereon, upon very long and reddiish Footstalks, divided at the ends into three or five divifions, and each of them cut in *on* the edges, fomc with deeper cuts than others, and all dented likewife about the edges, which oftentimes turn reddifh-, at the tops of the Stalks come forth feverai Flowers made of five Leaves, much lefs than thole of *Musk Cranesbill*, or *Dovesfoot*, thefe Flowers *Lobe/ fays* are larger in fome than in others, and of a more reddifh color, which being paf away, there come in their places Beakheads, as in other *Cranesbills*, which are not very fmall nor very great-, the Stalks are lender, weak, and brittle, fomewhat hairy, and reddifh -, the Leaves are alfo jagged, reddifh, (talked, and deeply cut, like to thofe of *Chervil*, and the Flowers are many times of a bright purple color.

IV. *The fecond; or Greater Herb Robert, hoi a Root which PS wholly red., both within and without, not Jmelling fo ftrong at the former^ and it fends up levrcal (lender hairy Stalks, three Feet high, at the Joints of wfyefi ftand Leaves upon fhorte^ yet redder Footstalks, divided at the ends mod commonly but into three parts, as large or rather larger than the former, and turning red likewife -, the Flowers are purphfh red, and of the fame magnitude, and fo alfo are the Beakheads and Seed.*

V. *The Places* They boch grow almoft evry where by Way fides, upon Ditch Banks, and watte Ground, wherefoever one goes, but thē fecond is not fo frequent as the other, yet often *iēfn* and found* the firft grows alfo upon old Walls, as well thole made of Brick and Stone, as thofe made of Mud or Earth; it grows too among Rubbifh, and in the bodies of Trees fometimes which are cut down, and other like ruined placēs.

VI. *The Times*. They Flower all *May, June, July, and Auguft*, and the Seed is ripe loon after; they are hardy Plants, being green generally all Winter, nor are they eafily hurt by cold.

VII. Their *Qualities, Specification, Preparations and Virtues* are the fame with *field Cranesbill* in Chap. 162.* aforegoing, and to that you are referred.

VIII. *No/a*. *Herb Robert* is not only commend-ed againft the Stone, but alfo to Itay Blood, whe^e or howfoever flowing, as alfo fpeedily to heal all green Wounds^ it cures likewife Wounds and Ulcers of the Dugs, or Womens Breats, and in die fecret parts*

C H A R C C C L X V I I I .

O f H E R B T E R R I B L E ,

O R,

G U T W O R T .

I. *HT* HE/Nantes*. It is called in *Greek* *Αλφύρα*, *ab *» privativa*, and *ΑΛΥΩ, Trifitiia, quhji indolens inoffenfumque Remedium*, but this feems to be fpoken »7* *Mi& *#* per contrarium*, fome think it may be derived from *<EMW* Salium, vel Maritimum*, becaufe it grows near the Sea •, in *Latine* it is called *Alypum*, and *Herba Terribilis*, alfo *Alypiat* by *Atfianus*-, the Root hereof is called by the fame *At'luarim Turpetum album*, as the Root of *Efula minor* is called *Turpetum nigrum*-, and in *Englijh Herb Terrible*, or *Gutwort*, becaufe *D'wfccrides* kys it lightly exulcerates the Guts.

II. *The Kinds*. Some Authors will have this Plant to be of the Kind of *Tithymals*, becaufe of its molt violent purging and (harp exulcerating quality, but without doubt it is rather a Plant of its own Kind, there are three feverai forts hereof, *viz. T. Alypum, Alypum Montpelienfium, Herba Terribil, Thy me if a tolijs acutk, Capitulo Succift*, Herb Terrible of Mompelier. 2. *Tartvnaire, Herba Terribilfs Maffilienfium Lobelij & Lugdunenjis, Gutwort, or Herb Terrible of Marfeilles, Alphonfus Pontius of Ferraria* took it to be *Crtcorum Tbeophrasti*, the Root of which, as *Pcna* fays, is like unto the *Turbith* of *Alexandria*, not having fo much heat and bitternefs therein, nor other evil taftes, as the others have; *Eauhinus* calls it *ThymeUa Polys candentibus Serici in/lar mollibus*. 3. *Alypum Montis Ceti*, which the People of *Valentin* call *Hippoglojjum*, and is *hippoglojjum Vakntinum Clufij*, Herb Terrible, or Gutwort of *Valencia*.

III. The Descriptions. *Thefirfl, or Herb Terrible of Mompelier, ha* a Root which is of a Fingers thickncfs^long, woody, and of a brownijh color, jomevahal Salt if it grtivs near the Sea Shoar, where it may receive t?J its Pabulumfome of the Sea Wuter^ or elfe not fait at all, but bitter, if it grows farther off7 the Leaves tajling alfo after the fame manner*,*
from

from this Root rises up many woody Stalks, two or three Feet high, dividing themselves into Smaller Branches, covered with a thin Bark, the elder Branches being of a dark purplish color, and the younger more red, thick set with small, hard, dry Leaves, without order from the bottom to the top, which are somewhat long, and small at the setting on, broader in the middle, and (sharpe pointed, somewhat like unto *Small Myrtle* Leaves, of a greenish color on the upper side, and whitish underneath, at the top of every Branch stands a round Flower in a scaly Head, consisting of many purplish Thrums or Threads, paler in the middle than roundabout, something like unto the Head of a *Scabious*, or rather *Knapweed*.

IV. *The second, or Gutwort, or Herb Terrible of Marfeilles, has a Root which is almost finally long, and woody, with many fibres at it, it is yellowish on the out side and white within, nothing so hot, bitter, or impleasent as the Leaves or Seed, yet leaving a small hot talk at the end, without any smell, and not giving any Milk, it is, as YQmfays, very like unto the Turbith of Alexandria, or of the Shops, and in the form thereof;* from this Root springs forth very many hoary, or Silver white, slender, and very tough Branches, two Feet high, divided into many other smaller, on which grow many small, white, hoary Leaves round about them, smaller than those of the former, the Flowers are white and small, set close together in a long Tuft, but so covered with the white wooliness, that they can scarcely be perceived, which being palt away, small black Seed come in their places, bitter and unpleasent, and so fiery hot, that if any one should chew the same, or the Leaves of the Plant in their Mouth, they will so heat the Mouth, Lips, and Jaws, that no washing will for a long time remove it or take it away.

V. *The third, or Herb Terrible of Valentia, is a small Shrub, three or four feet or more high, its Root is two fingers thick, brown of color, and of a woody firmance,* from this Root springs forth one or more Stalks, which spread themselves forth into

many other small Branches, having a thin Rind, which is first brown, then purple, with many little and thin Leaves thereon, not much unlike to those of the *Myrtle*, the Flowers grow at the tops of the Stalk and Branches, and are as it were scaly and rough, like *Scabious* Flowers, of a blew purple color; the whole Plant is very bitter, and of an unpleasant taste, like *Chamaedaphne*, but somewhat stronger.

VI. *The Places.* The first grows on the Mountain or Hill *Cefius*, called *Cap de Cejle*, and on other Rocky and Stony places in *France*; the second grows near *Marfeilles*, by the Sea side, on a small Hill near thereunto called *Mondron*, as *Pena* says, and all along the Coast of *Liguria*, and the Isles of *Loricazza*, *Sardinia*; the third grows about *Valentia* in *Spain*, as *Clufius* declares, they all grow on Mountains and Hills, as also in other places which are Gravelly Grounds, with us they are only nursed up in Gardens.

VII. *The Times.* They Flower not until it is late with us, as in *August* and *September*; *Clufius* found some of them in *Spain* Flowering in the Months of *February* and *March*.

VIII. *The Qualities.* They are all of them hot and dry in the fourth degree, Attractive, almost violent, and vehemently Cathartick, its purging faculty being much like the *Tithymals*; but the fecundity of these is far more powerful or violent than the others, and comes nearly to the quality of *Mezcremon*, so that by reason of its great heat and violence it is very dangerous.

IX. *The Specification.* They expel Watery, Flegetadck, and Choleric Humors in abundance, and *Clufius* says that the Landlopers in *Spain* do exhibit it with good success for the Cure of the trench

X. *The Preparations.* You may have therefrom, 1. A Bmde of the dried Leaves or Root. 2. A Decoffion of the Leaves or Root. 3. A Powder of the Seed.

The Virtues.

XL. *The Powder of the dried Leaves or Root, it is given in Bjoth to purge Choler and Flegm, also watery Humors in Dropfies, which it evacuates in abundance, it prevails also against the French Vifeafe: Penaisys that Empericks, tho' they find it to purge with much violence, do often give it with Wine or Broth; Pfsy lays the smallest quantity to be taken at a time, if Chicken Broth is two Drams, a mean quantity as four Drams, and the greatest Dose to be given, as once is six Drams, but in proportioning the Dose the Physician ought to act warily, and to begin with a smaller Dose at first, as half a Dram, to see the operation, and then to increase it to larger proportions as lie may see needful, to perfect its operation.*

XI. *The Decoffion, Qujus says the SpmhrIs give the Decoction of the Root, Leaves, Fleers and Seed, to those who are troubled with hat trench Difeafe, and that with great success.*

XII. *The Seed, it purges downwards black Choler or Melancholy if taken with a little Salt and Vinegar, and in like quantity with Epithimum, but it is said a little to exulcerate the Bowels, it is also revaick against the Dropfie, Pox, Kings-Evil, and other Diseases. These Preparations of this Plant, if skilfully corrected, and given in a fit Dose, agreeing with the strength of the Patient and violence of the Difeafe, (the Body being before hand prepared) may be admitted of, where better and safer things are not at hand to be had,*

CHAP. CCCLXIX

O/HOLLIHOCI^

OR

TREEMALLOW.

This Names. It is called in Greek *Awf&i* in Latine *Malva Arborea*, *Malva Rofea*, *Malva Hortenfis*, *Maha major*, in Engliſh *Hollihock*, or *Garden Mallow*, *Mo Tree Mallow*, this is the *ui<r%&7w** *Mofceuton Plinij Lib. 21. Cap. 4.* fo called *I fhyvoſe* * *faavitare oderis*, or from *quodd avulfis fur.culis plantetur.*

II. *Vie Kinds.* There are two principal Kinds hereof, viz. 1. **&&&*& *wno Malva Hortenfis vitlgaris*, The Common Hollihock. 2. *Aivfesuahd-X* pty*Mi Malva Rofea magna, Malva Rofea Arborea*, The Great or Tree Hollihock.

III. *Of the Common Garden Kind* there are two Species, viz. 1. *Malva Hortenfis vulgaris simplex*, *Malva Rofea Hortenfis simplex*, Single Flowered Hollihock. 2. *Malva Hort enfisvulgaris multiplex*, *Malva Rofea communis multiplex*, The Double Flowered Hollihock. *Of the Great or Tree Hollihock* there are likewiſe two Species, viz. 3. *Malva Jlr-borea, Malva Rofea magna Arfforea, Malva Arborea magna peregrina*, The Outlandiſh Tree Hollihock. 4. *Malva Arborea Marina nqftraf, Mqlva Rofea Arborea Marina nofirai*^ Our Engliſh Sea Tree Hollihock*

IV. The Defcriptions. *The firſt or Common ſingle Flowered Hollihock- It has a long white, tough Root, eaſily bom A, and grows deep into the Ground, not much unlike to the Root of the Common Mallow, but greater, and generally -abides all the Winter, n- Jing^ up again the next Spring; the Stalk grows up ltraight, almoſt like a Tree, of five fix .even, or eight teet high, according as the Ground is in good-*

nefs, the lower Leaves growing upon which are al- moſt round, and fomewhat large, with many corners, but not cur in or divided, and foc in handling, Luc thoſe which grow up higher are much more produ- ced into cornerſ * Hfcm the middle of* this Scalk up- wards to the top grow the Flowers upon ilender • Footstalks, where they ftand and make as it were a long Spike of ſmall Leaves and Buds for Flowers together-, the Flowers are ſingle, andconfit of five broad and round Leaves, Handing round, like unto ſingle Rofes, with a middle long Stile, and ſome Chives about them ^ theſe Flowers#re of divefs Col- ors, as pure White, orReddiſh, ſome are of a pale Bluish, almoſt like a White, ſome are more bluih, freſh and lively, of a Roſe Color, ſome are Scarlet, and of a deeper Red, like Crimfon., ſome of a d^k Red, like black Bl6od, ſome of a deep Purple, vary- ing in their Colors, as Nature is pleaſed to play with them-, after the Flowers are palt, there grows up round Knobs or Heads, but flattiſh. withal, being round about the bottoms, and compact or made up with a multitude of round, fiat, whitili Seed, in form of a Cheefe.

V. *The fecond, or Double Flowered Hollihock, in its Roots, Stalks, Leaves, magnitude, wanner and form of grovoing, and Seed, is exafily like the Jorwer, fo that thoſe parts need no other dejjpiptioji than what we have already juji novo given,* the difference between the former and this is only in the Flower, for whereas the former are ſingle, theſe are mimi- foldly double, and are like unto double Roles, fet very thick with Leaves, id that no Stile or Pointel is ſeen in the middle, the outwardmoſt row of Leaves in the Flowers are largeſt, the innermoſt being imai- ler, and thick let together, the Colors of which are manifold and various, according as we have decribed them in the former Settion.

VI. *The third, or Outlandiſh Tree Hollihock. // has a pretty large long Root, with ſome bib res a Jjoin- ing to it, vojſich, tho" the Stalk periſhes every Year, yet endures with us for about two Winters, and then decays:* This Tree Hollihock grows with us to be a great tall Tree, more likely than an Herb, having its Stalk or Body ſomething woody, and oftentimes fo great in compaſs, that no Man can grafp it round with both his Hands ^ the Leaves are twice as large as any Common Mallow, and as foft and woolly in handling as the *Marſh Mallow*, but not fo white and downy, and many times crumpled about the edges ^ it Flowers not in the firſt Year of its ſpringing up with us, but in the fecond Summer, if a proceeding ſharp Winter has not killed its Stalk in the firſt Year, (not then being grown to its full ſtrength) being then more tender than afterwards -, this main Stalk ſpreads it ſelf out into feverai Branches, With Leaves on them, butfmaller, among which ftand fair, great, and large deep purple Flowers^ with Stripes and Veiqs in them, like to the *Common Mallow*, after which come forth fuch like round Cafes, with black- iſh Seed in them, but largèr, according to the 'pro- portion ofJie Plant, which feidom comes to matu- rity in oui^ountry.

VII. *The fourth, or Engliſh Sea Tree Hollihock. It has a Root which is white, great, and woody, with many long fibres or^Strings adjoined to it, and in its Stem, Leaves, anJInanner of growing, is very like to the laſt deſcribed* its Stalk is woody, and as great as a Mans Arm, of a ruffet or hoary Color, upon which grow foft, whitifi, woolly Leaves, almoſt as large as the other, and as foft and ſmooth as Velvety the Flowers hereof are<latge, and of a whitifi or diluted purple color, like inform to the Flower of a Wild MMIOZV, but much larger* yet H-K fo large as the Liſt-*

I Hi. *The 3 laces.* The first two grow only in Gardens, and are almost every where to be met with the third grows near *Venue*, all along the *Tirrhene* Shoar, as also on the *African Sho' dV*, where the Root lives many Years, tho' w³ Jf¹ T¹ it scarcely ever out lives two Years ^ the fourth and last grows in an Island called *Dinnie*, three Miles from *Kings-Road*, and five Miles from *firiflol*, as also about the Cottages near *Hurft Cajile*, over against the *IJle of Wight*.

IX. *The Times.* The two first Flower thro' all the Summer Months, even till the approach of Winter, but the *Tree Hollihocks* begin to Flower later so that the first of them does not often perfect its Seed with us, but the last of them brings forth its rife Seed in a little time after its Flowering.

X. *The Qualities, Specification, Preparations and Virtues of Hollihocks* are the same with those of *Common Mallow, Marsh Mallow, and Vervain Mallow*, hereafter in their proper places to be declared, and to which we refer you.

CHAP. CCCLXX.

Of HOLLOW ROOT,

OR,

Caveous FUMITERRY.

I. *THE Names.* It is called in *Greek* *K*TM* *c** X *c* P/EJC07AW, in *Latine* *Radix cava, Fumaria R&dice cavata*, in *English* *Hollow Root, Caveous Fumiterry*, and in *Zoo?* *Rooted Fumiterry*.

il. *The Kinds.* It is the third general Species of *litimteny Cap. 304. Self. 2.*, of which we have three,

pecial Kinds, *J£. 1. *Radix cava major FlcYe alho*, Great White Flowered Hollow Root. 2. *Radix eam major Flare Cameo*, Great Bluff Flowered Hollow Root. 3. *Radix Cavq minor, CapnosRadie'dacea*, Small Kollow Root, Bean fashioned Hollow Root.

^ JII. The Descriptionis. *The first, or Great White Flowered Hollow Root, has a Root which is round and great, of a yellowish brown color on the outside, and ingre yellow within, and follow underneath, so that it seems but a Shell, yet being broken every part fit will grow*-, this Root sends forth Leaves, but they break not out of the Ground until the end or March, very seldom before, and are, both for proportion and color, somewhat like unto the Leaves of *Columbines*, divided into five parts, indented about the edges, standing on small long Footstalks, of a whitish green color, among which rise up the Stalks without any Leaves from the bottom to the middle, where the Flowers (shoot forth one above another, with every JH a small short Leaf at the foot thereof, which are long and hollow, with a spur behind it, somewhat like unto the Flowers *oiharkffurs* but having their bellies somewhat bigger, and the mouth not so open, being all of a pure white color when the Flowers are past small, long, and round heads spring forth, containing round blackish Seed.

IV. *The second, or Great Bluff Flowered Hollow Root. The Root is said to be bulbous, or rather tuberous, and hollow within, or underneath, on the upper part pressed down somewhat flat, covered over with a dark fellow Skin or Bark, with several firings adjoining thereto, arid of a bitter and austere taste* the Leaves hereof are jagged, and cut asunder, almost like those of *Coriander*, of a light greenish color, like the gray color of *Columbine* Leaves, to which they are also something like in form, but lesser, the Stalks are smooth, round, and slender, about which on the upper part stand little Flowers, orderly placed, long, with a little Horn at the end, like the Flowers of *Toad-Flax*, of a light red, tending to a purple color the Seed lies in flat Cods, very soft and greenish when it is ready to yield forth its ripe black shining Seed; this Plant is very much like to the former almost in all respects, saving that the Flowers are of a light red, tending to a purple color, both these Plants abide above Ground for a very small time.

V. *The third, or Small Hollow Root. It has a Root which is solid or firm, round, and a little long withal, two being usually joined together, after the manner of a Bean, being yellowish both within and without*-, the Leaves are of a bluish green color, yet greener and smaller than any of the former, and growing more thick together, the Flowers are like in proportion to the foregoing in all respects, but lesser, having purple backs, and white bellies, standing cloier and thicker together upon short Footstalks: But *Gerard* describes his *Small Purple Hollow Root*, that it has Roots, Stalks, Reaves, Flowers, and Seed, altogether like the first described, the especial difference being, that this Plant is every way somewhat less.

VL *The fourth, which is a Small Hollow Root with a green Flower, called Radix Cava minima Flore virkli, described by John upon Gerard - the Root hereof is small and toothed, made of little bulbs, resembling Teeth, and ending in white hairy Fibres*-, it sends up several little Branches, about three inches high, and the Leaves are somewhat like those of the *Yellow Fumiterry*, or of the *Radix Cava*, but much lesser, the Flowers grow cluttering on the top of the Stalk, commonly five or seven together, each of them composed of four

four

four yellowish green Leaves, with some Threads in them.

VII. *The Places.* These Plants grow about Hedges among Brambles and Briers, and in the borders of Fields and Vineyards in low and fertile Grounds in *Germany* and the *Low Countries*, but the three first of them grow with us only in Gardens ^ the fourth is found in its times of flourishing among Bushes in several parts of *England*, as about *Chijkhurjl* in *Kent*, especially in a Wood formerly belonging to one *Pits*, and at the farther end of *Cray Heath* on the Left Hand under a Hedge among Briers and Brambles, Which is its proper feat.

VIII. *The Times.* The three first, as also the fourth, may be accounted Vernal Plants, for they rise not out of the Ground till the Spring comes in, and are gone likewise before it is past remaining under Ground all the rest of the Year, yet the lesser abides longer above Ground than the greater, the fourth Flowers in *April*, the other three Flower in *March*, and their Seed is ripe in *JWJMi* and the Leaves and Stalks are gone in *May*, if long remaining have only the Roots, for small a time they continue,

IX. *The Qualities.* *Hollow Root* is Hot in the second degree and dry in the third, Aperitive, Absteriive, Afringent, and Diuretick, Pe&oral, Hepatick, Arthritick, and Alexipharmick.

X. *Their Specification, Preparations and Virtues* are the same with those of *fumiterry* in *Chap. 504. Sett. ii. ad 24.* to which for the particulars you are referred, there being little or no difference in their operations and effects, but with them you may take these following Notes.

XL *Not a. 1. The Powder of the Roots.* Given to a Dram or more in Wine, or any Alexipharmick Vehicle, it is very effectual against Poyson, the bitings of Mad Dogs, and of venomous Serpents, as also against the Plague or Pestilence, * the Patient being laid down to sweat upon the same* it also provokes Urine, and helps against the Jaundice, and being brewed upon putrid and running Ulcers it cleanses, dries up, and heals the same.

XII. *Not a. 2. The Powder of the Seed.* Drunk from one to two Drams in Red Port Wine, or in our *Aqua Bezoartica*, it stops Vomiting, stops all sorts of Lasks or Fluxes of the Belly, and strengthens all the Viscera.

XIII. *Not a. 3. The Decoction of the Roots in Wine.* It is good against Tumors in the Throat, and the long continued swellings of the Almonds, it prevails against stremous productions, and the pain of the Jaws with an afflux of Humors.

XIV. *Nota. 4. The Oil or Ointment of the Roots.* Anointed on the Fundament it is good against the swelling and pain of the Hemorrhoids, or Piles, dissolving the one and easing the other, it dissolves also scrophulous Tumors of the Throat.

is called in *Latine Selinum Hegetale*-, (*Joodicr culc* ^ it first *Sium Terrestrre*, afterwards it was called *Aprum Sij Folijs*, and from the compofure of the Leaves *Sium odoratum Tragi*; *Gerard* called it *Sium Scgetum*, and *Sium Agrorum*, but at length the first *Latine* Name *Selinum Segetale* obtained above the rest, from whence it is Named in *Englilh Corn Par fly*, but the Country People call it *Hone wort*.

IL *The Kinds.* It is accounted among the Umbelliferous Plants, for such it is, and is contrary one of the Stock of *Selinj*, or *Apia*, for which reason it was called *Apium SijWijs*, but with us *Corn Par fly* ^ as aforefaid.

III. *The Description.* It is a Root which is small, long, and white, which produces every Tear after it has Seeded, and rises again of its own Sowing ^ it is a small low Herb, having several long winged Leaves lying on the Ground, many being set one against another, finely dented about the edges, with one single Leaf at the end, which are each of them longer than *Burnet* Leaves, and pointed at the ends, from among which rise up several round Stalks, half a Yard high, with the like, but lesser Leaves on them, branching forth likewise from the Joints, and all of them bearing small Umbles of white Flowers, which turn into small blackish Seed, less than *Par fly* Seed, but as hot and (hard in taste as it. *Gerard* has a more ample Description of this Plant > which take in the following Words.

IV. *Gerard's Description.* The Root is small, and whitish, with many Threads adjoining to it, but not so big as *Parity Roots*-, the Herb comes up at first from Seed, *Parfly* > with two small, long, narrow Leaves, the next which spring up are two small round Leaves, smooth, but nicked about the edges, and so for two or three couples of Leaves of the next growth there are such round Leaves, growing on a middle Rib by couples ^ and one round one also at the top or end of the Wing-, afterwards, as more Leaves spring up, for the fashion of them also

Y y riange,

CHAP. CCGLXXI.

O/HONEWORT,

OR,

COM PARSLY.

THE Names. It is an *Englilh Plant*, and has no known *Greek Name* belonging to it, but

change, that is to say, every winged Leaf has about eight or nine small, smooth, green Leaves, finely fringed or indented about the edges, growing on each side of the middle Rib, one opposite to another, and one growing by it first at the top or end, in form resembling those of *Sium odoratum* *Tragi* but not so large or long, or at all brownish, from among which rise up many small, round, fringed Stalks or Branches, about two Feet in height, sometimes above twenty Stalks from one Root, sometimes growing upright, sometimes creeping not far from the Ground, jointed or kneeed, and dividing themselves into very many Branches, at every Joint grows one Leaf smaller than the former, which, together with the lowermost, perish betimes, so that seldom one green Leaf is to be seen on this Plant when the Seed is ripe, the Flowers are white, and grow most commonly at the tops of the Stalks and Branches, sometimes at most of the Joints, even from the Ground, in uneven or unordered Umbles, every Flower having five exceeding small Leaves, flat and broad at the top, and in the middle very small Chives with purple tops, the whole Flower not much exceeding the bigness of a small Pins head, which being past away, there comes up in the place of each Flower two small, grey, crooked, fringed Seeds, like *Parfly* Seed, but larger, intaste hot and aromatical.

V. *The Places.* It grows in Corn Fields among Corn, or where Corn has been Sown, in several places of England, it grows in Clay Grounds, and has been found in Wheat Lands about *Maple Durham* in *lampsire* and several other places.

VI. *The Times.* It begins to Flower about the beginning of July, and so continues Flowering a long time, *Parkin/on* says it Flowered not with him till August, and that the Seed ripened about a Month after, but part of the Seed is many times ripe in August and some other parts of it scarcely in the beginning of October in the mean season some of it falls, whereby it renews it self and grows with flourishing green Leaves all the Winter.

VII. *As to the Qualities Specification Preparations and Virtues* they come very near, or are the same with those of *Other Common Parfly*, for the Seed is in form and taste almost like *Parfly* Seed, and therefore to that you are referred.

VIII. *Not a. The Liquid Juice.* *Goody ere* related that the juice of a Handful of the Leaves being drunk in a draught of Ale or Beer every Morning falling for a Fortnight, did cure one that had a swelling in her Cheek, Yearly there arising, but its original cause was unknown, yet it was attended with great heat, redness, and itching, by the use of this herb it was perfectly cured, and rose no more, it is possible it may be an excellent thing against stumous Tumors, or the Kings-Evil in any part of the Body.

II; *The Kinds.* Some will have it to be *Telephium maculosum*, or *Telephium Qiojcoridi*, and as such they nurse it up in their Gardens In *Paris* *Dodonaeus* and *Clusius* say that many took it to be *Marrubium*, or *Almaria Avicenna* in *Cap. 46/p* of which he makes five sorts, but *Clusius* takes *Avicenna* to mean either *OUT. Borage* or *Buglojs*, and that this Plant is rather the *Leucographa Plinij* in *Lib. 27. Opusculum* because of the white spots of the Leaves *Gefner* says it was called by some *Cynoglossum Montana* and *Bauhinus* thereupon calls it *Cynoglossum Montanum Dalechampi* took *Calendula* to be *Cerinthus Lereopifius Flores appellata*, but *Clusius* refers it rather to the Kinds of *Borage* or *Buglofs*, to which in temperature he says it is nearest. Authors make at least six Kinds thereof, but we shall describe no more than grow in our Gardens, which are the following, viz. 1. *Cerinthus major Flores luteo & rubro Lobelius* & *Camerarius Cerinthus quorundam major Flores variegatae Clusius Cerinthus quorundam major Flores coloris Clusius Cerinthus seu Cynoglossum Montanum majus Bauhinus* The Greater Yellow and Red Honeywort. 2. *Cerinthus minor Flores luteo & rubro Lobelius* *Cerinthus quinta Clusius Cerinthus Folia non maculata viridi Bauhini*, The Lesser Yellow and Red Honeywort. 3. *Cerinthus major flavo Flores, Cerinthus flavo asperior Bauhini Cerinthus quorundam major flavo Flores Clusius*, The Greater Yellow Honeywort. 4. *Cerinthus minor flavo Flores, Cerinthus quorundam minor flavo Flores, Cerinthus minor Lobelius Camerarius & Tabernamontani, Cerinthus Plinij* The Lesser Yellow Honeywort. 5. *Cerinthus major Flores purpurante, Cerinthus tertia Clusius, Cerinthus Flores rubro purpurascente Bauhini* Purple Honeywort.

III. *The Descriptions.* The first or Greater Yellow and Red Honeywort, has a Root which is somewhat great and thick sending therefrom many Fibres within the Earth, but perishes every Year after Seed time. This party colored Plant rises up with divers thick hairy Stalks, almost two Feet high, on which are set long large Leaves, of a bluish green color, spotted with great white spots, round at their farther ends, and so much encompassing the Stalk at the lower ends, that it seems to go through them, with some small Pricks or Thorns thereon, and a little hairy withal, the Stalks are branched toward tops in other smaller ones, and full of Leaves, the much lesser, whose ends do turn inwards, like the *Turnsole* Heads, at every Leaf whereof comes forth a long hollow Flower, like unto a *Comfrey* Flower, and as large, which in some are all yellow, with a reddish circle about the middle thereof, but in others from the middle forwards is of a yellow color, the other part next the Stalk being of a purplish red color, with some Threads in the middle, trailing sweet like Honey, wherewith Bees are much delighted, each Flower ending in a green Husk, divided into five parts at the tops, in which, after they are past, grow the Seed, which is blackish, a little cornered, and flat at bottom, where it is joined to the Husk.

IV. *Gerard* describes it thus. *The Root perishes at the first approach of Winter*, it rises forth of the Ground after the falling of its Seed, with two small Leaves, like those of *hazily* between the which Leaves comes forth a thick, soft smooth, tender, and brittle Stalk, full of Juice, dividing it self into many other Arms, which are also divided into many other Branches, bowing or leading towards the Ground, being not able without supports to sustain it self, by reason of the great height of Leaves, Branches, and much Juice, with which the whole Plant is furnished, upon these Arms or Branches are placed many thick rough Leaves, set with very sharp prickles, like the rough Skin of a thornback.

CHAP. CCCLXXII
Of HONEY WORT,
OR,
WAX-FLOWER.

L. T. 2^E. JP^{mes} It is called in *Greek KASOR*; *Th* *J^ohra JiTM* *Lib. 6. Cap. 7; in Latine Cerinthus*, and in *Engl. Honey wort, and Wax flower*.

of a blewifh green color, spotted very notably with white ftrakes and fspots, like the Leaves of the, *True Pulmonaria*, or *Cowlip of Jerufalem*, and in (hape like thole of the *Codded Thorowax*, which Leaves do embrace or encompafs the Stalk round about, from the bofom whereof comes forth fmall clufteis of yellow Flowers, with a circle or band of bright Purple round about the midft of the yellow Flower; the Flower is hollow fafhioned, like a little Box, and of a Tweet or Honey tafte when it is fuck'd, in the hollownefs whereof are many fmall Chives or Threads, which being paf away, round black Seed does come in place, contained in foft skinny Husks* the Flowers are very various in color, which are of yellow or purple, and fometimes of both mixed to-

V. *Thefecond, or Leffer Red and Yellow Honeywort, has a long Root, full of fybres, perfifhing every ICear^ its Branches are both (horter and leaning downwards, not ftanding upright, on which grow long green Leaves, without any fspots on jttt, and leffer than the former *, the tops of t^p Branches are as full of Leaves and Flowers as the foregoing, but turn not in the fame manner \$ the Stalks which fuftain the Flowers, and fo likewife the fmall Leaves at the foot of every Stalk, are fomewhat purplifh, but the Hysk in which the Flower grows is green, and cut info five divifions} the FlowerJis long and hollow, like the former, and almoft as great, of a Gold yellow color, dented at the ends, and with a Red or deep Crimfon circle about the middle thereof^ and the Seed which follows is like the other, but fomewhat leffer.*

VI. *The third, or Greater Yellow Honeywort. It toasaRoot like the others, which perfifhes after Seed time in the fame wanner -, it rifes up with a reafonable great ^lk, Branched on all fides from the bottom to the top, many of the lowermoft lying upon the Ground, and the other ftanding more upright, on which grow long and large blewilh green Leaves, spotted as the firft is, but not fo latge at bottom, where they encompafs the Stalks, and having ibme prickles thereon in the m^ldie., as the firft has, and a^ little hoary ^J)out the brim or edges, j the tops of the Branches do bend downwards, fet with fmall Leaves, and Flowers at them, as the firft, and as large as they, but without any circle or bottom of Purple, being wholly of a fair yellow color, with fuch like Threads as the reft have, and Seed alfo much the fame-, the Leaves of this feem to be rougher than the Leaves of the firft, but narrower at their fetting on, as aforefaft.*

VII. *The fourth, or Leffe: Yellow Honeywort. It ha* a Root tiohich is white alfo, and long, and abides in more Southern Climes all the Tear long, but with mperijhes in Winter^ it has a flenderer Stalk than the former, near two Feet high, fet with fmall, narrower, and spotted Leaves thereon, without or- u* u^one above anothe*, on both fides the Stalks, which foreads it felf out into many fmall but longer Branches, from the middle thereof, thick fet with Leaves and Flowers, which are like the.fcft, all yellow, but lsmaller, and dented about their brims-, after which come fuch like Seed as the laft, but fmaller.*

VIII. *The fifth, or Purple Honeywort, bat'd white long Root, which per ifhes every Tear, and therefore wuli be newfown every Springy it grows very like the Great Tellow Kind, with low bending Branches, and foftnewhat large blewifh green spotted Leaves, like as the reft have-, the Flowers grow in the fame manner as the others do, and as large, wholly of a dark purplifh color, on the fuperficies whereof a little whitenefs is perceived-, the Seed which follows is like tjie others, but greater than any of them, and*

two.for the moft part ftanding together in a husk.

IXo *The Places.* The firft, third, and fifth, grow wild in *Spain*, the firft in *Boetica* and *Portugal*, the third in *Valentia*, alfo in *Monte Palatino* at *Rome*-, and in *Germany* in *Aujiria*, *Stiria*, *Bohemia*, and *Hungary*: the Originals of the fecond and fourth are unknown, they none of them*grow wild in *England*, but are only nurft up in *Gardens*.

X. *The Times.* They Flower all *June*, *July*, and *Auguft*, and fometimes fo late, that we do not gather good Seed from any of them, but from the Red^ if the ^ear proves not warm enough, and wet with* ai to ripen them, or if they be not well watered when it is a dry Summer, to bring themgrtie. fafter forward, h they perifh at the firft approach^ Winter, and muft be fown the next Spring.

XL *The Qualities.* They are temperafIn refpect to heat or cold, and dry in the fiift degree, Airring and Vulnerary.

XII. *The Specification.* They are peculiar to ftop Bleedings of all forts, the overflowing of the Terms, Bloody Flux, Hepatick Flux, ©V.

XIII. *The Preparations.* You may have there-front, 1. A *Liquid Juice* or *Efence of the Herb*. 4. A *Decoffion thereof in Wine*. ' ? . A *Poudcr*.

The Virtues.

XIV. *The Juice or Effence of the Herb.* Taken inwardly from one Ounce to two, or three, it is good to ftop inward bleeding, whether of any Veffel broken in the Lungs, or Piffing Blood, or the Bloody Flux^ it flops alfo bleeding at Mouth and Nofe, the overflowing of the Terms in Women, and other Fluxes of the Bowels -, if it is mixed withgp little Saffron, it is good for bleared and writei^*, Eyes, and being ufed in foul Ulcers after they are cleaned, it helps to incarnate them, efpecially fuch as are in the more nice and tender parts of the Body.

XV. *The Decoffion in Wine.* It has all the Virtues of the Juice or Effence before rfelared, and does the fame things, but not fo effe&ually, nor fo ipeedily, and therefore is to be given or ifted oftner. and in a greater quantity or Dole*

XVI. *The Powder.* It flops inward Bleedings and Fluxes, as the Juice, &c. does., and being apolied outwardly to any flux of Blood, it prefently flops, it5 ftrewed alfo upon moift and running Sores, or putrid Ulcers, it cleanfes and dries them, and dif pofes them to healing.

XVII. *Noia.* *Pliny* and *Virgil* affirm, that Bees are much delighted with the Flowers of thefe Plants, being fweet, or abounding wirh Honey, and that they gather from them more Honey and Wax than from many other Flowers^ and froirf thence doubtlefs it obtained the Name of *Cerinth*.

Of H O P S Garden and Wild-

I. ^pHE Names. *Diofcorides*, *Galen*, nor any of the Ancient *Greek* Writers make any mention of this Plant, nor yet any of the Ancient *Latine* Authors, except *Pliny* only, who *Lib. 21. Cap. 15.* does, but only name it, and number it among thole Herbs which grow of themfelves, and are ufed for Meat with divers Nations*, The *Arabians* h^e not Y y v - . K only

only remembred it, but commended it highly for many Diseases. The *Greeks* at this day call it BJKV. *g* Bawi«, *Bryon* and *Bryonia*, it is likely for the form or the Leaves, and running of the Branches. The *Latines* call it *hupulus*, *hupm Salitarivs*, *Lupuhts Salt Ban us* (*qui ad Salices affurgit, vel qui SaliSum c'lyt, vel quia falit iff reptat per Arbor-es, aut quia jcandit-Sahces*) *jMefne* makes it his third kind of *YolubiUs*, *Lobel* calls it *Vitk Septentrionalem*, (The Northern Vine) and *Tragns Smilax aspera*, which it is not; we in *Engliffh* call it *hop*, or *Hops*.

II. *The Kinds*. It is twofold, viz. i. *hupulus* ^{The} Garden or Manured Hop. 2. *Lupulus Sylvestns*, *hupulm Ixmina*, The Wild Hop.

III. *The Descriptions*. *The fir ft, or Garden Hop, hafa Root which is great at the head, Jhooting forth many blackijh firings, taking faft hold of the Grturt&h* it riles up at firft with feveral great brown heads, like unto *Asparagus*, but larger, which afterwards ipreading it felf out into rough Branches, climb up upon great, long, or high Poles, which are fet on purpofe for them ^o run upon; it has many hard and rough dark green Leaves, cut into three or five diviions, fomewhat like unto *Bramble* Leaves, and dented alfo about the edges; at the tops of the Branches, which hang down again for the moft part, come forth many Italy heads, being as it were a number of fmall yellowifh green Leaves growing thick together, from among which come forth the flowers, of a whitifh yellow color, which being P^u, and the heads changing their color to a more wovmfh yellow, they are then fit to be gathered to keep; in hjs jQower at tije Attorn thereof is contained the Seed, which is brown, or of a reddiifh brown color, fmall and round.

IV. *Gerard* describes the *Hop* thus. *The Roots Render, and diver fly folded one within another.* *The* *Stalks* *are* *very* *long* *Stalks*, *rough* *and*

hairy, alfo rugged Leaves, like thofe of the *Vine*, or rather *of Briony*, but yet blacker, and with fewer dented diviions; the Flowers hang down by clutters from the tops of the Branches, puffed up, and fet as it were with Scales, like little Canes, or *Scaled* **?ine Apples*, of a whitffh color, tending to yellownefs, and of a ftrong fmell.

• *V. Thefecopd, Wild, or Female Hop, has a foot like the former, and grjms tip in the fame manner, or fafhwn, climbing upon Trees or Hedges, or what ftands next unto it,*with rough Branches and Leaves like the former, but this bear? much fmallr Heads, and in far lefs plenty or number than the Manured does, and fometinjcs in fome Years there are but few Heads to be feen upon fome Plants, and herein confifts the efpecial difference.*

VI. *The Places*. Thefe Plants grow more frequently in our colder Climate, than in the hotter or more Southern, they delight to grow in low moift Grounds, where they may have moifture enough, and yet not too much, for which caufe they are planted on Hillocks as it were, and Trenches are made to receive or carry off any great oinnriJir nf Water, that the Plants may «L&S&L&S\$

fruitful Soil: The *Wild Kind* grows among Briers and Thorns about ^borders of Fields, thefe b/ being tranfplanted into Gardens, and being manured as the *Garden Kind* is, much alters it felf and becomes little inferior to that of the *Garden*, and in procefs of time comes to the fame goodnefs and perfehon.

VII. *The Times*. They fpring not up till *April*, when from the old Roots, which reraain'all the Winter, new Shoots or Buds come forth; they flower not till the latter end of *June*, and the *Hops* themfelves are not gathered till the middle of *Auguft*, and the beginning and middle of *September*, when they are dried, and fo kept all the Year for ufe.

VIII. *The Qualities*. They are hot and dry in the third degree, Inciding, Aperitive, Abfterfive, Subaftringent, Digeftive, Difcnffive, and Dhiretick, Neurotics,

Neurotick, Stomatick, Hepatick, Nepiritick, Hyfterick, and Arthritick, Emmenagogick, Sudorifick, Alexipharmick, and Lithonriptick.

IX. *The Specification*, They are of fpecial tile to cleanf the Blood, provoke Urine, help the Strangury, break and expel the Stone, Gravel, Sand, and Tartarous Mucilage from the Reins, Ureters, and Bladder, kill Worms, expel Poyfon, and provoke the Terms in Wpmen: *The Garden and Wild* are equal in virtue.

X. *The Preparations*. You may have theretrom, 1. *A Sallet*. 2. *A Liquid Juice of the Leaves, Roots, and green Hops*. 3. *An EJfence of the fame* 4. *An Infufwn in Wine or Water*. 5. *A Syrup of the Juice*. 6. *A Decofcon of the Roots*. 7. *A Powder of the Seed*, 8. *A Spirituous TinUure of the Flowers or Hops*, 9. *AnAcidTinfure*. 10. *AnOilyTinture of the fame*. 11. *A Saline Tinfure*. 12. *A Spirit from the Hops*. 13. *The Bath*.

The Virtues.

XL *The Sallet*. The firft Buds of the *Hops* being lafd a while in Sand will make them tenderer, and being boiled are ufed to be eaten after the fame manner as the Buds of *Afparagus* are, and with as great delight to the tafte^ they open the obftru&ions of Liver and Spleen, cleanf the Blood, loofen the Belly, expel Grayel and Sand from the Reins, and give eafe in the Strangury.

XII. *The Liquid Juice of the tops of Hops*. It has all the former Virtues, but much more powerful, it* effectually cleanf& the Blood, and is a good expedient for the cure of the *French Difeafe*, as alfo all Torts of Scabs, Itch, Pimples, Herpes, Tettars, Ringworms, Morpew, Scurf, fpreading Sores, and all forts of difcolorings of the Skin, being taken daily Morning and Night, from two Ounces to four, in any fit Vehicle* it is found by experience to expel Poyfon.

XIII. *The Effence*. It hjs all the Virtues of the Liquid Juice, but much more powerful to the Intentions, besides which, being taken two or three Hours before the coming of the Fit of an Ague, it is faid to cure it at fbmeCew times taking-, it kills Worms in the Body, provokes the Terms, and powerfully expels Urine-, dropt into fore and ulcerated Ears, cleanfes them from their Corruption, takes away their finking fmell, and heals them ^ it purges Choler, but more effe&ually if given in Whey of Goats Milk} if the ufe of it is continued for fome time, Spring and Fall, it has been found to cure the Kings-Evil, and the Scurvy.

XIV. *The Infufion of Hops in Wine or Water*. It cures the Strangury, or fuch as make their Water with heat and difficulty, and brings away Stones, Sand, Gravel, or Tartarous Mucilage, obftruating the paffages of the Reins, Ureters, and Bladder* if Decofion of *Hops* is ufed in making of Bread, it is faid to make the Dough to rife better, and the Bread to be the lighter-, it has all the Virtues of the Juice and tience, but not full out fo powerful, and therefore may be given to fix or eight Ounces Morning and Night

XV. *The pnotfion of the Root's*. *Clufius* fays, that the Women in *Spain* ufe it to cure the falling of the Hair, caufed by the *French Difeafe*. Take fair Water a Gallon, *Hop_m* Roots cleanf&ed and bruifed a Pound, or more, boil them together to the confumption of a third part, or better, ftrain out, and give half a Pint of it to drink every Morning fatting, letting the Patient fweat upon it^ fome add to theDecofion Roots of *Partly* and *utchgrafs*, with a few RaifonoftheSun.

XVI. *The Syrup of the Juice*. It has all the Vir-

tues of Juice, Effence, and Million, but mult be given in three times » larger quantity, becaufe the Medicament is fo much clogged with Sugar-, it cures fuch as have the Yellow Jaundice, eafes the Headach which comes of heat, attemperates the calidity of Stomach and Liver, and is very profitably given in long and hot Agues, arifing from inflamed Blood and Choler^ it loofens rhe Belly, and effe&ually cures the Scurvy, Dropfie, Gout, and Kings-Evil.

XVII. *The Ponder of the Seed*. Being given to the quantity of a Dram in the Morning fatting, and laft at Night going to Bed, it kills Worms in Children, or elder People, provokes Urine powerfully, and brings down Womens Courfes.

XVIII. *The Spirituous TinSure of Hops*. It is not inferior to any Diet-Drink which can be given to fuch as labour under the Scurvy, Gout, Dropfie, Pox, and Kings-Evil ^ it fingularly purities the Blood after a Salivation, but it is belt to be given to fuch as are of a cold and moift habit of Body, fat-and corpulent, and not to fuch as are thin, holiovtf, and f&erti to be emaciated or confumed-, it xlay be given from a Dram to two Drams, or more, in Ale, Beer, Wine, or other proper Vehicle.

XIX. *The AcidTinfure of Hops*. It has the Virtues of the Spirituous Tinfurc, but much more fit to be given to fuch as are of hot liabits of Body, becaufe it cools and refiefhes^ it exterminates all malignity of the Pox, Plague, or Poyfon, and is fingularly good againft the Sitings of Mad Dogs, Vipers, and other venomous Serpents, Cfc. it eradicates the Scurvy, Gout, and Kings-Evil, and after an admirable manner cures Agues and Feverts, and kills Worms in Old or Young.

^ XX. *The Oily TinSure of Hops*. As a Topick it gives eafe in the Gout and Sciatica, and jmies all pains of the Joints and Limbs coming of T& and moifture^ it is an excellent thing againft the Palfie, being anointed upon the Back Bone, and upon the parts affe&ed, giving it inwardly alfo at the fame time-, you may give from ten to twenty, or thirty drops for a dolo, beftj dropt into White Sugar, and thenjmixed with a Glajsof White Wine, and fo taken it gives eafe in the Strangury, provokes Urine and the Terms, and effe&ually cures the Colick, and cleanf&es the Reins, Ureters and Bladder from fmall Stones, Gravel, Sand, and Tartarous Matter lodging therein-, if theDofe is doubled or trebled, and given two hours before the Fit of an Ague, it commonly cures it at three or four times taking.

XXI. *The Saline Unfaire of Hops*. It cures by bathing therewith Scurf, Morpew, Leprofie, Tettars, Ringworms, Herpes, and other like breakings out, and clears the Skin of Tanning, Sunburning, black and blew Spots, Yellownels, and other like difcolorings thereof! *

XXII. *The Spirit of Hops*. It is truly Cordial, cheers the Heart, and refrefhes the Aniraal and Vital Spirits-, it is good in Fainting and Swoning Fits, repreffes Vapors, and other Hyfterick Difeafes, and after a fingular manner prevails againft Convulfions, whether in Old or Young, and is helpful againft Paralytick Diftempers.

XXIII. *The Bath*. It is itfade of the *Hops*, by boiling in fair Water-, if Women fit in it, and continue the ufe of it for fome time, it brings down the Terms, tho' long ftopt, provokes Urine, eafes pains of the Joints and Limbs, as alfo the exquisite tortures of the Strangury, and takes away the i welling and hardnels of the Womb.

XXIV. *Nota*. *Hops* are, now very much ufed to put into Ale, for thereby it not only makes it keep longer, and makes it finer, but alfo more wholfomy, and gratefuller to the Sromach and Palate-, b*#this

is to be observed, that because *Hops* have an admirable fragranc^y and subtil odor, and abound wonderfully with volatile parts, they are never to be boiled in making of Beer, (for fo all their volatile parts will be loft) but only fcalded and infufed in the fame, by which means, you will extraft into the Liquor all their volatile and excellent fubftance, leaving the earthy, or devilifh parts behind, which the way by boiling only extracts; and this Truth all fuch as are accuftomed to make Tea can demonftrate, who, if they boil their Tea, always fpoil their Liquor, for which reafon they only fcald, and infufe it in the fame, if they would have it admirable: The fame thing is to be underftood of *Hops*, and of ail other Vegetable fubftances, which confift of fragrant, odoriferous, and volatile parts, if fo be you would preferve them.
